Messrs. Alex. Dickson and Sons led for forty-eight, distinct, showing Wm. Shean, Mdme. Leon Pain, Her Majesty, and other fairly good flowers. Second went to Mr. W. H. Frettingham, Beeston Nurseries, Notts, Messrs. R. Harkness and Co. coming third. Messrs. Harkness and Co. again scored for the thirty-six triplets, staging some of the best varieties, but the heat of the tent sent the flowers to pieces before we were able to take notes of them. The Newtownards growers came a close second in this class, several of Messrs. Dicksons' recent introductions being included in their set. Mr. W. H. Frettingham was third.

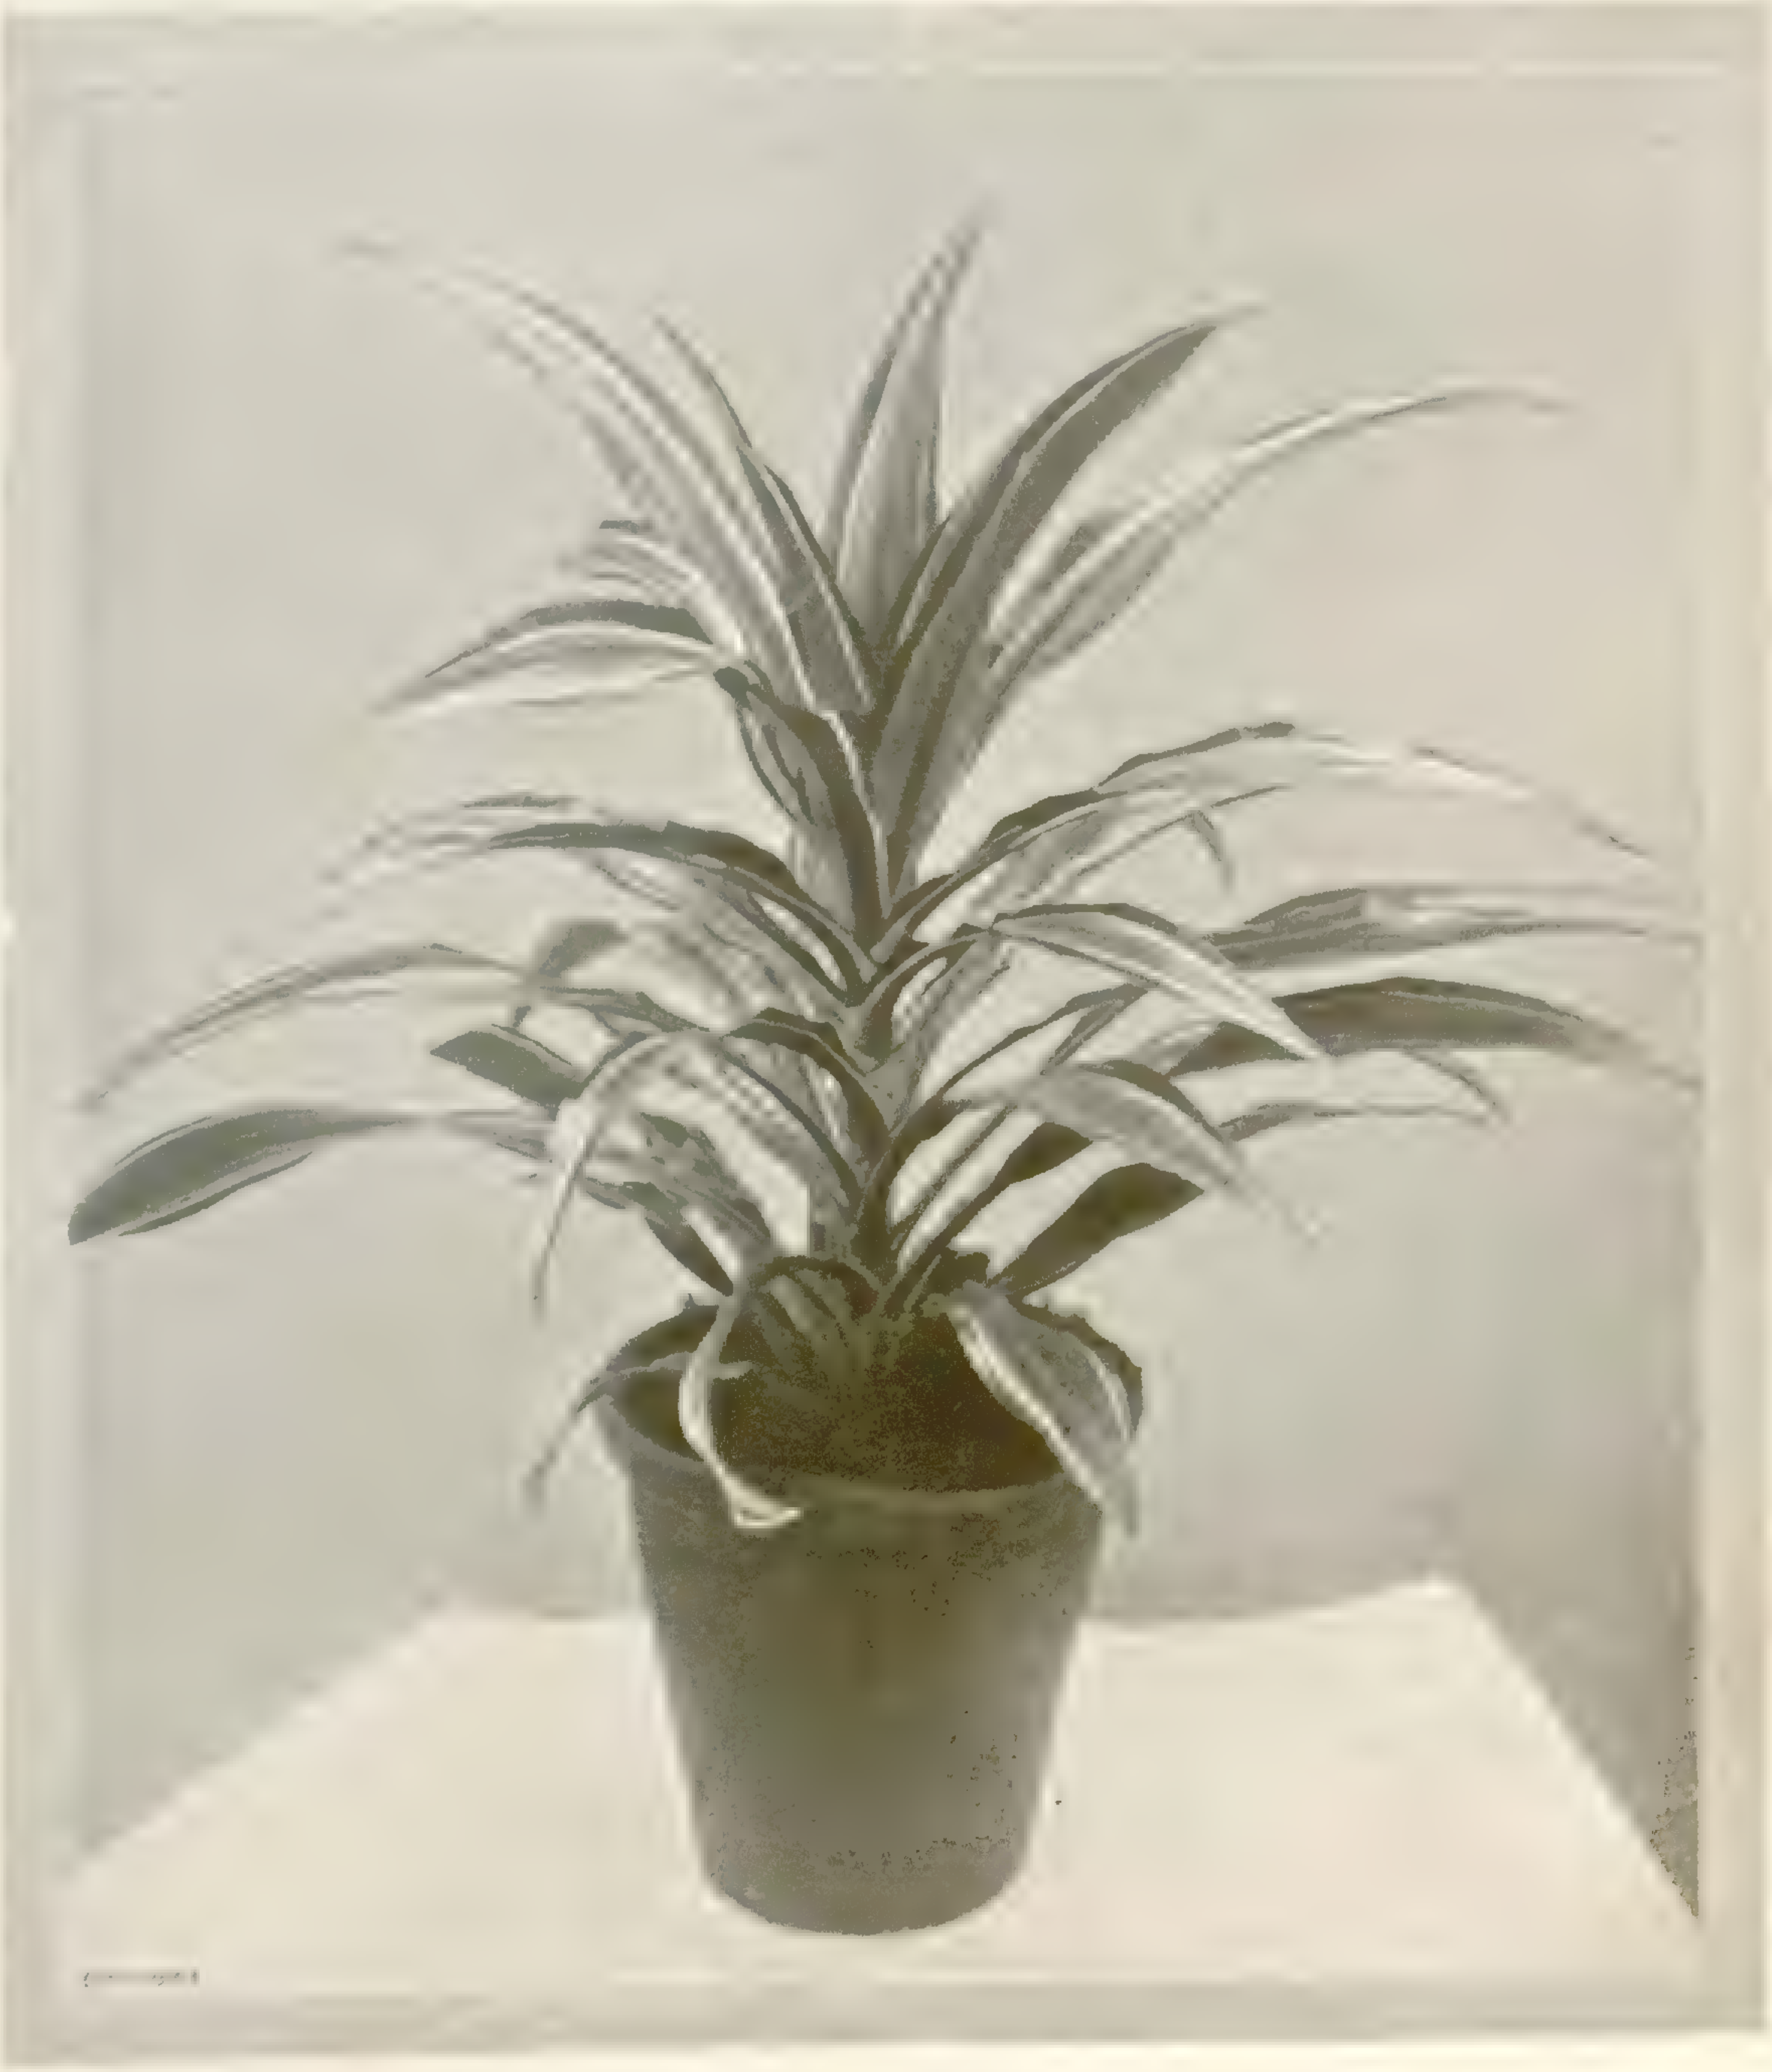
The Lyon Rose was shown by all the winners in the class for twelve yellows. We scarcely consider this variety to be yellow, but it was undoubtedly better shown than anything else in the class. Mr. W. T. Mattock, Barton End, Headington, Oxford; Messrs. Perkins and Sons, and Messrs. Alex. Dickson and Sons were the successful exhibitors in the order named. Mrs. Cornwallis West was adjudged the best white variety, Messrs. Alex. Dickson and Sons being the exhibitors. Teas and noisettes were shown in large numbers, but the flowers were small and weak. Messrs. Alex. Dickson and Sons scored for twenty-four varieties, and also for twenty-four hybrid teas.

The collections of hardy flowers put up for prizes, to the total value of £25, five in number, made a glorious display of colour. Messrs. W. Artindale and Son, Sheffield, were placed first, but subsequently disqualified through staging a mixed bunch of alstromeria, whereas the schedule stated no mixed bunches allowed. First, therefore, went to Messrs. Harkness and Sons, Bedale, Yorks; second to Messrs. Gibson and Co., Bedale; third to F. Bouskell, Esq., Market Bosworth. Messrs. Artindale were, on the recommendation of the judges, awarded a special prize.

SWEET PEAS

were a fairly good display, although not so numerous as we sometimes see. Mr. W. Davies, gardener to Dr. Phillips, Prospect House, Malpas, Cheshire, led in the class for eighteen varieties with a nice set, though staged somewhat flat. Mr. W. Marple, 27, Bristol Street, Wolverhampton, came second, his flowers being rather smaller and shorter on stem; third went to Mr. J. Bower, Woodseaver, Market Drayton. Mr. W. Davies again led for twelve varieties, showing beautiful flowers on fine stems, second going to Mr. E. Bebbington, Market Drayton, and third to Mr. H. S. Foster, gardener to F. E. Munley, Esq., Hockley Heath, Warwickshire.

In Mr. Eckford's class for twelve bunches the lead was taken by Mr. J. Bowler, followed by Mr. A. H. Hickman, Cookley, Kidderminster.



DRACÆNA DEREMENSIS WARNECKI.

Leaves deep green with longitudinal white lines. A.M., R.H.S., July 4.
Messrs. J. Veitch and Sons.

Decorative tables are always a big feature at Hanley, and on this occasion there were seven entries in the class confined to roses, and another seven in the class excluding roses, the whole series occupying the centre of the fruit tent. Mr. W. T. Mattock, Headington, Oxford, led the way in the first-mentioned class, using the lovely Irish Elegance on a tall centre stand with small vases of other varieties of suitable shades around. Flowers, foliage and arrangement were very pleasing. Mr. Stephen Sims, Borrowash, Derby, followed with a rather heavier arrangement of similar varieties of roses. Messrs. Townsend and Sons, Worcester, coming third. In the other class Enchantress carnations were very largely in evidence, there being but two tables of sweet peas in the class. Mr. A. J. Blair, Beech Hill, Cheddleton, took leading place, his blooms of Enchantress being set off by a somewhat lavish use of gypsophila. The conspicuous feature of Messrs. Lewis and Sproson's table was the great size of the carnations. Second prize was awarded this table, and third was secured by Mr. Stephen Sims, Borrowash, with his table of pink and mauve sweet peas with sprays of francoa and trails of lycopodium.

FRUIT.

The leading class in the fruit section was for a dessert table furnished with fruit and decorated with flowers, foliage, or plants. Mr. William Parker, gardener to J. Drake, Esq., Orford House, near Market Drayton, secured first prize. He had really good Madresfield and Buckland Sweetwater grapes, Taunton Hero melon, Royal George peach, beautifully-coloured apples, and fine strawberries. Pink carnations, sweet peas, and francoa were used as decoration. Mr. J. H. Goodacre, Elvaston Hall Gardens, Derby, took second, losing slightly on grapes. His total points were 113½ against 115. Malmaison carnations were well used on this table. Third place was taken by Mr. W. Nicholls, gardener to the Right Hon. Lady Beaumont, Carlton Towers, York. For a table of twelve dishes there were four good entries. Mr. N. F. Barnes, gardener to the Duke of Westminster, Eaton Hall, Chester, led the way with beautiful Muscat and Madresfield, Hambro', and Foster's Seedling grapes, Elruge nectarines of rich colour, fine Williams' Bon Chretien pears, Eaton Seedling melon, and other excellent dishes. Mr. W. Parker, Market Rasen, came second; Mr. Goodacre third. The special prizes for decoration were awarded: Mr. Goodacre first, who used odontoglossums and cattleyas; Mr. Barnes second for salmon-tinted carnations; Mr. Parker third.

VEGETABLES

made a good show. There were four entries for Messrs. Sutton's prizes offered for a collection of six varieties. Mr. W. Nicholls scored with Magnum Bonum cauliflower, White Leviathan onion, Early Giant pea, Sutton's Favourite carrot, Princess of Wales tomato, and May Queen potato. The remaining prizes went to Mr. H. S. Foster and Mr. A. H. Hickman, Kidderminster.

Mr. Nicholls won both the nine and six dishes in Messrs. Webb's class, showing capital stuff throughout.

MISCELLANEOUS.

A highly attractive exhibit was put up by Messrs. Sutton and Sons, Reading. It comprised a very fine collection of vegetables, groups of double begonias and beautiful annuals and perennial flowers, all raised from seed. This exhibit was awarded the silver challenge cup offered for the best non-competitive exhibit, and also the society's gold medal.

Messrs. W. Artindale and Son, Sheffield, filled a stage down the centre of a tent of a length of 110ft. The stage was filled with a series of distinct groups, each an exhibit of individual merit and interest. A variety of alpine and dwarf herbaceous plants finished off the frontage.

Mr. Henry Eckford, Wem. Shropshire, showed a very bright and charming lot of sweet peas, Dodwell F. Browne, Evelyn Hemus, Othello, and Constance Oliver were well represented. Another exhibit of sweet peas on an extensive scale was that arranged by Mr. Robert Bolton, Warton, Carnforth, who always shows flowers of high quality and tastefully arranged. A stand of useful border flowers, with roses in front, came from Messrs. Dicksons, Lim., Chester.

Mr. H. N. Ellison, West Bromwich, once again staged ferns in pleasing variety. The arrangement was very effective, and the group formed a welcome contrast to the surrounding blaze of colour.

Roses, perpetual carnations, and zonal pelargoniums were put up in distinct groups by Messrs. Jarman and Co., Chard, Somerset, who also had vases of their set of sweet sultans. Messrs. Seagrave and Co., Gleadless, Sheffield, and Mr. W. L. Pattisson, Cherry Orchard, Shrewsbury, were both exhibitors of violas.

On a wide stage across the end of the group tent Messrs. Aldersey and Marsden Jones, Tilston, Malpas, Cheshire, staged some lovely sweet peas.

Mr. William Lowe, Beeston, Notts, put up an extensive exhibit of roses, both in boxes and on bamboo stands. Messrs. William Conway and Sons, Lim., Halifax, Yorks, showed hardy herbaceous flowers in good style.

SPECIAL AWARDS TO TRADE EXHIBITS.

Silver Challenge Cup and Gold Medal to Messrs. Sutton and Sons, Reading.

Gold Medals.—Messrs. Artindale and Sons, Sheffield; Mr. H. N. Ellison, West Bromwich; Mr. R. Bolton, Warton, Carnforth; Mr. W. Lowe, Beeston, Notts.

Silver Medal.—Mr. H. Eckford, Wem; Messrs. Jarman and Co., Chard; Messrs. Dicksons, Lim., Chester.

Small Silver.—Mr. H. Pattisson, Shrewsbury; Mr. S. R. Compston, Macclesfield.

Scottish Horticultural Association.

The July meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 4th inst. Mr. Massie, the president, was in the chair, and there was an attendance of 65 members.

The Secretary gave an account, illustrated by a series of lantern slides, of Dr. Henry's experiments in the breeding of elms. The results obtained by Dr. Henry seem to show that there are two species only of elms native to the British Isles, viz., Ulmus montana (the Scotch or Wych Elm) and Ulmus glabra (also called Wych Elm in the East of England). The latter species occurs as a park and hedge row tree in the East of England, and is fairly common in Cornwall and the South of Ireland. The English elm (U. campestris) Dr. Henry considers to be a hybrid form, probably a descendant of a first cross between the above-mentioned species again crossed with U. montana. In the experiments the seed of this tree proved to be practically unfertile. The only two kinds which produced uniform seedlings were the two before-mentioned species. All the others produced mixed seedlings. In the case of the Huntingdon elm (U. vegeta), opposite-leaved seedlings of the U. glabra type and alternate-leaved seedlings of the U. montana type were produced in almost exactly the Mendelian ratio of 3 : 1, but taking into account the other points of difference in the two species there were possibly 64 kinds of seedlings. These experiments seem to show that what are generally looked upon as "varieties" are merely combinations of Mendelian unit characters, and all the forms of British elms met with have, no doubt, been produced by the interacting of these characters upon each other. Dr. Henry's theories regarding the origin of the Black Italian poplar and the cricket bat willow were also touched upon, and, after some discussion, a very hearty vote of thanks was accorded to the secretary on the motion of Mr. D. W. Thomson.

The exhibits were: Fine collection of roses, including Rhea Reid, Marquis de Sinety, Mrs. A. R. Waddell, My Maryland, Wm. Shean, Mdme. Melanie Soupert, Ecarlate, and Mrs. Aaron Ward, from Messrs. Dickson and Co., Edinburgh; begonia flowers and potato, Midlothian Early (tubers of two plants, weighing 10lbs.), from Miss Burton, Polton; fruit of Stephanotis floribunda, from Messrs. John Forbes, Hawick, Lim.; flowers of carnation Lady Hermione, from Queen Mary's Coronation Bouquet, from Messrs. Todd and Co., Edinburgh; seedling ox-eye daisies, from Mr. F. Bailie, Stenhouse, Liberton; new strawberry The Liberal, and pea Essex Star, from Mr. James Scarlett, Sweethope, Musselburgh; new marguerite Mrs. F. Sander, and hybrid passion-flower, from Messrs. James Grieve and Sons, Edinburgh; greenhouse rhododendron almost overtopped by a plant of common heather. The rhododendron was repotted when two feet high with peat brought from the Western Highlands eight years ago. The heather plant appeared in the following spring. The plants have been grown during the eight years in a dwelling-room window in Edinburgh. From Mr. A. Macmillan, Edinburgh (late of Trinity Cottage). Lathyrus rotundifolius (Drummondi), from the secretary.

At the meeting on August 1 a paper on perpetual-flowering carnations will be read by Mr. Thomas Hay, superintendent of Greenwich Park, late of Hopetoun Gardens. The arrangements for the excursion to Manduston, Duns, on August 19, were intimated. Five new members were elected.

Norwich Horticultural Society.

In addition to the great flower show held by the Royal Agricultural Society, which we duly reported, a local show was also held at the show grounds on Thursday, June 29, by the Norwich Horticultural Society. The display on this occasion was naturally much smaller than usual, for the committee and leading exhibitors had given their unstinted support to the larger show. Nevertheless, the exhibits of local amateurs made a bright and attractive display that was in every way creditable to our Norfolk friends.

One side of the tent was occupied by roses, the quality throughout being of a fairly high order. Mr. H. Youngman, gardener to R. Steward, Esq., Saxlingham Old Hall, Norwich, won first for thirty-six distinct varieties. He had Her Majesty, Lady Alice Stanley, Hugh Dickson, and Florence Pemberton among other good sorts; second prize went to Mr. Robert Balls, gardener to Miss E. V. Penrice, Witton House, Norwich. Six competitors staged in the class for eight triplets, and the successful one among these was Mr. Scurrell, gardener to Lieut.-Colonel M. L. McEwen, High House, Thorpe, Norwich; his flowers were of capital size, in nice condition, and well staged. Twenty-four distinct varieties found Mr. Youngman again to the fore, with Mr. R. Balls as runner up. Mr. Youngman also led for twelve distinct blooms, and for twelve of any one variety of tea rose, showing Souvenir de S. A. Prince; and for any one variety other than a tea with a fine box of Frau Karl Druschki.

Some good sweet peas were put up, and added considerably to the charm of the tent. The twelve bunches staged by Mr. M. Quinn, gardener to the Right Hon. Lord Stafford, Costessy Park, Norwich, which won first prize were of excellent quality. Countess Spencer, Arthur Unwin, Thomas Stevenson, and Earl Spencer were shown in pleasing style.

Hardy flowers made a creditable display there being four entries in the twelve-bunch class, but only one of twenty-four bunches. The latter was staged by Mr. Lewis Smith, gardener to Robert Fellowes, Esq., Shotesham Park, Norwich; Tropaeolum speciosum, big bunches of Heuchera Rosy Morn, and H. micrantha, Morina longifolia, and Iris ochroleuca were among the more prominent things in the collection which received first prize. In the class for twelve bunches the winner was Mr. F. W. Graveling, gardener to F. Newhouse, Esq., Bella Vista, Thorpe Road, Norwich; Frank Neave, Esq., Fingwood, near Norwich, coming second, and Mr. R. Goodson, gardener to R. Steadman, Esq., Woodhill, Gressenhall, Dereham, third.

Mr. W. Allan, gardener to Colonel the Hon. C. Harbord, Gunton Park, Norwich, received first for a collection of six dishes of fruit; his Gunton Scarlet melon, Violette Hative peaches, and Lord Napier nectarines were very good; Mr. W. Chettleburgh was second. Mr. Allen also scored for a collection of carnations with very well-grown flowers of up-to-date varieties. Mr. G. Davison, gardener to Colonel Petre, Westwick, Norwich, taking second place.

Wolverhampton Floral Fete.

A bright and very warm day saw the opening of a grand show of plants, fruits, roses, and other flowers held at West Park, Wolverhampton, on Tuesday, July 11, and the tw following days. For nearly a quarter century Wolverhampton Flower Show has bee an annual event, and during a greater par of that period the shows have been so larg and so excellent as to place them in the forefront of the finest flower shows in the country. Without a doubt the remarkable success and development of Wolverhampto Floral Fête is mainly due to the enterpris energy, and enthusiasm of a hard-workin committee, and we were glad to meet on more the same genial workers with Mr. Wi Barnett, the popular secretary, still holdin the reins, and conducting affairs as near to everyone's satisfaction as it is possible an individual to do. The arrangement the large tents and of the exhibits with was carried out in the admirable mann which has earned for Wolverhampton t reputation for being the best-arranged sh in the provinces.

As at most big shows, the grou of stove and greenhouse plants were prominent and highly interesting featu Everybody admired the tasteful arrange of beautiful foliage and flowers, and even uninitiated, who understood but little of t respective merits of the highly-colour crotons, the chaste caladiums and anth riums, or the distinctive characteristi the orchids, could nevertheless appre their exquisite grace and charm, that, after all, is one great object of th shows. Of the four groups put up, occupying 30ft. by 12ft. of space, Mess Cypher and Sons' exhibit was given pi place. The group was very bright wi cattleyas, oncidiums, ixoras, and hig coloured crotons, while the background palms was brightened up by carnations liliums, the permission to use cut th being taken advantage of by the introducti of two arches clothed with scarlet and whi carnations. Mr. J. V. MacDonald, garden to Sir G. H. Kenrick, Edgbaston was a good second. His crotons were very

LEICESTER.—ABBEY PARK FLOWER SHOW, 8th and 9th August next. Open Class, Group of Plants, £20, £15, £10, £6. Liberal prizes for Collections of Fruit, Displays of Roses; Silver Cup, Gold and Silver Medals for non-competitive exhibits. Schedules from JOSEPH BURTON, Supt.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

AN EXCEPTIONALLY FINE GROUP OF FOLIAGE PLANTS ARRANGED BY MESSRS. J. CYPHER AND SONS, CHELTENHAM. Awarded First Prize.

and bright, and arching racemes of odontoglossums and other orchids were well used. Mr. W. A. Holmes, Chesterfield took third, and Mr. W. Vause, Leamington, fourth.

Messrs. Cypher and Sons again led in the class for a group of foliage plants arranged at the side of the tent. The grand colours of the crotons, the glossy-leaved anthuriums and fine variegation of caladiums all told to great advantage in a very handsome group. Mr. W. A. Holmes, Chesterfield, followed with another nice group, in which similar subjects were arranged, third going to Mr. MacDonald, Mr. W. Vause bringing up the rear. In the class for twenty plants in 8in. pots, to include flowering as well as foliage plants, Messrs. Cypher and Sons still kept their lead, staging Ixora Regina, I. Williamsi, I. Pilgrimi, and I. coccinea, with Clerodendron Balfouri, C. fallax, and Acalypha Sanderiana among flowering plants, with beautifully-coloured Croton Inimitabilis. Dracæna Sanderiana, dieffenbachias, etc., as foliage. Mr. C. Weaver, gardener to B. H. Mander, Esq., Trepull, came second with smaller, but nicely grown stuff, Mr. W. Vause coming third.

King's Acre Nurseries, Lim., Hereford, arranged a circular group of well-fruited trees in pots. Gratioli of Guernsey, Doyenne Boussoch, and Conference Pears, carried remarkable crops, an umbrella trained Peregrine Peach, and the new King's Acre Berry were good. The latter is claimed to be both earlier and superior in flavour to the loganberry. First prize was awarded.

Interest is well maintained in the rock and water garden class that Wolverhampton has run so well for several years. Three really splendid exhibits competed for the prizes, which totalled £50. Messrs. J. Backhouse and Sons, Lim., York, once more took the lead, their exhibit being characteristic of the firm's distinctive style of work. The rocky bank in the background with a moist recess and dripping well on one side, and a cool peat bed in the opposite corner, were divided from the rock mound in front by a winding stream which accommodated nymphæas and other water plants. Sarracenias, Japanese iris, ferns, and orchids occupied the nooks where moisture was available, and in the chinks of the rocks grew campanulas, dianthus, saxifragas, and a mass of alpine plants disposed in a very natural manner. Mr. J. E. Knight, Tettenhall Nurseries, Wolverhampton, made a very close second, his arrangement of stone being very effective, and the dwarf shrubs and flowering plants were disposed with great skill. Messrs. Artindale and Sons' third prize exhibit was one of the most effective the Sheffield firm have put up, in fact it was as much a flower garden as a rock and water garden, spiræas, delphiniums, yellow callas, phloxes, and gladioli coming into the scheme and forming a bright array of colour.

For the group of flowering plants of one kind only there were four entries, among which the begonias from Messrs. Blackmore and Langdon, Twerton Hill Nurseries, Bath, were awarded first prize. To say the flowers were of tip-top quality is the least praise we can accord, and indeed it is difficult to imagine any great improvement upon flowers that have attained so high a degree of excellence in shape and colour. Mr. F. Davis, Pershore, stood second, also staging lovely begonias, Messrs. Cypher and Sons coming third with clerodendrons.

Mr. A. Cryer, gardener to J. A. Kenrick, Esq., Edgbaston, took firsts for coleus and for caladiums, and Messrs. J. Cypher and Sons, Cheltenham, scored for six specimen palms, Mr. Cryer taking second place, and Mr. Vause third.

ROSES.

Whatever the season or the weather the display of roses at Wolverhampton is always ahead of most provincial shows, and on this occasion the quantity was greater than ever. The quality, too, in spite of the recent drought, was very good, our Irish friends coming up particularly strong. The heat of the tent, unfortunately, told upon the flowers at an early hour, and the public lost the best view of a wonderful display. Mr. Hugh Dickson, Royal Nurseries, Belfast, took first in the class for seventy-two distinct varieties, there being five entries. Good flowers on the winning stand were Chas. K. Douglas, Queen of Spain, Lohengrin, and Florence Pemberton. Messrs. R. Harkness and Co., Hitchin, took second place, a few of their flowers being on the small side. Earl of Warwick, Jeannie Buatois, William Shean, and Florence Pemberton were nice. Mr. G. Prince, Longworth, Berks, was third, and Messrs. Perkins and Sons, Coventry, fourth. Mr. Hugh Dickson came out victorious among six competitors for forty-eight varieties, showing Leslie Holland, Caroline Testout, Bessie Brown, and Hugh Dickson in good form. Mr. Prince came second with several good teas on his stand, W. R. Smith being exquisite; third went to Messrs. R. Harkness and Co.; and fourth to Messrs. Perkins and Sons.

Mr. Dickson maintained his lead with twelve triplets, The Lyon, Hugh Dickson, Mrs. Theodore Roosevelt, and Mrs. Stewart Clark showing well. Messrs. Harkness and Co. followed closely with Bessie Brown, Dean Hole, Horace Vernet, and other nice blooms. Third was taken by Mr. W. H. Frettingham, Beeston, Notts, and Mr. Prince was fourth. Twenty-four distinct varieties were splendidly staged by Mr. Hugh Dickson, and Mr. J. Mattock, of Oxford, showed well for second place, Messrs. Harkness and Co. following.

Twelve varieties, introduced not earlier than 1908, formed a small but interesting class, Mr. Dickson still proving invulnerable. His varieties were Queen of Spain, President Taft, Mrs. Maynard Linton, La Galassiere, Mrs. Molly Hobbs, Margaret, Souvenir de M. Louis Perriere, Lyon, Lady Ursula, W. R. Smith, Mrs. James Craig, and Jonkherr J.

L. Mock. Messrs. Harkness and Co. and Messrs. Perkins and Sons followed in order named. The best twelve dark roses came from Mr. G. Prince, who showed Reynolds Hole, and Messrs. Perkins and Sons' Frau Karl Druschki scored for twelve light roses. Twelve distinct teas found Mr. Prince the victor, the same exhibitor winning for nine vases of teas. Mr. J. Mattock scored for twelve bunches of decorative roses, there being seven entries. His bunches of Betty, Mdme. Ravary, Lyon, and Mdme. A. Chatenay were effective. Mr. G. Prince took second in this class, Gottfried Keller, Maharajah, Mdme. Jean Dupuy, and others being nicely displayed. Mr. W. T. Mattock, Headington, Oxford, was third.

Three gorgeous banks of hardy flowers competed for the prizes in the collection arranged on a space 15ft. by 5ft. Messrs. J. Harkness and Sons, Bedale, Yorks, received the chief award with a lightly arranged collection of good delphiniums, malvas, verbascums, and a host of seasonable subjects fit to grace the finest gardens. Messrs. G. Gibson and Co., Leeming Bar, Bedale, were a fine second, their yellow verbascums, bright gladioli, and gaillardias were well used among campanulas, veronicas, and potentillas, as well as other useful things. Messrs. W. Artindale and Son, Sheffield, third. Messrs. G. Gibson and Co., Leeming Bar, led for a collection of delphiniums, staging Rev. Lascelles, Ustane, King of Delphiniums, and a number of other good sorts. Messrs. Harkness and Sons were second with massive spikes of Philemon, Satisfaction, Mrs. J. Harkness, and many others, third prize going to Messrs. Blackmore and Langdon, on whose stand Statuaire Rude stood conspicuous above all. The whole class was a grand display of these stately flowers.

For a collection of decorative plants and cut flowers, arranged on table space 6ft. by 4ft., Messrs. Bastock and Son, Moseley, took leading honours. Carnations, zonals, early gladioli, and liliums were grouped among ferns, small crotons, carex, etc. Mr. J. V. Macdonald took second place, using larger crotons, with orchids, Malmaison carnations, Chelone barbata, Humea elegans, etc., third prize going to Mr. C. Weaver. Only two entries for a collection of cut carnations were forthcoming, Mr. C. F. Waters, Balcombe, winning over Mr. J. E. Knight, Wolverhampton. Both stands had good flowers, Edith Waters on the winning stand being particularly well shown.

SWEET PEAS

were largely shown, and the competition was well sustained, both in the society's classes and in those provided by various seedsmen, the flowers being of good quality, considering recent scorching sunshine and drought. Mr. A. E. Usher, gardener to Sir R. L. Baker, Bart., M.P., Ranston, took first for eighteen varieties, his flowers being good throughout. Mr. W. Maiden, gardener to Dr. J. E. Phillips, Malpas, came second, and Mr. F. Hindley, Lymm, third. Mr. J. Watson, Wem, Salop, scored for twelve bunches, followed by Mr. C. Flaver, gardener to Mrs. Twentyman, Wolverhampton, and Mr. A. H. Hickley, Cookley. The prizes in this class were provided by Mr. H. Eckford. The best dozen in Mr. Sydenham's class came from Mr. D. Richards, Kingswinford; Mr. Blackburn, gardener to Captain Starkey, Leamington, second; and Mr. E. Tilt, Erdington, third, among five entries. Mr. A. E. Usher, Mr. H. Smart, The Weys, Wolverhampton, and Mr. W. Richards, of Kingswinford, were winners in the order named in Messrs. Bakers' class.

The most tasteful arrangement of violas and pansies on 7ft. by 3ft. of tabling was an excellent class. Messrs. W. Pemberton and Son, Bloxwich, received first for a very effective arrangement. The flowers were disposed in vases before a perpendicular mirror, and the quality of every variety staged was excellent. Messrs. Bastock and Son, Moseley, took second place with an arrangement on somewhat similar lines; Messrs. Seagrave and Co., Sheffield, were third, using boxes for their pansy blooms, and shallow bowls for the violas.

FRUIT.

This section has been stronger here than on this occasion, but this does not mean that the table of fruit with which Mr. S. Barker, gardener to the Duke of Newcastle, Worksop, won first was in any way inferior. Indeed, the peaches, melons, apples, and figs, as well as the grapes, were splendid. Mr. Barker also received first for decoration, using Malmaison carnations to capital purpose. Mr. W. Parker, gardener to J. Drake, Esq., Market Rasen, was second, showing Muscat of Alexandria and Madresfield Court grapes, Sutton's Scarlet Melon, Brown Turkey figs, and other nice dishes. The exhibit also taking third for decoration. Mr. N. F. Barnes, Eton Hall Gardens, Chester, took third, showing eight good bunches of grapes, and some pears, peaches, plums, etc.; second for decorations. Mr. W. Barker scored for four bunches of grapes, his followers being Mr. S. Barker, and Mr. N. F. Barnes. Mr. S. Barker led both for peaches and nectarines, Mr. H. Taylor, gardener to the Right Hon. Lord Hatherton, Penkridge, having the best strawberries. Mr. S. Barker was again to the fore with three varieties of tomatoes, showing Suttons' Best of All, Perfection, and Polegate.

VEGETABLES.

The prizes in these classes were provided by seedsmen, Messrs. Sutton and Sons' class for six dishes, distinct, bringing five entries, among which Mr. J. Gibson, gardener to the Duke of Portland, K.G., Welbeck, was accorded leading position. Centenary pea and Favourite carrot were grand. Mr. A. R. Searle, gardener to the Marquis of Northampton, K.G., Northampton, was second, and Mr. H. S. Foster, gardener to F. E. Muntz, Esq., Hockley Heath, third. Mr. J. F. Simpson, gardener to Sir C. T. Mander, Bart., Tettenhall Wood, Wolverhampton, had the best six dishes in Messrs. Webb and Sons' class, and Mr. Searle the best in the eight dishes, every item being of superb quality.

The gentlemen's gardeners' and amateurs' section occupied a great deal of space, the quality of the exhibits reflecting great credit on the exhibitors in all sections. For a group of plants occupying 250 square feet, Mr. A. Cryer, Edgbaston, took the lead with a nicely arranged group of well-grown flowering and foliage plants. Second prize was secured by Mr. W. R. Manning, Dudley. Gloxinias were well shown, Mr. W. B. Burchill, gardener to Captain Simpson, Perton, taking the lead among five exhibits of a dozen plants. Roses in this section were largely shown, the winning thirty-six, put up by Mr. W. H. Skeys, gardener to F. Dennison, Esq., Leamington, being a nice set; second prize in the class went to the Rev. J. H. Pemberton, Havering-atte-Bower; R. Foley Hobbs, Esq., Worcester, being third. Mr. Skeys again led for twenty-four blooms, R. Foley Hobbs, Esq., coming second. The last-named gentleman scored for twelve blooms, followed by the Rev. J. H. Pemberton.

Mr. W. Thorneycroft, gardener to D. Green, Esq., Compton, took first prize for twelve vases of sweet peas, staging in a very tasteful manner; Mr. A. E. Usher having to take second place; Mr. F. Hughes, Wolverhampton, bringing up the rear. First for twelve bunches of hardy flowers was secured by Mr. E. Walker, gardener to T. B. Adams, Esq., Compton, who showed some excellent flowers in good bunches; Mr. J. F. Simpson, Tettenhall Wood, came second; and W. R. Wilson, Esq., Compton, third. Mr. W. Parker, gardener to J. Drake, Esq., Market Rasen, was first for six dishes of fruit, showing four pairs of bunches of grapes and two melons, rather an exceptional interpretation of the term "six varieties." Mr. S. Barker, gardener to the Duke of Newcastle, Worksop, took second with Lady Sudeley apple, Mignonne peach, Dryden nectarine, a good melon and two dishes of grapes. First for decorations was awarded this exhibit; equal second for decorations was awarded Mr. N. F. Barnes, on whose exhibit was also a first prize card, although the same class number prevailed throughout. There was another second prize card awarded to Mr. L. Bayley, gardener to the Right Hon. Lady Hindlip, Worcester. Mr. J. Gibson, Welbeck, won for ten dishes of vegetables with splendid examples of peas, potatoes, cucumbers, marrows, tomatoes, beetroot, French beans, onions, carrots, and cauliflowers. Mr. A. R. Searle was second with another nice collection, and Mr. H. S. Foster, Hockley Heath, third.

NON-COMPETITIVE EXHIBITS.

These, as is always the case at this and other big shows, were a grand adjunct to the competitive classes, and were of sufficient extent, variety, and merit to make a good show in themselves. One of the first exhibits to demand attention was an exceedingly beautiful table of plants, cut flowers, vegetables, and fruit staged by Messrs. E. Webb and Sons, Wordsley, Stourbridge. A mound of brilliant gloxinias, arches, pillars, and vases of sweet peas, well-flowered plants of Spiræa Peach-blossom, Lilium auratum, and double clarkias constituted the flowering subjects, all arranged harmoniously behind and above a great variety of vegetables and tall epergnes filled with well-grown melons.

Mr. W. J. Unwin, Histon, Cambridge, showed sweet peas particularly well. King Edward Spencer, Constance Oliver, Edna Unwin, and W. J. Unwin were good, and so indeed was every vase on the stand.

Messrs. Bakers, Wolverhampton, carried out a model garden of extensive proportions and bold design. In the foreground was a formal lily pond, with paved walk backed by rock walls furnished with suitable alpines. The walk led on the one hand to a smaller, irregular pool and bog garden, in which spiræas, bamboos, rushes, etc., were the main features, and on the farther side were steps leading to a raised garden, where beds of roses were cut in a grass plot. The space behind the formal pond was utilised for a herbaceous border, in which such things as delphiniums, liliums, gaillardias, English iris, Eremurus Bungei, and many other usefu plants were dispersed in most pleasing style. It was a great effort, and the whole exhibit was well planned and executed.

Delphiniums were largely shown by Mr Amos Perry, Enfield. Gertrude, Carnegie, Queen Wilhemina, and Midas, among pa lavender and mauve shades, and Mrs. Rushton, W. B. Child, Falquire, and Candida among darks, were all striking and distinct. Mr. H. N. Ellison, West Bromwich, staged ferns in considerable variety, the various species and varieties of davallias being mo attractive. Gleichenias and plumose nephr lepis were other features of the exhibit.

Among the hardy border flowers shown Messrs. B. Ladhams, Lim., several remar ably distinct gaillardias occupied a prom nent position. Shirley, Brilliant, Rownham Queen, Superb, Aurora, and Sulphur G were all really good, whilst Charles L hams was a remarkably distinct break colour, salmon and terra-cotta being blend Good pinks were also shown by the So ampton firm.

A large and really fine group of pot-gr carnations was put up by Mr. F. Green, g dener to Lady Grey, Enville Hall, Staff The plants were of great size, carrying masses of flowers, and the varieties were first rate.

Floral designs of quite original charact were exhibited by Messrs. E. and H. Sec ling, 6, Lichfeld Street, Wolverhampt vase of doub'e white stocks contained a bunch of Mdme. A. Chatenay roses, a c of white asters had sprays of Crimson b'er twined around, and through stand roses were freely used to capital

Messrs. Jarman and Co., Chard, Som exhibited a very bright collection of zonal pelargoniums, among which Clevedon was perhaps the most brilliant. Duchess of burgh, a new salmon, and Sir T. Hanbury, a crimson, stood out boldly. The popular sweet sultans appeared to be finer than ever, and the carnations and roses that finished off the stand were useful additions. A group of choice ferns came from Messrs. H. B. May and Sons, Dyson's Lane, Edmonton, which included Platycerium grande, and other varieties of the Stag's Horn fern, as well as several gymnogrammas and choice adiantums, etc.

Tall stands of liliums, phloxes, delphiniums, and other border flowers were well arranged by Messrs. Dicksons, Lim., Chester, who also showed a collection of the newer H.T. roses, among which The Lyon figured prominently. Messrs. Seagrave and Co., Sheffield, staged violas in the form of fan-shaped bunches. Mrs. W. H. Gabb, Agnes Kay, Countess of Eglington, and Lady Grant were typical of the good varieties put up, and a new seedling named Willie Coe was of good form and distinct colour, rich purple on a white ground. Messrs. Clibrans, Altrincham, occupied a considerable length of tabling with a collection of cut roses, which embraced many of the most useful decorative or garden varieties. Violas were again seen in capital order on the stand occupied by Mr. H. Masters, Grove Lane Nurseries, Handsworth. Mr. John E. Knight, Wolverhampton, arranged floral designs on a table. A fan of pink stocks and lily of the valley, a Union Jack in cornflowers, white stocks and scarlet zonals, a lady's hat and satchel, and a chaplet of silvered foliage were original and tasteful. A pretty display of roses was made by Mr. E. Murrell, Shrewsbury, such varieties as Arthur R. Goodwin, Hugh Dickson, Amateur Teyssier, etc., being very nice.

MEDAL AWARDS.

Large Gold Medal.—Messrs. Bakers, Wolverhampton, for model garden; Messrs. E. Webb and Sons, Wordsley, for vegetables, fruit, and flowers.

Gold.—Messrs. H. B. May and Sons, Edmonton, for ferns; Messrs. Dicksons, Lim., for hardy flowers and roses; Lady Grey, for carnations.

Silver-Gilt.—Messrs. B. Ladhams, Lim., Shirley, Southampton, for hardy flowers; Messrs. E. and H. Suckling, Wolverhampton, for floral designs; Mr. H. N. Ellison, West Bromwich, for ferns; Messrs. Clibrans, for roses; Mr. W. J. Unwin, Histon, for sweet peas; Mr. E. Murrel, Shrewsbury, for roses; Mr. Amos Perry, Enfield, for delphiniums.

Silver.—Messrs. Jarman and Co., Chard, for zonals, centaureas, etc.; Messrs. Seagrave and Co., Sheffield, for violas; Messrs. Blackmore and Langdon, Bath, for carnations; Mr. J. E. Knight, Wolverhampton, for floral designs.

Bronze.—Mr. H. Masters, Handsworth, for violas.

Good Early Cauliflowers.—Some of the finest heads of cauliflowers we have ever cut are those of the variety White Queen, which produces a fine white head, and in size quite equal to the best autumn cauliflowers; and, moreover, it has stood the drought well. Our plants were from autumn-sown seeds. Magnum Bonum is an ideal type, with beautiful firm and close white heads of very fine flavour. Purity is of especial value, as it stands so long in good condition, and does not open as soon as ready like some of the early types; it is very strong and robust, and winters well. Those we are cutting now stood out unprotected. Favourite is an early and distinct variety, and should be a most popular one; it is producing fine heads of pure whiteness. Sutton's Universal will follow this, and is extremely promising, and has withstood the late hot weather in a marvellous manner. I have found that the autumn-sown varieties do not run or bolt so quickly as some of the very early spring-sown types. Carter's Forerunner is one of the very earliest to come into use, we were cutting it long before the broccoli had finished; it is also a real gem for forcing.—W. A. Cook, Leonardslee.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

DISEASED ONIONS.—Subscriber: The onions you have sent are seriously injured by onion mildew and onion smut, the two most destructive diseases of the cultivated onion. The fungus (Urocystis cepulæ) attacks the onion at a very early period of its growth, and usually the first leaf gives evidence of its presence before the second is developed. It then spreads through the tissues, as the growth proceeds, and finally it reaches the bulbs, when the outer tunic shows signs of its presence. It is a good rule when the seedling plants show signs of having been attacked, to draw them out and at once burn them, for when they remain on the ground until the fungus has attained full development the epidermis is ruptured and the spores are shed upon the ground. Where, as in your case, the soil has been infected by the spores of the fungus causing the disease care should be taken not to carry the soil from the area of the onion bed, by means of boots and tools, to other parts of the garden. It is also desirable not to grow onions on an infected quarter for several years. If this cannot be avoided, raise the seedling onions elsewhere, and plant out when they are fairly well advanced in growth, as it is only at the earliest stage that there is danger of infection. With reference to the onion mildew, you cannot do much at the present time beyond gathering up and burning the leaves, with a view to prevent an attack next year. The spread of the onion mildew may be checked by dusting the plants with a mixture of lime and sulphur, consisting of one part of sulphur and two parts of lime. The application will be more efficient if applied when the plants are moist with dew. Spraying with sulphide of potassium, prepared by the addition of one ounce of the sulphide to three gallons of water, can also be recommended.

HORTICULTURAL EXAMINATIONS.—F. B., Suffolk: The examinations in horticulture held by the Royal Horticultural Society take place early in the year. Preparations for next year's examination in which you wish to take part should be commenced at once. Write to the Secretary of the Royal Horticultural Society, Vincent Square, Westminster, S.W., enclosing a stamped and addressed envelope for a syllabus of the last examination; it will be a guide to the course of your studies.

PLANTING CHOICE DAFFODILS.—R. B. F., Herts: Such varieties as Emperor, Empress, and Sir Watkin will bloom satisfactorily when planted early in January, provided the bulbs were well ripened and stored under the best possible conditions, as we have proved to demonstration on several occasions. The Barri and incomparabilis varieties, which have small bulbs, on the other hand, will not bloom satisfactorily when planted after the end of November. In no case will late-planted bulbs make a vigorous growth in the season following their flowering, and, as a consequence thereof, they will bloom indifferently in the second year after late planting. It may be convenient, but there is no advantage in keeping daffodil bulbs out of the ground for any considerable period after lifting, and we should therefore strongly advise you to plant the bulbs of the choice varieties that you have purchased quite early in August. In the meantime select an open position in the kitchen garden or reserve ground, and if the soil was liberally enriched with manure during last winter or early in spring, it will not require manuring now. In no case should the ground be dressed with animal manure immediately before the bulbs are planted. If the ground requires enriching use a phosphatic manure, such as dissolved bones.

PLANTING WINTER GREENS.—A. B., Sussex: The planting of the various kinds of winter greens may be proceeded with during periods of dry weather such as we are now experiencing, provided they receive careful attention for a short time after they are planted. The best course is to draw drills about three inches deep, and at the proper distances apart, this latter point being determined by the space required by the several kinds. Then flood them with water, and when this has soaked into the soil, put the plants out along the trenches, and give them a watering. It will be an advantage to put out the plants in the evening, and it will be necessary to water them every day if the weather is dry, or on alternate days, until they are commencing to root into the new soil. This may appear tedious, but, if you put out a few rows each evening, and proceed according to the directions given, you will obtain an ample return for the additional labour involved as compared with the method usually adopted in seasons of average rainfall.

UNHEALTHY CATTLEYAS.—W. M. R., Devonshire: If the material you send is a fair specimen of that in which your cattleyas are growing, we are not surprised they are in an unsatisfactory condition. We are surprised that several of the plants have not died. In the ordinary way it would have been well had you stated in your letter what materials you have been using, but in this case it is not a matter of much consequence. We can see that you have used a liberal proportion of leaf-mould, and that you used the watering-pot more freely than would have been desirable in the case of plants growing in a mixture much more open than one containing a large proportion of leaf-mould. The material has evidently been kept in a constantly saturated state, for it has become thoroughly decayed, and so sour that healthy root action has been impossible. We should not be surprised to learn that many of the plants have lost a considerable proportion of their roots. We advise you to turn the plants out of the pots, carefully remove the material from about the roots, and then cut away such of the latter as are decayed, and then wash the remainder in tepid water. Repot, using pots that are just large enough to receive the roots, and a light, open material.

NEW SWEET PEA.—G. A., Leicestershire.—The flowers of the sweet pea you send bear so close a resemblance to those of the varieties of the same colour that have been bracketed by the National Sweet Pea Society as too much alike, that we have some doubts as to the variety being sufficiently distinct to possess any great value. Your best course will be to grow the variety another year, and also send it to the society mentioned for inclusion in their trials.

NAMES OF PLANTS.

R. S., Lancashire.—A poor variety of Cattleya Mossiæ.

M. A., Sussex.—Your plant is evidently Brugmansia Knighti. You should have sent a flower and leaf.

S. T., Surrey.—1, Campylobotrys refulgens; 2, Aralia filicifolia; 3, Gloriosa superba; 4, Acalypha musaica.

F. H., Cornwall.—1, Pteris leptophylla argentea; 2, Rhipidopteris peltata; 3, Nephrolepis rufescens tripinnatifida.

W. F., Dorset.—1, Picea Pinsapo; 2, Retinospora obtusa aurea; 3, Cupressus Lawsoniana erecta viridis; 4, Wellingtonia gigantea.

G. B., Luton.—The rose blooms had shed their petals in the box, and it was therefore impossible to differentiate them. We cannot, however, undertake to name florists' flowers.

THE SCLEROTINIA DISEASE OF THE GOOSEBERRY.

The sclerotinia (botrytis) disease of the gooseberry—or "die-back," as it is called in some districts in Kent—is widespread in England, and is liable to occur wherever gooseberries are grown, whether in plantations or in private gardens. It attacks bushes growing on stiffish clay as well as bushes growing on light, gravelly, or stony soils. In view of its destructive character the Board of Agriculture have issued a leaflet dealing with the disease, and from this we make the following extracts:

Description of the Disease.

The gooseberry bush may be attacked in four distinct places, viz., the main stem and the base of the branches, the young wood of the current year, the leaf, or the berry. As regards the main stem, the spawn (mycelium) of the fungus penetrates into the tissue (permeating the cortex and bast), and at the end of a season's growth causes the bark to crack and peel off, often in large pieces. The part of the stem first attacked is usually that portion situated at the ground level, or a little above it; eventually the spawn of the fungus "rings" the stem at this place, and the whole bush is killed. Before this occurs, however—and death does not occur, as a rule, in the case of a well-grown bush until after several seasons from the time it was first attacked—the spawn of the fungus spreads upward in the stem to the base of the branches. Here it frequently attacks some of the branches so severely that they die. The presence of dead branches in a few bushes, or the death of half the bush, is a characteristic sign of the first appearance of the sclerotinia disease in a plantation, And, as is noted below, it is at this time that steps should be taken to stop the disease.

Renewed growth of the spawn of the fungus in the stem takes place every spring, and it is at this time that the manner in which the fungus exists and spreads can be most easily seen. If a diseased stem be examined during a warm and damp spell of weather in the spring, the bark will be found to be peeling or cracking off, while greyish, fluffy patches of a "mould" have appeared at the edges of the peeling bark or in the fissures where the bark is cracked.

If there is a dead branch on the bush, then, as a rule, small greyish tufts or little cushions—which soon develop in suitable weather into fluffy patches—will be found scattered here and there over its surface. These tufts of the fungus occur both on the main branches nearly down to their base, and frequently also on the younger wood.

Little hard blackish bodies, of irregular shape, name sclerotia are also produced. They are extremely resistant to climatic conditions, such as frost, drought, etc., and serve to carry the fungus through all vicissitudes from one growing season to the next.*

If an affected bush has been weakened by the Sclerotinia disease in previous seasons, the renewed growth of the fungus during the spring will frequently cause the death of the bush. In the affected plantation gooseberry bushes here and there may suddenly wilt and die out in all stages of growth; this occurs most frequently at the time when the leaf-buds have just burst open, but often also at a later stage when the bush is in full flower or bearing young berries. If such bushes are examined the stem will be found to be "ringed" by the spawn of the fungus, and on the surface of the stem will be found the botrytis fructification. If the disease has not developed to a sufficient extent to kill the bush, the spores which are continually being produced throughout the spring and early summer serve to spread the disease to other parts of the bush.

Very commonly the spores affect the leaves, which then soon show a discoloration at their edges, which are first turned yellowish, and finally become ashy-grey or whitish. If the attack extends from the edge of the leaf inwards until the greater part of the leaf is affected, the fall of the leaf soon takes place; if, however, as is often the case, the injury remains restricted to the edges of the leaves, the latter remain on the bush until the usual time for the fall of the leaf. Whether the injury spreads over the leaf to such an extent as to make it fall prematurely seems to depend on the climatic conditions which prevail at the time. When a large number of leaves are attacked throughout a plantation and made to fall prematurely, serious damage is often inflicted: in such cases the berries produced are much smaller than on healthy bushes, and a quantity of unripened spindly shoots may be formed. The under-surface of the leaf is the part attacked, and during the months of June and July the botrytis fructification may be found on leaves.

Another part of the bush which may be attacked is the young wood. In the case of young bushes especially, a considerable proportion of the young shoots may be attacked and much weakened or killed—a fact which has caused growers to speak of the present disease as "die-back." Infested dead shoots may constitute a prolific source of infection. Prunings of botrytis-affected bushes left lying in a heap in a corner of the plantation or garden may develop during the following spring an abundant crop of powdery tufts of botrytis, the spores of which, carried by the wind in countless numbers, will spread the disease through the plantation. There is also the danger of cuttings being taken from botrytis-infected bushes, when many of the young bushes thus obtained will become diseased. In one case which was investigated it was found that a lot of 2,000 young bushes of Crown Bob, planted out direct from a nursery, were already diseased—the young shoots harbouring the botrytis stage of the fungus.

Lastly, the fungus occasionally attacks the berry and turns it rotten. The first sign of the appearance of the disease on the berry is the browning of the skin at some spot; this browning gradually extends until one side of the berry shows obvious signs of softening, and of being badly diseased. The botrytis fructification, in the form of the characteristic ashy-grey "mould," then soon appears on the surface of the discoloured portions, and the berry, in a week or so, is turned completely rotten, and decays.

(To be continued.)

---

* These sclerotia are also able under certain conditions to give rise to another form of fructification in which winter-spores (ascospores) are produced. In this stage the fungus has been known under the name of sclerotinia, while the name Botrytis has been applied to the stage where summer-spores only are produced. It is probable that the sclerotinia stage with its winter-spores, only rarely occurs. It is certain that the disease can be perpetuated from season to season in its absence by means of the Botrytis stage, which by means of summer-spores spreads the disease during the growing season, and then remains dormant in the form either of mycelium in the stem or of sclerotia on its surface—both enabling the fungus to hibernate during severe winters.

KELWAY'S MANUAL OF HORTICULTURE is the best of all Garden Books. 2s. post free, from KELWAY and SON, LANGPORT, SOMERSET.
Capt. ———, Londonderry.
10th February, 1911.
I have received your Horticultural Manual, and on looking through it, I felt compelled to write and thank you for it. To an enthusiastic amateur gardener like myself who, through reading the weekly papers on the subject, is familiar with many of the names but not with the corresponding flowers, this book must be absolutely invaluable, and the artistic way in which it is got up, and the beautiful photographs with which it is embellished, make it a treasure well worth having. I have had the Catalogues of most of the leading firms sent to me, but nothing compares in the remotest way with yours."

67 Illustrations, 17 Plates and Frontispiece. 200 Pages. 2/6 net; by post 2/10.

ROSES AND THEIR CULTIVATION.

SEVENTH EDITION.

By T. W. SANDERS, F.L.S.

ROSES
and their
Cultivation

- How and When to Plant Roses.
- Propagation of Roses—Ways to Grow Them.
- How to Prune, Bud, and Graft Roses.
- Erection of Pergolas and Arches.
- How to Show Roses.
- Insect Pests and Fungoid Diseases—Remedies.
- Types of Roses, full description, Culture, etc.
- Soil and Manures for Roses.
- The Rose Grower's Calendar; showing what to do each month.

LIST OF OVER 1,700 CULTIVATED ROSES:

Showing Variety, Section or Class, Date Introduced, Colour, Habit of Growth, How Best Grown, Mode and Time of Pruning, Description of Flower.

ORDER FORM.

To the Publishers of **"THE GARDENERS' MAGAZINE,"**
148 and 149, Aldersgate Street, London, E.C.

Please send me a copy of "ROSES AND THEIR CULTIVATION," for which I enclose remittance of 2/10.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Heat and Cold.

Although we speak of heat and cold as of two different things, cold is in reality a mere negation, and not a thing at all; it is simply a relative condition of temperature, implying such a low degree of heat as may affect us or our belongings, particularly in the way of plant life, unpleasantly or prejudicially. All terrestrial matter is suffused with a certain amount of heat, dependent superficially upon the amount absorbed from the sun, which is constantly sending us fresh supplies by its beneficent beams; while there is doubtless an enormous store of it in the earth's interior due to the same solar source, but acquired at the inconceivably distant period when our planet first became an intensely hot satellite of the sun itself. Ever since that period the earth has been cooling down stage by stage, until its surface froze, as it were, solid by the deposition of such materials as became solid at comparatively high temperatures, while subsequently the oceans were formed by the deposition of aqueous vapours at a very much lower temperature. At the present epoch these waters are still in an unstable condition, a comparatively small difference changing them, in one direction into solid ice, and in the other into invisible vapour. The retention of vitality of organic life is entirely dependent upon the presence of a certain but variable amount of heat, the variation depending upon the greater or less complexity of the organism in the case of animals, and also upon the nature of the environment in which they have been evolved and adapted thereto, this last also determining to a large degree the resistance of plants to cold conditions. With very simple organisms, such as bacteria, it has been found that these germs survive such extremes of cold as will freeze the air itself; but no active organism can do this or anything approaching it, as such cold naturally involves the solidifying of their vital fluids. In point of fact, so far as active life is concerned, prolonged exposure without protection to any temperature much below the freezing point of water is fatal, and in the other direction a hundred degrees above it is equally so if long continued. As regards organic life, therefore, it is seen that, apart from artificial protection, living existence lies between a very narrow range of temperature as compared with the difference between the actual zero, or no heat at all of stellar space, and the inconceivably high degree of heat which must rule in the sun, judging by the portion we receive across some 90 millions of miles. In this connection, however, solar heat must be regarded as a manifestation of force inherent in the sunbeam, and capable of being developed only under certain conditions. Between us and the sun lies, as we have said, about 90 millions of miles of space, which those beams do not heat at all in their transit. They only exercise their power of heat development when they enter our atmosphere, and the amount developed appears to depend very largely upon local conditions of the earth's surface, and the angle at which the rays strike it. That the heat increases in like ratio to the depth of the atmosphere traversed is obviously untenable, since in our cold seasons, when the rays reach us obliquely, they naturally pass through a much greater volume of air than when they traverse it perpendicularly, as in the tropics at noon. Such direct impact, of course, implies a concentration of energy, but the rays are equally concentrated upon the perpetual snows of the tropical mountains above the equatorial snowline, and yet fail to melt them, while in the deep valleys below the heat may be intense. Travellers, indeed, tell us that from a single point of view all grades of climate and, what is very interesting to the horticulturist, belts of varying vegetation to such, may be beheld at once in such regions. The development of heat indeed would appear to depend upon the presence of some body, gaseous, liquid, or solid, whose molecules it can affect to sympathetic vibration. The ether of space of which we know so little, appears to be entirely devoid of such sympathetic reaction, though capable of conveying those complex sets of waves which form the sunbeam, and embrace the heating waves as well as those of light. Analysing that beam by means of a prism we may separate the two kinds, and find perfectly invisible heat rays, which may be focussed by a lens, and set up heat vibration, which will speedily ignite inflammable materials or render metals incandescent. It is, in fact, these rays which do the work in an ordinary burning-glass, but the experiment is much more striking if the spectrum be employed, and the burning be effected by something we cannot see at all.

SIR F. W. MOORE, M.A., V.M.H.,
Keeper of the Royal Botanic Gardens, Glasnevin.

Sir F. W. Moore, M.A., V.M.H., is so highly esteemed by those who are acquainted with the splendid work he has accomplished during the many years he has occupied the important position of Keeper of the Royal Botanic Gardens, Glasnevin, that it is in no way surprising that the honour of knighthood conferred upon him by the King has evoked the warmest expressions of approval from both scientific botanists and practical horticulturists. We have had ample evidence of this in various ways, and since the announcement, in our issue of the 15th inst., of the honour that had been conferred upon him, almost every letter we have received has contained an expression of the pleasure felt that he had received a distinction he so well merited. Sir F. W. Moore affords us a splendid example of the advantages resulting from the combination of a thorough acquaintance with practical horticulture with a full knowledge of scientific botany. At Glasnevin both the scientific and practical work has been carried out with a degree of success that might well be regarded as exceptional, and in devoting close attention to scientific matters Sir F. W. Moore has constantly kept in view the desirability of botanical gardens being made as interesting and attractive as possible to the general public. In giving practical expression to his views he has been successful in rendering the gardens under his charge highly popular among the citizens of Dublin. Sir F. W. Moore has long enjoyed a high reputation for his remarkable knowledge of plants and their cultivation, and his success in the growing of what are generally known as botanical orchids is quite unique. Imbued with a strong belief in the possibilities of horticulture and agriculture in Ireland, Sir F. W. Moore has shown remarkable energy in the initiation and the support of the various movements that have for their object the development and improvement of these two important industries, and, as recorded in these pages, he has specially interested himself in the all-important question of fruit culture. It will be remembered that when the Victoria Medal of Honour in Horticulture was founded by the council of the Royal Horticultural Society in 1897, Sir F. W. Moore was included among the first sixty recipients of the medal; and that years since the Royal University of Ireland conferred upon him the degree of Master of Arts, Honoris causa.

British Association.—This year the British Association will meet at Portsmouth, and it is a point of some interest that this is the first time in its history the Association has held a meeting at this important centre. The meeting will open on Wednesday, August 30, when Sir W. Ramsey, the president-elect, will deliver his presidential address. In this he will urge the importance of scientific training, with a view to the future as well as present-day requirements. He will also pass under review modern conceptions of the nature and constitution of the elements, and will then pass on to a consideration of the available sources of energy in this country, and whether they are being utilised with due regard to economy. The president of the botany section will be Professor F. E. Weiss, and during the session a joint meeting of this section and the geographical and geological sections will be held for the purpose of considering the relation of the present plant population of the British Isles to the Glacial Period. A general discussion on this subject will, it is anticipated, be opened by Mr. Clement Reid. Much additional interest will be given to the work in the botany section by the presence of a number of American and Continental botanists who have attained distinction in connection with plant geography. There will be two papers on Jurassic plants, and papers on sand dunes, the vegetation of pebble beaches, the wilting of moorland plants, and numerous other subjects of interest to botanists. Mr. W. Bateson, V.M.H., will preside over the agricultural sub-section, which is now attached to the botany section, and will devote his opening address to a consideration of the proper scope of applied science, so far as it relates to the application of genetic research to horticulture and agriculture.

National Sweet Pea Society's Floral Committee.—The Floral Committee, elected rather late in the season, to adjudicate upon the sweet peas being tested by the society at Sutton Green, Guildford, consisted of the following experts: Mr. Robert Bolton, Mr. S. B. Dicks, Mr. George Herbert, Commander Humphery, R.N., Mr. Andrew Ireland, Mr. Thomas Jones, Mr. A. Malcolm, Mr. Herbert Smith, and Mr. Thomas Stevenson.

Summer Flowers at Bridlington.—Flowering and fine-foliage plants are liberally used in beautifying the open spaces at Bridlington, one of the several fine towns on the Yorkshire coast, and this year they have attained a high state of development, and at the present time produce a series of charming effects. The arrangements in the Princes Parade are the most noteworthy, and these include a floral clock and a floral crown. The clock has for some years been a distinct feature and of unvarying interest to visitors. The floral crown is a new creation, so far as Bridlington is concerned, and is proving very attractive. The crown has been made in one of the large beds to the right of the main entrance to the parade, and stands about five feet high. The floral arrangements generally are such as to reflect much credit on Mr. E. R. Crofts, the head gardener.

A Garden City at Walton.—Under the terms of the late Mr. William Whiteley's will, Mr. Justice Eve has sanctioned the purchase of a site between Walton and Weybridge, and near both Esher and Burhill. The estate in question extends to 220 acres, and it will, if the provisional agreement is confirmed, be laid out as a garden city for about 700 poor people. For such a site and purpose, and for the erection of homes for poor people the late Mr. Whiteley left the sum of £1,000,000.

The Walter Voss Cup for Sweet Peas, offered by the National Sweet Pea Society at its recent exhibition, was won by Mr. Lewis S. Peters, of Strathmore, St. Austell, and not by Mr. Beech as inadvertently stated in our issue of July 15; Mr. Beech won the Humphery Challenge Plate, and in both instances the prizes were secured with fine flowers in the face of severe competition.

Yield of a Small Mixed Orchard.—An interesting note on the actual yield of a cherry orchard in Kent has been supplied to the Board of Agriculture by Mr. C. H. Hooper. In his introductory remarks Mr. Hooper says: The following is a record of yields and prices of fruit for twenty-nine years (1882 to 1910) from a grass orchard chiefly planted with cherries, at Sheldwich, near Faversham, Kent. From this orchard are sent some of the best cherries that enter Covent Garden, and they are, in addition, carefully sorted and packed. In the opinion of the owner the prices received represent the average prices obtained for good quality fruit from this district. The area of the orchard is 4¼ acres, on loam over clay over chalk. The trees, which were mostly mature at starting, consist of 97 cherries, 61 apples, 27 pears, 96 plums, 2 quinces, 2 walnuts, altogether 285 trees, or 67 trees per acre. In the hedges surroundiing the orchard there are about 50 damson trees. The total net return from salesmen in Covent Garden in twenty-nine years is £1,762 6s. 5d., an average of £60 15s. 5d. per annum, or £14 6s. per acre. The owner says that, in addition, the value of fruit consumed by his household has been about £7 yearly, and he has received about £3 yearly for the grazing of the orchard by sheep.

Strawberries on Light Soils.—It appears that no matter what pains are taken to cultivate them, strawberries are not a success on the light soil in the Royal Horticultural Society's Gardens at Wisley. In the new "Journal," under the heading of "Commonplace Notes," by the secretary, superintendent, and editor, the varieties of strawberries grown are discussed, and it is stated that out of the forty tried there are only half a dozen which make really good rows and continue to fruit for two years, no matter what trouble we have taken. We are fortunate, however, in having in these half-dozen varieties all that is required for a supply of dessert fruit and fruit for jam-making. Our best six varieties are "Aprikose," "Climax," "Cropper," "Fillbasket," "Royal Sovereign," and "Scarlet Queen." Of these "Scarlet Queen," in company with "Royal Sovereign," supplies dessert fruit of the best, and both sorts will force well, whilst for cooking and preserving we have "Climax," "The Cropper," and "Fillbasket." These bear very heavy crops of fine fruit, and stand well on our soil, bearing good crops the third season, as no others do. "Bedford Champion," "Filbert Pine," "Kentish Favourite," "Monarch," "Mentmore," "The Laxton," and "Yarles," make moderately good growth, but before the fruit is gathered the second year many of the plants collapse.

British Pteridological Society.—The annual meeting of this society will be held this year at Barnstapl on Monday, August 7 (Bank Holiday), a it is hoped that a goodly number of me bers will be able to arrange to attend arriving, if possible, on the previous F day, and meeting in the evening at t Golden Lion Hotel, which will form t headquarters. As there is ample accom dation in the town no previous bookings needed, but the secretary (Mr. C. Druery, V.M.H., 11, Shaa Road, Ac will regard it as a favour if members vise him beforehand of their intentio be present. Members and friends are vited to bring fern plants or fronds naming.

Ibis Horticultural Society. Numbers of our readers would be greatly prised if they could see some of the horticultural exhibitions held during year in the great Metropolis. We d here refer to the displays under the control of the Royal Horticultural Society and the several national floricultural societies to the large number of shows held employees of large business houses an lic bodies. A few days ago the offic of the London County Council held commendable show in the County Spring Gardens, roses and sweet pe great features, and last Wednesday of the Prudential Assurance Compa their summer show—under the tit Ibis Horticultural Society—at H Bars, and here again roses and swe were greatly in evidence, and first-ra nary peas, tomatoes, etc., were also

People's Palace Horticultural Society held a very successful exhibition on the 14th inst. There were three thousand entries, of which two thousand were contributed by children. The Duke of Fife, who presided at the opening ceremony, spoke appreciatively of the excellent work the society is doing in the encouragement of the art of gardening among the dwellers in East London.

Royal Gardeners' Orphan Fund.—On and after Monday next, the 24th inst., the offices of this fund will be at 19, Bedford Chambers, Covent Garden, London, W.C.

Rose History.—In "A Natural History Note," contributed to the "Hampshire Advertiser," Mr. A. H. Swinton refers to the introduction of some of the older roses, and he states therein that "Wild roses are known to have been crossed with the beauties of the garden, which double from luxuriant growth on the mould, are not absolutely sterile." He also quotes a lengthy manuscript in which the famous Gloire de Dijon is mentioned. This commences as follows: "In the year 1841 my father, Mr. J. J. Gibb, decided on an Italian tour, with his wife and family, but among his business acquaintance he could only find one who had been there, and he gave him Mr. Starke's guide." The writer, who belonged to the fair sex, for "us girls" are mentioned, describes the journey, and states that the party met with an old General, who discoursed on roses, and "spoke with enthusiasm of a beautiful kind grown at Dijon, which we ought to see there, doubtless the yellow variety known to us as the Gloire de Dijon." The manuscript concludes with the statement that on the arrival of the party at Dijon "we wended our way to a garden and a pleasure ground, inquiring everywhere, but in vain, for that lovely rose, the Gloire de Dijon." The writer must have been blessed with a strong prophetic instinct to have known this rose, which was not raised until some years later. It was not, in fact, until the year 1853 that Jacotot introduced Gloire de Dijon to cultivation, and therefore it is not surprising that inquiries made for it in 1841 should have been in vain.

New Perpetual Carnations. Mr. Hayward Mathias, the hon. secretary of the Perpetual Flowering Carnation Society, informs us that the following new varieties have been registered by his society, namely, Afonwen (W. J. Smith), pink and mauve; Cheltonia (Young and Co.), Liberty red; Coronation (Bertie E. Bell), light pink; Hon. Lady Audrey Neeld (Young and Co.), carmine, with white margin; Judith (B. E. Bell), white; Lady Fuller (C. Wall), warm salmon; Mrs. F. C. Harwood (Harwood), purple; Mrs. C. F. Raphael (H. Burnett), cherry-red; Mrs. Greswold-Williams (Young and Co.), pink, passing to soft mauve; Pluto (H. Burnett), bright crimson; Princess (C. Wall), white, striped pink; Queen (Young and Co.), yellow, with pink markings; Queen Mary (A. Smith), pale pink; Sultan (H. Burnett), crimson; and White Chief (H. Burnett), white. Mr. Mathias also informs us that the Carnation Society has registered the undermentioned American varieties: Delhi, red; Elsie Grey, flesh-pink, splashed with deep pink; Vassar, white ground with pink; May Day, pure pink; Brooklyn, deep pink; Pink Supreme, flesh pink; Miss Dimple Widener, scarlet; Howard Gould, clear pink; Pennsylvania, cerise, brighter than Lawson; E. G. Gillett, scarlet; Minnehaha, cerise-pink; Neshaminey, white, mottled with pink.

VIEW OF THE NATIONAL SWEET PEA SOCIETY'S TRIALS AT SUTTON PLACE, GUILDFORD.

SWEET PEA OUTINGS.

The sweet pea week has now become a great institution, and many folks devote four days to the popular annual. Two days are filled up by the National Sweet Pea Society's Exhibition at Westminster, and with short private trips to the large growers of sweet peas resident within easy distance of London. The third day is generally devoted to an inspection of the society's trials at Sutton Green; and the fourth day to the inspection of some great trade or private grower's flowers. These outings are greatly enjoye for their educational value and for th opportunities they afford of meeting so many sweet pea celebrities.

The exhibition itself was a splendid triumph of cultural skill, while the elegance and fragrance of the blossoms and the wonderful variety and shade of colours they now present rendered the display at once interesting and attractive. Although there was an immense crowd during the earlier part of July 11, the paying attendance was not so great as last year, when a fine record was set up. The hot weather and the recent multitudinous festivities in connection with the Coronation had, doubtless, tired many folks who would otherwise have paid to attend. Of course the society's membership has increased, and Fellows of the Royal Horticultural Society are admitted on showing their passes, so if the "takings" were £20 less than in 1910 it does not suggest that the cult of the sweet pea is waning.

Immensely successful was the outing to Sutton Green and Sutton Place on Thursday, July 13. About a hundred members caught the 9.20 a.m. from Waterloo and arrived at Woking at 9.59 a.m., instead of 9.59 p.m., as per programme (printer's error, of course). A pleasant drive of between four and five miles landed the party at the gates of the Times Experimental Station, and soon the hon. secretary and Mr. Harry Foster were busy selling Trials Lists at 6d. each. Although there was a pleasant breeze, the day was intensely hot, the sun fierce, and the sky cloudless, but the members went religiously through the trials from 1 to 268. They said nice things about Mr. Harry Foster's conduct of the trials, suggested that a duplicate trial on heavy land would prove of great value, criticised the work of the Floral Committee, and wondered how it was that their own seedlings were mixed here and fixed at home, and voted the hon. secretary a general nuisance because he persisted in gathering in cash on the slightest pretext.

The trial rows were full of bloom, but the great heat of previous days had shortened the stems, made the flowers small, and rather spoiled the colours. Had there been some wet and cool days instead of hot and dry ones everyone would have exclaimed at the beauty of the blooms. But these things are not ordered for the N.S.P.S., and while we grumbled at the heat and its consequence we should have grumbled just the same if there had been cool, moist weather. Our American friends filled their books with notes, and both Mr. W. Atlee Burpee and his sons, Mr. David and Mr. W. A. B., jun., were as busy as bees.

By 12.45 we were all ready for luncheon, and when Mrs. C. Foster led the ladies across the fields to the recreation ground Lord Northcliffe has so generously provided for his employes, the men folk speedily followed. At the entrance to the ground Lady Northcliffe was waiting to receive the members, and Mr. H. J. Wright and Mr. Curtis were kept busy introducing the company, for every member of whom our lady president had a hearty handshake and a pleasant word of greeting. Lady Northcliffe presided over the luncheon, gave the usual loyal toasts, and proposed "The Society" in a charming little speech. She said how greatly she appreciated the honour of acting as president, how much she admired the grand flowers at the exhibition, and how delighted she was to know that the cult of the sweet pea was extending in the colonies, and that 260 new members had been, so far, added during her presidential year.

Mr. Cuthbertson responded for the society, and made a feeling reference to our late friend Mr. Charles Foster. Then Mr. Alfred Watkins proposed her ladyship's health, and Mr. W. Atlee Burpee, from Philadelphia, seconded the motion, and quite captured the audience when he said that if in America they had such a charming and generous lady president as Lady Northcliffe the question of a new president would never arise so long as she cared to occupy the position. The toast was received with acclamation, and cheers were given her ladyship and for Lord Northcliffe. After luncheon there was the inevitable photograph, and then followed a tour of the grand old house, built four hundred years ago. The splendid old tapestries, the oak panelling, and the old furniture were all greatly admired. Then we explored the garden, and those who had not previously seen Lady Northcliffe's natural garden, a quarter of a mile long, were astonished at its extent and beauty, while those who had seen it before enjoyed it as much as ever. The rose garden, the great hedge of Dorothy Perkins, the lily pool, the blue border composed of Salvia patens and Anchusa italica Dropmore variety, with Lilium Browni dotted all through, were all features of the greatest beauty. The shade of the cedars was grateful, and tea time was a delicious interval that everyone took full advantage of. Another parting look at the sweet peas, and we entered the brakes, gave a cheer to Mrs. C. Foster and Mr. Harry Foster, caught the 5.54 up to Waterloo from Woking, and, tired but having had a grand day, we went our various ways homewards.

Friday, July 14, provided a long-distance trip; this was to Messrs. R. H. Bath's Floral Farms, Wisbech. About fifteen members started from King's Cross, but there were others who came different ways, so that there were about thirty to partake of the sumptuous luncheon provided on arrival at the Ship Hotel. Mr. G. W. Leak presided, and after doing justice to the good things, we acknowledged his kindness, climbed into the brakes, and drove to the Floral Farms. Many acres are devoted to fruit culture, and other areas to cauliflowers, etc., for pickling. Daffodils, tulips, carnations, delphiniums, and hardy flowers in general are extensively cultivated, while fruit trees and roses occupy large breadths. The firm has altogether about 1,200 acres under cultivation.

The sweet peas were a great delight to everyone, though they would have been appreciated even more than they were had the sun been a little less ardent, and had there been a breeze across these broad fen lands. The sweet pea trials at Wisbech were just at their best, full of bloom and very healthy. Several miles of wide-meshed galvanised wire netting are used for supports, and the varieties are all grouped in their colours for close comparison. Seeds are purchased from the various raisers, and a good row planted, and at the time of our visit no roguing had been done. The need for more care in fixing and roguing sweet peas was here very patent, and the evidence of the Wisbech trials emphasised that given by the Guildford trials in numbers of instances.

About four hundred long rows were patiently examined, and Mr. Leak drew attention to various characters shown by certain varieties, and the particular colour rogue that comes in some sorts. To the seedsmen of the party these trials were of special interest and value, but the amateurs made notes freely, registering good marks against pure stock and black marks against unmixed ones. In every case the row bore a number, and in the lists provided there was a corresponding number with the name of the variety and that of the person or firm from whom the seeds of that particular stock had been raised. Surely there were miles of sweet peas. Well over two solid hours were occupied in inspecting them. Florence Wright, Nettie Jenkins, George Stark Improved, Mrs. Hugh Dickson, Earl Spencer, Anglian Pink, Tom Bolton, Sunproof Crimson, and Senator Spencer were a few among a goodly number of outstanding varieties that seemed to please everyone.

Never was tea more welcome than on this afternoon, after about two hours and a-half out in the broiling sunshine. Mrs. Leak and Mrs. Boyce dispensed the cup that cheers, not to mention strawberries and cream, but even in the spacious seed room we could not get away from sweet peas, for here on a long bench were hundreds of bunches of flowers, each bunch representing a distinct variety, or at least bearing a distinct name, and these were grouped in their colours. Mr. Herbert Smith returned thanks to the Messrs. Bath for their kindness and splendid hospitality, and to Mr. Leak for arranging everything so admirably. Mr. Leak, who has been chairman of the N.S.P.S. Committee during a somewhat trying time, appropriately responded, and then, after the photographer had worked his will and we had peeped into the carnation and tomato houses, we once more entered the brakes, started homewards, tired, but feeling that the sweet pea week of 1911 had come to an end all too soon.

Chas. H. Curtis.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price, bound in cloth, 1s. 6d. net, post 1s. 9d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

PERSIMMONS.

In the interesting article on Persimmons, which Mr. W. Botting Hemsley, V.M.H., has contributed to the current issue of the "Kew Bulletin," the following interesting reference is made to the early history of Diospyros Kaki: "Although on the authority of Bretschneider, the Kaki is cultivated all over China, it does not figure among the vegetable products of China mentioned by Marco Polo, the pioneer of European travellers in that country, who resided there for a number of years towards the end of the thirteenth century. About the middle of the sixteenth century the first Jesuit missionaries landed in China, and it is to successive members of this order that we are indebted for our earliest knowledge of the Kaki. Bretschneider gives extracts from their writings, accompanied by comments in relation to his identifications. Ricci is the earliest (1615) cited, and he refers to a peculiar very common fruit which the Portuguese used to call Chinese Figs. Alvarus de Semedo (1643) has the following passage, as translated from the French by Bretschneider: 'There is a kind of fruit grown everywhere in China which they call su zu in their language. The Portuguese used to term it Red Fig. It bears, however, no resemblance to a fig, for it is of a red colour outside, contains a gold coloured pulp and seeds resembling almond kernels. Its shape is that of an orange, but it varies in size. It has the skin very soft, and is of a delicious flavour. The best are grown in the colder parts of China, namely, in the provinces of Honan, Shensi, Shansi, and Shantung, especially in the last-named, where they used to dry them and send them off to the other provinces of the Empire. When dried this fruit resembles somewhat our figs, but it is superior in flavour.' Bretschneider remarks: 'This is without doubt the Diospyros Kaki, Linn. f. (D. Schitze, Bunge), a very common fruit tree all over China, where a great many varieties of it are cultivated. The Chinese name of the fruit is schitze; in the Amoy dialect sutsu.'"

YUCCA GLORIOSA.

In the beautiful gardens of "Arcadia," the charming residence of G. H. Rolls, Esq., J.P. (chairman of the committee of the Bournemouth Horticultural Society) yuccas are a special feature. Magnificent giant spikes of flowers of Yucca gloriosa rear their heads in the herbaceous borders. Mr. Jones, the head gardener, told me that he had tried an experiment with these plants, lifting and replanting a number of them. Nearly every specimen so treated last autumn is now flowering. Those not lifted are not flowering. A number of spare plants were heeled in in the fruit garden, and the strongest of these, too, are also flowering. More lifting and replanting is to be done during the coming autumn, as Mr. Jones firmly believes that such treatment will induce freer flowering. Old plants, he thinks, ought to be lifted every two years. Furthermore, he favours rather dry borders—those that are well drained not unduly dry—and rather light.

Geo. Garner.

"**Kew Bulletin.**"—The principal contents of the current issue of this publication are the "Balsaminaceæ of the State of Chitral," by Sir J. D. Hooker; notes on "Trees Suitable for Experimental Forestry," by Mr. W. Dallimore; "Persimmons," by Mr. W. B. Hemsley, V.M.H.; "Fungi Exotici XII.," by Mr. G. Massee, V.M.H.; and "Diagnoses Africanæ XLII."

AN ATTRACTIVE LILY POOL.

As duly recorded in our report, rock and water gardens formed a distinct and attractive feature of the Royal Horticultural Society's Summer Show at Olympia, and the numerous arrangements were of much interest as evidence of the high degree of popularity which plants from alpine regions and from still and running water, or the margins thereof enjoy. They could hardly have failed to prove useful, for they were varied in design and admirable in execution, and visitors interested in these two important classes of plants had an opportunity of obtaining much information relating to rock and water gardening generally. We were equally interested in both the large and small gardens, and we selected for illustration one belonging to the latter class because of its adaptability to gardens of quite moderate dimensions.

This was exhibited by Messrs. G. Bunyard and Co., of Maidstone, who are not less successful with hardy plants than with hardy and other fruits, and was distinguished by simplicity of design and for its adaptability to the requirements of the several classes of plants that thrive in or near water. This is a point of some importance where the pleasure grounds have a comparatively small area, for in such cases water gardens that are elaborate in design either occupy so much space as to be out of proportion to the other features, or fail to afford room for a choice selection of water lilies. In Messrs. Bunyard's pool there was ample room for a goodly number of nymphaeas, and as it could be readily extended, should space permit, the design is one that has much to recommend it to the general body of cultivators. The general effect was, it should be mentioned, remarkably good, for in the pool were finely-flowered examples of numerous water lilies, and on the margin were well-developed examples of the best of the pink astilbes and spiræas, and as a background bamboos were freely and tastefully used. Contiguous to the lily pool, but separated from it by a neat pathway, Messrs. G. Bunyard and Co. had a tastefully-arranged herbaceous border and a well-planted rockery, both of which contained much to interest lovers of hardy plants.

A TASTEFULLY-ARRANGED LILY POOL.

Exhibited at the R.H.S. Show at Olympia by Messrs. G. Bunyard and Co., who were awarded a silver cup.

EUPHORBIA FULGENS.

It is very rare indeed that the gardener who has to do much house decoration during the winter months, and especially at Christmas time, has too many scarlet flowers. The latter are always welcome on account of their warm appearance and suitability for mixing with foliage plants, also for use in sprays and buttonholes.

Gardeners who have not had any experience in the cultivation of this euphorbia may find the following brief hints useful. When the flowers have faded water should be withheld from the soil for a time, but the plants must be kept in a warm house. New shoots will quickly grow from the top portion of the stem, and when they are about five inches long they should be taken off with a heel of hard wood attached and inserted as cuttings in a sandy compost. The moment the cuttings are severed from the parent plant, dip the ends in a heap of dust-dry sand for the purpose of stopping the flow of sap from the cut portion. Plunge the cutting pots in a brisk hot-bed in a propagating frame, and the cuttings will soon callus and form roots. When they are sufficiently rooted, transfer them to larger pots, using a compost of light fibrous loam two-thirds, peat one-third, and sufficient coarse washed sand to render the mixture porous. Pot lightly and replace the pots on the top of the plunging material in the frame for a few days, then gradually expose the young plants to the temperature of the warm stove.

As they require repotting use the same kind of compost, but a little rougher, and pot more firmly. Keep the young plants in a light position to prevent the stems being unduly drawn up. The old plants may be cut down when sufficient cuttings have been secured. Very shortly afterwards new shoots will grow from the old stems if the latter are left about six inches long; and where the young shoots are two inches long, greatly reduce the ball of soil, and repot, using a much smaller pot, in the same way that a fuchsia is dealt with. Use a similar compost to that employed for the potting of the young plants, and so grow them that the wood will be well ripened by the time autumn comes. The old examples may possess a number of shoots, and will be useful for associating with other subjects in the dwelling-house in the winter.

The young examples may be limited to a single stem, or be pinched to induce the growth of several. The finest batch of these plants I ever saw were grown in a garden in Lancashire. Early in the autumn they were placed in a pine-apple stove, and trained to an arched wire trellis at the back of the pines. They were grown in seven-inch pots, and mostly confined to single stems, which were from four to six feet long, possessing very long sprays of flowers.

This long row of plants, so profusely flowered, was very attractive behind the bed of pines.

G. B.

LYCHNIS CHALCEDONICA.

The well-known old flower of Constantinople, a showy border plant of many, many years standing, does not bulk so largely in the modern gardens as in those of long ago. An early recollection brings to us a long border, with big clumps of Lilium testaceum, and of tall-grown Campanula latiloba, or grandis, associated with large clumps of the old double Lychnis chalcedonica, and where the effect was truly fine. It doubtless took some time to raise all these big groups of this lychnis, but the garden was a very old one, and no doubt the plants had been there for many years. At any rate, they had been in that garden long before the regime of the then gardener, who had been in his post for more than ten years. Such big plants were worth having, and readers who want a brilliant scarlet flower for the border need not hesitate to secure either the double or the single scarlet Lychnis chalcedonica. How long they have been prized as garden plants is difficult to tell, but the student of old garden lore will find much to interest him in reading about the double one, while the admirer of bright flowers of bold habit will discover in this old, and not scarce, plant one which may be dear to him. As for the double white one, I think we prize it most because it is not so plentiful as the other. It appeals to me less than do the single and double scarlet forms, which are pretty well described somewhere as "the well known old 'geranium' scarlet lychnises." Any good border will grow these old-fashioned flowers.

S. A.

ROSES THAT ARE DOING WELL.

It almost invariably happens that a few varieties of roses do much better during one season than in others, so much so that they are almost unrecognisable as the same rose in its normal condition. We well remember years in which White Maman Cochet, Mrs. Edward Mawley, Earl of Warwick, A. K. Williams, Hugh Dickson, and Frau Karl Druschki came so exceptionally good that the seasons were respectively named after these varieties. It is a little too early to name one for the present, but as many are coming exceptionally good—all the more so when we consider the erratic character of the present summer—I propose a few notes upon them.

Lyon is very good, but I do not think the majority of the flowers, so far, have possessed so much of the fiery salmon noticeable in a cooler season. It was present before we had the very hot and sunny spell, and will probably be found again towards autumn attended with cooler nights and dewy mornings. For this glorious rose has the merit of being a good autumnal. I am also quite satisfied with Rayon d'Or this summer. We, and many others, had a little bother with this rose during winter propagation: but from observations and from notes my friends have kindly supplied, it appears most impatient of artificial heat, having done well where planted out carefully, and even better when the plants were potted up and kept quite cool and steady. It is notorious that the first plants received were very sappy and unripe through the wet summer and late growth of last season, and this will doubtless account for many failures. Beauté de Lyon, Viscountess Enfield, A. R. Goodwin, and Soleil d'Angers, other hybrid briar or Pernettiana roses, have also done remarkably well, and the dry atmosphere has been highly favourable for these slow openers. But an English-raised variety from Waltham Cross, named Juilet, has pleased as much as any. In some cases the sun has robbed the flowers of much of the charming gold shadings, but those coming during the cooler weather we could scarcely praise enough.

We have a beautiful yellow in Muriel Jamieson, a large single flower, produced in great profusion, and certain to become popular. Another taking decorative variety is Mrs. Arthur Tate. The buds are long and pointed, deep coppery-red when young, with fawn shadings with age. Not very full, but opening well and exceptionally free. We think it one of the prettiest of all the garden roses. Quite a different flower is found in Mrs. Arthur Munt, which is large, full, and with the most perfectly shaped high centre of any variety. When quite young we can discover soft peach on a deep cream ground, but as the flower develops it comes a clear ivory-white. Every growth carries a flower upon a long and stiff stalk, while from the very first they are of perfect form, finishing into one of the best exhibition whites.

Mary, Countess of Ilchester, with its erect growth and large crimson-carmine flowers, has been very conspicuous this season. So, too, has the beautiful yellow H.T. James Coey, one of the deepest golden yellows of all in the younger stages, but going lighter towards the edges with age. This variety blooms in large trusses, and is valuable for beds and for cutting. We have also been very pleased with Excelsa as a maiden dwarf. This very bright Wichuraiana begins to flower as a maiden almost as freely and early as those of the new and deep-coloured dwarf polyantha Jessie, and both have been exceedingly showy from the first. It is not often the extra strong growers, as maidens, flower so early and continuously as Excelsa. Some grafted plants in pots were also very pretty from the time they commenced growth. Theresa is a new hybrid tea that all should grow where bedding and decorative varieties are most in request. It is a very taking combination of orange-apricot, madder-pink, and carmine. Only semi-double, but produced in the greatest profusion, and of good habit. Messrs. Pernet-Ducher are most noted of late for giving us such beautiful and almost indescribable forms of orange and other yellows, but in Souvenir de Gustave Prat we have a light sulphur-yellow that might almost be called a white when the finely formed and large flowers are developed. This has a fine spreading habit, and is vigorous.

Among the new hybrid perpetuals the intense poppy or vermilion-scarlet of Rouge Angevine is most striking. It is better now than I have seen it hitherto. The petals are very large, buds long and pointed, but when fully expanded reminds one of a pæony. Of good but robust growth, and free flowering; a most striking scarlet in a bed.

The yellow Wichuraiana Aviator Bleriot is very good, and appears to be quite the best of its colour in this section. Another good yellow is Robert Craig. Our standard Wichuraianas were fully a fortnight earlier this year, and have been very showy. Among the newer varieties, Coquina, Excelsa, Elsie, and Troubador are really good. Many of the dark hybrid perpetuals were rather burnt, and I note that even Commandant Felix Faure was injured, which I have not found in this rose before. Just before the heat wave we had very intense coloured darks in Charles Lefebvre, Abel Carrière, Grand Mogul, Prince Camille de Rohan, Fisher Holmes, Victor Hugo, Crown Prince, and Horace Vernet.

But to return to some of the older hybrid teas. Kaiserin Augusta Victoria has been perfect. So, too, have Le Progres, Madame Melanie Soupert, George C. Waud, Mrs. Theodore Roosevelt, Dean Hole, Earl of Warwick, Harry Kirk, Mrs. Aaron Ward, Mrs. Peter Blair, Madame Ravary, Madame Segond Weber, Marquise de Sinety, Mrs. W. J. Grant, Pharisaer, and William Shean.

Anna Olivier, Lady Roberts, Medea, Bridesmaid, Maman Cochet, and its grand white sport Muriel Grahame, Molly Sharman Crawford, Mrs. Edward Mawley, Souvenir de Pierre Notting, and W. R. Smith have been good amongst teas.

At the time of writing (July 12) our plants are rather tried by the excessive sunshine, but the maidens are growing satisfactorily. I am, however, sorry to note the rapid advance of thrips in the blossoms, the more so because we cannot effectually combat this pest without more or less injury to the flowers.

A. P.

EARLY-RAISED WALLFLOWERS.

Seldom have wallflowers been in better condition than they were this spring. I think that cultivators are realising more and more every year the importance of raising the stock of plants early in the season. There is plenty of room for improvement in this direction yet, as I have seen many gardens in which the wallflowers were poor, indeed, which had been raised from seeds sown very late last year.

Some good cultivators sow the seeds in May; I have done so, and also in June, and, as far as my experience goes, the June-raised plants were in every way the most satisfactory. If carefully grown on such plants make fine bushy specimens by the end of September, and they are then in prime condition for planting in the flower beds directly the latter become vacant.

There are few persons who have had gardens to attend to who have not had som experience in the cultivation of wallflowe But probably many of them have not trie the plan of raising the seedlings in ope borders without any protection. I d not favour the plan of growing the plan in a poor soil, but rather that of raisin and cultivating them in a soil of mediu richness, but made firm.

A border having a west aspect is a sui able one; the soil must be deeply du liberally manured with decomposed manur which should be thoroughly mixed with t soil, and made firm while in a medium sta of moisture. The seeds may be sown thin broadcast, or in drills. The resulta seedlings should be duly transplanted fo inches apart in similar beds. Anoth shift will be beneficial before they a finally planted in their flowering quarte The second time the distance between t young plants should be seven inches ea way. One hundred plants so grown worth three hundred spindly examples, result of lack of attention as regards in raising the seedlings, and in transp ing. Specimens transplanted several t possess many fibrous roots, as well several branches, each one capable of bea ing a grand spike of flowers.

Geo. Garner

Anemones and Ranunculus will usually give better results if take and dried than when they are allowed t main in the ground all the year. All t may now be lifted, dried, and sorte— E. C. P.

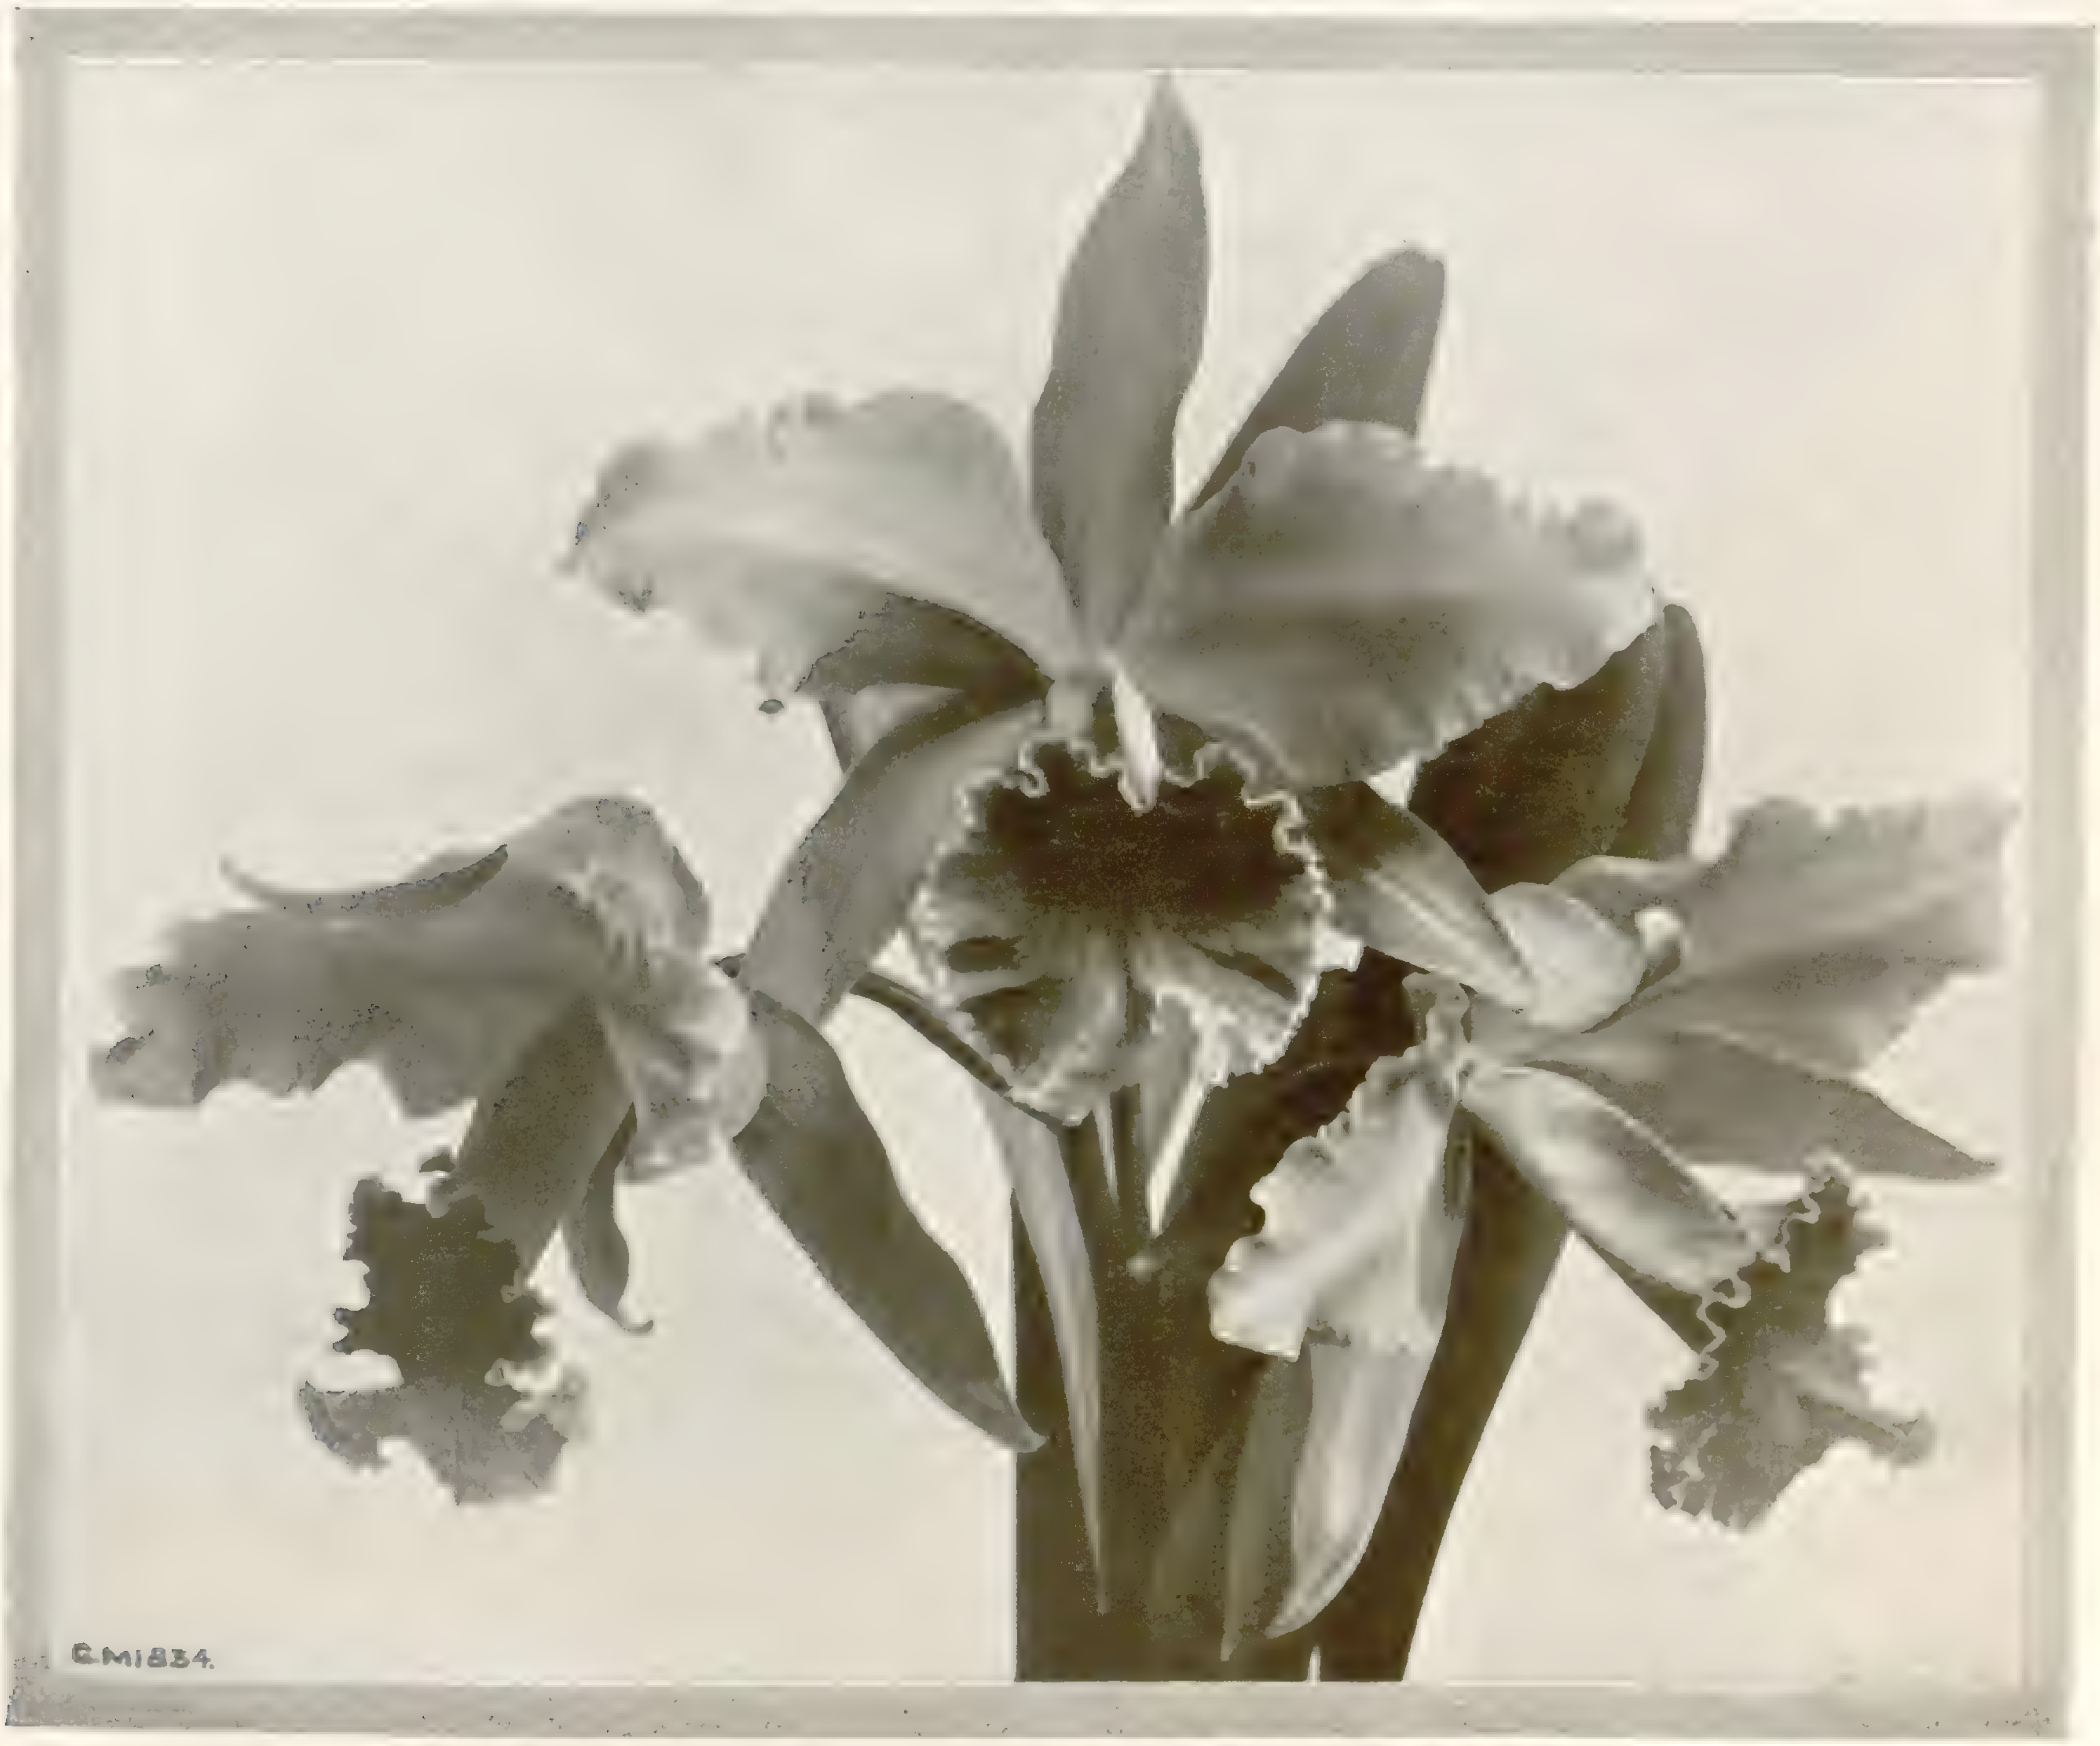
NEW PLANTS, ETC.

LÆLIO-CATTLEYA MARTINETTI KING GEORGE V.

A large-flowered variety and a very attractive one. The sepals and petals are rich rosy-purple, and the fine lip deep crimson-purple. One of the boldest and best forms of this useful hybrid. A.M., R.H.S., July 4. Messrs. Charlesworth and Co., Haywards Heath.

SWEET PEAS.

Barbara.—A distinct variety with comparatively large flowers of a rich salmon colour, tinted rose. See illustration page 512. F.C.C., N.S.P.S., July 11. Mr. R. Holmes, Norwich.



LÆLIO-CATTLEYA MARTINETTI KING GEORGE V.

Flowers large and the colouring rich rose-purple and crimson. A.M., R.H.S., July 4. Messrs. Charlesworth and Co.

Dobbies' Thomas Stevenson.—A fine strain of this brilliantly-coloured variety. The flowers are of large size and the colour rich scarlet. See illustration, page 511. F.C.C., N.S.P.S., July 11. Messrs. Dobbie and Co., Edinburgh.

F. Seymour Davies.—A beautiful variety with finely-formed flowers of a pleasing pink-lavender colour. A.M., N.S.P.S., July 11. Mr. F. S. Davies, Farnham.

Mauve Queen.—An effective variety, the flowers large and the colour rich mauve. A.M., N.S.P.S., July 11. Messrs. Dobbie and Co.

May Campbell.—Distinct and attractive, the flowers rich cream, the wings and standard marked with a rose flame. A.M., N.S.P.S., July 11. Messrs. Dobbie and Co.

Mrs. B. Gilbert.—An attractive marbled variety, the flowers large and marked with purple-violet on a light ground. A.M., N.S.P.S., July 11. Messrs. Gilbert and Son, Bourne, Dyke.

Red Star.—A finely formed flower of a bright rich crimson colour. A.M., N.S.P.S., July 11. Mr. A. Malcolm Duns.

NOTES OF OBSERVATION.

Tomatoes.—This is a good time to sow the seeds of tomatoes for winter stock, so that strong plants may be ready for the winter months. I find Sunrise a good variety, also Sutton's Winter Beauty, which is excellent for early spring supplies. The seedlings should be soon potted into small pots, and grown on outside, and they will make fine strong plants before being housed in September. I prefer growing tomatoes in pots through the winter, as they can then be shifted with more ease. Growing plants should now have the laterals constantly picked out. and be relieved of fruit as it becomes ripe. If the fruits are regularly picked as soon as ready, the plants will keep on growing with much more freedom than otherwise.—W. A. Cook.

Philadelphus purpureo maculatus.—First distributed by the raiser—M. Lemoine, of Nancy, in the autumn of 1902, this was some time before it made its way far in popular favour. Now it is very generally recognised as a break away from all the older forms of Philadelphus, as the flowers of these are white, whereas those of P. purpureo maculatus have a deep purple blotch at the base of each petal, thus giving, as it were, a purple centre to the flower. This coloured character was said by the raiser to be derived from the Californian P. Coulteri, which is tender in this country, but P. purpureo maculatus seems to be as hardy as the other hybrid forms. It may be of interest to note that M. Lemoine distributed last autumn another coloured variety under the name of Œil de Pourpre, but I have not yet flowered it.—W. T.

Geranium argenteum.—That size is no just criterion of merit is nowhere more clearly in evidence than in Geranium argenteum. The genus embraces many species, some of which attain a height of two and three feet, while the flowers are quite insignificant; in curious contrast to these is the present plant, which is one of the smallest and daintiest, and with flowers that are exceedingly large in comparison with the plant. The flowers are a rose shade with delicate veins of a deeper tint traversing the segments, and are usually borne in pairs on slender, erect stems, that scarcely exceed the leaves in height. It is also esteemed as a foliage plant, as the leaves are most intense silver-grey on both surfaces, and are divided into five to seven parts, with many secondary lobes. In habit it forms a low mound of silky grey leafage, growing freely in ordinary soil in a well-drained part of the rock garden, and is not averse to a strong limestone soil. It is a native of Northern Italy, and flowers during June and July.—Thomas Smith.

AVAILABLE PLANT FOOD.

(Continued from page 451.)

The element which is present in greatest amount in plants is carbon. This material is derived from the carbonic acid of the air. In order to become plant food this carbonic acid is first absorbed largely by the leaves, afterwards its usefulness depends upon the green colouring matter of the foliage, the chlorophyll, as it is called, and also upon the amount of bright sunshine.

The chlorophyll absorbs some of the heat rays of the sunlight, and by means of the energy thus provided the carbon unites, in some obscure way, with the elements of water, ultimately forming starch. The oxygen which has been taken up is thrown off through the pores of the leaves. This process of the formation of plant food from carbonic acid and water is called carbon assimilation.

Faulty preparation of the ground for seed sowing is the cause of more failures in plant growth than any subsequent treatment of the crop. The tillage of the soil for seeding should be governed by two factors, first by the needs of the particular crop which is to be grown, and, secondly, by the character of the land.

To properly prepare a seed bed for any crop the habits, likes, and dislikes of the plants should be studied. That is to say, it is not enough that the soil be well prepared; it should have the kind of preparation which is demanded by the crop.

While all plants need certain chemical elements for their growth, they cannot use these ingredients in their raw or uncombined form. In fact, the elements as such do not exist in the soil; they are united with each other in compounds, and it is by absorbing the compounds that the plants obtain the necessary elements. For example, phosphorus is essential to the life of all plants, but it is never used by them in the form of phosphorus. It is always taken up in the form of some compound, as phosphoric acid or a phosphate.

When the compounds exist in such condition as to be readily absorbed by the plant roots the soil is said to contain available plant food.

One problem for the gardener is to secure available plant food, and then to determine whether it is better to unlock the food in the soil by means of tillage, or by supplying the elements nitrogen, potash, and phosphoric acid, in some artificial manure.

In many gardening establishments, and especially in these days of motor cars, animal dung cannot be obtained in sufficient amount for the total requirements of plant food. In such cases it is necessary to obtain as a basis for the manuring some slowly-acting nitrogenous body of an organic origin which will provide a certain amount of humus matter, such as meat meal, fish guano, dried blood, rape dust, or shoddy. This should be dug into the ground in winter or early in spring, at the rate of 8lb. to 12lb. per square rod. With this should be applied 4lb. to 6lb. per square rod of a phosphatic manure, like steamed bone flour or phosphatic guano, also kainit at the rate of 6oz. to 8oz. per square yard, every other year or so. Finally, when the plants begin to grow a little active nitrogen, in the shape of sulphate of ammonia, nitrate of soda, or nitrate of lime, at the rate of 1½lb. to the square rod, or ½oz. in a gallon of water.

For plants in pots it is better to use manures in solution. For example, nitrate of soda and superphosphate, or 1oz. of sulphate of ammonia and 3oz. superphosphate, with a little soot, dissolved in ten gallons of water, making an excellent manure for finishing when buds are opening or fruit swelling. If a soil compost is to be enriched let the slowly acting forms of nitrogen, like the guanos or meat meal, be used with phosphates in corresponding quantities, and let the manures be mixed with the soil some time before the compost is wanted, because the early stages of decomposition in the soil of these concentrated manures are injurious to tender rootlets. One of the strongest and most powerful artificial manures in commerce can be made by mixing together equal quantities of nitrate ammonia and phosphate of potash. The chemical analysis of such a mixture is 17½ per cent. of nitrogen, 12 per cent. of potash, and 40 per cent. of phosphates. It may be applied at the rate of ½oz. in a gallon of water, once a week, to all plants requiring available food with the greatest success. Being a soluble well-balanced manure it will prove one of the best fertilisers for feeding plants in pots that a grower can have.

J. J. Willis.

SOME ROSE GARDEN FEATURES.

Glimpses at rosaries in different gardens reveal different uses made of the Queen of Flowers, and suggest, therefore, how the distant, even smaller, home rose gardens can be improved another season. There are some beautiful effects that can be imitated; one of these is the carpeting with eschscholtzias of one of the dwarfer types; sown late it will form an elegant grey-green mass during the chief rose show, the blooms can be picked off it after this, if preferred, but, at any rate, the growth will not be too vigorous. One of the best of all carpets is that of sown or transplanted Platystemon californicum, a handsome grey-leaved hardy annual, that has King's Cup shaped flowers of primrose-cream, a tint that suits with all but white roses.

Rose trees extra wide apart, in a rose garden on a giant scale, have been given a rockery border surrounding. The groups of grey stones are not built up high at any point, over most of the space the rocks are scattered, but they suffice even so to hold sun-heat off the light sandy soil that needs, otherwise, such constant hoeing and watering. Only dwarf light-growing plants are tolerated in the ground. These are irregularly grouped, mostly between and behind the stone groups, and include perennials, hardy annuals, and bedding plants; any subject, in fact, the appearance of which is desired just there. By this means exquisite colour schemes have been carried out: orange Erysimum Peroffskianum is near white roses, magenta Kaulfussia kermesina occupies patches of soil near the lemon teas, and in front of a pillar-trained yellow Rambler; Reine Marie Henriette's peculiar rosy-cerise is shown up by cream begonias and a few maroon nasturtiums, blue flax harmonises exquisitely with the apricot of Madame Falcot and Lady Roberts; the salmon-rose of Madame Abel Chatenay is seen above white Iceland poppies, while deep carmine roses have a setting of dwarf blue cornflowers, which minimise the unpleasant appearance of blue shadings in the petals of such roses as they fade.

Shading is essential to preserve the colours of some roses, and one gardener has achieved a beautiful success by growing different varieties of white clematises up twelve-foot poles at intervals along the outer edge of a giant round rose plot. The clematis branches are partly trained out from pole to pole at the top, but others are tied to strands of tarred string stretched bodly across the rosery, forming a skeleton roofing that affords just sufficient but not excessive shade. The similar employment of mauve and purple clematises, if only yellow roses were in the plot, would have a lovely result. Further combinations might be thought out; for instance, red clematises with white roses, blue clematises with pink, and only pale lilac ones with maroon roses, such as Xavier Olibo.

Formal rose gardens of stiff-shaped beds and tiled walks can well have groups of pot plants formed here and there, either against walls or in the path spaces. Palms, aralias, beets, Cineraria maritima, cannas, liliums, chrysanthemums, all will be of service among countless other charming plants.

M. H.

JAPANESE MAPLES.

Few shrubs make so bright a display in the garden at the present time as Japanese maples, their elegantly divided and attractively coloured foliage rendering them objects of much beauty, and gaining for them a prominent place in gardens where the more choice trees and shrubs are appreciated. Grown as single specimens on the grass, or arranged here and there near a stream in the water garden, they present a highly attractive appearance; while grouped in beds by themselves they are very effective. The colour of the foliage is frequently intensified when purple-shaded violas are grown as a carpet to them, and this combination is especially pleasing in the case of the more highly-coloured crimson forms. Viola gracilis is one of the best for this purpose, and it is seen to advantage under the maples.

Japanese maples succeed well in any good garden soil, but a medium loam that has been well cultivated probably suits them best. In the case of those growing on the lawn it is necessary to keep the grass away from them by cultivating the ground for a distance of two feet from the stems.

There are many really good varieties and amongst these are Acer palmatum sanguineum, which has richly coloured foliage it makes a good-sized specimen. A. p. palmatifidum is a lovely variety, with elegant cut dark green foliage. A. p. atropurpureum, A. p. aureum, and A. p. rufinerv are very showy. A. p. roseo-marginatu is a lovely plant; A. p. ampilopsifolium, A. p. dissectum, A. p. dissectum variegatum and A. p. septemlobum elegans, are a charming, with brilliantly coloured foliage A. p. ribesifolium is a distinct and ornamental maple; while A. japonicum aureu and A. j. laciniatum, form lovely specimens; the latter has beautiful green foliage, which turns a brilliant crimson i the autumn.

J. G.

Philadelphus Lemoinei Virginal.—The month of June must be regar as the season when most members of the m orange or philadelphus family are at th best. There have been great addition these beautiful flowering shrubs with re cent years, and the variety Virginal at the meeting of the Royal Hortic Society on June 20th, not only attra good deal of attention on the part o visitors, but it was also given the hon a First Class Certificate. Readers o Gardeners' Magazine will not need t any detailed description of this beaut variety, as it is so admirably portray the issue of June 24. Like so many novelties, this variety was raised and di buted by M. Lemoine, of Nancy, who wa first to raise hybrids from the pretty Philadelphus microphyllus. Virginal first distributed in the autumn of

W. T.

QUEENWOOD, ENGLEFIELD GREEN.

This, the residence of W. G. Rigan Esq., pleasantly situated on the outskirts of Windsor Great Park, is one of many beautiful places that abound in the neighbourhood of Englefield Green. Those who are acquainted with the district will know that the situation is fairly high, and, generally speaking, all kinds of vegetation flourishes exceedingly well, notwithstanding the fact that the natural soil is rather light and porous. Being so near the forest every opportunity is taken of adding leaves to the natural soil, and, judging by the results obtained this addition is very beneficial.

The owner of Queenwood is very fond of gardening in all its branches, and to this fact must be attributed much of the beauty and success of the garden, as he bought the house quite bare some thirty years ago, and the trees originally planted have now made some very fine specimens. At the time of planting these appeared to have plenty of room, but now, in one or two instances, they are just a little crowded, and, to some extent, cramp the outlook, though I noticed that where they can be best spared the trees are being gradually removed. It is, however, a hard matter to part with trees, etc., that have for a number of years been a source of pleasure.

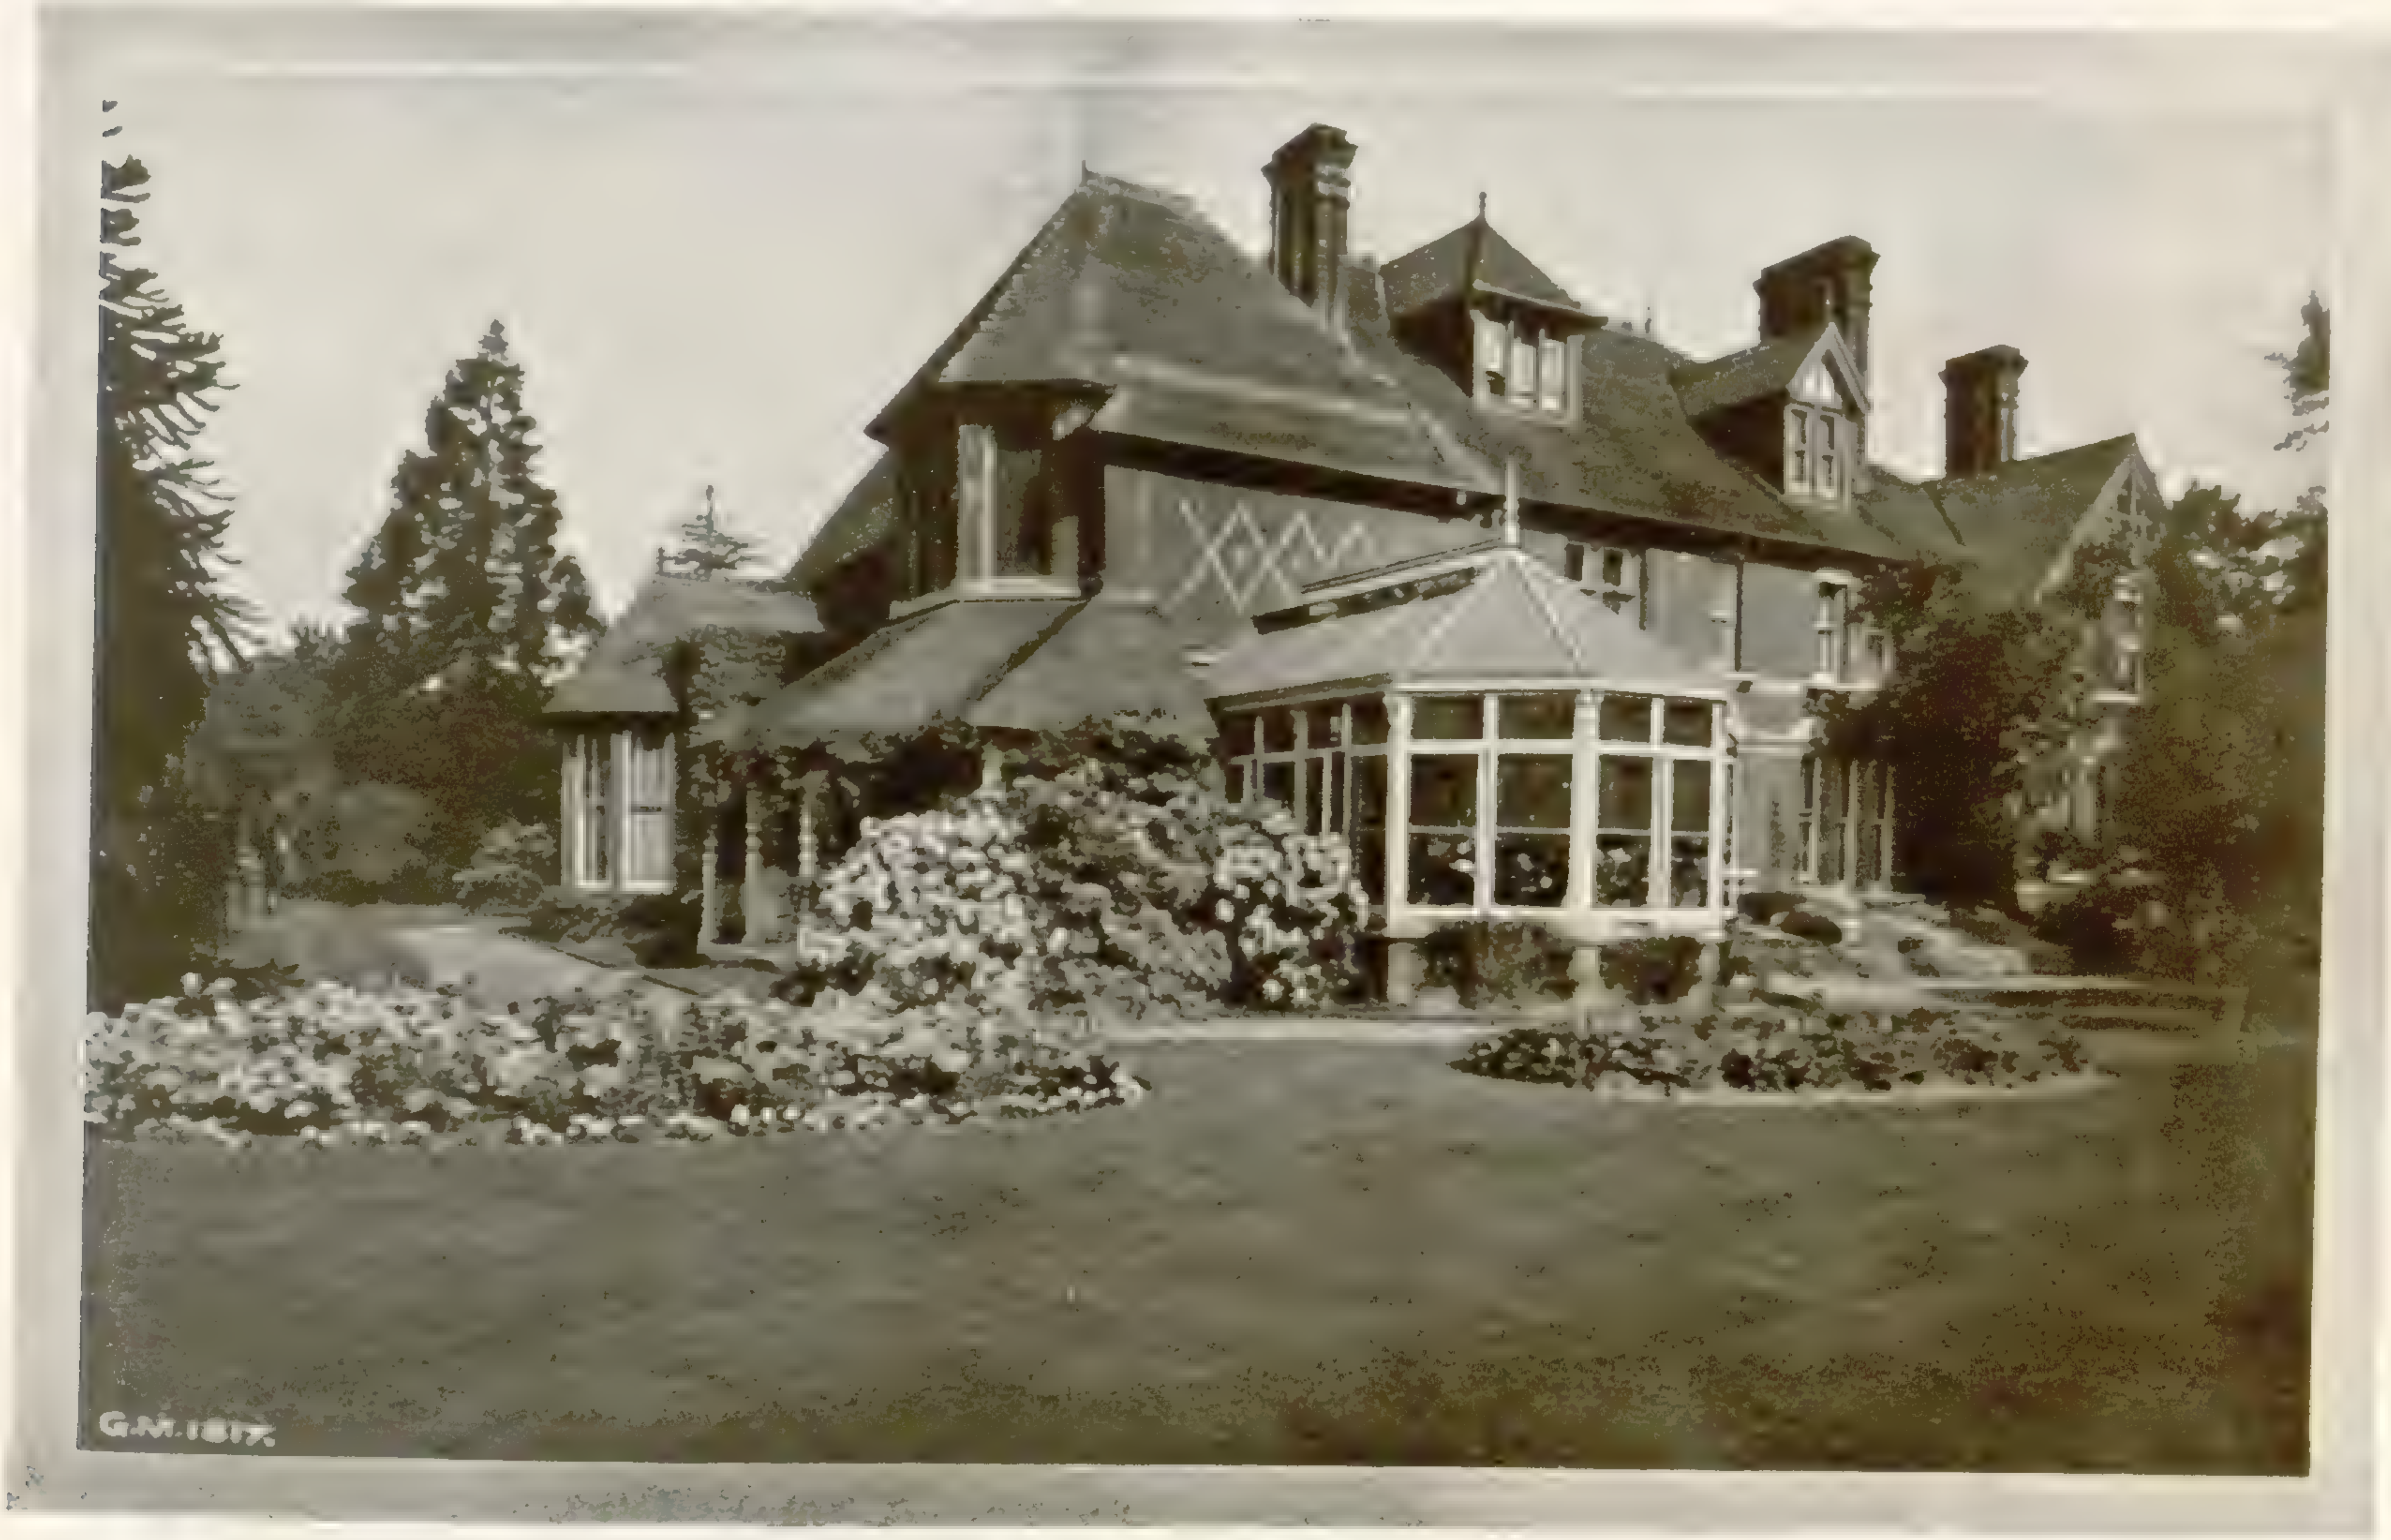
Amongst others, Araucaria imbricata, Pinus insignis, Cedrus Deodora, Wellingtonia gigantea, Thuya Lobbi, and Picea Nordmanniana have made really fine specimens, from 30ft. to 40ft. high, and in every instance are furnished down to the ground; and it is easy to imagine that a few of these appear to take up a quite large space in a garden which, at the most, covers only about five or six acres.

The small pleasure grounds are certainly the feature of the place, and much use has been made of beds of rhododendrons and azaleas, and, as may be seen by the illustrations, these plants do exceedingly well, planted as they are in leaf soil and peat. They would do credit to much larger establishments. The bed of Pink Pearl was planted some six years ago, and contains twenty-five plants, and, as will be seen, they now cover the whole of the bed, which is thirty yards in circumference, and at the time the photograph was taken the bed was a picture worth going a very long way to see, hardly any green being visible owing to the wealth of flowers. Other beds of rhododendrons doing equally well are Kate Waterer, Anthony Waterer, and John Waterer, while in another part of the garden specimens have been planted to great advantage, and from the windows of the house many fine displays of colour are seen in the spring.

Another feature of the pleasure grounds is the roses, which are planted in two or three very large scroll beds; these are almost entirely enclosed by pillars and arches of the more popular climbing varieties, whilst near the house there is a very fine weeping standard of The Garland. This stands from 10ft. to 12ft. high, and is about 6ft. to 8ft. in diameter.

The bedding here is very extensive for a garden of its size, and though the beds are few in number they nevertheless accommodate a quantity of plants. For spring display large quantities of tulips are used, the beds being carpeted underneath with aubrietia and Violas Maggie Mott, Bridal Morn, White Swan, Purity, and Sutton's Yellow Bedder, the latter variety being the one seen in the photograph. The four beds take upwards of 6,000 plants.

For summer bedding large quantities of Paul Crampel pelargoniums are used, and with dot plants of Lilium longiflorum, are most effective. Fuchsias, coleus, heliotropes, marguerites, iresine, etc., are also used in quantity, as also is the very bright Salvia Glory of Zurich.



QUEENWOOD, ENGLEFIELD GREEN,
The Residence of W. G. Rigan, Esq.

The kitchen garden is not extensive, but it is well cropped at all seasons, both with fruit and vegetables, and I have no doubt quite fulfils the requirements of the place.

The glass department, again, is not extensive, but here, as with every other part of the establishment, everything is exceptionally well done, and it is astonishing how many fine batches of plants are worked through the houses during the season. Where all things undertaken are well managed it is a difficult matter to pick out one or two, but such subjects as amaryllis, begonias, gloxinias, caladiums, gesneras, and streptocarpus are worthy of special mention, and at the present time a batch of the latter plants in 24-sized pots are literally one mass of bloom, many of them carrying from 17 to 20 blooms on a single stem.

Grapes, peaches, and melons have houses allotted to them, and all carry good crops, whilst the stove plants and orchids seem to revel in the treatment accorded them. Mr. J. Lingwood, the gardener, is a great believer in single chrysanthemums as decorative plants for the autumn, and so grows them well, and he has raised several good seedlings during the past three or four seasons, Willie Lingwood, Jack Alfred Aylett, and Lingwood's Pride being probably the best.

Mr. Lingwood is secretary of the Egham Gardeners' Association, his employer being president, as he also is of the Egham Flower and Industrial Society, which is probably the largest and most successful society of its kind in England. Mr. Lingwood does not exhibit in competition, but he puts up many fine exhibits during the season at the shows and meetings of the above-mentioned societies, and both he and his generous employer are to be congratulated on the excellent results obtained at Queenwood, and further for the way in which they support anything and everything pertaining to horticulture.

T. S.

SOME GREENHOUSE CLIMBERS.

Where a selection of climbers is made for a small or medium-sized structure a common mistake is to use plants of too vigorous a growth for the purpose. Such being the case, it is necessary to repeatedly cut them away in order to prevent encroachment on their neighbours, the result being that the climbers have not space to develop their true character, while the continual cutting necessary to keep them within bounds is detrimental to their flowering. This applies more particularly to such as the strongest growing of the passifloras, the tacsonias, Cobæa scandens, and its variegated variety, with others of this class. These, properly placed, are all very beautiful, but their use should be limited to a large structure, for among other considerations is the fact that when growing vigorously they obstruct a considerable amount of light, certainly far too much for the welfare of the plants underneath. The choice of subjects suitable for clothing the roof or rafters of a medium-sized conservatory is an extensive one, but a selection likely to suit all is not easily made, as it is very rare to find two persons who see eye to eye in such matters.

For all this the following may be relied upon as a good and representative selection.

Acacia Riceana is a very distinct member of the Australian acacias. If the main branches are trained to a roof the cord-like secondary shoots will hang down for a considerable distance, and when these are studded for the greater part of their length with pale yellow blossoms, a specimen of this acacia forms a very striking feature.

Clematis indivisa.—One of the most popular of conservatory climbers, and exceedingly pretty in the spring when the shoots are laden with their pure white starry flowers. This will attain a considerable size, but by judicious pruning immediately after flowering, it may be readily kept within moderate dimensions. In addition to this, it is often grown with success as a pot plant.

Fuchsias.—From the drooping character of their charming blossoms in no way are fuchsias seen to greater advantage than when trained to roof or rafter, as the charms of the individual flowers are then fully seen. All, except the dwarf-growing varieties, are available for the purpose, but those of a loose nature are decidedly preferable to the more compact growers. For this purpose, too, single flowers are, at least, from my point of view, preferable to double ones. Some of the species, particularly F. dependens, are also very fine when treated in this way.

Hibbertia dentata.—Trained to a rafter and allowed to depend therefrom for some little distance, this hibbertia forms a mass of handsome leafage, bronzy olive in the adult stage, but deeply suffused with red when young. The beauty of this hibbertia is greatly enhanced when studded with its bright golden blossoms, which are borne about the first three months of the year. They are from two to three inches in diameter, and somewhat suggestive of those of a hypericum.

Ipomæa rubro-cærulea.—An annual species of ipomæa, which, if raised from seeds in the spring, will keep up a succession of its fragile blossoms—in colour an indescribable blending of blue, red, and metallic purple, throughout the summer and well on into the autumn.

Jasminum grandiflorum.—Somewhat like our hardy jasmine, but with larger flowers, which have a reddish suffusion on the exterior. They are borne in late summer and autumn, and are very sweetly scented.

Kennedya Marryattæ.—An Australian member of the leguminosæ, with pretty trifoliate leaves of a silky nature, and a profusion of scarlet pea-shaped blossoms.

Lantana salviæfolia.—Notwithstanding the fact that the great value of this lantana as a rafter plant for the greenhouse has been for many years demonstrated at Kew, it is very seldom met with treated in this way. When the main shoots are trained to a rafter and the minor ones allowed to dispose themselves at will, they hang down for some distance and form quite a living curtain, which from spring till autumn is studded with rounded clusters of lilac flowers.

Lapageria alba and rosea.—To these must be assigned a place among the choicest of greenhouse climbers, yet at the same time they are more exacting in their cultural requirements than many others. They are natives of Chili, and, in common with many other subjects from that region, they prefer a liberal amount of atmospheric moisture. For this reason it is useless to employ them in a hot and dry situation, as then the foliage is particularly liable to be attacked by thrips. Conditions suitable to greenhouse ferns will suit the lapagerias well.

Lonicera sempervirens minor.—The tender member of the honeysuckle family will bloom from spring till autumn, and the plant can be readily kept within reasonable bounds. The tubular-shaped flowers are brightly coloured, showing a combination of red and yellow.

Manettia bicolor.—This is one of the most continuous flowering of all conservatory climbers, as where favourably situated it is rarely without blossoms. These last are tubular in shape, the colour being sca

A MAGNIFICENT BED OF RHODODENDRON PINK PEARL AT QUEENWOOD.

tipped with golden yellow. It is a delightful climber for a small structure, though its merits are too often overlooked.

Rhynchospermum jasminoides. — A charming evergreen, whose white jasmine-like flowers are freely borne. They have somewhat the fragrance, though in a less pronounced degree, of a gardenia.

Rhodochiton volubile.—A Mexican plant that flowers with great freedom. The blossoms, borne for a considerable distance along the slender shoots, are composed of a large reddish bell-shaped calyx from the centre of which protrudes a tubular corolla of a deep purple colour.

Solanum jasminoides.—Valued as an outdoor climber in the West of England, this white-flowered solanum is well suited for the embellishment of the greenhouse in the colder parts of the country.

G.M.1818

A VIEW IN QUEENWOOD GARDEN WITH RHODODENDRON PINK PEARL.

Of pillar plants may be particularly mentioned:

Clianthus puniceus, with its red lobster claw-like blossoms; Habrothamnus (cestrum) of sorts; Lasiandra macrantha, whose rich purple flowers are borne in late summer and autumn; Jasminum primulinum, often regarded as hardy, yet it appreciates a little protection; Mitraria coccinea, with scarlet tubular flowers, interesting as one of the few shrubby gesnerads; Plumbago capensis, a universal favourite; Plumbago capensis alba, a white counterpart of the preceding; pelargoniums, particularly the ivy-leaved varieties; Streptosolen Jamesoni, valued for its orange-red colour; and Thibaudia acuminata, a South American evergreen shrub, with tubular flowers and large reddish bracts. W. T.

BULBS.—A practical treatise on the cultivation of hardy, half-hardy and greenhouse bulbous and tuberous-rooted plants is "Bulbs and their Cultivation," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

LITHOSPERMUMS.

Lithospermums are among the most desirable of rock garden plants, and particularly those having blue flowers, for, in a minor degree, they are reminiscent of the brilliant blue of the gentian. The majority of the species are hardy in this country, L. rosmarinifolium being an exception, as it requires some protection in winter. L. graminifolium at times suffers from excessive damp, and for this reason should always be planted on a sharp pitched sunny slope.

The most popular member of the genus is undoubtedly L prostratum, a species native of the Western Pyrenees, and having deep blue flowers. It forms a dwarf trailing sub-shrub, with prostrate branches clothed with evergreen leaves; it is admirably adapted for rockwork, and as it flowers more or less all the summer it merits a position of the greatest prominence. A distinct variety, with pale blue flowers, has recently originated from the type, and to it the name Heavenly Blue has been given. This is quite a notable addition to hardy plants, and a mass in flower is one of the floral triumphs of the rock garden.

L. prostratum and its variety are the only kinds I have found fail on limestone soil, as no amount of coaxing will induce them to make progress, whereas in any good sandy or loamy soil they are always certain, and generally the most vigorous and free flowering of the genus.

L. rosmarinifolium is a shrubby species, much more erect in habit than the last, and while it grows tolerably well in limestone (chalk) soil, it is much freer and healthier in soil where lime is practically absent. This species is rather tender, and must have a warm sheltered spot, and generally succeeds best against a wall, with some light protection in winter.

L. Gastoni is a herbaceous species, and grows with marked vigour on limestone soil; the flowers are produced in terminal heads on the extremity of the year's growths, and are purple-blue in bud, but open to a clear shade of blue, with a white eye. The leaves are dark green, hairy, and ovate-lanceolate in shape; it succeeds best in an exposed sunny position tightly wedged among stones.

L. graminifolium is a most distinct species, with tufted growths and narrow grey-green foliage, somewhat grass-like in appearance; the flowers are borne in scapes some six to nine inches in length, and recurve gracefully, with the flowers inverted on the stalk, and of a clear shade of blue. It is a most reliable species on limestone soil, provided some precautions are taken to guard it from the evil of winter damp.

L. purpureo-cæruleum is a rare native species, with creeping branches furnished with quantities of purple and deep blue flowers; it is not so partial to a sunny spot as the others, and succeeds in a position where it is subjected to a fair amount of shade.

Lithospermums are readily propagated from cuttings taken during July and August and inserted in sandy soil in a cold frame, and kept close until roots are formed, afterwards potting up the plants to establish, and subsequently planting in their permanent positions in spring. L. Gastoni and L. graminifolium will at times give a few good seeds, which are best sown as soon as ripe, standing the pots in a cold frame until germination takes place.

Thomas Smith.

ERRATIC FERN SPORES.

By the term "erratic" we mean in this case such spores from a constant parental form as will yield very diverse progeny, not merely on one occasion, but, as a rule, successive sowings from different annual crops yielding similar results. As is well known, when once the normal type of a plant has broken into an abnormal one, yielding a "sport," the seed or spore, as a rule, inherits the peculiarity; but it is also a well-recognised fact by all selective cultivators that the peculiarity may appear in different grades in the progeny, being more emphasised in some and less in others, the more emphasised cases constituting the selector's opportunities for improvement of type. In this way, sometimes by gradual steps and in others by more advanced ones, the greater part of our horticultural wealth of flower and foliage has been acquired.

In the cases, however, which we have in mind, the spores concerned have yielded such entirely unexpected results that the cultivator has been unable to satisfy himself of the origin of the plants obtained until a second sowing has convinced him by similar produce. Thus in the case of the Jones and Fox wonderful plumose Shield ferns, spores were sown from a wild decomposite or merely tripinnate form, the result being a batch of such finely dissected and feathery varieties, so widely differing from the parent that their origin seemed an entire mystery, until a second sowing from the same plant revealed the fact that its spores were endowed with the capacity of surpassing it to that extent, a similar lot arising.

These, however, resembled each other closely, varying only in fineness of cutting or density of foliage. Another form, however, known as Pearson's decompositum, while producing also a beautiful plumose form far surpassing it in delicacy and foliose character (Polystichum angulare divisilobum plumosus Pearson) regularly produces, in conjunction with a percentage of this plumosum and a number of the parental form, a very remarkable and distinct form of "grandidens," which no one ignorant of its origin could possibly impute to such a parent. In this the fronds are narrow, the pinnæ being short and somewhat irregular, while the pinnules, instead of being extra feathery, are all reduced to short pointed spikes, so narrow that the abundant fructification shows on the upper side of the frond. A greater contrast could not be imagined than there is between this and plumosum, and yet both forms arise from spores from one and the same frond or even pinnæ.

Here it will be observed a character comes into evidence of which there is absolutely no trace visible in the parent, which is in itself a thoroughbred constant form, with no eccentricities at all to which such results could be imputed by inheritance. Yet by repeated sowings it has been proved that the three forms—the parental, the plumose and the "grandidens" type arise in more or less the same proportions whenever the decompositum spores are sown. Pteris aquilina percristata is another fern which constantly produces two different varieties when sown—viz., the parental form quite truly, and a large percentage of "grandiceps," a quite barren variety, with the fronds consisting entirely of stalks and heavy crests, these also being quite alike. This being barren, it can only be propagated by sowing spores of the parental form when it is quite sure to appear again.

The superbum section of Lady Ferns arose first from a beautifully crested seedling raised from an entirely uncrested form (Athyrium filix fœmina elegans Parsons) raised from an equally uncrested wild find (A. f.f. plumosum Axminster). In this case the extraordinary feature was that over 90 per cent. of the same batch were crested also, only two of the parental form resulting, while most of them were more or less defective, only two being perfect, though no defects are visible in either parent or grandparent. Spores of the better of these two (superbum) being sown, the next unexpected result was the appearance of two distinct sections, one uncrested and extra plumose, and one crested on varied lines, some to the fourth degree (percristatum). Here again was a sudden divergence of type in two distinct directions in spores gathered from one and the same plant.

In the more recent case of Polystichum aculeatum pulcherrimum a similar divergence took place, some 20 per cent. of the plants assuming a quite distinct type, "gracillimum," in which half-inch pinnules were lengthened to two to three inches, quite transforming the plant, while one plant assumed a decomposite plumose form of quite distinct character, rivalling those of the Jones and Fox angulares. A subsequent sowing from another plant (of which the first was, however, a division) is now yielding the same results, so far as the gracillimum type is in evidence, though the possibility of further divergencies is evidenced by a very promising diversity in other directions in the young seedlings.

In Blechnum spicant, a long narrow variety (strictum Hartley) has in successive sowings yielded a percentage of a very dwarf congested variety (crispissimum Hartley), quite the antithesis of the parental form. Doubtless if fuller records had been kept regarding the origin of new forms, other cases could be cited; but there is no doubt that the above embrace the most remarkable. It will be noted that in every case Nature has started the ball rolling by providing an abnormal sport. Most of the types in cultivation are due to such, though the selective cultivator may have enhanced the original types through their spores. The plumose types, however beautiful, are extensions of Nature's "decomposite" inventions; but so far, with the exception perhaps of the mysterious A. f.-f. Kalothrix, we must credit the selective cultivator with the gracillimum type of Shield ferns which are here described.

Chas. T. Druery, V.M.H., F.L.S.

AN EFFECTIVE ARRANGEMENT OF VIOLAS AT QUEENWOOD.

Billbergia Rhodocyanea.—The handsome and unique markings of this bromeliad render its foliage most attractive and interesting. It succeeds best in good fibrous loam, and a little peat and sand. Propagation may be effected by the removal of suckers from the base of the old plant with a few roots retained on each piece, if possible; place them singly into small pots, plunge in brisk bottom heat, and remove to a light position near the glass as soon as the plants become established.—J. Donoghue.

RHODODENDRON GLORY OF LITTLEWORTH.

Of the several new rhododendrons noted at the recent Temple Show I should be inclined to give the first place to this beautiful variety, and it would not have surprised me in the least if the Floral Committee of the R.H.S. had given it a First Class Certificate. However, opinions vary, and probably the foliage was looked upon as its weakest point. This rhododendron is perfectly distinct from any of the others shown, and belongs to that section to which the name of Azaleodendron has been before now applied. As suggested by this name, it is the result of a cross between one of the evergreen and one of the deciduous members of the genus. These last are by botanists classed with the rhododendrons, but are always known in gardens are azaleas. Examples of these crosses are to be met with in two old forms, Smithi aureum and Broughtoni aureum, both of which have flowers of a buff-yellow colour. Another of this class is one of the oldest of hybrid rhododendrons. It bears the various names of Rhododendron azaleoides, R. hybridum, R. odoratum, R. fragrans, R. ponticum deciduum, and R. ponticum azaleoides. The flowers of this show various combinations of white and lilac. The variety Glory of Littleworth, so well illustrated in the Gardeners' Magazine (p. 415), has white or almost white, flowers, with a large blotch of orange on the upper part. The weakness of its leaf character above referred to is very apparent in the illustration. This is, however, characteristic of the azaleodendrons in general.

W. T.

A BEAUTIFUL BOWL OF ROSES.

The decorative side of rose showing was especially strong at the recent exhibition held by the National Rose Society in the Royal Botanic Society's Gardens, and the many beautiful arrangements in competition for the prizes formed one of the most attractive of the several features of this great gathering. There was a strong competition in the whole of the classes, and the decorated dinner tables and the baskets, bowls, and other receptacles filled with roses were equally remarkable for their beauty and the value of the object-lessons they afforded. This section of the exhibition was dealt with in the usual course in the report which appeared in our issue of the 15th inst., and we have now the pleasure of giving an illustration of the bowl of roses that formed the centre-piece of the round table for which Miss Florence Molyneux, Swanmore Farm, Bishop's Waltham, was awarded the first prize. We have seen a considerable number of floral arrangements with which Miss Molyneux has been successful in obtaining premier honours in keen competitions, and meritorious as they were, we have no hesitation in saying that on this occasion she surpassed herself. The arrangements were so delightful in their composition that we should have preferred illustrating the table; but photographs of round tables are invariably so unsatisfactory that we considered it advisable to illustrate the centre-piece which was so beautifully arranged as to obtain for Miss Molyneux's taste and skill the warmest praise. The roses used were The Lyon and Irish Elegance, which, in combination with bronzy foliage, produced as perfect a harmony of colour as we can well hope to see among roses, or, indeed, any other flowers.

A BEAUTIFUL BOWL OF ROSES

That formed the centre-piece of Miss Molyneux's first-prize round table at the N.R.S. exhibition.

PREPARING STRAWBERRIES FOR POT CULTURE.

To have a batch of strong plants for fruiting in pots, it is necessary to make a start at once by layering from plants that have been grown specially for the purpose, and these should have the flower trusses removed so as to strengthen the runners. Use 3in. pots, and place a piece of turf in the bottom of each, filling them firmly with old potting soil or other suitable material. There are frequently several plantlets on a runner, but only the first should be layered; peg it down firmly in the pot, and pinch the runner stem immediately beyond this. Spray them twice on bright days, and do not allow them to suffer from dryness of the soil. When they become established sever the runners from the parent plants, and should mildew appear dust them over with flowers of sulphur.

Early in August the young plants will be ready for their final potting, and for this use a compost consisting of three parts fibrous loam, one part old mushroom bed material, some road grit, and a 32in. pot full of bonemeal mixed with each bushel of the compost. The pots, which should be six inches in diameter, must be clean and well crocked. Some growers obtain good crops from plants grown in 48's, but these should only be used for early forcing, and it is a good plan to scatter some half-inch bones over the drainage. Pot firmly, and place the plants at such a depth that the roots are well below the surface with the crowns above. Give a good watering, and place the plants in a rather shady position until the roots are running freely in the new soil. Then they may be stood on a bed of ashes in an open position. Spray them over daily during bright weather, and when the pots are well filled with roots give weak liquid manure twice a week. Remove all runners and side shoots as they appear, and thus keep the plants to single crowns. When winter approaches they may be housed in cold frames, while those for late use should have the pots plunged up to the rims in ashes.

J. Gardner.

SWEET PEAS.

Sweet peas are now growing freely, and producing an abundance of fine flowers. Green-fly is rather troublesome, and may be removed by syringing with quassia extract. This pest may be readily detected by the presence of sparrows amongst the peas, and by the bruised buds which have been pinched by them in capturing the aphis. Watering is an important point, and, when considered necessary, should be accomplished thoroughly. Where one has the benefit of a hose for washing in a dressing of artificial manure, it is easily and quickly got over, but when one has to make use of a can the work takes some considerable time. The great thing is to give the plants a thorough watering, which will last a few days. The fact of giving water daily in driblets, which only penetrates about half an inch of the soil, is very harmful for the ground is constantly wet and cold. Great care must be exercised when artificial manures are used, or they will prove more harmful than beneficial. Liquid manure is an excellent stimulant, given in a diluted state, and an occasional watering with soot water proves of great assistance. Seed pods must not be allowed to form, or the plants will soon cease flowering. A mulching of farmyard manure will help to conserve the moisture, but this must not on any account be allowed to remain trodden tight to the ground; it will require to be loosened up frequently with a hoe or fork to allow the air to penetrate the soil.

E. C. P.

Mr. William Deal, F.R.H.S., "Brooklands," Kelvedon, Essex, gives a cordial invitation to all interested in sweet peas to inspect his crops growing for seed. He has about 12 miles growing on sticks, stocks equal to any in the country. Crops are about half-a-mile from Kelvedon station.—[Advt.]

TROCHODENDRON ARALIOIDES.

In European gardens this Japanese plant is cultivated solely on account of its evergreen foliage, for its flowers are so small that they scarcely warrant attention. Forming a comparatively low shrub, its rate of growth does not suggest that it will ever attain its largest natural proportions, which are from 15 to 25 feet in height with a trunk 9 to 12 inches in diameter, in this country. The obovate leaves are arranged in a sub-verticillate manner, and are up to six inches in length and two inches or so in width. They are thick in texture and glabrous. In its native country, however, the tree is put to a commercial use, for bird-lime is made from its bark. The species is cultivated specially for this purpose, and apparently somewhat largely. In the forestry section of the Japan-British Exhibition at Shepherd's Bush last year examples of the bird-lime were shown, also pictures representing the process of manufacture. For garden purposes it is well worth planting, for its glossy leaves are distinct, and it forms a change amongst other evergreens. W. D.

ROCK GARDEN NOTES.

Much attention is required at this season of the year by the occupants of the rock garden, especially with regard to weeding, pruning, propagating, etc. During dry weather a liberal quantity of water must be given the plants to assist them in the making of their growth. Although the early beauty has gone, there must be no neglect, for each plant will require attention in some form or other. The helianthemums should be cut over to clear off all the old flower stems, and, in many cases, will have to be pruned back to prevent any encroachment over the dwarfer subjects. Where the aubrietias and arabis have become old and straggly they should be cut back to advantage; this will induce them to produce young growths. Arenaria grandiflora sometimes requires the same treatment as the above when the stems become bare and untidy.

Top-dressing is an important matter now, and the enthusiast will see at a glance where this is necessary. Frequent waterings and heavy storms wash away much soil, and this must be made up again, for on no account must the stems be allowed to remain bare.

Propagation is the principal item of work, for to maintain a rock garden in a high state of keeping there must be a surplus supply of pot plants to fill up vacancies as they occur. Again, many plants become worn out with age, and it is necessary to replace them with young ones. In dealing with some subjects the young stock has to be raised from seeds, which should be gathered and sown as soon as they have ripened, especially so with the various primulas. Saxifraga pyramidalis is readily raised from seed, although it takes two or three seasons to obtain plants of a good size. Flowering plants of the edelweiss may be obtained in two seasons if the seed is sown immediately it is ripe. It is of quick germination, and the seedlings should be potted up singly when large enough to handle. The various dwarf phloxes can be easily increased either by cuttings or layers. Small pieces pulled off will quickly root in sand, and make nice plants for putting out next spring. Layering may be accomplished by working a liberal quantity of fine soil amongst the stems, which will soon produce roots if kept well watered. The amœna and canadensis varieties should be propagated by cuttings, but the sublata, or mossy section, can be rooted by following either method. The mossy section of saxifragas should be lifted and divided when the growths become crowded. Two or three growths should be potted into small 60's, and kept close, and shaded in an unheated frame until they are rooted. Androsace lanuginosa can be readily propagated by cuttings; it is one of the gems of the rock garden, and is also suitable for dry walls. Other subjects to propagate now are iberis, dianthus, silenes, saponarias, cheiranthuses, helianthemums, etc., all which can be easily increased by cuttings.

Amongst the many plants which produce their flowers at this season are the campanulas, a few of the best being garganica, garganica hirsuta, rhomboidalis, muralis, isophylla, and its varieties alba and Mayi. G. F. Wilson is of exceptional merit, having a close dense growth and large dark blue flowers. C. Riverslea, Isobel, China Cup, and White Star are all good, especially White Star, with its large saucer-shaped flowers. Cynanthus lobatus and Codonopsis ovata are both choice subjects, and belong to the campanula family. The latter requires a position on the higher part of the rockery to allow the insides of the pendent flowers to be seen to the best advantage. Antirrhinum glutinosum is a good wall plant, as well as being suited to the rock garden, delighting in a position in full sun. Haberlea rhodopensis is similar to the ramondias, and requires the same treatment. The dwarfer geraniums are very well adapted for sunny parts of the garden. G. sanguineum, G. lancastriense, and G. grandiflorum are three of the best. Erigeron mucronatus is a pretty prostrate species, bearing numerous daisy-like flowers in abundance. It is useful for drooping over a ledge or shelf in full sun. Myosotis azorica is one of the best of the genus, with dark blue flowers; it is fairly hardy, and well suited to half-shady damp positions. M. Welwitschi has a flat growth, and is excellent for covering stones.

Mimulus alpinus and M. Burnetti are useful for the bog garden, producing an abundance of flowers. In the south and south-western counties the mesembryanthemums are excellent for summer display; they all delight in a sunny position, and are wonderfully well adapted for dry walls. Calceolaria polyrhiza is an interesting slipperwort, and requires a half-shady position. It produces small rosettes of foliage from underground stems, and the flowers are borne on slender flower stalks about four inches high. At present it is rather rare and choice.

Convolvulus mauritanicus is rather tender, and probably would succumb to the frosts in cold localities, but it well repays the extra trouble of lifting annually and wintering in frames. Diascia Barberæ is a beautiful little plant, and one well suited for the rock garden. In the genial climate of the south-western counties it is perennial in character, but when it has to be treated as an annual it is well worth growing, making a useful addition to the summer-flowering plants. A few of the evening primroses are worthy of a place, such kinds as acaulis, macrocarpa, rosea, and cæspitosa are extremely useful. Cæspitosa is very beautiful, bearing large white flowers, which, with age, are slightly tinged with a pink flush and sweetly scented.

These, and many others, are welcome inmates of the rock garden during the summer months.

E. C. Pooley.

SUMMER PRUNING OF HARDY FRUITS.

Summer pruning of hardy fruit trees is practised for two reasons: to induce the formation of buds for another year, and to prevent the tree becoming overcrowded with a surplus growth of shoots. In some seasons there is an extraordinary profusion of clean, healthy foliage, and the work of disbudding or pruning is then not a little arduous. Summer pruning, as a matter of fact, is a kind of repressive and artificial system of training, which works on the same lines as disbudding. The first thing to be considered is whether the tree already bears more buds than it is properly able to mature. If this is so, pruning will consist of a thinning out of the weaker and badly placed shoots. It is a common practice to pinch the tips of shoots repeatedly, the same treatment being meted out to the little shoots which succeed them, but a better plan is to rub off all the secondary shoots as fast as they are produced, only the primary leaves being left. The chief object to aim at in summer pruning is to prevent the tree becoming overcrowded with more shoots and foliage than is actually necessary for its requirements. Vigour and fertility is then encouraged, and subsequently the tree should, as far as is possible, be kept in that condition during its growth. The work of summer pruning should not be commenced until the shoots have reached a certain stage, otherwise the buds at the base will burst into growth instead of remaining dormant and providing material for next season's fruit buds.

Severe cutting is quite unnecessary, and even harmful, for this work belongs properly to the annual winter pruning. As a rule, summer pruning is performed at the end of June or early in July.

In addition to the thinning of the shoots and fruit, and the pruning that may be necessary at the present season, protection must be given to the fruits against their numerous feathered enemies, such as sparrows, starlings, etc. The destruction of insects also calls for attention during the hot, dry summer months, when these pests become extremely troublesome. Water should not be given in any case when the fruit has commenced to ripen, but until then it may be applied occasionally for the benefit of the trees. Insecticides should be used to combat these insect pests, and traps may be set for earwigs, snails, and flies, all of which are extremely vicious enemies of open-air fruits. The feeding of hardy fruit trees is an item to which nearly every modern fruit-grower devotes considerable attention. The drainings from cow-sheds, stables, and piggeries, etc., are a most valuable source of liquid manurial stimulant for fruit trees growing in the open.

J. C. N.

Dahlias of all sections greatly appreciate liberal treatment, and when growing strongly, should receive frequent supplies liquid manure. The surface of the soil should receive a mulching of half-decayed manure, which must be frequently loosened wit fork to allow the air to have free access the soil. If exhibition blooms are required the quantity of shoots should be reduced about six, allowing no side shoots to gr on them. Disbudding will have to be attended to when the buds are in a small sta Supporting the growths must not be neglected, or they will split off from the ma stem when the foliage becomes wet heavy. When grown only for decorative poses such hard thinning and disbudding not required, merely a few growths removed where they are very thick.—E. C. P.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

ODONTOGLOSSUM GRANDE and its nearly allied species O. Insleyi and O. Schlipereanum are all autumn-flowering kinds, and where conditions suitable for their requirements are provided there is little difficulty found in their cultivation. These kinds are often found growing most satisfactorily in places where there is no pretence to orchid culture, and possibly few species are grown in these establishments. In practically all such gardens we find the plants cultivated all the year round in the ordinary plant stove, where they have an excessive amount of moisture during the summer, and until the growth has matured. After this they may be seen occupying an isolated position, where the only sustenance they obtain is from the moisture in the atmosphere. The plants often are used for decorative purposes in the house, and are found exceedingly useful. In orchid houses we generally give these kinds intermediate house treatment, and the plants are induced to grow and flower satisfactorily when we have a reasonably bright, sunny season. To flower them with any degree of certainty it is essential to freely expose them to light, and I find that where they can be accommodated under the same conditions as that usually provided for the successful flowering of Lælia anceps, they rarely fail to bloom satisfactorily. At the present season of the year the plants are in full growth, and some of the earlier-flowering kinds will soon be, if they are not already, showing their flower scapes. It is at this stage that they are particularly subject to the attacks of thrips. These soon do considerable damage, and constant observation is necessary. Dipping once or twice a week in some safe insecticide is a good method of destruction, but where regular fumigations and spraying are practised there is little likelihood of the thrips doing serious damage. We consider the best time to attend to repotting is when the new roots are pushing from the base of the new growth. This generally takes place about the flowering period, so that the plants may be conveniently attended to as soon as they pass out of bloom. They should not be disturbed for repotting more frequently than is necessary, so that good lasting material should be used. We use equal portions of fibrous peat, osmunda fibre, and finely chopped sphagnum moss, with sufficient broken crocks added to render the compost porous. Shallow pans are often found serviceable; these should be well drained, and have a suspending wire attached, so that they may be hung near the roof glass during the whole of the dormant season. Much of the success in flowering depends on the proper ripening and treatment through the resting season.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

BOUGAINVILLEAS. — These are now flowering freely, and producing an effective display. In a warm greenhouse or conservatory where they are used as roof climbers, the flowering shoots being allowed to hang loosely from the roof, they form a charming picture of floral beauty, and the flower sprays are most serviceable in a cut state. Specimens that are cultivated in large pots or tubs may be allowed to complete their flowering season in a cool house, and afterwards be transferred to outside, where they will have the young growths thoroughly ripened. Although I have seen bougainvilleas exposed to a few degrees of frost without injury, I would not recommend a temperature of less than 45 degrees for their winter quarters.

ACHIMENES.—As these pass out of bloom some attention should be given to the ripening up of the corms. Place them in a position near the glass, where they will obtain a free circulation of air, and treat somewhat drier at the roots until the growths die down. It will be advisable, and in some cases most convenient, to store the corms in dry sand for the winter, where they may remain until required for starting into growth again next spring.

CALANTHES.—These are now developing their new bulbs, and I find it essential to give alternate waterings of weak farmyard liquid. A top dressing of good lumpy compost will also be of assistance. In some cases where stimulants have not been employed at this stage with calanthes I have observed premature ripening of the bulbs, and usually a weak flower spike is the result.

MYRSIPHYLLUM ASPARAGOIDES (SMILAX). — Most gardeners are fully expected to produce a continuous supply of trails of this useful plant. In most establishments it is almost indispensable, and is constantly in demand for the greater part of the winter and spring months. A batch of seedlings can be raised from seed sown at this date. Use shallow pans or boxes, and thoroughly steep the seeds in water for twenty-four hours previous to the time of sowing for the purpose of assisting germination.

STEPHANOTIS FLORIBUNDA is now profusely blooming, and if careful attention is regularly paid to watering and feeding the usual flowering season will be considerably prolonged, and the vigour of the plants improved. Remove the weak and undesirable growths, and train the permanent shoots in position. A sharp and constant look out must at all times be observed for insect pests, mealy bug being almost invariably present. It will be advisable to occasionally syringe with some approved insecticide. — John Donoghue, Bardon Hill Gardens.

THE FLOWER GARDEN.

BORDER CARNATIONS.—No time must be lost now in carrying out the layering operations. The sole reason why so many people fail to grow these successfully is because the layering is done too late. The latter half of July is an ideal time for the work because root action is quicker than it is in August, and it is essential that the young plants should be well rooted before they are put out into their permanent quarters. In many cases it is necessary to thin the growths, allowing sufficient only to fill the available space without overcrowding. A suitable soil for the layers to root into may be made up with loam, leaf-soil, and sea sand in equal parts, and then thoroughly mixing them. Before placing this round the plants the ground should be slightly broken with a hand fork. It is desirable that a sharp knife should be used for the operation of cutting the shoots, which must be accomplished in the following manner. The knife should enter the stem of the shoot immediately below a joint, and cut half way through it, turning the knife in an upward direction, cutting up the centre and withdrawing it below the next joint. Gently press the tongue into the soil, and make secure with a peg, covering it with soil to prevent the shoot from swaying about. When layering is completed, give a good watering to settle the soil round the layers and help to keep them firm.

EARLY-FLOWERING GLADIOLI. — In gardens where they can be successfully grown in the open, these gladioli provide an abundance of cut bloom for decorative purposes. They delight in a light, rich soil, and increase rapidly. In the southern districts they thrive wonderfully well, but in cold localities it is almost useless trying to grow them, as they start early in the autumn, and consequently are cut down by frost. Lifting and dividing is necessary when the corms become overcrowded, and this should be accomplished immediately the foliage has died down. The corms should be sorted out, and the best replanted singly in rows twelve inches apart, allowing six inches between each corm. There are several varieties, some of the best being Colvillei The Bride, which is perhaps the best known of any, Ackermanni, Blushing Bride, Peach Blossom, Lord Grey, Rosy Gem, Ne Plus Ultra, Crimson Queen, and Salmon Queen.

IRIS, ENGLISH AND SPANISH.—These greatly repay for being lifted, divided, and replanted into fresh quarters. When they are allowed to remain in an overcrowded condition the flowers naturally become small.

IXIAS and SPARAXIS form two beautiful groups of summer flowering bulbous plants, and should be largely grown for cutting purposes. A light soil and sunny border is the most suitable place for them, and when the winter is very severe a covering of light litter will usually give them all the necessary protection.

HERBACEOUS BORDERS will demand much attention with regard to hoeing, weeding, etc. The flower spikes should be removed from the delphiniums immediately the blooms fade. This will often induce the plants to produce more spikes which will open late in the autumn. Of course, they will be considerably shorter than the first ones, yet the flowers are highly appreciated. During dry weather abundance of water must be given to keep the phloxes, Michaelmas daisies, etc., in a healthy growing condition. —E. C. Pooley, Gnaton Gardens, Plymouth.

FRUITS UNDER GLASS.

EARLY VINERY.—Admit an abundance of air by both top and bottom ventilators, and if birds are troublesome put some wasp-proof netting over the opening. This will keep out both birds and wasps should these become troublesome. As soon as all the fruit is used the house should be opened to the fullest extent to give the vines all the sun and air possible, and when the wood is sufficiently advanced the branches should be pruned back to admit more sun and light for ripening purposes. It is a good plan, as soon as all the fruit is removed, to prepare some insecticide, and with a garden engine give them a thorough washing, directing the liquid over and under the leaves. This will effectually eradicate every insect should there be any. I consider it the best time for doing the work of cleaning, as the pests are now active.

BORDERS.—In August the borders may be seen to if this is necessary from any cause, and some soil should be prepared as advised in a previous number for the renovation. Meanwhile keep the borders moist, but not wet, and, of course, much depends upon the nature of the soil used and its peculiar character, which must always be carefully considered.

MUSCATS.—Since the break in the weather much more fire-heat has been used to keep up the recommended temperature, viz., 70 deg., and not so much damping down has been requisite. This, however, must not be neglected with the return of bright, sunny weather, or the foliage will quickly fall a prey to red spider or thrips. Govern the inside conditions by those of the outside with regard to fire-heat, so that the temperature may not at any time fall below 70 degrees. The weather now (July 14) is hot and sultry, 75 to 85 degrees shade temperature, with 122-130 in the sun during the week. With this heat the outside walls became very hot, and a damping down outside is an advantage. Look over the bunches and cut out with a pair of scissors any small or stoneless berries, and keep on pinching out strong lateral growths, and more especially those that are touching the glass, and in the case of young vines, train up the rods straight and under the wires.

STRAWBERRIES FOR FORCING.—Pot up the runners as soon as possible—that is, as soon as they have enough roots, and in potting take care that the roots or the ball are not broken. Use good sweet soil, such as maiden loam, and in case of its being on the stiff side, use plenty of opening matter, such as old mortar rubble, wood ashes, and a fair proportion of bonemeal.—W. A. Cook, Leonardslee Gardens.

EXHIBITIONS AND MEETINGS.

Bath Summer Show.

JULY 12 and 13.

There is no place in England quite like Bath. In the first place, it is built of its own particular stone, which makes it unique; secondly, it has history which dates back to the Roman period; and thirdly, it occupies a sheltered position, protected, as it were, by the hills which surround it. Under ordinary circumstances Bath is warm, but on July 12 and 13, when the annual floral fête was held, it was hot, almost overpoweringly hot, and it is difficult to say who felt it most—the flowers or the visitors. There was one redeeming feature, however, the site of the show, for the Sydney Gardens is a place of trees and shade, and the tents were dotted about in a way which avoided any suggestion of monotony. The show was one of the events of the great Bath Carnival, which extends over a period of nine days, and on the opening day of the show Bath gave a hearty welcome to the guests from the overseas dominions of the Empire. The exhibits, which were of a most varied character and mostly floral, were arranged in three marquees, and, while two of these were well filled, the third presented a somewhat bare appearance, which is accounted for by the fact that this was mostly set apart for amateurs. Roses and the tropical weather had proved one too many for them. Variety was, perhaps, the leading feature of the show, and while we saw there roses which were splendid for the season, hardy flowers in great profusion, sweet peas as good as any we have met with this year, well-grown carnations, and splendid begonias, there were also collections of named wild flowers, artistically arranged table decorations, baskets of flowers, bouquets, sprays, and lastly, models of flower gardens, which reminded us of a feature of flower shows that was at one time very popular, but which in late years has dropped out of most exhibitions.

The luncheon was quite a happy little event of brief and pointed speeches. The Mayor of Bath presided, the Rev. R. Powley, a portly rose growing vicar from near Warminster, spoke on behalf of the rosarians, and that well-known amateur Mr. Conway Jones, of Gloucester, responding to the toast of "The Judges," enlarged on the excellence of the roses in the nurserymen's classes, despite the heat and the drought, and recounted a few anecdotes of the late Dean Hole. The veteran and highly-respected gardener, Mr. T. Challis, regretted the fact that specimen stove and greenhouse plants are no longer a feature of the Bath shows as they were in days of yore, and he pointed out how shows at the present time are largely made up of trade exhibits, and nurserymen have to a great extent taken the place of gardeners and wealthy amateurs, though Mr. Challis refrained from giving reasons for the change. No toast was received more enthusiastically than the vote of thanks proposed to Mr. B. R. F. Pearson, the worthy secretary, who maintained his genial urbanity of manner throughout, and this in spite of the complicated nature of his task and the sweltering conditions which prevailed. We hope the Bath show has proved as successful financially as it was in other respects.

ROSES, NURSERYMEN.

In the big class for seventy-two distinct blooms the task of placing the winner was not a difficult one, and Messrs. A. Dickson and Sons, Newtownards, won with a collection of beautiful flowers. The substance of the blooms helped them to withstand the great heat for quite a long time, and the best flowers on the stands were fine specimens of George Dickson (one of the finest blooms we have seen), Her Majesty, Marie Rady, Horace Vernet, madame Eugene Verdier, the new rose Brilliance, Charles J. Grahame, and a new pinkish-white rose Eric. Mr. John Mattock, of Oxford, was placed second, but the quality of bloom here fell short of the first prize exhibit, and the third prize collection exhibited by Mr. Rowland Adams, Bath, struck us as being a very fresh lot of flowers.

The class for thirty-six trebles brought out a very close competition, and here Messrs. Alex. Dickson and Sons were again victorious, winning with fine specimens of Charles Lefebvre, Dr. Andry, A. K. Williams, Brilliance, Tom Wood, and others. Mr. John Mattock again occupied the second position, his best flowers being A. K. Williams, Mildred Grant, Hugh Dickson, Mrs. W. J. Grant, and Earl of Warwick.

In the class for eighteen trebles Mr. H. Drew, Longworth, was victorious, and, considering the season, the flowers were quite good, the best specimens being Maman Cochet, Duchess of Bedford, Ethel Brownlow, and A. K. Williams. Messrs. A. A. Walters and Son, Bath, came second, and in this exhibit the Lyon Rose, Robert Scott, and Baroness Rothschild were the best flowers.

The box of teas and noisettes which won for Mr. H. Drew, Longworth, the first prize in the class for eighteen was one of the finest stands of flowers we have seen this season. Amongst the varieties shown Madame Constance Soupert was grand, and the same adjective might be used to describe Mrs. W. Kennedy, Maman Cochet, M. J. Dupuy, and Edward Mawley. Mr. J. Mattock was second with a moderate lot of flowers.

AMATEURS AND OPEN.

In the class for twenty-four distinct varieties there were two entries, and Mr. Conway Jones, Gloucester, easily defeated Mr. W. J. Ball, Chippenham. In the first-named stand there were good flowers of Mrs. John Laing, Hugh Dickson, and Ulrich Brunner. There was no entry for trebles, and in the class for eighteen varieties, Miss Fisher, of Potterne, won with a fresh and creditable stand of flowers, amongst which Maman Cochet, M. Joseph Hill, and Countess of Derby were good. The Rev. R. Powley, Warminster, was a very fair second, and Mr. W. J. Ball, Chippenham, third. The Rev. R. Powley was the only exhibitor in the class for eight trebles, and was deservedly given the first prize. There were two competitors in the class for nine hybrid teas and nine teas, but, as neither of them showed according to schedule, no awards were made.

In the classes open to growers of less than 1,000 plants, Mr. W. J. Ball, Chippenham, had the best twelve roses, the flowers in this stand being particularly fresh and good. Mr. A. Searle, Bassett, Hants, was a good second, and Miss Fisher third.

The Rev. J. T. Kershaw, Warminster, was easily first with six blooms, and Mr. R. H. Merrett came second. In the class for four lots of trebles the Rev. J. T. Kershaw won with a choice lot of flowers, Mr. W. J. Ball being second, and Mr. R. H. Merrett, third.

Quality in the local classes was very moderate, Mr. R. H. Merrett being first for twelve, this being the only notable stand.

Mr. Conway Jones had no rival in the class for eighteen tea and noisette roses, and was awarded first prize. In the class for twelve blooms, the Rev. R. Powley won with good flowers, and the second prize went to A. Searle, Esq. A moderate lot of trebles shown by Mr. Conway Jones won for him the first prize, the Rev. R. Powley being second. For six hybrid tea and tea roses, the Rev. J. T. Kershaw won the first with a very nice stand of flowers, in which a good bloom of F. Pemberton was conspicuous.

The class for a collection of garden roses shown in bunches was very effective, and the first prize was well won by Mr. John Mattock, who showed Betty, Countess of Gosford, Edu Meyer, Gottfried Keller, Madame Abel Chatenay, and Hiawatha in good style. Mr. Rowland Adams, of Bath, was a very creditable second, and Messrs. G. Cooling and Sons, third. One of the most pleasing classes in the show was that in which prizes were offered for the most decorative arrangement of roses, and Mr. R. Adams's display which won first prize was highly creditable. The flowers were of good quality and tastefully arranged in bamboo stands, etc. Messrs. G. Cooling and Sons were second, and Messrs. A. A. Walters and Son, third. Mr. J. Mattock was first for eighteen blooms of one variety, and Mr. Rowland Adams second.

The six bouquets of roses which won first prize for Mr. F. J. Cole, Bath, displayed unmistakable signs of the effects of the heat, and the same state of affairs was noticed in the class for one bouquet, where Mr. R. Adams came first, and Mrs. Colston Hale second. In the open class for twelve blooms of any rose except tea or noisette, Mr. J. Mattock won with Bessie Brown, and Messrs. Alexander Dickson second with Horace Vernet. Mr. H. Drew won with twelve blooms of one variety tea or noisette, and the same exhibitor had the best twelve blooms of any new rose, showing Mrs. Foley Hobbs.

In the class for twelve distinct varieties of exhibition roses, five blooms of each, shown in vases, Mr. H. Drew had the best blooms and first prize, but the arrangement of Mr. Rowland Adams's second prize exhibit was better, and Mr. J. Mattock came in third.

Mr. Conway Jones won in the amateurs' class for nine distinct varieties of garden roses, Miss Ashe, Chippenham, coming second, and Mr. W. A. Hick, Batheaston, third.

SWEET PEAS.

In the class for a collection of twelve varieties of sweet peas there was a splendid competition, and in a stiff fight Mr. F. G. Bealing, Southampton, won first honours. The quality of the flowers was superb, the best vases being Tenant Spencer, Etta Dyke, Scarlet Monarch, M. Beaver, and Othello. Mr. G. A. H. White was second with a tastefully arranged exhibit, in which the flowers were good, and Mr. G. Humphries, Chippenham, came in a creditable third. Mr. F. G. Dealing was also victorious in the class for six bunches of sweet peas, his flowers of Helen Lewis, and Mrs. C. Foster being very good. Mr. G. A. H. White was a good second, and Mr. G. Humphries third. There was a good competition in the class for the most tastefully arranged table of sweet peas, and Mr. J. T. Curtis, gardener to S. W. Howell Davies, Bristol, was awarded first prize. The blooms here were beautiful, but for a table decoration we thought there was rather too great a variety of colour. Mr. F. T. Cole, Bath, was placed second, but some of the visitors seemed to prefer Mr. Edward Fisher's table of pink sweet peas.

For an ornamental vase of sweet peas Mr. E. M. Mutlow, Hapsford, won with a pretty arrangement, Mrs. Vallis, Frome, being second, and Mrs. Colston Hale third. The last-named exhibitor also won first with a bouquet of sweet peas, Mrs. B. Hooper being second, and Mrs. M. L. Pierce third. Mrs. Colston Hale also had first for a bouquet of sweet peas arranged with fern. There was a good entry in this class, but none of the bouquets were very tastefully put together.

OTHER FLOWERS AND PLANTS.

Geraniums looked bright in the class for twenty-four bunches, Mr. G. McMurtrie, Radstock, coming in first, and Mr. J. Wi Tormarton, second. Baskets of cut flowers were pretty, Mr. E. Viner, Frome, being first, and for a basket of roses Messrs. A. A. Walters and Son, Bath, occupied the premier position.

The collection of carnations which won first prize for Mr. Charles Wall, Bath, was arranged in a very pleasing manner, and it was probably the arrangement that placed the exhibit in front of the carnations shown by the Duchess of Somerset. Mr. C. Wall also won first prize for twenty-four carnations and picotees. Mr. W. J. Ball second.

Not the least interesting class in the

CARDIFF FLOWER SHOW.
By kind permission.
SOPHIA GARDENS, CARDIFF.
WEDNESDAY and THURSDAY, July 26th and 27th, 1911.

24, Duke Street, Cardiff.

LEICESTER.—ABBEY PARK FLOWER SHOW, 8th and 9th August next. Open Class, Group of Plants, £20, £15, £10, £6. Liberal prizes for Collections of Fruit, Displays of Roses; Silver Cup, Gold and Silver Medals for non-competitive exhibits. Schedules from JOSEPH BURTON, Supt.

NATIONAL VEGETABLE SOCIETY.—Entries close AUGUST 21st. Schedules of classes and prizes offered at the Society's
GREAT EXHIBITION OF VEGETABLES
to be held in the Royal Horticultural Hall, Westminster, on August 30th next, are now ready, and can be had on application to
HON. SEC., E. G. QUICK,
Kelmscott, Harrow View,
Wealdstone, Harrow.

SHREWSBURY GREAT FLORAL FETE.
AUGUST 23 and 24, 1911.

£1,200 in Cash Prizes.

Schedules for this year are now ready, and may be had post free from—
Messrs. ADNITT and NAUNTON, Hon. Secs.,
Shrewsbury.

THE THIRTY-SEVENTH ANNUAL EXHIBITION will be held in SWANMORE PARK, BISHOP'S WALTHAM, AUGUST 2nd, 1911.
Special Features: £10 0s. 0d. Table Decoration and many other valuable prizes in Floral Classes.
Schedules from
E. MOLYNEUX,
Swanmore Park,
Bishop's Waltham, Hants.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

show was that for a collection of hardy flowers, occupying a space of 12ft. by 3ft. Messrs. A. A. Walters and Son, Bath, were the winners with a beautiful lot of flowers, but overcrowding was the fault of the arrangement. Mr. F. Eames, Frome, was the second-prize winner, and here again a grand lot of flowers was rather spoilt by crowding. Messrs. Rich and Co. were placed third, and though the flowers were not quite so good as in the first and second prize lots we liked the arrangement better.

Mr. John Walter, Larkhall, showed six good single begonias, which won first prize, Mr. J. Dyke, of Bath, being second. Mr. A. C. Palmer, Tiverton, was the champion exhibitor in the class for double begonias, his plants being very fine. Mr. John Walter, Larkhall, was a creditable second, and Mr. J. Dyke third. The last-named exhibitor staged the best 36 double begonia blooms in twelve varieties, the flowers being very fine. Mr. A. C. Palmer was second, but he won in the class for twelve blooms, Mr. J. Walter coming second, and Mr. J. Dyke third. Mr. J. Walter had the best single begonia blooms, Mr. Herbert Pike, Radstock, taking the second place.

Two exhibitors competed in the class for a group of plants, and Mr. E. C. Pearce, gardener to W. Waite, Esq., was placed first for a pleasing arrangement of stove and greenhouse plants, which, if anything, was rather too flat. Mr. W. Sims, gardener to Major H. Doherty, was second, with a collection that was lacking in quality compared with the first-prize exhibit.

Mr. G. A. H. White had first prize for twelve bunches of hardy flowers, but the arrangement was somewhat stiff. Mr. W. A. Hick came second, and Lady Sybil Codrington, Badminton, third.

TABLE DECORATIONS.

This division created a good deal of interest, and for the most tastefully arranged floral decoration for a dinner table Mr. J. T. Curtis, Bristol, was first with an elegant arrangement, in which cattleyas, selaginella, and croton leaves were employed. Mr. E. Fisher, Batheaston, was second, with a pretty arrangement of roses, and Mr. F. J. Cole came third. In the ladies' class Mrs. E. Welden won with a pretty mauve and white sweet pea decoration, Miss Dobbs being second, and Miss B. Castellain third, but the last two tables were quite of an ordinary type.

FRUIT AND VEGETABLES.

Compared with the flowers the display of fruit and vegetables was small, but what was lacking in quantity was made up in quality, and some of the exhibits were extremely good. Mr. W. Strugnell, gardener to Rt. Hon. W. H. Long, M.P., of Rood Ashton, Trowbridge, easily won first prize for four dishes of dessert fruit with grapes, a melon, a dish of nectarines, and a good dish of figs. Mr. D. McIntosh, gardener to Rt. Hon. Lord Islington, was second, and Mr. E. Fisher, Batheaston, third. Mr. Herbert Pike, gardener to W. Wailes, Esq., Radstock, had the best melon; Mr. W. Sims, gardener to Major H. Doherty, second, and Mr. W. Strugnell third.

Strawberries were a fair lot for the time of year. Mr. J. Ricketts, Batheaston, was first for six dishes in not less than four varieties, and for three dishes of the same fruit Mr. W. Hood, Batheaston, was the victor. The same exhibitor also had the best single dish of strawberries, showing Sir Joseph Paxton, and for the twelve heaviest berries Mr. W. Hood was first.

Mr. George Horsell, jun., Bath, had the best collection of vegetables, cauliflowers and tomatoes being the best dishes, Mr. W. Burt, gardener to Miss Hamilton, Bath, being second, but he might with advantage have substituted something else for his pigmy kidney beans. Mr. A. J. Andrews, Batheaston, was first for cucumbers, Mr. Thomas Emm, gardener to Mrs. Hargood Ash led with tomatoes, and Mr. George Horsell, jun., had the best collection of salading, which even included salad cream and hard-boiled eggs, rather a novel departure in the exhibiting of salads.

Mr. W. Strugnell was successful in winning Messrs. Sutton and Sons' prize for a collection of vegetables, his best dishes being Sutton's Prizewinner scarlet runner beans, Ideal peas, and Magnum Bonum cauliflower. Mr. A. J. Andrews, Batheaston, was a good second, and Mr. T. H. Bolton, gardener to the Earl of Devon, Exeter, third. For the prizes offered by Messrs. Webb and Sons for a collection of vegetables Mr. A. J. Andrews, Batheaston, came out top, his marrows and peas being exceptionally good. Mr. W. A. Woodfield was placed second, but we fancied Mr. W. Strugnell's collection, which was awarded third prize.

There were several other classes in addition to the above, in which prizes were offered for table plants, collections of wild flowers, and model flower and ornamental gardens, and in each of these the competition was up to the average.

TRADE EXHIBITS.

Messrs. Cooling and Sons, Bath, set up a nice collection of roses, in which big bunches of Lady Grey, Hiawatha, and the new bedding rose Orleans were conspicuous. Messrs. Blackmore and Langdon, of Bath, were represented by a collection of border carnations tastily arranged in vases and bamboo stands, double and single begonia flowers of enormous dimensions, and mostly named, and a striking collection of delphiniums in different shades of blue and purple. Messrs. Jarman, of Chard, had a choice little lot of their well-known centaureas, a few roses, and a big display of their new sweet pea Mrs. Townsend. A little reminder of the Temple Show was made by Mr. J. Milburn of Bath, who put up a pretty arrangement of rockery. Messrs. Young and Co., Cheltenham, set up a most beautiful display of carnations, which was awarded a gold medal, and a nice lot of zonal pelargoniums were shown by Mr. Vincent Slade, Taunton. Mr. A. Edward Arnold, Notts, had specimens of Edwardian table decorations, and Messrs. Rich and Co., Bath, showed herbaceous flowers and roses.

Royal Horticultural Society.

There was a very small exhibition at Westminster on Tuesday, July 18, and a quite small attendance. Shows innumerable, the recent Coronation festivities and hot summer weather all contributed to this state of affairs; crowds of Fellows have gone for their holidays, and most of those present last Tuesday wished themselves far away in the country or by the seaside. Hardy flowers were moderately shown, and roses and phloxes showed the influence of heat and lack of rain. Some good carnations were on view, and a most interesting collection of Cape pelargoniums. The Gladiolus Society held its exhibition at the hall, but it was a tame affair.

FLORAL COMMITTEE.

Mr. Amos Perry, Enfield, presented a water garden with its complement of water lilies and a surroundng of Japanese irises, the bold golden Senecio macrophylla, pink astilbes, Lilium Humbolti, L. Krameri, Japanese maples, and hardy ferns. The latter occupied both ends of the group, and the crested and plumose lady ferns proved of great interest.

The stately white-flowered Eremurus Olgæ alba, shown by The King's Acre Nursery Co., Hereford, was greatly admired, and an Award of Merit was made in its favour; it has white blossoms, each segment with a green central line. The pink E. Olgæ was also well shown by the same firm.

Delphiniums and gaillardias, with a few gladioli made up an effective exhibit from Messrs. Kelway and Son, Langport; Queensland, Devonshire, Glory, Gold Standard, and Langport were a few gaillardias of exceptional merit.

Although there was nothing specially rare in the display made by Messrs. Thos. S. Ware, Lim., Feltham, this firm's exhibit of big bunches of popular and seasonable border flowers was a good one.

A rare exhibit of border carnations, filling one long table, was arranged by Mr. A. F. Dutton, Iver, Bucks. The splendid blooms were put up in big vases, and associated with asparagus sprays. Very fine were the vases of Marie Studholme, Hayes Scarlet, the yellow Mrs. Forbes, the crimson Mephisto, Ronny Buchanan, Graham White—a grand broad-petalled pure white variety; Bendigo—a new rich blue-purple variety; the pink Miss Schiffner, the crimson Agnes Sorrall, the scarlet Roy Morris, and the beautiful white, rose-flaked Herbert Newman (A.M.), a grand long stemmed border carnation.

No group was of greater interest than the one of Cape pelargoniums set up by Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree. All the plants were well grown and chiefly in 32-sized pots, thus making neat and easily-handled specimens from 18in. to 2½ft. through. About eighty species and hybrids were shown, and they afforded ample evidence of the wonderful variety of form and habit the genus possesses. From the cactus-like P. tetragonum, with scarcely a leaf on its succulent square stems, to the downy broad-leaved P. tomentosum, was a far cry in the matter of appearance. P. crispum minor, P. artemisiodes, P. grossularioides, and P. terebintha, all had tiny leaves, while P. betulæfolia somewhat resembled beech leaves. P. multibracta with white flowers and purple-marked leaves, was striking, and so were P. radula, P. Blandfordiana, and P. glutinosus. Among the old hybrids we noticed Moore's Victor, Clyne Seedling, Shottesham Pet, Prince of Orange, Lady Plymouth Fair Emily, Lady Mary, Rollison's Unique, the bright scarlet Shrubland Pet, and Little Gem. We did not think such a grand collection of species and old hybrids was in existence, and it was a great treat to have the opportunity of seeing so many old friends. This exhibit gained the highest award of the day for plants and flowers.

A superb set of border carnations from Mr. Jas. Douglas, Great Bookham, was as remarkable for its arrangement of big bunches as for the beauty of the blooms. Elizabeth Schiffner, the pink Court Beauty, Agnes Sorrel, crimson; Cardinal, scarlet; Mrs. G. A. Reynolds, buff; Forester, yellow fancy; Mrs. Andrew Brotherston (A.M.), crimson and rose fancy; Mrs. Elliott Douglas, a fine clear yellow self (A.M.); Mrs. G. Marshall, deep crimson; and Robert Berkeley, soft scarlet, were a few of the very best.

An elegant new conifer of selaginella-like appearance was shown by Mr. A. J. Jones, gardener to Miss Weyburn, Hadley Manor, Barnet, Herts. This was Fokienia Hodginsi, a Chinese shrub that has yet to prove its usefulness in this country. Dr. Henry recently founded the genus Fokienia on this plant. Several small seedlings were shown, raised from seeds sown at Hadley Manor on April 4, 1910.

Messrs. W. Cutbush and Son, Highgate, presented a very fine group of cut carnations, putting up very large vases and bowls. Among the older sorts Winsor, White Perfection, Mikado, Cecilia, Beacon, and May Day were excellent, and among newer varieties we noticed Miss Winnie Pryor, red flaked on white; Edna, very large, heliotrope shade, good form; Countess of Bradford, buff and rose; and The Bell, a fringed white, very fragrant.

A number of new sweet peas were staged by Mr. William Deal, Brooklands, Kelvedon, and the most notable of these were Scarlet Monarch, very bright; Winifred Deal, blush and white; Colleen, two shades of bright rose; and Juliet, a cream pink.

The early flowering gladioli exhibited by Mr. Frank Lilley, Guernsey, were greatly admired, as also were the long, arching spikes of Sparaxis pulcherrima, the alstrœmerias, and liliums.

Messrs. Paul and Son, Cheshunt, showed a charming lot of roses, including Gustave Regis, Grus an Teplitz, Renée W. Urbar, and Caroline Testout, with ramblers behind and weeping standards towards the front. These latter were on very tall clean stems, the stock being a new one raised by the Cheshunt firm, and named the Rosite stock.

Especially good were the huge African marigolds, Lemon Queen and Prince of Orange, so well shown by Messrs. Dobbie and Co., Edinburgh.

Cannas were grandly staged by Messrs. James Veitch and Sons, Chelsea, and among them we were greatly struck by the new Fraulein E. Kracht (A.M.), a large-petalled variety with rosy-salmon colouring and an unusually elongated spike; Gaekwar of Baroda, yellow and vermilion, was also a grand variety. Border carnations, gloxinias, Exacum macranthum and Solanum Wendlandi were also contributed by the Chelsea firm.

Messrs. Stuart Low and Co. presented roses and carnations in tall vases; among the former Harry Kirk, White Killarney, and Duchess of Wellington were conspicuously good.

Mr. Maurice Prichard, Christchurch, exhibited large bunches of Crinum Powelli, Lilium testaceum, and phloxes, but the latter suffered from the heat.

The curious white-flowered campanula Vidati was a notable feature of the group of flowers staged by Messrs. G. and A. Clark, Dover; it has erect spikes and pendant flowers.

Duchess of Normandy, a soft yellow, pink shaded sport from the famous Dean Hole rose, was presented in excellent condition by Mr. P. Le Cornu, Jersey Nurseries, Jersey; all the flowers shown were cut at 5 a.m. the previous day.

Nerissa, a lovely full H.T. rose, of softest and palest peach yellow shade, tinted with pink, was well shown by its raisers, Messrs. William Paul and Son, Waltham Cross, and gained an A.M.

Plagianthus Lyalli, a white-flowered shrub that needs wall protection to be a success, was exhibited by Mr. C. J. Lucas, Warnham Court, Horsham, and gained an A.M.

Mr. Charles Blick, Hayes, Kent, had a few very fine carnations, and gained an Award of Merit for James Quin, a buff fancy with bright rosy markings; for King George, a clean petalled white border variety; and for Dora Blick, a beautifully formed variety that may perhaps be best described as orange terra-cotta.

A grand lot of herbaceous phloxes from Messrs. Gunn and Sons, Olton, also suffered somewhat from the heat, but Baron von Dedem, deep salmon red; Wilbur Wright, brilliant rosy-red; King Edward VII., scarlet; Mrs. Oliver, pink; and Elizabeth Campbell, salmon-pink, were a few that stood the heat well, and held up their fine trusses bravely.

A bold group of caladiums, backed by palms, and set up opposite the entrance by Mr. L. R. Russell, Richmond, was a feature of the show.

Other exhibitors included Messrs. Wells and Co., Merstham; Messrs. Phillips and Taylor, Bracknell; Mr. H. J. Jones, Lewisham; Messrs. Frank Cant and Co., and Messrs. B. R. Cant and Sons, Colchester, both firms staging cut roses; Messrs. H. B. May and Sons, Edmonton; Messrs. Whitelegge and Page, Chislehurst; Mr. G. Reuthe, Keston; Mr. A. J. Harwood, Colchester; Messrs. S. Bide and Sons, Farnham; and the Guildford Hardy Plant Company.

ORCHID COMMITTEE.

Particularly fine was the large specimen of Dendrobium Victoria Regina, carrying scores of fair-sized, blue-purple and white flowers, shown by Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking; it secured a F.C.C. and also a Cultural Commendation.

In the small exhibit put up by Messrs. Charlesworth and Co., Haywards Heath, the finest things were Vanda cœrulea, the aromatic golden-flowered Anguloa Cliftoni, Cymbidium Huttoni, Odontoglossum Schleiperianum citrinum, Stanhopea oculata, and the handsome Lælio-cattleya Sibyl.

Mr. de Barri Crawshay, Sevenoaks, brought up a pale form of Odontoglossum Waltonense and a very richly-coloured O. Rosefieldiense. Cattleya Warscewiczi was well shown by Messrs. J. and A. A. McBean, Cooksbridge; with these were several good forms of Odontoglossum crispum.

Stanhopea tigrina was a striking plant in the collection of orchids submitted by Messrs. Stuart Low and Co., Enfield; Epidendrum vitellinum majus, Oncidium Lanceanum, the charming Disa grandiflora, Cattleya Warscewiczi, and the brilliant Renanthera Imschootiana were other good things.

From Messrs. Sander and Sons, St. Albans, came the rare Dendrobium regium, with large rosy-mauve flowers, the quaint Bollea cœleste the yellow fringed Brasso-cattleya Mrs. J. Leemann, Cattleya intermedia alba, and the long pendant spiked Acineta chrysantha.

FRUIT COMMITTEE.

The display of gooseberries made by Messrs. J. Veitch and Sons, Chelsea, was at once attractive and instructive. Along the back were trained gooseberries, each stem a cordon, and clothed with fine fruits. A few red and white currants similarly grown carried quantities of clean fine fruits. In front were baskets of beautiful fruit, and notable varieties of gooseberries on show were Langley Beauty, Langley Gage, Fearless, Golden Gage, Gipsy Queen, Warrington, Speedwell, Keepsake, the little dark-hued Ironmonger, Trumpeter, Criterion—a big golden-green form—and Leviathan, a still larger greenish berry.

Twenty-three excellent Queen pine apples, grown and exhibited by Mr. T. Coomber, gardener to Lord Llangattock, The Hendre, Monmouth, were very fragrant, and a great temptation on such a warm day.

Melons were exhibited from the Horticultural College, Swanley.

CERTIFICATES AND AWARDS.

First-class Certificate.—To Dendrobium Victoria Regina, from Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.

Awards of Merit.—To Eremurus Olgæ alba, from The King's Acre Nursery Company, Hereford; to Carnations James Quin, King George, and Dora Blick, from Mr. Charles Blick, Hayes, Kent; to carnations Herbert Newman, Mrs. Elliott Douglas, and Mrs. Andrew Brotherstone, from Mr. James Douglas, Great Bookham; to Canna Fraulein E. Kracht, from Messrs. James Veitch and Sons, Chelsea; to rose Nerissa, from Messrs. William Paul and Son, Waltham Cross; to Fokienia Hodginsi, from Miss Wayburn, Hadley Manor, Barnet; to Plagianthus Lyalli, from Mr. C. J. Lucas, Warnham Court, Horsham. Awards made to the following culinary peas at Wisley were confirmed: America and The Caithness, from Mr. Holmes, Norwich; Eureka, King Edward, and Matchless Marrowfat, from Messrs. Sutton and Sons, Reading; Bell's Premier, from Messrs. Bell and Bieberstedt, Leith; and to The Cottager, from Mr. Yates.

MEDALS.

Silver-gilt Knightian.—To Mr. Coomber, gardener to Lord Llangattock, The Hendre, Monmouth, for pine apples; to Messrs. J. Veitch and Sons, Chelsea, for gooseberries.

Silver-gilt Flora.—To Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, for Cape pelargoniums.

Silver-gilt Banksian.—To Messrs. J. Veitch and Sons, Chelsea, for flowering plants; to Mr. A. F. Dutton, Iver, for carnations.

Silver Knightian.—To the Horticultural College, Swanley, for melons.

Silver Flora.—To Messrs. B. R. Cant and Sons, Colchester, for roses; to Messrs. William Cutbush and Son, Highgate, for carnations; to Mr. James Douglas, Great Bookham, for carnations; to Messrs. H. B. May and Sons, Edmonton, for ferns, etc.; to Mr. Amos Perry, Enfield, for hardy ferns, water lilies, etc.; to Mr. L. R. Russell, Richmond, for caladiums; to Messrs. W. Wells and Co., Merstham, for phloxes.

Silver Banksian.—To Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids and one for roses and carnations; to Mr. H. Jones, Lewisham, for herbaceous phloxes; to Messrs. Frank Cant and Co., Colchester, for roses; to Messrs. Gunn and Sons, Olton, for herbaceous phloxes; to Mr. F. Lilley, Guernsey, for gladioli; to Mr. M. Prichard, Christchurch, for hardy flowers.

Bronze Flora.—To Mr. G. Reuthe, Keston, for hardy flowers; to Messrs. Paul and Sons, Cheshunt, for roses.

National Gladiolus Society.

This society held its exhibition in conjun tion with the Royal Horticultural Societ Show on July 18. There was little to in cate what the various classes were. though there was plenty of literature re tive to the objects and rules of the so we could find no schedule. Some very flowers were staged, but so far as we c ascertain, the competition was confined tirely to nurserymen. Mr. Frank Lilley Messrs. Kelway and Sons, each secured silver medal for early gladioli, and in latter firm's exhibit the blood-red Vip fine. The Langport firm annexed the gilt Medal for three spikes of a new see with Cecilia Kelway, a splendid flowered deep pink variety, with the inner segments creamy yellow and pink red staining; the same firm secured a Banksian Medal for James William K a grand gladiolus with large blooms vivid crimson-scarlet hue; and they a a Bronze Medal for Bala, a deep rose splashed with scarlet, and with crim cream inner segments. Other prizes won by Messrs. J. Kelway and Son Frank Lilley, Guernsey, and Mr. K thuys, Hillegom.

East Anglian Horticultural Club.

A SWEET PEA MEETING.

At the Boar's Head Hotel, Norwich, on the 13th inst., the members of this club had a very interesting evening with the sweet pea. There was an essay competition upon its cultivation, and general and special prizes for cut blooms. Somewhat surprising was the fact that at this meeting no one had a sport or new variety which they claimed to be better than this or that existing variety. In the way of merit Mr. W. Laws, gardener to G. E. White, Esq., Eaton House, exhibited a spray of Etta Dyke with six perfect flowers, and a Maud Holmes with five double standard flowers. Mr. F. Williams, gardener, to Louis Tillett, Esq., Catton, had the boldest and freshest flowers, and secured the two first prizes in the classes he entered. Mr. F. Willey, gardener to F. A. Bainbridge, Esq., Hethercott, won the first prize given by Messrs. G. Stark and Son for four of their novelties.

The essay competition proved a great success, the five papers were read and proved thoroughly practical, and before the winners were made known an animated discussion took place. The three winners were as follows, in order named: C. Mathews, Mundesley; W. Laws, Eaton; and J. F. Ewing, Evington Place.

There were keen competitions in other sections, such as roses, culinary peas, tomatoes, stocks, and lettuce.

Mr. H. J. Clayton (Yorkshire), who was spending a holiday in the district, was a visitor to the meeting, and congratulated the members upon their interest in such a flourishing club. Permission has been given the club to have its summer outing to Sandringham on August 31, and a great day is being looked forward to by the members.

Formby.—JULY 12.

The annual exhibition of this society was held in the grounds of Briars Hey, by the kind permission of Mrs. F. A. Rockliff, and in the tent there was as usual a charming combination of colour, in which roses and sweet peas played a prominent part, although the former, after a short period, gave evidence of distress occasioned by the tropical heat. A firm stand was made with regard to adhering to the terms of the schedule. For example, in the class for 8oz. of currants dishes varying from 5 to 16oz. were staged, and those that were not of the correct weight were disqualified. This will undoubtedly induce exhibitors to follow the schedule more closely.

Roses formed the most important feature of the show, and the exhibits gave evidence of what can be accomplished, even on a sandy soil, when the cultivator is determined to succeed. For twelve distinct varieties, Mrs. Rockliff occupied the position of honour, having good blooms of Caroline Testout, Killarney, Mrs. W. J. Grant, and other well-known varieties. In the class for twelve trusses in six varieties Mr. Jos. Booth was first with a good lot, including J. B. Clark. For six distinct varieties Mr. Thomas, Carlisle was first. Six light-coloured roses, in three varieties, were well shown by Mr. H. S. Hodgkinson, Dean Hole and Mrs. E. Mawley being the most noteworthy. In the class for six dark roses Mr. E. Hacking was first. Mr. F. W. Passmore had the best six blooms in three varieties, and staged the Lyon rose in fine condition. For six blooms of any one variety Mr. A. E. Gunson won with Dean Hole.

For two vases, in which the blooms had to be shown as cut from the bush, Mrs. Rockliff obtained premier honours. Mrs. Storey was first for one vase of five blooms, and for one vase of cluster roses Mr. B. Kennedy was successful; and for one vase, not climbing, Mr. A. W. Ardran proved the winner. In this section Mr. Thomas Pugh led for the best bloom with Dean Hole.

For six light roses in not less than three varieties, and for six distinct varieties, Mr. L. Thomson was first, and had the best bloom in the section with Mr. Miles Kennedy. For a vase of five roses Mr. W. Beckett was adjudged the winner, and for the vase of cluster roses Mr. F. B. Jones took the premier award.

Sweet peas are largely grown in the district, and the entries were numerous and the blooms of good substance and colour. For twelve bunches the prize-men were Messrs. Ernest M. Allen, W. [illegible], and A. [illegible]. The winning collection had ten spikes of Dainty Spencer, Tennant Spencer, Dorothy [illegible], Arthur Unwin, and King Edward VII. For nine bunches the first and second prize-men in the former class occupied similar positions. For six bunches Mr. H. Thompson took the lead with good spikes, Mr. T. G. C. Fitzpatrick being second.

In the plant classes Mr. J. Booth came out strong with seven firsts, and Mr. W. McConnan with five; Mrs. Rockliff, Mrs. Storey, Mrs. W. Dodds and Mr. A. E. Gunson were also first-prize takers in several classes. Gloxinias were exceptionally good.

In the classes for miscellaneous cut flowers Mrs. Glynn and Messrs. F. A. Cook, W. McConnan, T. B. Jones, F. C. Calthrop, J. Gilbourne; and Mr. R. Williams shared the premier awards.

Mr. Thomas Norris led for six varieties of vegetables with a good collection, Mr. B. Burnett winning for three varieties of peas with pods of much merit.

Messrs. A. Dickson and Sons, Newtownards, contributed roses and hardy flowers, Mr. H. Middlehurst sweet peas, and Messrs. Woodward and Cuthbert cut flowers of hardy herbaceous plants.

Edgware Horticultural Society.

JULY 15.

The annual exhibition of this enterprising society was held on the above date, and was as usual attended with a full measure of success. Roses and sweet peas were the outstanding features, and there was a remarkably fine display of vegetables, of which some excellent collections were contributed by allotment holders.

The principal class for roses in the trade division was that for thirty-six blooms, in which the Edgware Challenge Cup, value ten guineas, was offered, in conjunction with a cash prize as the premier award. The entries were numerous, and the blooms of a high order of merit, and in the result Messrs. R. Harkness and Co., Hitchin, were successful in winning the cup. The blooms staged by this firm contained several of the highly coloured hybrid perpetuals in superb condition, Alfred Colomb, Horace Vernet, Comte de Raimbaud, A. K. Williams, and Madame C. Crapetel being especially noteworthy. Messrs. D. Prior and Son, Colchester, were a good second, with a collection in which the dark crimson Reynolds Hole was seen at its best, the bloom being selected as the best bloom of a hybrid perpetual in the trade division. Messrs. B. R. Cant and Sons, Colchester, were third. Messrs. D. Prior and Son obtained premier honours in the class for twelve teas or noisettes, closely followed by Messrs. W. and J. Brown, Peterborough, and Messrs. B. R. Cant and Sons, for second and third places. Messrs. W. and J. Brown were successful in obtaining premier honours for twelve bunches of garden roses with a highly meritorious collection.

In the amateurs' division Mr. E. B. Lindsell was first for twenty-four blooms, which far surpassed in quality those with which he won the champion trophy at the National Rose Society's Show on the 7th inst. The premier award in this class was the Edgware Challenge Cup, of the value of six guineas. The collection included a magnificent bloom of William Shean, which was selected as the best bloom in the amateurs' classes. Mr. H. R. Darlington, Potter's Bar, was a successful competitor in a number of classes, winning first for six teas, five blooms of one variety, and for four bunches of garden roses. In competition for the prizes for twelve blooms, Mr. J. Hart, Potters Bar, was first, Mr. H. R. Darlington second, and Mr. W. Fowler, Mill Hill, third.

Sweet peas were so largely shown and of so high a quality as to produce a fine display. There was a strong competition in the trade class for twenty-four bunches distinct, and the winner of the ten guinea cup was Mr. C. W. Breadmore, Winchester, who staged a collection of exceptional excellence. Mr. W. R. Hammond, Burgess Hill, was a capital second with finely developed flowers, and Mr. W. E. [illegible], Waterlooville, Hants, was a close third with a meritorious collection. In the class for twelve bunches, open to all amateurs, Mr. E. B. Lindsell was first with a magnificent collection. For nine bunches Mr. H. K. Judd, Edgware, obtained premier honours with splendidly developed flowers. Mr. H. R. Darlington was a close second with a collection remarkable for the success achieved in arranging the flowers. In the class for twelve bunches open to amateurs resident within ten miles of the place of exhibition, Mr. H. K. Judd won the Blair Challenge Cup with a magnificent collection. For a display of sweet peas, Mr. C. H. Wainwright, president of the society, was first with an arrangement remarkable alike for the high quality of the blooms and the taste evinced in their arrangement.

THE SCLEROTINIA DISEASE OF THE GOOSEBERRY.

(Concluded from page 528.)

Remedies.

1.—The best means of getting rid of the disease are the prompt removal and burning of all dead bushes or dead branches in the plantation. As soon as the leaves of bushes show signs of being diseased the bushes in the plantation generally should be examined, and any bush found with the main stem diseased should be grubbed up and burned. The prompt removal and burning of all dead (or dying) bushes, carried out for a few seasons, has proved more efficacious against this disease than spraying. It must not be forgotten that this fungus is capable of developing vigorously on dead parts of the bush. In nearly all cases—except in the comparatively rare ones where a plantation has been planted up with botrytis-infested young bushes—the disease appears first either on single bushes scattered here and there through the plantation, or on all the bushes over a small patch of ground in the plantation, while the surrounding bushes are healthy. If the disease on its first appearance is dealt with summarily by the burning of all dead bushes and dead branches, there is no need to spray or to take any other remedial measure, since the disease soon completely disappears.

2.—Where the disease has been allowed to become severe and widespread, or where it is not in the power of the grower to remove entirely the source of the disease, spraying must be resorted to—in addition, of course, to the prompt burning of all dead bushes. A heavy spraying with a solution of copper sulphate (4lb. dissolved in 100 gallons of water) should be given just before the buds burst, with the object of destroying the tufts of botrytis, care being taken to spray heavily the main stems of the bushes. The infection or premature falling off of the leaves may be prevented by spraying, directly the fruit is set, with Bordeaux mixture composed of 8lb. copper sulphate, 8lb. quicklime, and 100 gallons of water. In this spraying it is essential that the under-surface of the leaves should be sprayed as much as possible. No injury follows the application of Bordeaux mixture of this strength, and if the spraying is done at the time indicated no spotting of the berries occurs.

3.—It may be noted finally, that any treatment which induces the bushes to make vigorous growth tends to stop the attacks of the fungus.

SHADE AS A GARDEN BEAUTY.

The usual way in which shade in the garden is considered is as a factor of which special use must be made merely in the sense of bearing with an evil. Certain shrubs and plants are proved to live without sunshine, so are called into requisition for the improvement of these places; but the truth that some gardens are less fair than they should be, just for lack of shadow, seldom enters into the mind of their owners. Unmitigated sunshine is as wearisome in appearance on a summer's day as unmitigated colour. Providence gave foliage about flowers, clouds in the sky at times, and also, throughout natural scenery of greatly populated lands, those trees and hills that create welcome shade, both for yielding coolness and beauty. Looking over undulating country, how welcome to the eye is the outspread variation between bright plains and dark valleys; gazing through a woodland, how perfect is the effect where vistas of light intersect the dim mysterious avenues; even the hills and larger mountains have their alternative hollows and crests, and the latter would not charm us but for the contrast of the former. A desert, trackless, bare, is our name for a land that is wearisome; but as soon as civilisation touches the tract cultivation comes into being, and, no matter how this is obtained, its immediate result is the making of shade.

Gardeners who are thinkers may learn a useful lesson from facts such as these. The pleasure grounds that bask under summer suns must be given shadows by artificial means, unless natural undulations, or groups of trees of ancient grandeur, have already provided that needful beauty and refreshment. Many a small garden requires height just for this purpose; a flat expanse of lawn, beds, and borders, though brilliantly coloured, or even when tinted delicately enough by the employment of white blossom and grey, green, and bronze foliage among the vivid hues, will never be entitled to the fullest praise. Shade is wanted, whether it be cast by arches, pergola, pillars, shrubs, trees, trellises, walls, or hedges.

By moonlight, as by daylight, the scene of a garden is exquisite when each tall object gives its backward line of shadow; in summer evenings the streaks are very long, the masses broader as well as more extended than in winter, for the earth requires cool solace more. Let us all aim, then, at giving the lawns their beautiful lines or networks of shade.

Quick ways of introducing this improvement are sufficiently numerous. Summer climbers may be placed anywhere if given twelve-feet poles, up which they can be trained. A series of poles, two yards apart, may have fish-netting stretched between them, and Cobæa scandens or annual convolvuluses, Nasturtiums or Canary Creeper, will mount high with glorious rapidity.

Curved lengths of rustic fencing, six or more feet high, have a decided value. Pot roses may be sunk against these, and summer climbers used to give immediate luxury of foliage. Another admirable plan is to put out by them Plumbago capensis, or large eucalyptuses from the greenhouse, and tie the branches to the wood.

Rustic pillars may be set up on a lawn, with only the smallest bed cut in front of each to hold a climber or two. Two pillars, four or six feet apart, can have a cross-bar from which a fine hanging basket of begonias and trailing tradescantia is suspended.

M. H.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

FUNGUS ON CŒLOGYNE.—J. D., Uckfield: The fungus is Fulima septica, and it is not a parasitic one, but, as it spreads over the surface of plants like orchids, it may soon suffocate them; therefore, it should be sponged off, using a sulphide of potassium solution. Remove the old decaying wood and other material that is harbouring the fungus, and have a good clean up in the house, washing pots and staging, cleaning the orchids, etc., so that the plants may have a chance to grow. Frequent and regular sponging of the leaves and stems of orchids will work wonders.

FAILING CULINARY PEAS.—W. C., Bridgwater: The collapse is due to root rot which in turn is caused by eelworm. Severe weather such as long drought and sunshine coming just as the plants are feeling the strain of cropping also acts against the well-being of the peas, so that if there is any disease or eelworm trouble collapse inevitably follows.

WOOD-LICE IN VINERY.—A. C., Gillingham: If there is no risk of harm coming to human beings or domestic animals, slices of potato soaked in white arsenic or Paris green set in the places where wood-lice congregate will answer for large numbers of the pests. Pieces of old board, partly decayed, laid down in the vinery will attract crowds of wood-lice, and if a bucket of boiling water is at hand when the board is lifted at night or early morning then the pests can be swept off into the water. Little heaps of old leaves, dirty dry moss in a dirty pot, and, it is said, little heaps of wet grass, all prove attractive traps for wood-lice, but we have never used wet grass in this connection, so cannot speak from experience concerning its efficacy. Some patience must be exercised, and if the traps are varied frequently and examined regularly, the pests should soon be cleared out or at least reduced in number so as to cause no harm.

MILDEW ON CUCUMBERS.—S. E. J., Chesterfield: The whitish mould on the under surface of the leaves is due to the presence of a fungus named Peronospora cubensis, the cucumber mildew. It is not a particularly common disease in this country, but is common in America. Some cultural error, probably dryness at the roots and in the atmosphere, is the cause of the trouble. Spray with diluted Bordeaux mixture, making certain that the underside of every leaf is wetted.

VINES IN UNHEATED HOUSE.—F. T., Torquay: It is most probable that the vine roots have escaped beyond the border proper and have reached moist soil. This would cause excessive growth, shanking of the berries, and immature growth in the autumn. Directly the foliage of the vines changes colour this autumn at once proceed to find the actual condition of border and roots. It may be necessary to remake the border, or perhaps it will only be necessary to bring the roots nearer the surface after cutting away any that have gone astray. The work must be done carefully, the fibrous roots being kept moist while the work proceeds, and new, rather fine soil used in which to lay out these surface roots. The drainage must be examined and remedied if necessary, and if a concrete wall is built so as to confine the roots within the border so much the better. Write us again on this matter in early September.

CHLOROPHYTUM ELATUM AS A BASKET PLANT.—A. B., Leicester: We have seen the variegated form of Chlorophytum elatum used with great success for baskets. It is a good plan to select a strong young plant with a single crown, and plant it in a mixture of loam, leaf-soil, and sand, in a moss-lined wire basket. Place in a warm house, shade and syringe well for a few days, and then gradually harden it off so that it may be used in the conservatory or greenhouse or even out of doors, for the plant is nearly hardy.

ONCIDIUM CONCOLOR.—T. T. H., Exeter: At this season of the year Oncidium concolor should be growing freely and making new roots, therefore if your plants fulfil these conditions they should be at once potted if more room or fresh material are necessary. Pans are better than pots, and these should be wired so that the plants may be suspended. Drain the pans well, and use a mixture of polypodium fibre, sphagnum, finely broken crocks, and coarse sand. Pot firmly, suspend in a shady position at the warmest end of the cool house, and give water carefully.

TULIP TREE.—W. T., Beddington: The difference in the appearance of the leaves of the two trees is, no doubt, due to age, and probably also to soil and position. If the tree is healthy it should flower in due course.

GOOSEBERRIES.—W. T., Beddington: One gooseberry is not sufficient for purposes of identification, as the position of the berries and the position of the tree have considerable influence upon the fruits. If you care to send half a dozen firm clean fruits we will endeavour to name the varieties for you.

R.H.S. CERTIFICATE FOR CHILDREN.—M. E. J., Roade: You probably have in mind the card of "Recognition of Diligent Interest in Plants," issued by the Council of the Royal Horticultural Society, in response to frequent applications by school authorities for some token of encouragement of work with plants amongst scholars. It is to be awarded to the boy or girl (or both) who, in the yearly school competitions in plant cultivation, or garden plot-keeping, or nature study, has secured the first prize. The cards are 12 inches by 8 inches, and may be had on application to the Secretary, R.H.S., Vincent Square, London, S.W. (price 6d. each), signed by the head master or mistress, and a member of the educational authority concerned. The application should contain information as to (a) the nature of the competition, (b) the number of competitors, (c) the judges, (d) the number of prizes awarded in the competition, (e) the full name of the first prize winner. The Council of the R.H.S. will at their own absolute discretion grant or withhold this "recognition."

NAMES OF PLANTS.

W. H., Bury St. Edmunds.—Helxine S-lieroli.

P. H. W., Ruabon.—1, Lathyrus grandiflorus; 2, Bougainvillea glabra.

N. S. G., Wisbech.—1, Rudbeckia purpurea; 2, Inula glandulosa; 3, Polygonum Baldschuanicum.

C. H., Beddington.—1, Rosa Wichuraiana; 2, Vitis Labrusca; 3, Anguloa Clowesi; 4, Oncidium macranthum.

S. T., Dorking.—1, Centaurea macrocephala; 2, Physalis Franchetti; 3, Ceropegia Woodi; 4, Leucophyton Browni.

M. J., Royston.—1, Jasminum nudiflorum; 2, Jasminum officinalis; 3, Helenium Bigelowi; 4, Campanula persicifolia plena; 5, lactiflora.

L. T. S., York.—The sweet peas were so faded and shrivelled on arrival that identity was impossible; but we cannot undertake to name florists' varieties of flowers.

FORTHCOMING ENGAGEMENTS.

TUESDAY, July 25.—National Carnation and Picotee Society, at Royal Horticultural Hall.

WEDNESDAY, July 26.—Cardiff Horticultural Society; two days.
Bishop's Waltham Flower Show.
Irish Gardeners' Association.
Chesterfield Horticultural Society.
Hayward's Heath Horticultural Society.

THURSDAY, July 27.—St. Ives Horticultural Society.

FRIDAY, July 28.—Southampton Carnation and Sweet Pea Show.

Continental Holidays have a great attraction for a large number of horticulturists, and especially those who desire to gain knowledge of wild plant life and of the ways and means followed in the adornment of Continental public and private gardens. But the journey is a matter for consideration, and nowadays one looks for comfort as well as speed and safety. A handy and helpful booklet, freely illustrated, issued by the Great Central Railway Company, should be consulted by those contemplating holidays, as it gives the fullest information concerning trips possible by the Grimsby route.

TRADE NOTE.

Mr. Montagu C. Allwood, who for some years past has been regarded as one of the leading authorities on perpetual-flowering carnations, has, we are informed, retired from the position of carnation specialist to Messrs. Hugh Low and Co., now Messrs. Stuart Low and Co., held during the past seven years. Mr. Allwood has taken up the joint management of the firm of Messrs. Allwood Bros., which was founded by Mr George W. Allwood, at Haywards Heath, on his return from America, where he spent several years in studying carnations and their culture.

OBITUARY.

◆

MR. GEORGE WOODGATE.

We regret to record the death of this able and highly esteemed horticulturist, which occurred early in this month at his residence, Kenley, Surrey. Mr. Woodgate was for some years head gardener at Warren House, Kingston Hill, and during some part of the period he was secretary of the Kingston Chrysanthemum Society, at the time it was one of the most important societies of its class in the United Kingdom. Leaving Kingston Hill, Mr. Woodgate was appointed head gardener to Sir Oswald Moseley, Bart., Rolleston Hall, Burton-on-Trent, where he remained fifteen years, retiring in 1910 owing to ill-health. During the greater part of the time he was at Rolleston Hall Mr. Woodgate was a contributor to this journal. The funeral took place at Bandon Hill Cemetery on the 10th inst.

GARDENING APPOINTMENT.

Mr. C. Foster Crump, for the past three years general foreman at Kingston Hall, Derby, and previously of the Royal Gardens, Windsor, has been appointed head gardener to Earl Spencer, at Althorp Park, Northampton.

Of course, it is sometimes necessary to INSIST upon your ironmonger or Seedsman getting a **PINE SPRAY SYRINGE** for your approval. it's worth while, and it would be a pity to buy a Syringe at the same price, arge or well-made, and with none of the Pine Spray's great advantages. The R particularly are going sick for the want of relief from greenfly and numerous o pests. Get to work on them at once with a **PINE SPRAY SYRINGE** and **PINE SPRAY INSECTICIDE.**

Insist upon your tradesman sending at once for the former on approval. A large sample tin of Insecticide will accompany it for acceptance if you approve the Syringe, and you will.

Size of Syringe, 24in. over all by 1¼. **PRICE 10s. 6d.**

ROBINSON BROS., Ltd., West Bromwich, STAFFS.

ROBINSONS PINE SPRAY SYRINGE (Patent).

Employment THE GARDENERS' MAGAZINE Register.

The charge for an Advertisement INCLUDES A FREE ENTRY ON THE REGISTER. Immediate Notice must be given when an engagement is secured.

A List of Gardeners on the Register will be supplied to employers only upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.

Situations Wanted.

GARDENER (Head, where several are kept); thoroughly experienced in all branches, Inside and Out, Grapes, Peaches, Melons, Stove and Greenhouse Plants; 4½ and 11 years' excellent references as head; married, family out. E. STONE, 13, Coniston Road, Addiscombe, Croydon, Surrey.

J. F. G. BANNATYNE, Esq., Haldon, Exeter, will be pleased to recommend H. NICHOLSON as GARDENER (Head Working); thoroughly practical and reliable; life experience in all branches; 3½ years here; age 31. Address, NICHOLSON, Haldon Gardens, Exeter, Devon.

GARDENER (Head Working); thoroughly experienced in Fruit, Flowers, Vegetables; Inside and Outside work, where two or three are kept; well recommended. Apply, F., care of Messrs. Charles Turner and Son, Royal Nurseries, Slough, Bucks.

GARDENER (Head Working).—H. ESSAM can with confidence recommend his Foreman, where several are kept; life experience in all branches; age 31; married when suited; excellent references. Address, Closes Hall, Gisburn, Clitheroe.

GARDENER (Head Working), life experience Inside and Out; 5 years present situation as General Foreman; excellent refs.; disengaged when suited; age 28. T. CHAMBERLIN, Canons Park Gardens, Edgware, Middx.

GARDENER (Head Working), where one or two more are kept; life experience in all branches; aged 36; married, four children; 8½ years' excellent references. Apply GARDENER, The Wharf, Abingdon, Berks.

GARDENER (Head Working, where two or three or kept); life experience; leaving through death; highest references; age 35; married. STEVENS, Thanes Croft, Shamley Green, near Guildford, Surrey.

GARDENER (Head Working).—CAPTAIN USHER highly recommends R. Appleby as above; life experience in all branches; thoroughly understands Planning and Laying Out; also Land and Stock; many years' excellent character. Address APPLEBY, care of Captain T. Clemins Usher, Little Wymondley, Stevenage.

GARDENER (Head Working).—Mr. WATSON can highly recommend C. WALLIS, where two or three are kept; been here six years as Second of five; age 31; married, two children. The Gardens, Bushey Down, Tooting Common.

GARDENER (Head Working). — Mr. PHILIP ASHWORTH wishes to recommend W. H. SHAW as above; life experience; accustomed to large establishment; especially good at Laying Out new grounds; also Flowering Shrubs and Herbaceous Borders; married, family; many years' excellent character. Apply W. H. SHAW, The Lodge, Horsley Hall, Gresford.

GARDENER (Head Working).—F. W. FLETCHER, Esq., can highly recommend his Head Gardener as a thoroughly trustworthy experienced good all round man; age 45; married; one girl 14 years. F. GREENGRASS, 40, Primrose Terrace, Browning Road, Enfield, Middlesex.

GARDENER (Head or good Single-handed with help); well up in all branches; age 42; married, no encumbrances; good references. A. VENABLES, 6, Greatham Road, Bushey Hall Road, Watford, Herts.

GARDENER (Head); good Single or Fruit Gardens Manager; Budder, Grafter, Pruner, Cucumbers, Melons, Vines, Chrys., Bedding Plants, Roses, Mushroom, ridge or flat; Kitchen, Lawn, Flower Garden. Special Prize 1910. W. BLOOMFIELD, Staplehurst, Kent.

GARDENER (Head, or Single-handed with help); age 30; life experience in all branches; highly recommended. Near London preferred. GOLDSMITH, 55, Suffolk Road, Milton, Portsmouth.

GARDENER (good Single-handed or otherwise); life experience; good all-round Man in all branches; age 45; married, one child; would take very moderate wage with cottage for a comfortable place. Excellent testimonials; willing to be useful. F. OSBORNE, 48, Bradshaw Road, Watford.

GARDENER (Single-handed or otherwise); over 2 years as Foreman in present situation; experienced Inside and Out; can be highly recommended by present employer; age 28. Apply W. BICKER, or Head Gardener, The Gardens, Avenue House, Church End, Finchley. Eastern Counties preferred.

GARDENER (Single-handed or otherwise); 12½ years' experience Inside and Out; good references; 4½ years last place; age 30; single. REYNOLDS, Sandy Hill, Beddington.

GARDENER (Single-handed, or with Son to help); life experience in all branches; age 37; disengaged; good references. E. LIMEHOUSE, 11, Charleville Road, West Kensington.

GARDENER (Single-handed), seeks situation; 16 years' experience in flowers, fruit, vegetables; excellent references; age 30; single; disengaged.—F. HYDER, 7, Stamford Road, Watford, Herts.

GARDENER (Single-handed or otherwise); 14 years' general gardening; used to gas engine; married, 2 children, youngest 4½; age 31. J. MOONEY, The Stables, East Moor House, Harpenden.

GARDENER, 40; Single-handed preferred; thoroughly experienced; excellent character; active worker; Inside and Out with early vegetables; abstainer; immediate. A. BISHOP, Windmill Hill, near Hailsham.

GARDENER (Single-handed, or with help); experienced, Inside and Out; age 30; married, no family; good references. H. CATLEY, The Lodge, Pilgrim's Holt, Margery, nr. Reigate, Surrey.

MR. A. LINDLEY recommends A. SIMMONS as GARDENER (First of two or Single-handed); life experience Inside and Out; two years present situation; six years previous; age 35; single. Apply, 6, Little-Roke, Kenley, Surrey.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Gardening Excursions.

There is probably no section of the industrial community wherein so keen an interest is taken by the members in their avocations as in the case of those who are engaged in the several branches of practical horticulture. We have evidence of this on all sides, but there could not well be any proof more conclusive upon this point than the readiness with which advantage is taken of opportunities for visiting neighbouring and other gardens, nurseries, and seed grounds. Young gardeners who are imbued with a strong desire to fit themselves for a position of some importance, have very soon after they have entered on their training a wish to see what is being done in gardens of note within a convenient distance of those in which they are engaged. In this matter a convenient distance is interpreted somewhat liberally, and many of those who read this will call to mind walks of eight or ten miles that they have taken after the usual working hours for the purpose of visiting gardens they have been desirous of seeing. They will also remember the pleasure such visits gave them, and the useful information they obtained upon some of the many points of practice with which those engaged in gardening should be fully conversant. It need hardly be said that with increased knowledge of gardening and the difficulties associated therewith there is a stronger desire to take advantage of the object-lessons that are afforded by other gardens, and it may be to obtain help from those in charge in clearing up doubtful points, for the majority of those in charge of gardens make a practise of visiting their neighbours with some degree of regularity. For a long period it was the rule to make such visits alone, or in company with one or two friends, but now the general practice is to visit gardens of note in organised parties, and this is so great an improvement upon the older method that all concerned have good reason for congratulating themselves upon the change that has been brought about. The informal visits of one or two will continue to be made, and happily so, but parties properly organised by the various societies have a double advantage. They enable the visitors to see all that is to be seen, and they bring into close association the greater proportion of the gardeners in a given district, and amid more pleasant surroundings than is the case when they meet for the reading and discussion of papers. These excursions can hardly fail to be pleasant and instructive, whatever may be the status of those who take part in them, provided each member is desirous of contributing his share to the enjoyment of the others. Happily, this is the rule, and we recall with pleasure the fact that we have not as yet taken part in an excursion in which the proceedings from first to last have not been of the most pleasant character. We have been reminded of the important position occupied by excursions in the programmes of many societies by several that have been made within the past ten days. These included the visit of the members of the Horticultural Club and their lady friends to the beautiful gardens of Friar Park, Henley-on-Thames, the residence of Sir Frank Crisp, one of the most distinguished of amateur horticulturists; the excursion of the National Chrysanthemum Society to Cliveden; and the visit of the Exeter Gardeners' Association to the interesting gardens of Roby Hall, Torquay, the residence of Sir John Edwards Moss. The members of both the Horticultural Club and the National Chrysanthemum Society made some part of the journey by water, and they did well in taking advantage of the opportunities thus afforded for enjoying the beautiful river scenery in the neighbourhood of Henley and Cliveden. At Friar Park the visitors had an opportunity of seeing one of the finest examples of garden design in this country, and probably the most noteworthy rock garden that has a place in a private garden in the United Kingdom. The proportions of the rock garden are great, and the collection of alpines that have a place within its boundaries is quite unique. At Cliveden the visitors were able to enjoy to the full a garden rich in attractions, and of much interest for its historical associations. At Roby Hall the features are many, but those of outstanding importance are the large collection of splendidly-grown orchids, and the many rare and beautiful trees in the pleasure grounds; consequently, however diverse may have been the taste of the members of the party, there was more than sufficient to interest all of them. These excursions, it need hardly be said, occupied the whole of the day, but in many districts the practice has within recent years obtained of making afternoon or evening visits to gardens, and such visits have the advantage of not taking the members of the party away from their duties at home for any considerable period, and also of enabling the owners of the gardens to meet the parties and extend to the members a hearty welcome. Such excursions as these are organised with much success by the Croydon Gardeners' Association, and we have been assured on more than one occasion that they are both pleasant and profitable, and much appreciated by those who take part in them. These short excursions are especially adapted for districts where, as at Croydon, good gardens are numerous and situate within so short a distance of the centre that they can be readily reached in a comparatively short time. Some few good gardens are seldom if ever visited on the occasion of day excursions, a fact to which we have had our attention called more than once, but on enquiry it has invariably been found that they are situated some distance from the nearest railway station, and that the hire of carriages in addition to the cost of the railway tickets, would involve an expenditure beyond the means of some of those who would like to take part in the excursions. The question of cost is an important one, and we are

MR. D. WILLIAMS.

glad to know that in making their arrangements societies keep it in view.

Mr. D. Williams, who has had charge of the gardens of Duncombe Park, the seat of the Earl of Faversham, for nearly a quarter of a century, is a native of North Wales, and possesses in a marked degree the qualities that have contributed to the success achieved by many of his countrymen in various walks of life. Mr. Williams began well, for, after having served an apprenticeship in a good garden, he went as an improver in the Penrhyn Castle gardens under Mr. Speed, where he remained four years. Thence as journeyman to Chatsworth, where he remained a second period of four years, and then he went to Lockinge Park as foreman, a position he occupied for a similar period, and was then appointed head gardener to Lord Wimborne at Canford Manor, Wimborne, Dorset. Here he remained eight years, and then assumed charge of the important gardens of Duncombe Park. When at Canford Manor Mr. Williams obtained a high position among practical horticulturists in Dorset, and in Yorkshire he has not been less successful in commanding the esteem of those whose avocations are similar to his own. We could have no better proof of the thoroughness of Mr. Williams' training and his remarkable ability than the fact that he should be equally successful at Canford Manor and Duncombe Park, where the climate and soil conditions differ as widely as they well could do. During the long period Mr. Williams has been chief of the Duncombe Park gardens he has achieved much success in the cultivation of fruit under glass and in the open, and he has specially distinguished himself as a cultivator and exhibitor of chrysanthemums. Ample evidence of his ability is also found in the immense kitchen garden under the shadow of the ruins of Helmsley Castle and in the extensive flower garden and pleasure grounds that form so magnificent a feature of Duncombe Park.

Floral Decorations at Edinburgh.—On the occasion of the return of the King and Queen from Edinburgh on the 21st inst. the Waverley Station was tastefully decorated with flowers. In the scheme of decoration carried out on the platform white lilies, red roses, and blue lobelias were used with excellent effect, and the station offices were embellished with festoons of evergreens. Mr. J. F. McHattie, the City Gardener, brought to the Waverley Station two baskets of flowers, one tastefully filled with white carnations destined for the Queen, and the other contained white heather, which was presented to Princess Mary on her arrival by the Lord Provost of Edinburgh.

The Hot Weather that has been experienced over the greater part of the country during the current month reached its maximum intensity at the close of last week, when some exceptionally high temperatures were recorded. Previous to the 21st inst. the thermometer had on several days registered 80 degrees, but on that date it recorded 90 degrees, both in London and at Margate, and 92 at King's Lynn. The temperature in London was 15 degrees above the average, and was the highest recorded in the Metropolis since September 2, 1906, when the thermometer rose to 91 degrees. On the following day, July 22, the thermometer reached 93 degrees at South Kensington, and 94 degrees at Margate, but at Kew it touched 89 degrees. This proved the hottest day in London since July 15, 1881, when 95 degrees were recorded, and at Margate the temperature was also the highest recorded during the past thirty years. There have been light falls of rain in London, Wales, the western and northern parts of Scotland, and in some of the northern parts of England, but at Kew and in the southern counties of England there was practically an absence of rain for twenty-four days. So long a period of drought in July has not previously been experienced during the past forty years, and, as so well known to cultivators, has seriously affected growing crops of all kinds, and rendering the work of garden management extremely difficult. The dryness of the atmosphere has been a characteristic feature of the past drought, and on the 21st inst. the relative humidity at Kew was only 35 per cent. The drought practically came to an end on Tuesday, when rain fell heavily in various parts of the United Kingdom.

Horticultural Trade and Undeveloped Land Duty.—Some dissatisfaction has been felt by nurserymen and market gardeners for some time past with regard to the additional burdens thrown upon the trade by recent legislation. It is considered that undeveloped land duty on the difference between the agricultural value and the hypothetical value of the land, for building or for the purpose of any other trade, although levied at one halfpenny in the pound on such difference in the capital value, represents in effect a tax of nearly 1s. in the pound on rental value. The feeling of uneasiness has been intensified by the sympathetic reception given recently by the Prime Minister and the Chancellor of the Exchequer to a petition signed by 172 Members of Parliament, urging that increased taxation should be thrown upon land values. As the result of this feeling a special committee of those interested in commercial horticulture has been formed, with a view to resisting further impositions. The list of members comprises such well-known names as Messrs. G. Bunyard, W. Bull, R. Cobley, H. E. Honnor, George Monro, R. Piper, C. E. Pearson, S. Pickering, T. A. Rivers, J. Rochford, W. B. Randall, E. Sherwood, H. J. Veitch, J. G. Veitch, N. Sherwood, H. Morgan Veitch, A. Watkins, W. Poupart, W. Sams, B. Hurst, J. Sweet, H. O. Larsen, E. Rochford, R. W. Wallace, and W. R. Pennell. Arrangements have been completed by this committee for securing the assistance of the Land Union with its organisation of 140 branches throughout the country.

A Shakespearian Flower Border. We learn from the "City Press" that Mr. Henry Clarke, J.P., has in the gardens of his old-world Hampstead residence, Cannon Hall, a border containing specimens of the whole of the plants and flowers mentioned by Shakespeare in his works.

The Aperture of Stomata. To a recent meeting of the Royal Society Mr. Francis Darwin and Miss D. F. M. Peitz contributed a paper on a new method of estimating the aperture of stomata. The apparatus used is known as a porometer, and is similar in principle to that devised in 1873 by N. J. C. Müller, but differs from it completely in construction. By a simple arrangement a current of air is drawn through the stomata of a living leaf, its velocity being measured by the fall of a water-column. At a constant pressure the rate of air-flow is necessarily dependent on the size of the stomatal pores, and it is accordingly found that agencies such as darkness or loss of water supply, which are known to diminish stomatal aperture, cause a striking drop in the rate of air-flow as recorded by the porometer. In studying the effect of severing the leaf stalk, and thus cutting off the water supply, it has been proved that the first effect of withering is a wide opening of the stomatal pore. The porometer has been found of value in attacking the question of the causal relation between stomatal aperture and transpiration. A large number of observations have been made, but in the paper a single experiment was given as illustrating the parallelism between the transpiration rate and the condition of the stomata as revealed by the porometer.

Wye College.—At the meeting of the Governors of the South-Eastern Agricultural College, which was recently held at Wye, under the presidency of the chairman, Lord Ashcombe, the plans of the proposed new buildings, forming part of a new quadrangle, were passed, and orders were given to commence the work at once. It was decided to commence an investigation into the losses of sheep from parasitic worms, and Mr. Gardener, B.A. (Cantab.), was appointed to deal with the biological side of the enquiry. An exhibition of up-to-date farm implements has been established, and the leading implement makers have sent specimens of their manufactures. The college investigation work is being continued on tobacco, hops, digestive values of sheep foods, extraction of lavender and mint oils, use of lime-sulphur washes, cocoanut cake, Para rubber seed cake, and Durra for stock feeding, manurial trials on poor chalk land, etc.

Record Price for Peas. — Remarkable prices have been obtained for peas this season, but perhaps the "highest price on record" was realised at the sales conducted recently by Messrs. G. H. Banks, auctioneers, of Kidderminster, when a six-acre field of Senator made no less than £41 per acre; a 19-acre field of the same variety also fetched £25 per acre. Both crops were grown in the Stourport district. This fine pea was raised and introduced into commerce by Messrs. Webb and Sons, of Wordsley, Stourbridge, and has become exceedingly popular with growers for market and gardeners for private use on account of its remarkable productiveness and fine flavour. It was awarded a First Class Certificate by the Royal Horticultural Society.

Forestry Development.—With reference to the development of forestry in the United Kingdom the Development Commission has formulated the following principles: (a) That the first requirement for such development is effective education in forestry at suitable centres, regular and organised research and demonstration. (b) That no scheme of State afforestation on a large scale can be considered until investigation has shown where State forests might be economically and remuneratively provided (regard being had to the interests of other rural industries), and until a trained body of foresters has become available. (c) That for the present applications for grants for the above purposes should include provision for the creation and maintenance of such staff as may be necessary to give practical advice and assistance to those who desire to undertake afforestation or to develop existing afforested areas. The Commissioners state that, acting under the section of the Development Act which permits them to recommend advances for forestry, they appointed four of their number to form the Forestry Committee. This committee has drawn up the outlines of a policy which the Commissioners have approved as a guide in dealing with the applications for grants for the development of forestry in England, Scotland, and Wales, Ireland being dealt with separately. Communications have been opened up with

Board of Agriculture in England, the Scottish Education Department, and the Department of Agriculture in Ireland, with the following results: With regard to England and Wales, the Commissioners have received a comprehensive scheme from the Board of Agriculture and Fisheries. In the case of Scotland, they have agreed to the provision of a central demonstration area—for the acquisition of which preliminary steps are being taken—and of a forestry school in connection with it; and also to the provision of small forest gardens for the local use of the agricultural colleges. With regard to Ireland, they have agreed to advances of £25,000 or £30,000 for the purchase of land, and to further advances, as soon as formal and definite applications are made under the Act, for additions to staff and for the maintenance and management of small woodlands in the hands of county councils.

Queenswood.—In our issue of the 22nd inst., we gave a short account, with illustrations, of the gardens of Queenswood, the charming residence of W. G. Rigden, Esq., at Englefield Green, and made reference therein to the success achieved in the cultivation of various subjects under glass. It may now be mentioned as a matter of additional interest that all the greenhouses in the gardens were erected by Mr. J. Gray, the well-known horticultural builder, of Chelsea, and are admirable examples of his high-class work.

New Rock Garden at Derwent Hill.—The delightful gardens of Derwent Hill, Keswick, the residence of Mr. Robert Slack, have had their attractions and interest greatly enhanced by the creation of a new rock garden, which has been just completed by Mr. T. R. Hayes, landscape gardener, resident at Keswick. The work of construction has occupied a large body of men during the past eighteen months, and to show his appreciation of the admirable manner in which all concerned had discharged their duties Mr. Slack entertained Mr. Hayes and his staff at dinner a few days since. In the course of the after-dinner proceedings the speakers testified to Mr. Slack's interest in gardening, and to the success that had been achieved by Mr. Hayes in connection with the work he had just completed.

Importation of Plants into Canada.—Revised regulations have been issued under the Destructive Insect and Pest Act (Canada). The following is a summary, as given in the "Journal" of the Board of Agriculture of the regulations in so far as they relate to stock originating in this country. Nursery stock, including all trees, shrubs, plants, vines, grafts, scions, cuttings, and buds are to be imported only through certain ports at stated periods. The port through which the stock is to enter must be clearly stated on the package. Importers must give notice to the Dominion Entomologist, Experimental Farm, Ottawa, within five days from the date of ordering the stock, and transportation companies or other persons bringing the stock into Canada must give similar notice immediately the consignment is received by them. Nursery stock or other vegetable matter (coming from Europe) is exempt from fumigation, but is to be inspected either at the port of entry or at its destination. If it is found to be infected with certain specified diseases or insect pests it will be destroyed, together with the cases, compensation being allowed up to two-thirds of the value of the stock. The above regulations do not apply to greenhouse-grown plants, herbaceous perennials, herbaceous bedding plants, or bulbs and tubers.

NATIONAL CARNATION AND PICOTEE SOCIETY.

Held at the Royal Horticultural Hall on Tuesday, July 25, this society's show was scarcely up to the average of extent or quality. The great surprise everyone felt was that there were so many and such good carnations, considering the peculiarly drying and brilliant weather experienced of late. In the larger classes for blooms on boards the competition was very limited.

The silver cup for the highest aggregate of points in Division I. was won by Mr. Jas. Douglas, who also won the Cartwright Cup for the highest aggregate in the open classes: in Division II. Mr. Hayward Mathias won the cup for the highest points, while Mr. C. A. Linzee and Mr. Linington won the aggregate awards in their sections. For these cups a first, second, or third prize has a certain point value, and the highest points gained secured the cup.

PREMIER DIVISION.

The premier division of the schedule is for the stalwarts, and in it the competition is chiefly confined to the leading trade growers. Entrants are confined to one division, though all may meet on common ground in the open classes.

The best stand of eighteen bizarre and flake carnations was adjudged to be the one staged by Messrs. A. R. Brown, Lim., King's Norton, who showed clean flowers of Shamrock, G. Melville, Bo-Peep, Joseph Lester, Robert Houlgrave, Guardsman, E. Adams, J. S. Hedderley, Gordon Lewis, Briar Lea, Mrs. T. Lord, Meteor, Wilfred, and C. A. Herbert; second prize fell to Mr. Jas. Douglas, Great Bookham. The chief award for eighteen fancy carnations in not fewer than twelve varieties was won by Mr. Jas. Douglas, Great Bookham, with a very fine lot of flowers, the varieties being Lord Steyne, Linkman, Liberty, Erl King, Ironside, Pasquin, Mrs. Gardiner, Forester, Mrs. Paton, Orient, King Solomon, Sam Weller, Hidalgo, and Alice B. Stewart; Messrs. A. R. Brown, Lim., second.

Mr. Jas. Douglas secured first place for eighteen white-ground picotees in not fewer than a dozen varieties, with beautiful flowers of Fair Maiden, Polly Brazil, J. Smith, Fortrose, Queen of Spain, W. E. Dickson, Favourite, Mrs. Openshaw, Lena, Mrs. Herbert, Mrs. G. Chaundry, and Hon. Mrs. Kenyon; Mr. A. R. Brown, second. Yellow-ground picotees are always great favourites, their brilliant colouring appealing to everyone.

Five classes were provided in this division for flowers shown as grown. In four of these classes six varieties were asked for, three blooms of each, staged in vases with carnation foliage. For self carnations Mr. J. Douglas led with Daffodil, Mrs. G. Marshall, Mdme. Castrilo, Rosy Morn, Mrs. Griffith Jones, and Golden Oriole; Messrs. A. R. Brown, Lim., second. The same exhibitors occupied similar positions for fancies, and here Mr. Douglas had Forester, R. A. Rowberry, and Lord Steyne in good form. For white-ground fancies Mr. Douglas again beat Messrs. A. R. Brown, Lim. The Bride was a very beautiful flower in this set. The same order was held by these competitors in the class for yellow-ground picotees, Mr. Douglas's best varieties being John Ruskin, Onward, and Mrs. Lennox.

For a dozen varieties, four each of selfs, fancies, and yellow-ground fancies, and three

SELF CARNATION ELIZABETH SHIFFNER.

Miss Shiffner's first-prize vase in the class for any buff or terra-cotta carnation at the National Carnation Society's exhibition.

blooms of each variety, shown in vases, the first prize fell to Mr. Jas. Douglas, who showed Mrs. R. J. Reynolds, Lord Steyne, Daffodil, Mrs. G. Marshall, Forester, and Liberty finely; Messrs. A. R. Brown, Lim., second. In all these classes there were but the two competitors.

SECOND DIVISION.

In this division the classes were similar to those in the premier division, except that fewer flowers were required. Mr. H. R. Taylor, Cheam, led for a dozen flakes and bizarres in not fewer than nine varieties, his Bedouin, Gordon Lewis, and Mrs. T. Low were good examples; Mr. C. F. Thurston, Penn Fields, Wolverhampton, second, and Mr. H. Mathias, Medstead, third.

For a dozen fancies Mr. A. W. Jones, Stechford, led from five competitors with grand blooms of Lord Steyne, Hercules, Mrs. Leo Hunter, Linkman, Father O'Flynn, Deerslayer, Claude Egerton, Orlando, and Queen Eleanor—a splendid set; Mr. C. F. Thurston second, and Mr. W. H. Parton, Moseley, third. Mr. H. R. Taylor scored for white ground picotees, and here he had Mary D. Anstiss, Favourite, and Radiant in good form; Mr. C. F. Thurston second, and Mr. H. Mathias third. There were five entries of yellow-ground picotees, and the best set was from Mr. H. Mathias, who showed clean bright flowers of Gloria, Constance, Oriel, Exquisite, Corona, Togo, Santa Claus, Golden Pippin, Ida Pope, Libra, and H. Brown; Mr. C. F. Thurston second, and Mr. W. H. Parton, third.

SELF CARNATION DAFFODIL.

Mr. Lakeman's first-prize vase in the class for any yellow carnation at National Carnation Society's exhibition. The flowers are rich yellow.

In this section four varieties, three blooms of each, were required in the classes for flowers shown as grown. For selfs Mr. A. W. Jones led with Elizabeth Shiffner, Cardinal and Chrystal; Mr. R. Morton, Woodside Park, second, and Mr. H. Mathias third. Mr. H. Mathias led for fancies with Lord Steyne, Devonian, Linkman, and Liberté. Mr. A. W. Jones second, and Mr. W. H. Parton third.

Mr. Mathias was the only exhibitor of white-ground fancies, with seedlings. Mr. R. Morton led for yellow-ground picotees with bright blooms of John Ruskin, Santa Claus, Her Majesty, and Peregrine; Mr. W. H. Parton second, and Mr. H. Mathias third. The best set of nine vases, three each of selfs, fancies, and yellow-ground picotees, was from Mr. W. H. Parton, who put up a fine lot of blooms of popular varieties; Mr. H. Mathias second, and Mr. H. R. Taylor, Cheam, third.

THIRD DIVISION.

In the third division the smaller growers foregather, and four prizes are offered in each class. Mr. J. J. Sheldon, South Woodford, scored for six flakes and bizarres, with Mr. C. A. Linzee, Alresford, second. For six fancies Mr. F. W. Goodfellow, Walsall, led with fine blooms from among eight competitors, Mr. E. J. Price, Bourneville, following him closely. The best half-dozen white-ground picotees were clean, even, but rather small blooms from Mr. G. D. Ford, Acock's Green; Mr. F. W. Goodfellow second. Mr. Goodfellow was first and Mr. C. A. Linzee second for six yellow-ground picotees; there were seven entrants.

The chief prize-winner in this division, in the classes for flowers shown as grown, were Mr. F. W. Goodfellow, Walsall, who led for a pink self; Captain A. Gordon Russell, Wheatley, for white self; Mr. C. A. Linzee for crimson self with W. H. Parton, Captain A. G. Russell for a yellow self with Daffodil, Mr. F. W. Goodfellow for a scarlet self with Cardinal, Captain Russell for a yellow-ground picotee with Mr. W. Heriot, Mr. E. J. Price for a terra-cotta or buff self with Elizabeth Shiffner, Mr. C. A. Linzee for a yellow-ground fancy with Lord Steyne; Mr. Aubrey Spurling for a fancy other than a yellow, buff, or white ground, with a seedling of heliotrope colour, faintly splashed with red, Mr. F. W. Goodfellow for a white-ground fancy with grand examples of Nizam. For a self of any other colour than that previously mentioned, Mr. L. Hart, Queen's Hill, Hertford, led with a purple seedling. For six vases of selfs, fancies, and yellow-grounds Mr. C. A. Linzee was a capital first, Mr. C. J. Price coming second, and Mr. G. D. Ford, Acocks Green, third.

MARTIN SMITH CUP CLASS.

A keen competition is usually found in the class for a dozen distinct varieties, selfs, fancies, and yellow-ground picotees, three blooms of each variety, flowers shown as grown. The chief award is the Martin Smith challenge cup and medal. There were three competitors on this occasion, and the cup was won by Mr. R. Morton, Woodside Park, who had the largest flowers, and exhibited Liberté, Elizabeth Shiffner, Lord Steyne, John Ruskin, Daffodil, Erl King, Agnes Sorrel, Santa Claus, Togo, R. A. Rowberry, Onward, and Etna; Mr. W. H. Parton, Moseley, Birmingham, second, with smaller but very clean, well-marked flowers; Mr. H. R. Taylor, Cheam, third. We should add that this class is for amateurs only.

OPEN CLASSES.

By far the most attractive division was the open one, where vases of nine blooms were required, and these to be shown as grown. Wiring was allowed, and in many cases the wiring was too much in evidence. For a vase of a pink or rose self Mr. H. Mathias came first with Mrs. Flight, and Messrs. A. R. Brown, Lim., second, with Ayesha. For a white variety Mr. J. Douglas led with Kate Nickleby, and Captain Russell was second. Messrs. A. R. Brown, Lim., scored for a crimson self with Mrs. G. Marshall, and Mr. Douglas was second with the same variety. There were six competitors in the class for a yellow self, and here Mr. H. Lakeman, Thornton Heath, led with fine blooms of Daffodil, with Miss Shiffner, Lewes, second, also with Daffodil. Adonis was the best scarlet self, shown by Mr. J. Douglas; Messrs. A. R. Brown, Lim., second with Cardinal. Mr. H. Mathias scored for a yellow-ground picotee with Togo in good form; Mr. J. Douglas, second, with the same variety. For a terra-cotta or buff self Miss Shiffner, Lewes, was a capital first, with fine flowers of Elizabeth Shiffner; Messrs. A. R. Brown, Lim., second, with Ben[illegible]. In the yellow-ground fancy class Mr. Jas. Douglas was to the front with the handsome Pasquin; Mr. W. H. Parton second with R. A. Rowberry. With The Bride Mr. J. Douglas won the premier award for a fancy other than with a yellow or buff ground.

In the seedling classes the only two varieties of importance were Ariel, a pink-edged yellow picotee, from Mr. H. Mathias; and Mrs. F. J. Johnston, a deep crimson self, from Messrs. A. R. Brown, Lim., King's Norton.

PREMIER BLOOMS.

Undressed Flowers: Heavy-edged yellow-ground picotee—Her Majesty, from Mr. Robt. Morton, Woodside Park; self carnation—Mr. George Marshall, from Mr. A. W. Jones, Stetchford; fancy—Pasquin, from Mr. Jas. Douglas, Great Bookham; light-edged picotee—Togo, shown by Mr. H. Mathias.

Premier dressed flowers: Flake carnation—Gordon Lewis, from Mr. H. R. Taylor, Cheam; light-edged white-ground picotee—Lavinia, from Mr. E. J. Price, Bourneville; heavy-edged white-ground picotee—Mary D. Anstiss, from Mr. H. R. Taylor, Cheam; light-edged yellow-ground picotee—Onward, from Mr. J. Douglas, Great Bookham.

NON-COMPETITIVE.

Messrs. H. B. May and Sons, Edmonton, contributed a collection of choice and beautiful ferns.

Messrs. Barr and Sons, Covent Garden, were represented by a display of popular hardy flowers, wherein good varieties of phloxes were conspicuous.

Messrs. Stuart Low and Co., Enfield, brought up a few carnations, chiefly those of their own raising.

Mr. Chas. Blick, Hayes, put up a capital stand of carnations, in which there were vases of fine flowers.

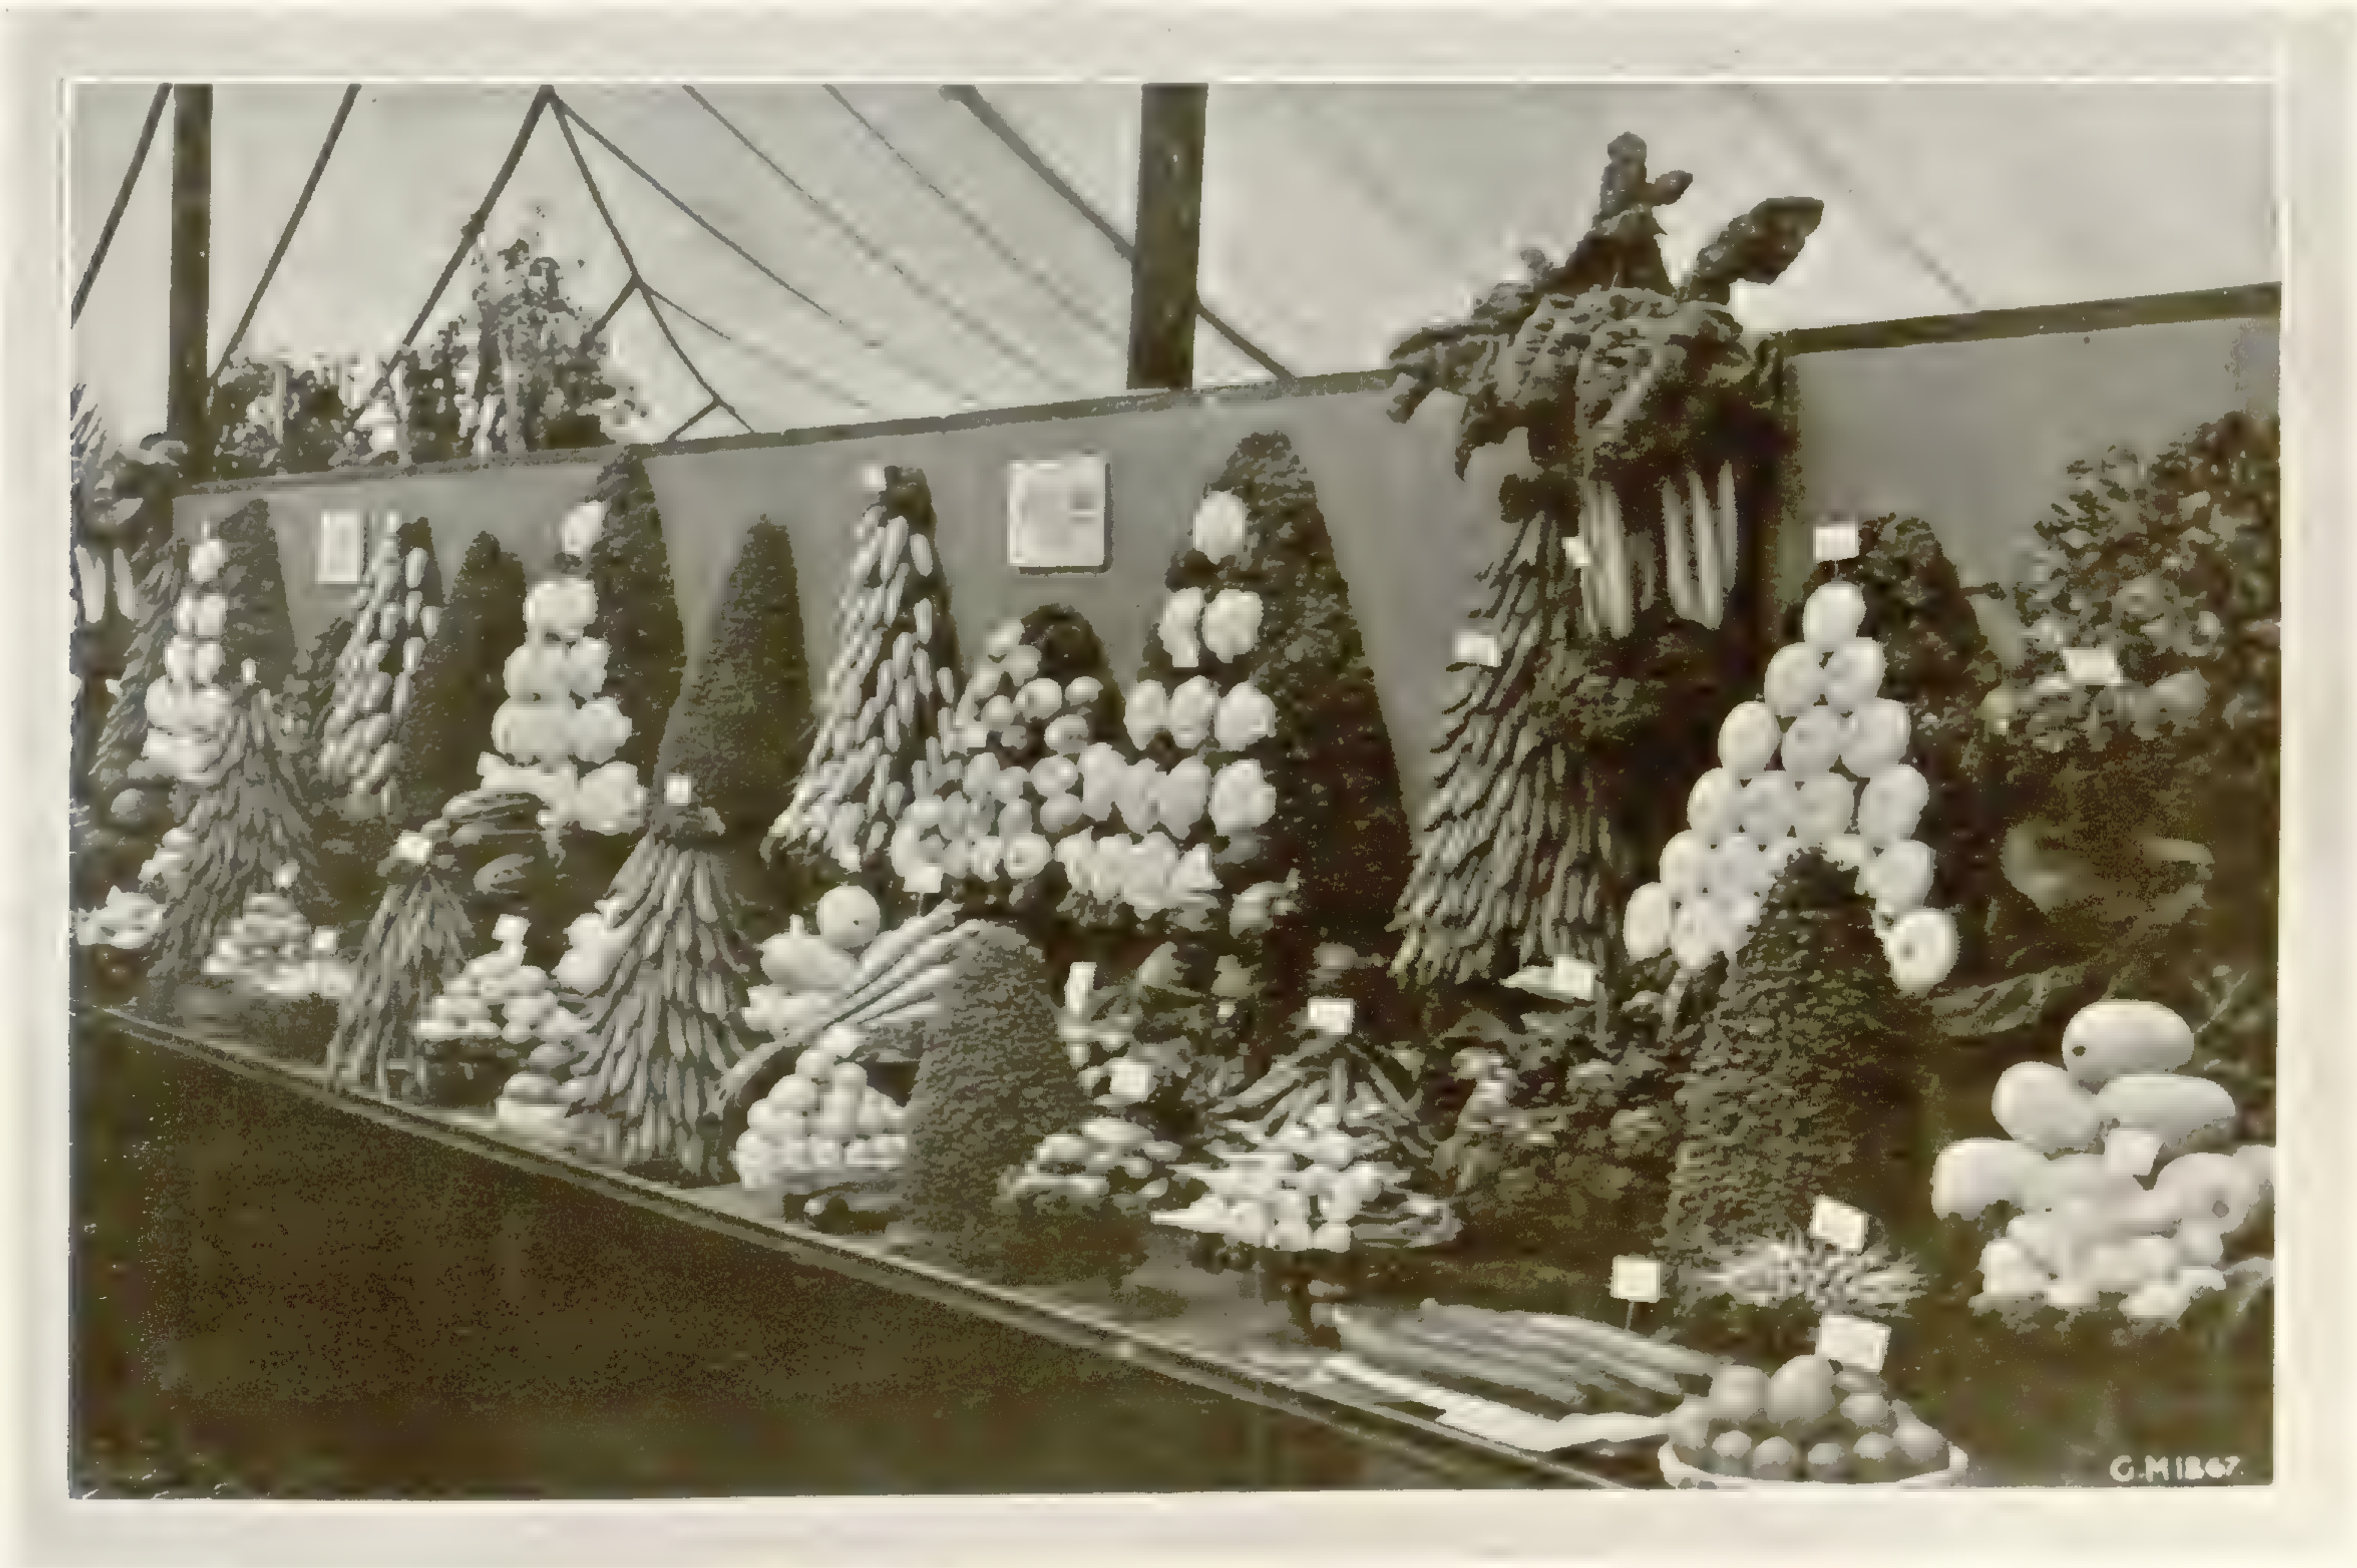
Mr. Lakeman, Thornton Heath, and Messrs. Phillips and Taylor, Bracknell, exhibited groups of cut carnations.

GOLD MEDAL VEGETABLES.

In the accompanying illustration we present our readers with a view of a most wonderful collection of splendidly grown vegetables exhibited by Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree. Our readers are well aware that Mr. Beckett occupies an unique position as an exponent of the art of vegetable culture, while as an exhibitor he is second to none. Of course, at a great London or provincial show one expects Mr. Beckett to put forth all his strength for the sake of his generous employer and for his own reputation, but at a quiet local show there would be an excuse if some reduction of effort was apparent.

But at the Elstree and Boreham Wood Horticultural Society's exhibition, held a few days ago in the grounds of Aldenham House, the collection illustrated was arranged, and all who saw it, and have seen other displays made by Mr. Beckett, agree that never has he exhibited so finely. Most speakers like a good audience, at once large and influential; many actors fail to do themselves justice before a thin house, and probably a somewhat similar feeling exists in horticulture, therefore there is greater honour due to the Hon. Vicary Gibbs and his able gardener for their successful effort at Elstree. A gold medal was awarded — no other award was possible.

A few of the outstanding subjects shown included Centenary, Marrowfat, and Sutton's Selected Duke of Albany peas, Golden Waxpod dwarf beans, Sutton's Globe beet, Sutton's Earliest cabbage, Early Giant cauliflower, New Red Intermediate, and Favourite carrots, Delicacy cucumber, Earliest White Purple kohl rabi, Ideal lettuce, Improved Custard marrow, mushrooms, White Leviathan onions, Perfection, and Sunbeam, and Supreme and King Edward potatoes.



GOLD MEDAL COLLECTION OF VEGETABLES.
Exhibited at Elstree and Boreham Wood Show by Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs.

TIME OF PRUNING FRUIT TREES.

> "All superfluous boughs
> We lop away, that bearing boughs may live."
> —"King Richard II."

It is not proposed to embark upon that sea of contention, the summer pruning of fruit trees, but to discuss the best time for carrying out that operation which everybody believes to be necessary to some extent with bush and dwarf fruit trees, or, indeed, trained fruit trees of any sort, namely, the cutting out of the superfluous growth of one season before the next season's growth begins. It is obvious that if this operation is altogether neglected the trees soon cease to be either trained or dwarf. The practice of gardeners varies very much, and, apart from what is distinctively termed summer pruning, is in progress from September to March. I propose in these few notes to draw attention to the advantages of doing the final pruning of the year while the leaves are yet on the trees, preferably in August and September, though some amount of pruning which takes the form of cutting out old and exhausted wood must necessarily be deferred till the fruit has been all gathered, which means that there must be some of this work left till the latter part of October in the case of late varieties.

To the professional gardener who has daylight in the garden right through the winter there is not much to recommend this practice on the score of convenience, for though the work may be, and undoubtedly is, much pleasanter in the autumn, on the other hand, he has much less pressure of work in the winter. But for the amateur who likes to prune his own fruit trees, and, generally through stress of business, sees little of his garden from November to February, there is much to be said on this ground alone for doing the work in the late summer and early autumn. But there are stronger grounds than this. For one thing, with the foliage still on the pruner can form a much better judgment of which growths should be removed to keep the tree open, while this same pruning will enable the foliage and the wood which is left to make the most of the precious autumn sunshine, and sap will be diverted from superfluous wood to the swelling up of next year's fruit buds. Where the fruit will not be picked till late October pruning should still be done, as far as possible, at the time suggested, not only for the reasons stated, but for the stimulus it will give to the swelling of the fruit, while the removal of some of the growths will give the fruits in the inner parts of the tree a better chance of colouring. There is no danger of loss of sap by cutting out branches when the leaves are on, as some seem to think, and it is surprising how soon the edges of the wounds begin to form a callus. One should not, however, choose a time when the sap is in its most active state, say late May or early June. No matter how thoroughly summer pruning is done, there is always some final pruning to do after the summer's growth is over, often the removal of secondary growth, which is usually recommended to be cut off at a joint below its origin on the primary shoot. It is only in a very damp autumn that there is any likelihood of any buds bursting out into growth after the middle of September, with the exception of one or two late growers like Winter Nelis pear or Adam's Pearmain.

Another advantage of September pruning is that the new bark, which the month or more of the growing season yet remaining enables to be formed, lessens the risk of woolly aphis and other diseases and pests appearing next year, while with plums it decidedly lessens the chances of gumming. With the Victoria plum, for instance, which is rather notorious for losing its branches, this may be reduced to a minimum by finishing the pruning directly the fruit is picked, that is, about the middle of September. This is a point especially to be observed with the extra-strong growth. I have adopted this system for many years, and have rarely had a case of gumming. I have all my stone fruit trees pruned and nailed up for the winter as soon after August as the fruit is cleared. Stone fruits rarely make any fresh growth after the end of August, so that it is safer to do their pruning earlier than with apples and pears, while gooseberries and currants may be pruned any time in August. An exception may sometimes be made, however, in the case of gooseberries and red currants where birds are troublesome, partly because the closeness of the growth during the winter lessens the visits of the birds, and partly because it can be seen in the spring which branches have suffered most from loss of buds, and these can be selected for removal. Some lessen the risk of loss of buds by tying up into a sheaf for the winter the branches of such bushes as lend themselves to it.

Another qualification should perhaps be made, and that is, with varieties of weak growth, where we want to strengthen them as much as possible, it may be advisable to defer the pruning till the end of October so that the foliage may be using all the autumn sun for elaborating further material for building up into the tissues of the tree.

Alger Petts.

Pyrethrums.—This is an excellent time for lifting and dividing the old plants. Replant them in ground which has been thoroughly prepared by receiving a liberal dressing of decayed manure, and then deeply dug. Should the soil in the new quarters be infested with slugs, it will be necessary to make use of an approved soil cleansing product. The divided parts may be put out twelve inches apart each way and well watered in.—E. C. Pooley.

VIOLA GRACILIS.

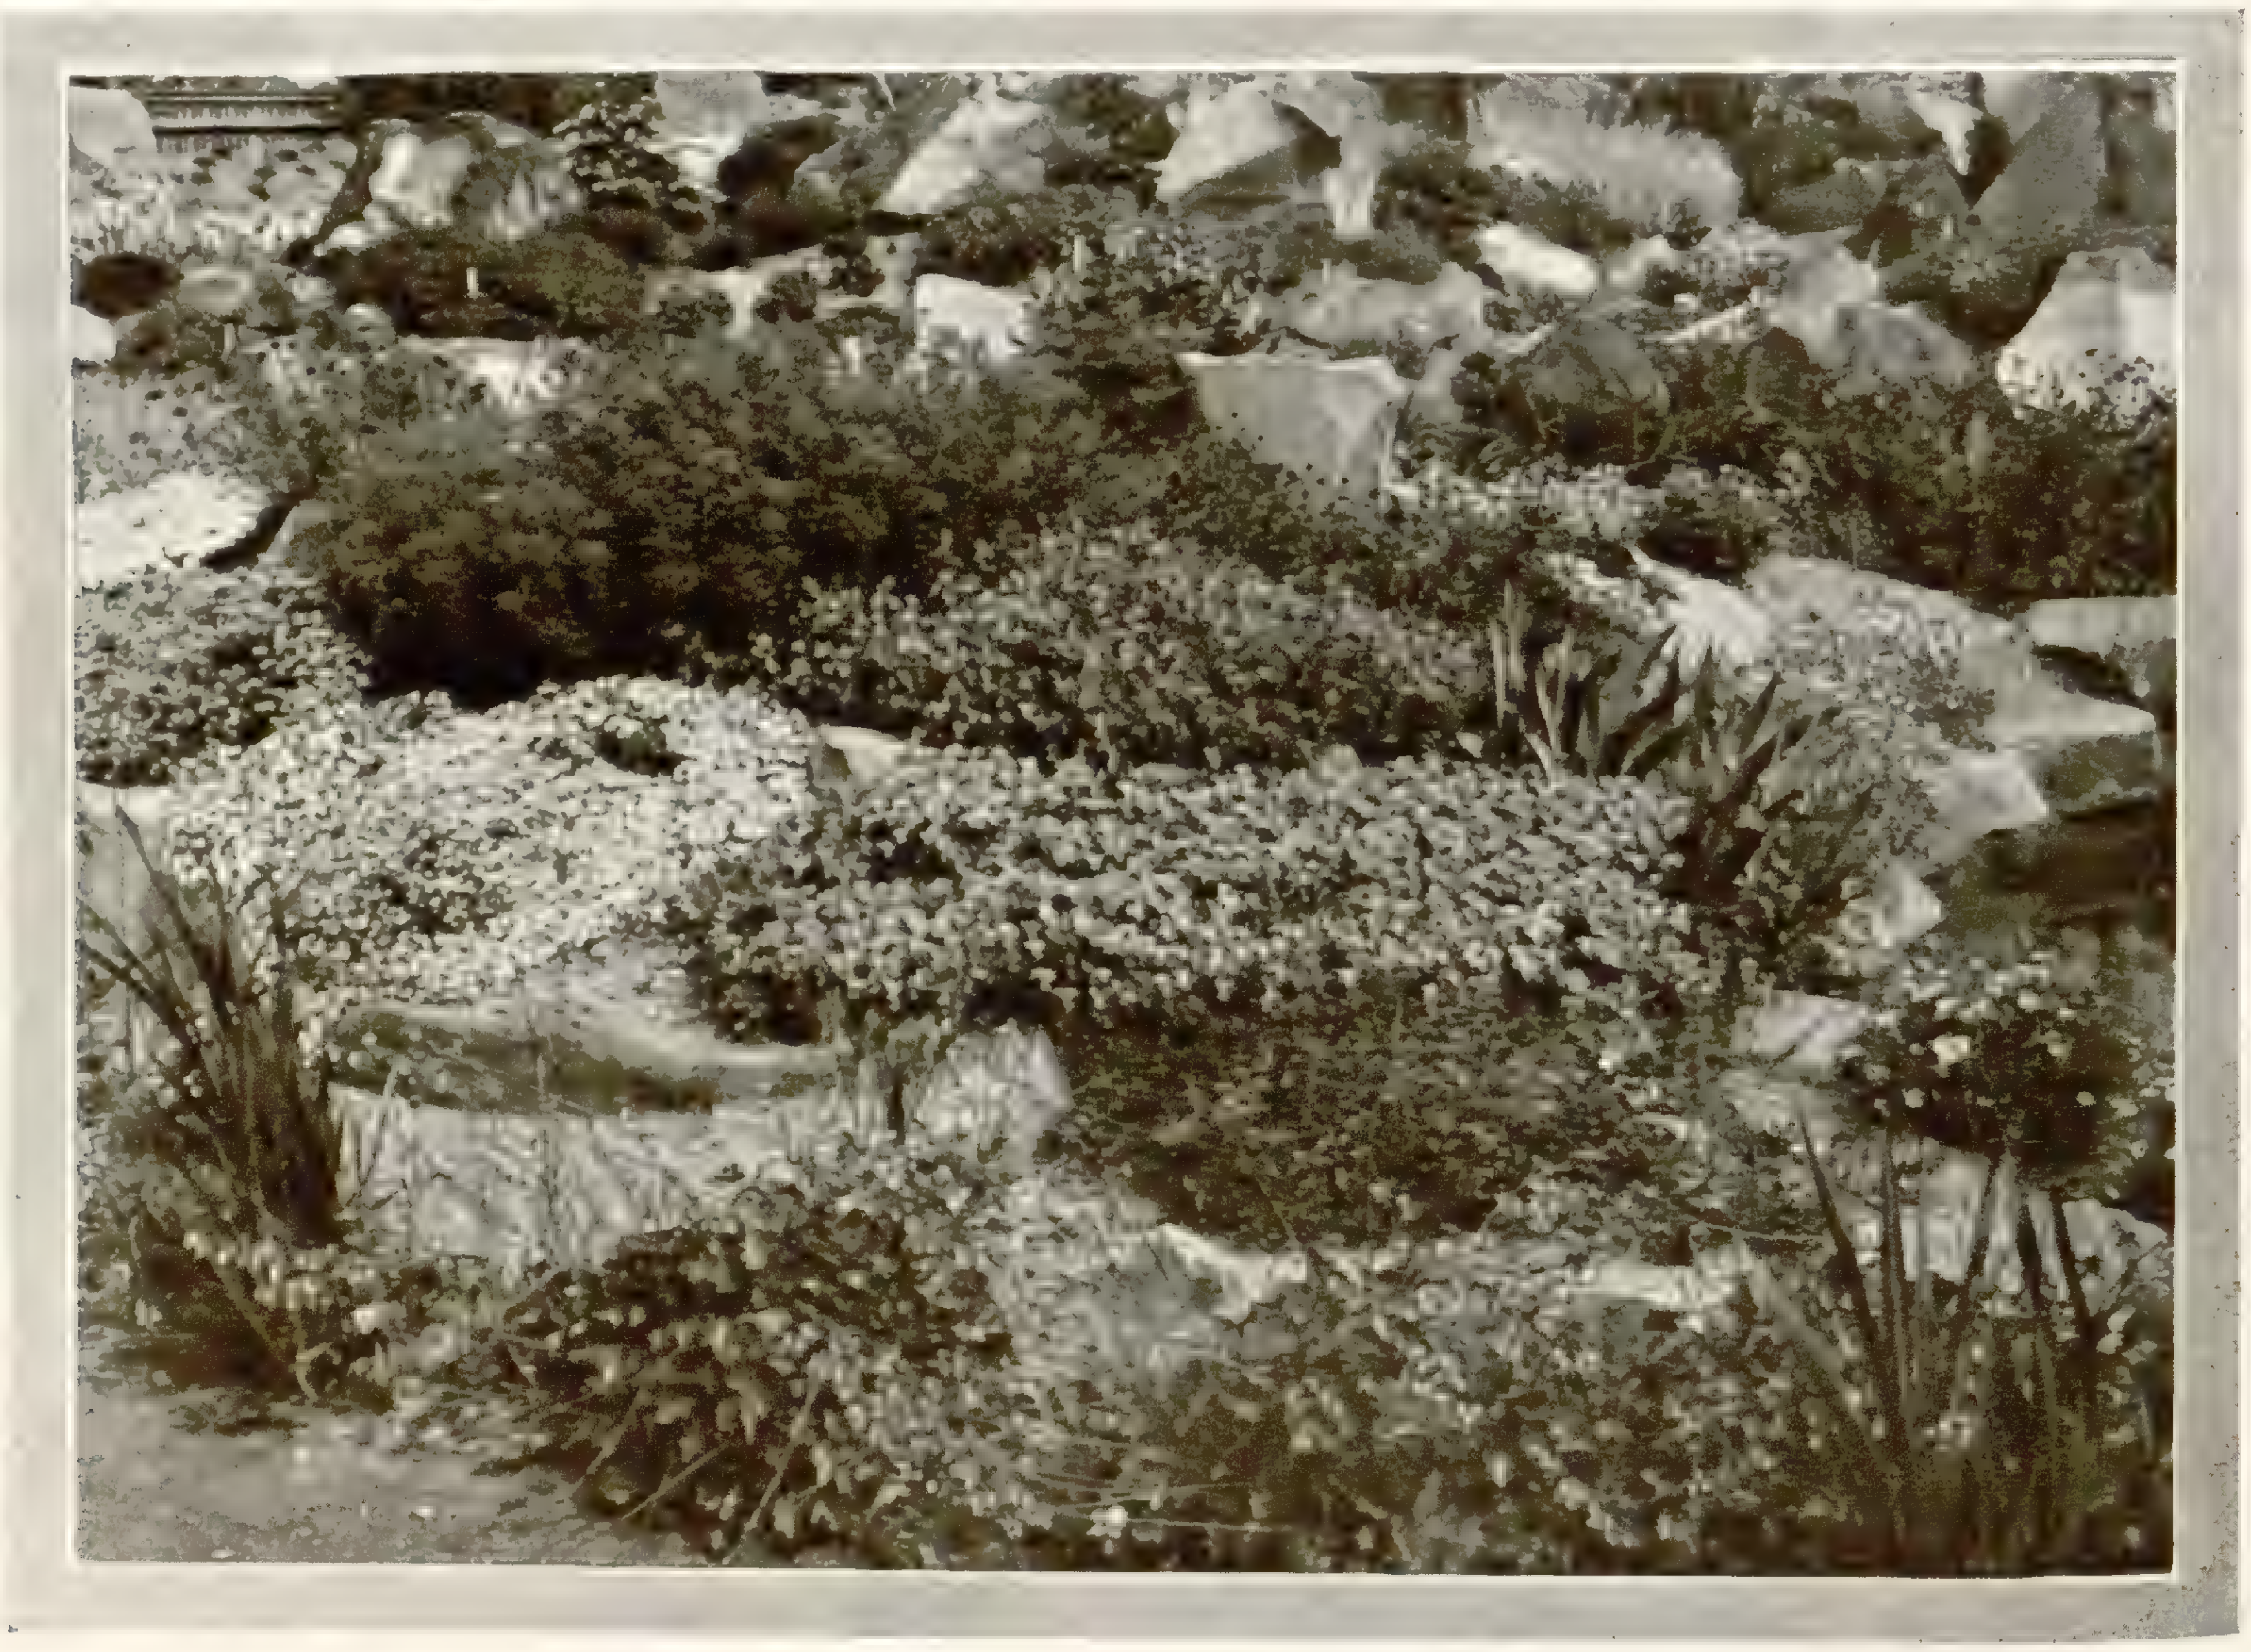
This sterling Grecian viola, distinguished by its charming mounds of low greenery, and its countless intense violet-hued blossoms (relieved simply by the tiny central white eye), is a first-rate subject for many phases of spring gardening. I have a good opinion of Viola gracilis, and would commend it for carpeting the ground planted by daffodils, tulips, and many other spring bulbs, especially those which are planted on sloping banks or ridges. It is fine also for a marginal plant for borders, especially if the borders are edged with natural stone, when the vivid masses of tiny violet blossoms, crowding over the grey stones, makes a distinctly meritorious and pleasing effect.

But perhaps of even greater importance is the value of the rock garden plantings of this exquisite viola. Here it can be planted well up among the rocks, where the blossoms can peer from the edge of the rock face on a level with the eye, the favourite position in which Mr. R. W. Wallace uses it.

The propagation of V. gracilis is very easy from cuttings, which can be rooted under the shelter of a handlight or frame at any time during late summer. The cuttings should be shaded from direct sunlight for a few days, and air must be given sufficiently to keep the young plants dwarf and sturdy. When rooted they can be transferred to small pots, or transplanted in prepared beds, as here they will make strong plants for late autumn or early spring planting. As for the time of blossoming, one cannot give a definite period, as its duration varies somewhat with the garden situation and weather conditions. This season one may put the flowering time as four months—i.e., March, April, May, and June. April is the month of months, the display then being very fine. At the end of June the plants should be cut over, and all old blossoms, seed-pods, etc., removed, the result being a few later flowers at intervals through the summer.

V. gracilis has hitherto been practically devoid of noteworthy varieties, if one excepts Purple Robe (which is really a ruby-purple), a truly valuable form. My own selection of Viola gracilis varieties which have been given considerable attention, include several meritorious varieties which may be of interest to lovers of rock gardens. Taking them in detail, we have Ruby, the nearest of all to Purple Robe, though with rather more of a warm reddish shade in the blossom, making it very effective in the sunlight. For freedom and good habit this is a very desirable form. Red Coronet is a lovely perpetual variety, and should become a useful rock plant in the near future. This has beautiful butterfly blossoms with ruby-red upper petals and lower petals of clear creamy-white, the one colour enhancing the other in a mos valuable degree.

Aurea is a free, continuous butt yellow variety, producing growth an blossoms freely for a long peri a very pretty little viola. Golde Fleece is the beau ideal of a roc plant, perfect to type, with the tinies leaves, and little violet-like blosso faintly rayed at the centre with tiny bla markings, being the finest yellow for colou ing in the series, a deep golden hue. Blue Jacket is a rich deep blue, without any trace of purple, an exact replica of V. gra cilis, save in its colour, and it has th making of an attractive little subject. Ex quisite is paler blue than the preced otherwise exactly similar; a pretty shad Grandeur, has a smaller, more perfect flow than the type, is very dwarf in habit, an rather bolder in foliage; it provides a ta ing deep rich blue with clear white e



VIOLA GRACILIS IN THE ROCK GARDEN, HOLLAND HOUSE, SOUTHCLIFF.
A distinct and beautiful free-blooming species bearing violet-purple flowers.

and is a model plant for rock garden or border, and practically perpetual.

Grandiflora gives the exact violet colouring, with clear white eye, and has the good habit of V. gracilis, with a flower of the approved florist's type in form and substance. It is good for practically all purposes to which the violas can be put.

These practically exhaust the notable forms we have secured here (as far as V. gracilis is concerned), but I should like to include with them in these notes the varieties raised as intermediate forms between V. gracilis and V. Papilio. These, though unnamed, are worthy of note, as they give the colourings near to V. gracilis with the size and continuous blossoms of V. Papilio.

Of varieties of papilio, true to type, we have selected three for further trial and extended planting. Two of these are under the labels of grandiflora and magnifica; the former is a large pale blue, not so washy as the type, and the latter a deeper colour with a tone of purple in it; both may be regarded as simply good, improved floriferous forms of the type. But the third, V. Papilio Brookside Fairy, is a lovely winged flower of great beauty, with a neat, prostrate, spreading habit. The blossoms are delightfully fragrant, with golden-yellow lower petals, and a ruby-red crown, having tiny black pencillings at the eye. For covering sloping banks, massing under taller plants, or for rock garden groupings, this truly butterfly form of V. Papilio will be of immense service.

In emphasis of my remarks as to the floriferous character of Viola gracilis, may I refer my readers to the accompanying illustration of a mass of V. gracilis upon one of the lower mounds in the rock garden at Holland House, Southcliff, as showing the floriferous character of the plant in question, though, unfortunately, without suggesting the intense colouring given by the countless blossoms.

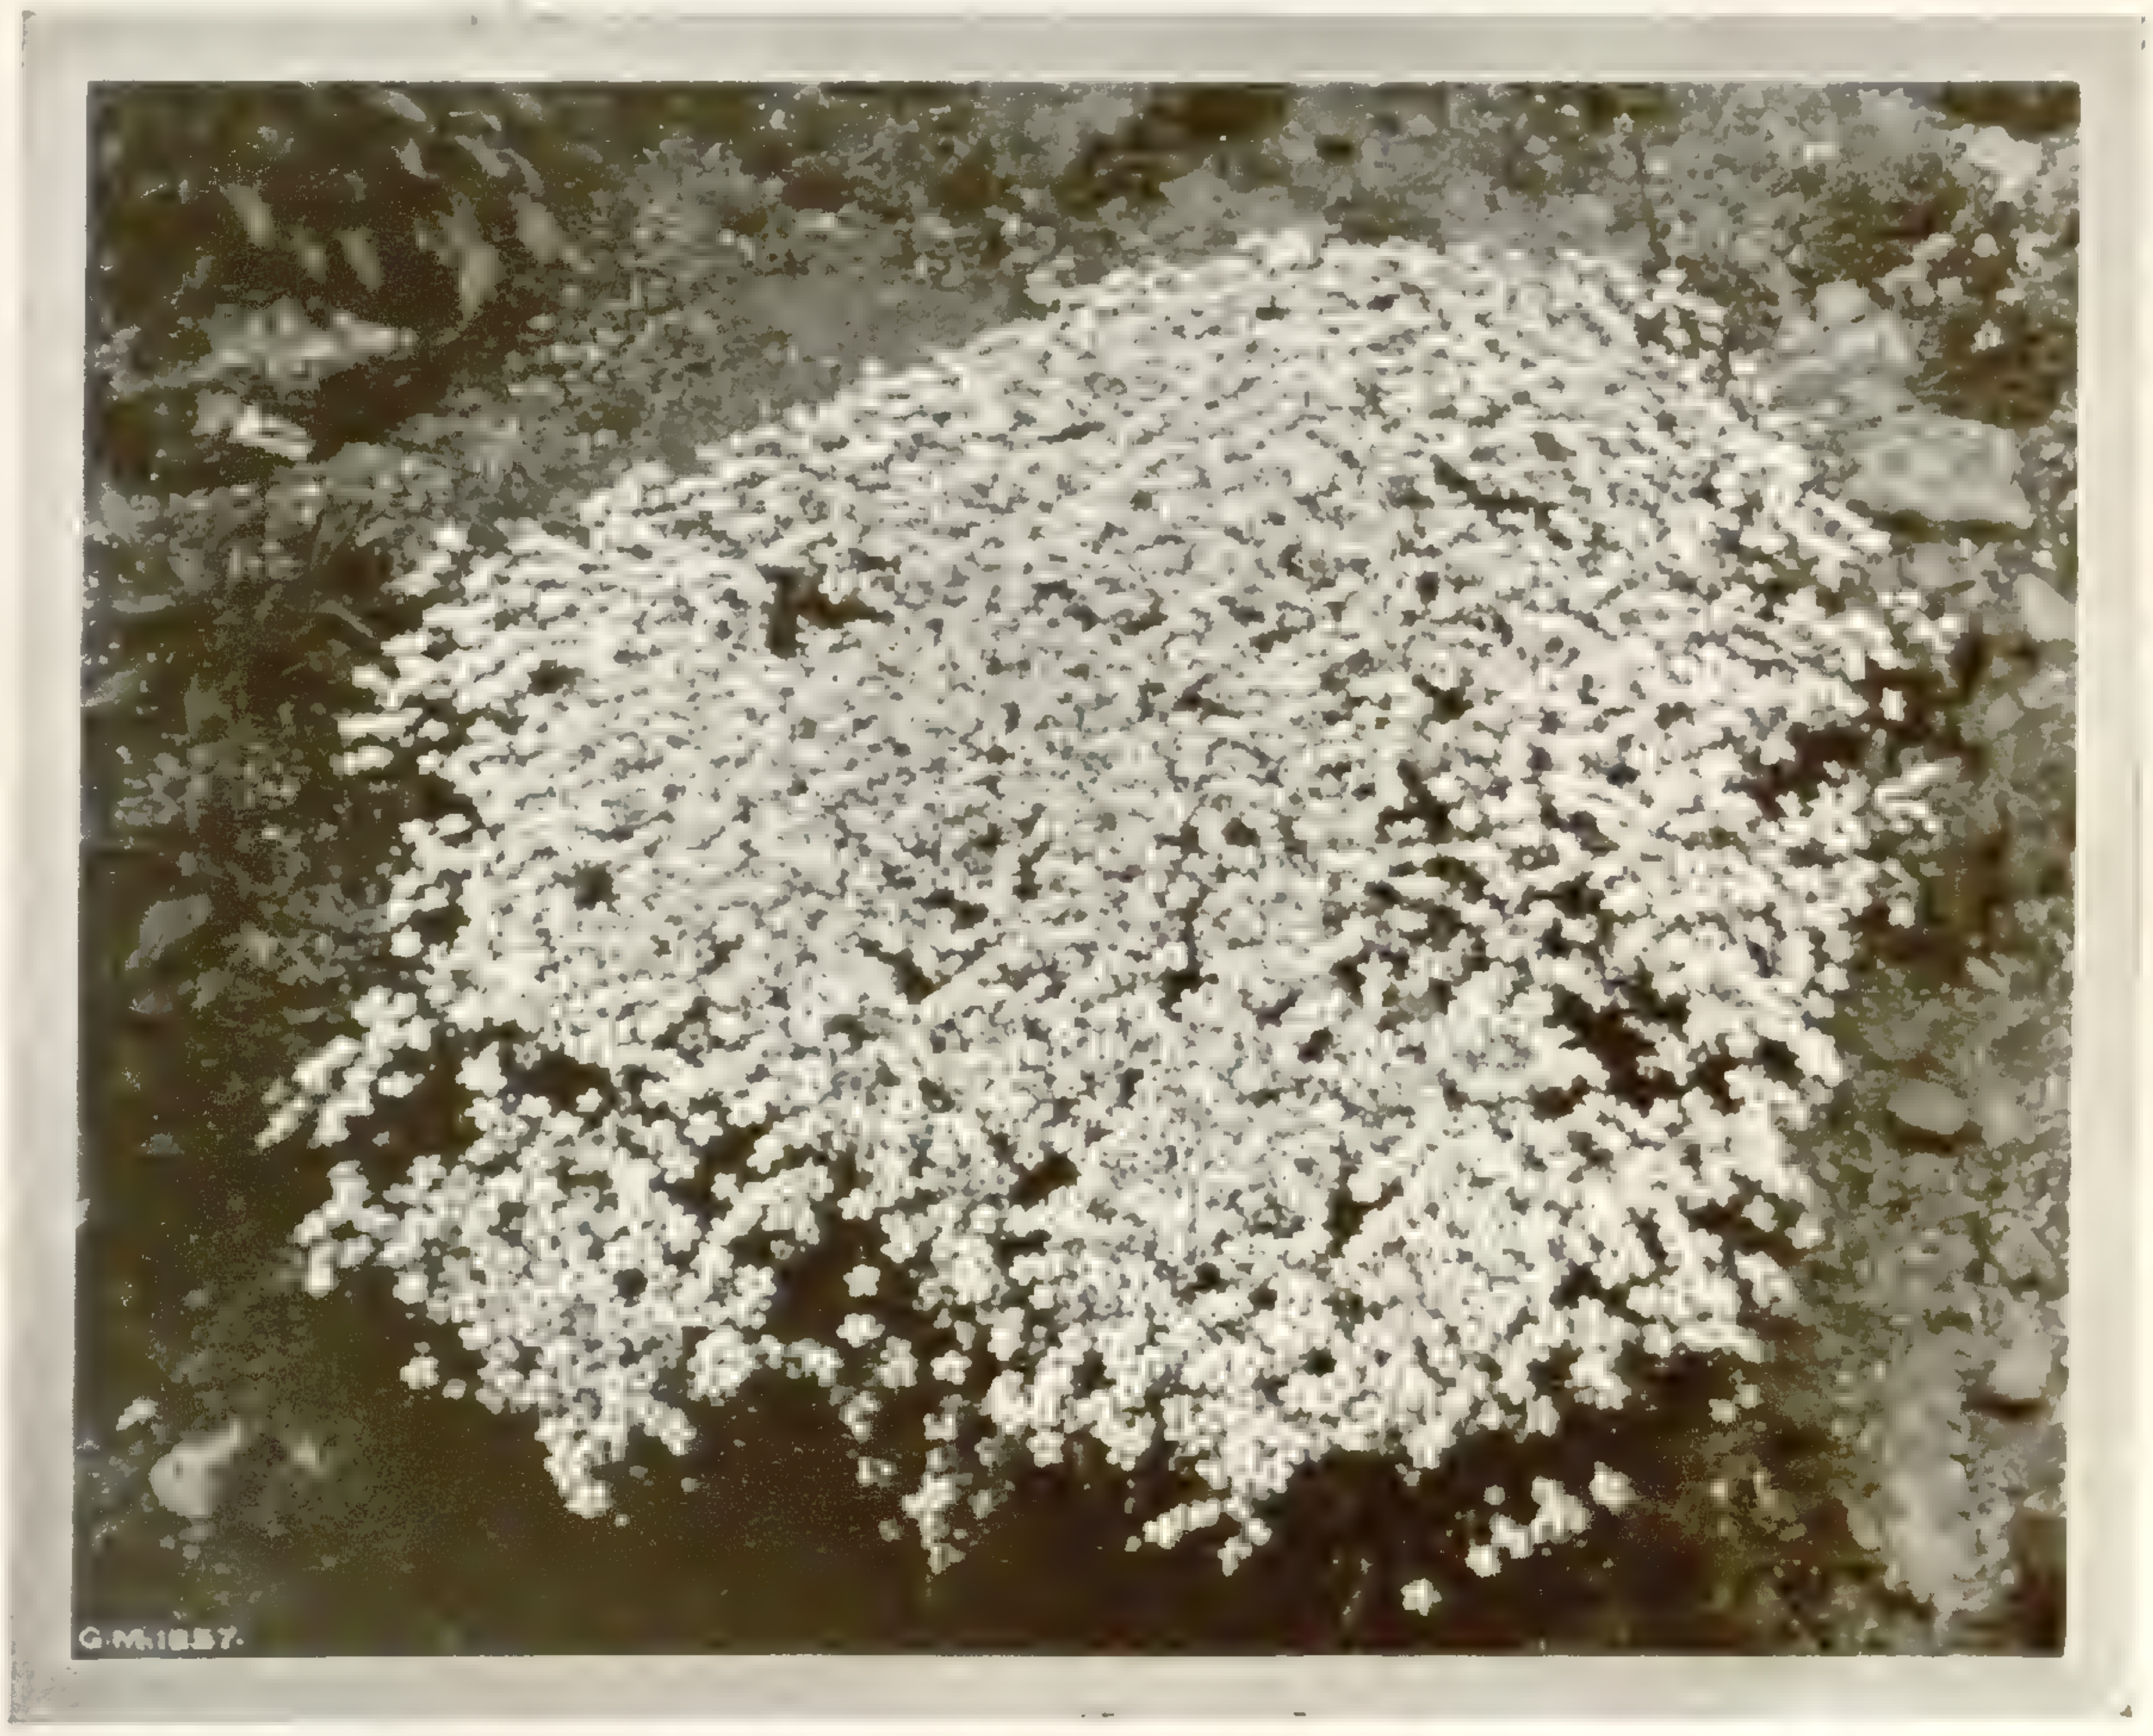
P. S. Hayward.

SAXIFRAGA EXARATA.

Like most of the other members of the mossy section of this genus, this species is a very variable one, and when Engler monographed the genus he divided it into several varieties. The present plant has been grown in gardens under the name of S. punctata, quite a distinct species of the umbrosa group from Siberia. Another name under which it is met with is S. pulchella, which is a synonym of S. exarata. The present plant agrees with authentic figures of S. exarata.

Very floriferous, the plant is a mass of pure white when in flower, the blooms being on stems about three inches high. In habit it is very compact, forming a mass of small rosettes that do not spread so readily as many of the other mossy kinds. The leaves forming the rosettes are each divided into three nearly equal narrow lobes, gradually becoming quite entire higher up the stem. S. exarata, in its various forms, is spread over the Alps of Europe at fairly high altitudes, and the form shown in the illustration is a first-rate garden plant suitable for the partially-shaded parts of the rock garden, where it remains in full beauty for a considerable period. It is also quite at home in the more open parts, provided that it obtains sufficient moisture. Propagation is readily effected by means of division in autumn or early spring. Seeds cannot be relied on, for, like all saxifrages, this kind readily hybridises with any other mossy member of the genus that happens to be planted near it.

W. Irving.



SAXIFRAGA EXARATA.
A distinct species producing a profusion of pure white flowers.

HYPERICUMS.

It is difficult to overestimate the value of hypericums in the summer garden. Their flowering propensities are notorious, nearly all are neat in habit, many being dainty as rock plants, while others are among the most elegant of shrubs. They are not particular as to soil, as many succeed under very indifferent conditions, although it always pays to prepare the ground by digging and manuring previous to planting.

All the species and varieties are readily increased by seeds, cuttings, or divisions, the former not infrequently germinate around the parent plant; cuttings are best inserted in late summer or autumn, in sandy soil, in a semi-shady border, while division of the plants may be carried out during the normal planting season.

Hypericum Androsæmum, the common Tutsau, is a plant of great merit, yet frequently neglected; the flowers are yellow, small, and are succeeded by oblong fruits which, at first, are a rich mahogany shade, but eventually change to an intense jet black. These fruits are exceedingly lasting, and branches of them are beautiful when arranged in vases indoors.

H. calycinum (Rose of Sharon) produces large yellow flowers, the centre being filled with a huge boss of delicate stamens, making a brilliant spectacle when in flower. The plant bears a large amount of shade, and the roots battle successfully with those of other plants, and for this reason it becomes a valuable subject to mass in woods and banks, where the natural conditions preclude the use of other subjects. It grows about 12in. high, and is almost evergreen.

H. Coris is a low shrub, only six to nine inches high, with narrow needle-like leaves of a grey-green colour. The flowers, though small, are large for the plant, and are borne on twiggy branches throughout summer. It makes one of the prettiest rock plants found in the genus.

H. Hookerianum, a Himalayan species, and somewhat tender, produces large flowers that are slightly cupped, on bushes some two feet high; it is one of the best for garden purposes, and is seen to advantage when freely massed as a foreground to other shrubs. H. oblongifolium is a synonym of this.

H. Kalmianum develops into a stiffly branched twiggy bush some two to four feet high, carrying its flowers in terminal corymbs during summer and autumn. The leaves are narrow and the growth is slow, so that it makes a capital subject for moderate-sized rock gardens. It is a North American species, and quite hardy.

H. fragile is prostrate in growth, the stems being terminated by clusters of rich golden flowers that almost hide the plants in June and July. The leaves are grey-green in colour, and are quite effective on the rock garden, even when the plant is out of flower.

H. patulum forms a spreading bush up to five feet in height; it is none too hardy, and occasionally suffers in a severe winter. The variety Henryi is hardier and more robust in growth, and succeeds if the stems are cut to the ground level each year in spring; the flowers are yellow, of medium size, and freely produced in late summer and autumn.

H. uralum (nepaulense) is much in the way of H. patulum in height, hardiness, and season of flowering. H. repens is a dwarf species from Eastern Europe, resembling H. fragilis in habit, but the foliage has not the glaucous tint of that species.

H. reptans is a slender creeping species with flexible stems and rounded box-like leaves, that present a vivid red-bronze colour in autumn; the flowers are large, cupped, and of a rich soft shade of yellow. A native of the Himalayas, it is quite distinct from any other member of the genus.

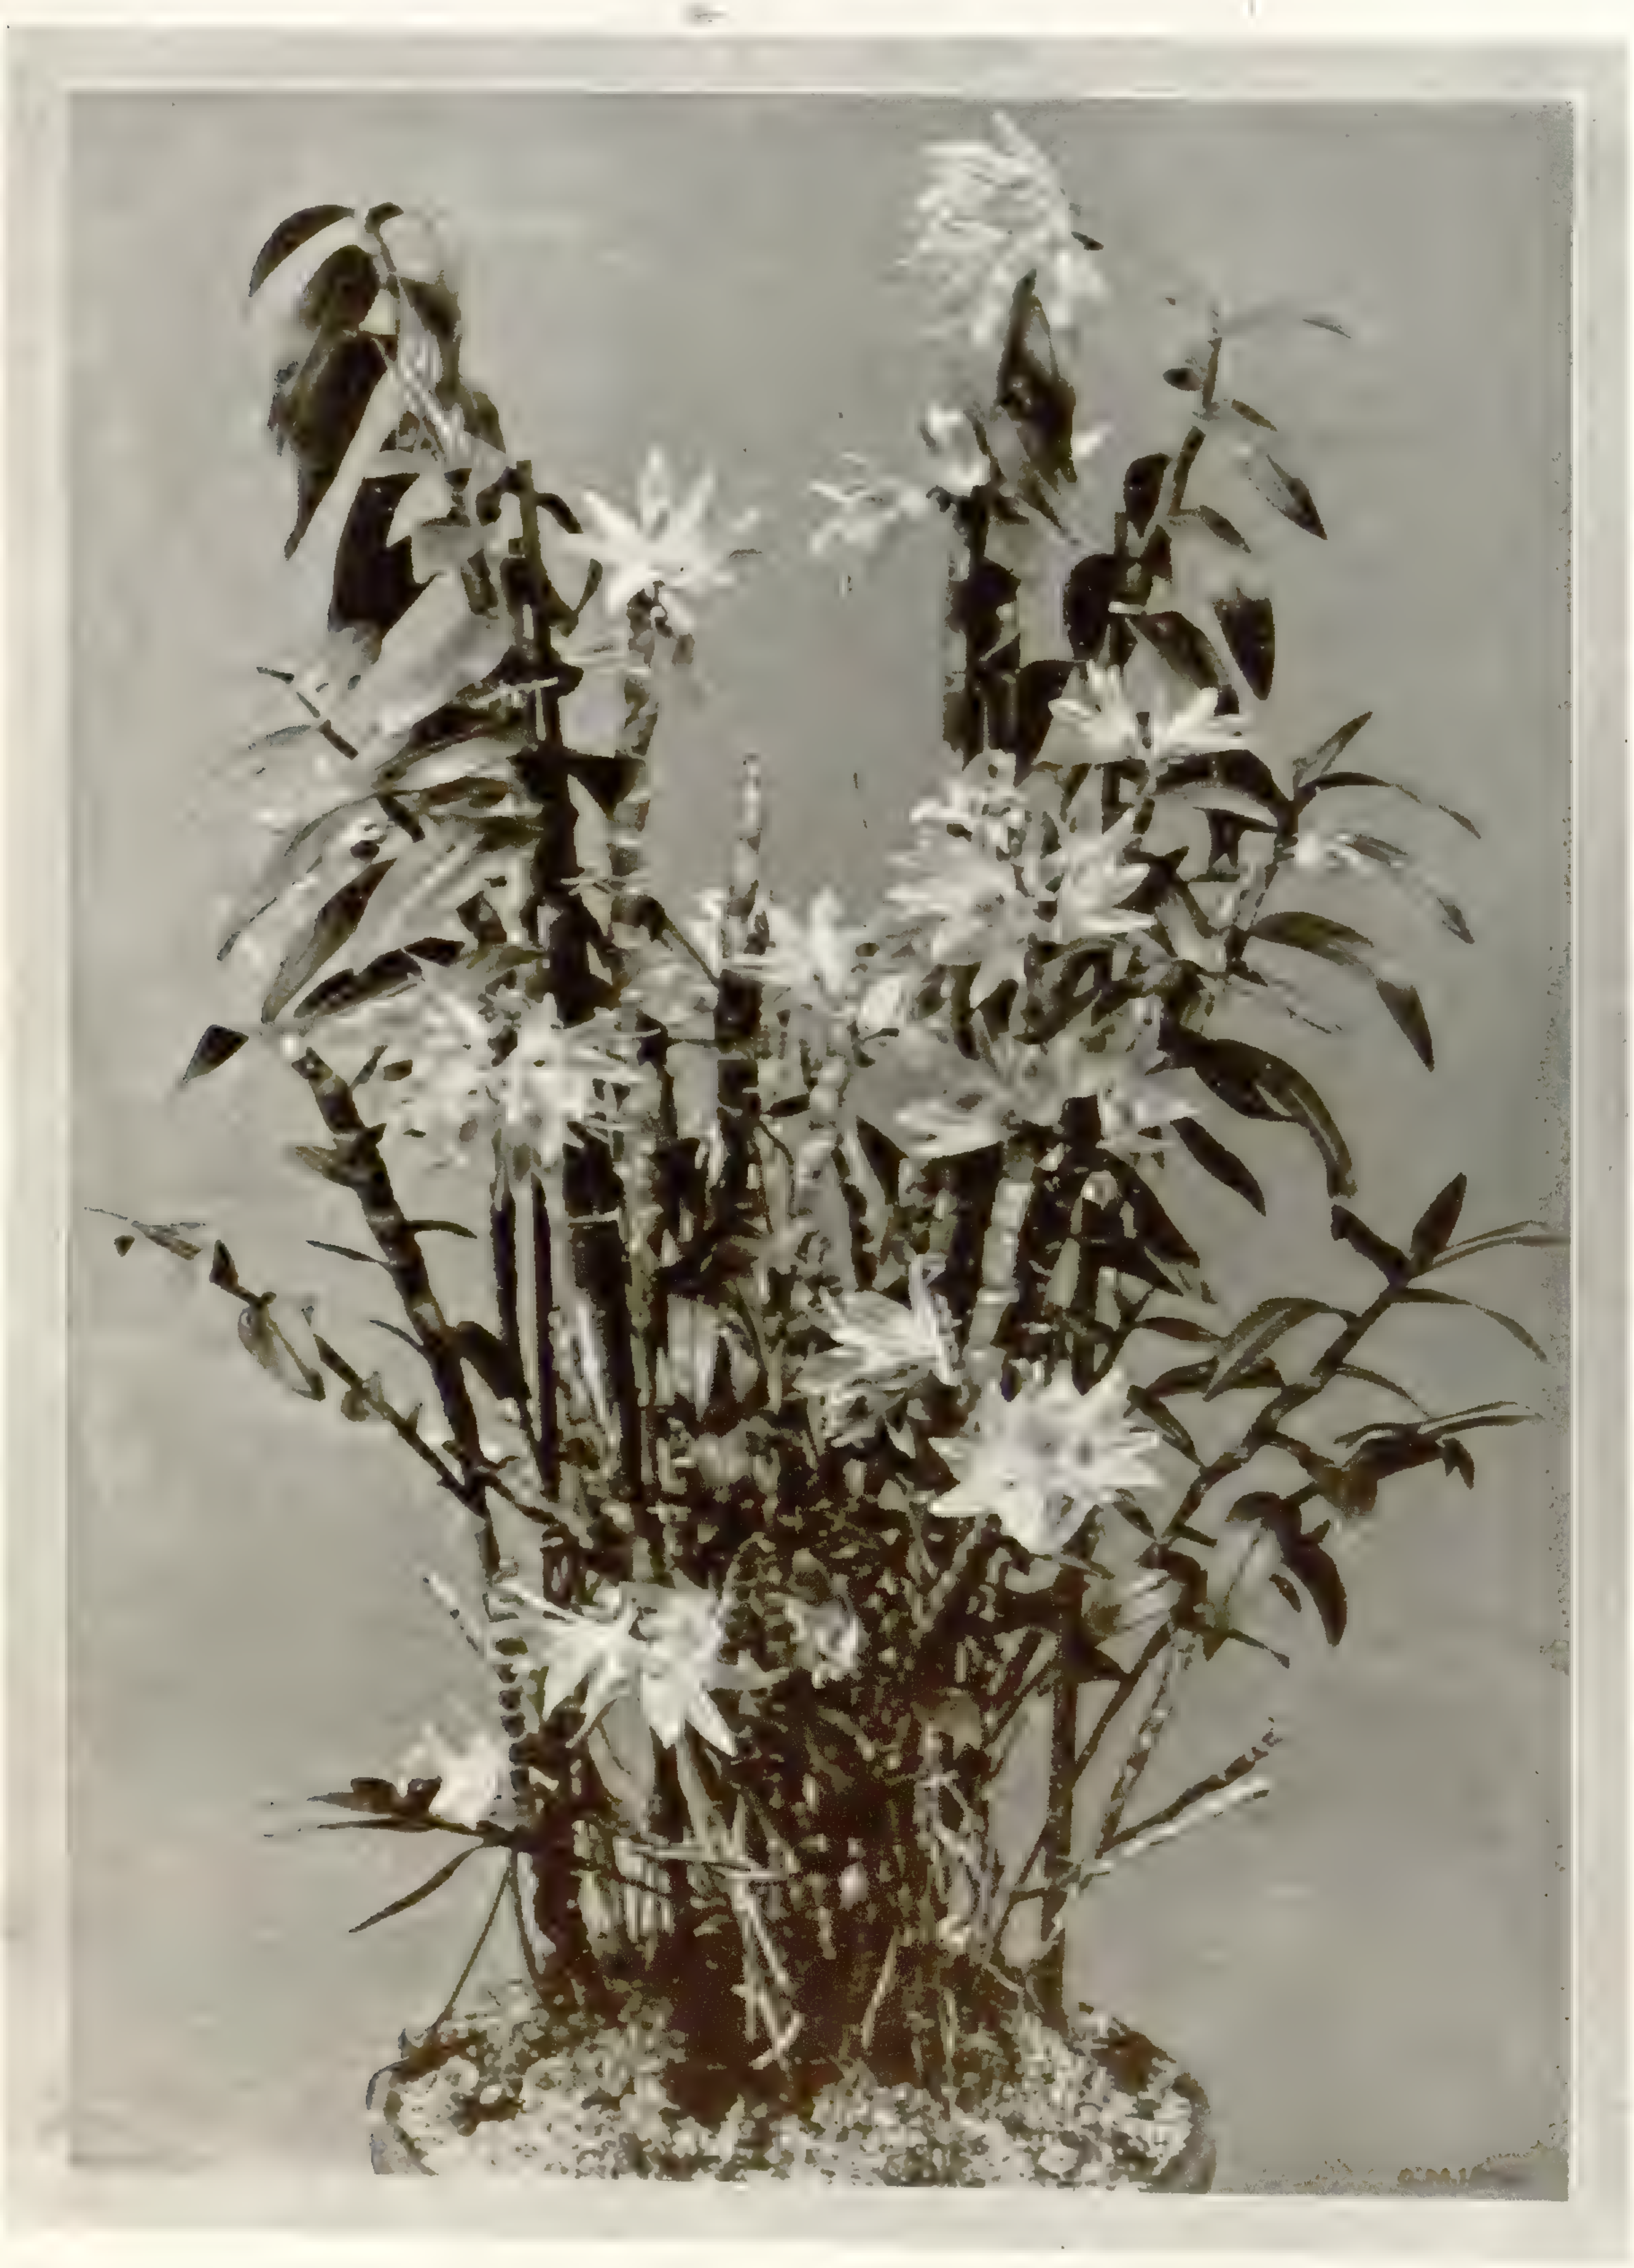
H. Moserianum is an evergreen, and the result of a cross between H. calycinum and H. patulum. It attains a height of four to five feet, and bears deep yellow flowers with red-tipped anthers that are in season during summer and autumn.

Thomas Smith.

NEW PLANTS, ETC.

DENDROBIUM VICTORIA REGINA.

Never has the blue Dendrobium Victoria Regina been seen in such fine form and condition as at the recent Royal Horticultural Society meeting. The species comes from Manila, and though it has been in cultivation some years it is rare, and not very popular. However, it is now obvious that a higher type of flower is available, and that cultural skill can evolve a good specimen. The flowers are of medium size, bright purplish-blue with white bases to the segments. F.C.C., and Cultural Commendation, July 18. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.



DENDROBIUM VICTORIA REGINA.

Flowers bright purplish-blue, with white bases to the segments. F.C.C., R.H.S., July 18. Sir Trevor Lawrence, Bart.; grower, Mr. W. H. White, Burford Lodge, Dorking.

PLAGIANTHUS LYALLI.

A malvaceous shrub that is hardy in this country only in particularly sheltered spots. At Kew and other southern gardens it grows well against a wall. The flowers are white, an inch or so across, have a central cluster of golden stamens, and are produced in the axils from the leaves. P. Lyalli is a native of New Zealand. A.M., R.H.S., July 18. Mr. C. J. Lucas, Warnham Court, Horsham.

CANNA FRAULEIN E. KRACHT.

A striking variety with large bold rosy-salmon flowers, borne on an unusually fine and elongated spike. So many varieties bunch their flowers thickly, whereas this one carries them in a large spike. A useful and handsome canna. A.M., R.H.S., July 18. Messrs. James Veitch and Sons, Chelsea.

FOKIENIA HODGINSI.

This is a new conifer from Fokien, and one on which Dr. Henry has founded a new genus. Evidently the plant has a close affinity with Libocedrus. The small plants shown were of elegant selaginella-like habit, and suggested that the species would do well in pots. Some of the plants exhibited had recently come from China, while the others, and quite small ones, had been raised from seeds at Barnet. A.M., R.H.S., July 18. Miss Weyburn, Hadley Manor, Barnet

CARNATIONS.

King George.—A very beautiful broad-petalled variety of purest whiteness; it has good form, size, and stem to recommend it. A.M., R.H.S., July 18. Mr. Charles Blick, Hayes.

James Quinn.—A showy buff ground fancy carnation with heavy markings of rich rosy-red. A.M., R.H.S., July 18. Mr. Charles Blick.

Dora Blick.—This very fine and distinct carnation appears certain of a great future. It is of fine form and substance, and of good size, while the colour is best described as orange terra-cotta. A.M., R.H.S., July 18. Mr. Charles Blick.

Herbert Newman.—A long-stemmed border variety, its large flowers being pure white, lightly flaked and splashed with soft scarlet. A.M., R.H.S., July 18. Mr. A. F. Dutton, Iver, Bucks.

Mrs. Andrew Brotherstone.—A bold fancy border carnation its showy flowers being coloured crimson and rose. A.M., R.H.S., July 18. Mr. James Douglas, Great Bookham.

Mrs. Elliott Douglas.—A splendid border carnation carrying its large, well-formed golden-yellow flowers on long stiff stems. A.M., R.H.S., July 18. Mr. James Douglas.

EREMURUS OLGÆ ALBA.

A charming new form that differs from the type in having white flowers and a green line down the centre of each segment, instead of pink flowers and a carmine line. It was collected in Persia, in a new district at an altitude of 7,000 feet, and is a desirable garden plant. A.M., R.H.S., July 18. The King's Acre Nursery Company, Hertford.

ROSES.

Nerissa H.T.—A lovely full-sized hybrid tea rose with palest peach-yellow petals exquisitely tinted with pink. Should make a good exhibition rose. A.M., R.H.S., July 18. Messrs. William Paul and Son, Waltham Cross.

George Dickson H.P.—A remarkably fine addition to the high coloured hybrid perpetuals; the blooms are large, of great depth, and of superb form, and the colour red glowing crimson. Gold Medal, N.R.S., July 19. Messrs. Alex. Dickson and Sons, Newtownards.

Mrs. David Baillie H.T.—A distinct and beautiful variety that has the promise of proving of much value for decorative purposes as well as for exhibition. The flowers are of medium size and fine form, and the colour rich glowing rose-red. Silver-gilt Medal, N.R.S., July 19. Mr. Hugh Dickson, Belfast.

Mrs. Muir Mackean H.T.—A charming variety, the blooms of good size and excellent form; the colour soft bright rose. Silver-gilt Medal, N.R.S., July 19. Messrs. S. McGredy and Son, Portadown.

Lady Dunleith T. — An effective variety, flowers comparatively large and good form, the colour bright yellow, deeper in the centre. Silver-gilt Medal, N.R.S., July 21. Messrs. Alex. Dickson and Sons.

Earl of Gosford H.T. — An attractive variety remarkable for its brilliance of colouring and also for its fragrance. The flowers are of large size and good form, and the colour rich crimson. Card of Commenda N.R.S., July 21. Messrs. McGredy and

---

Colchicum speciosum album —A plant of outstanding merit in the garden, Colchicum speciosum album has years stood at a premium, but is now the reach of almost every collector, a plant that should be acquired at the est possible moment. The well-known chicum autumnale gives but an idea of the glorious character present in variety, the flowers being thrice as and composed of bold, firm petals of white to which the golden-tinted afford a pleasing contrast. It is hardy, and increases at a moderate any good cultivated soil. It is best on the rock garden among dwarf similar subjects which protect the from soil washing, as these come of the leaves. The type with its flowers and the variety atrorubens be overlooked, but along with the constitute a group of bulbous plants that considerably to the beauty and interest the garden in autumn.—Thomas Smith.

HARDY PLANT CHAT.

Boltonia asteroides.

I do not think people are sufficiently well acquainted with the true value of this composite, which is rather aptly named "asteroides," seeing that its flowers resemble those of some of the finest of the perennial asters, or Michaelmas daisies. They are earlier, however, but last a long time in bloom, as the plants give a succession of flowers for several months. This year Boltonia asteroides has flowered in the very beginning of July, and, although other things in bloom are numerous, yet we ought always to have a welcome for such a good plant as this, which, by the way, is by some classed now as an aster, this species bearing the anomalous name of Aster asteroides. "The aster-like aster" is rather an absurd name for any flower, and I thus prefer the more familiar and appropriate enough one of Boltonia asteroides.

It is a handsome border plant, with branching stems of good daisy-like flowers of about two inches across, and with the narrow ray-petals which constitute such a charm of some of the erigerons. For cutting it is serviceable, and for the border in istelf it is a valuable plant.

Then it presents no difficulties in cultivation, contenting itself with a poor soil, although preferring a richer compost, and flowering happily in either. A native of moist soil, in which it grows in the Eastern United States, it is apparently indifferent to its supply of moisture, and thrives quite well in a dry place. By this, of course, I do not mean a dust-dry position, but one in which border plants of the ordinary class will exist and flower on, even though not the most congenial quarters. It is a variable plant, but is not often seen with us with a stature of about eight feet, one which some of the plants at home are said to reach. We are all the better satisfied when it flowers at a height of from two to four feet. This season, when other plants are shorter than usual on account of the drought, it is fully two feet high in a border of fairly good loam, but on the dry side.

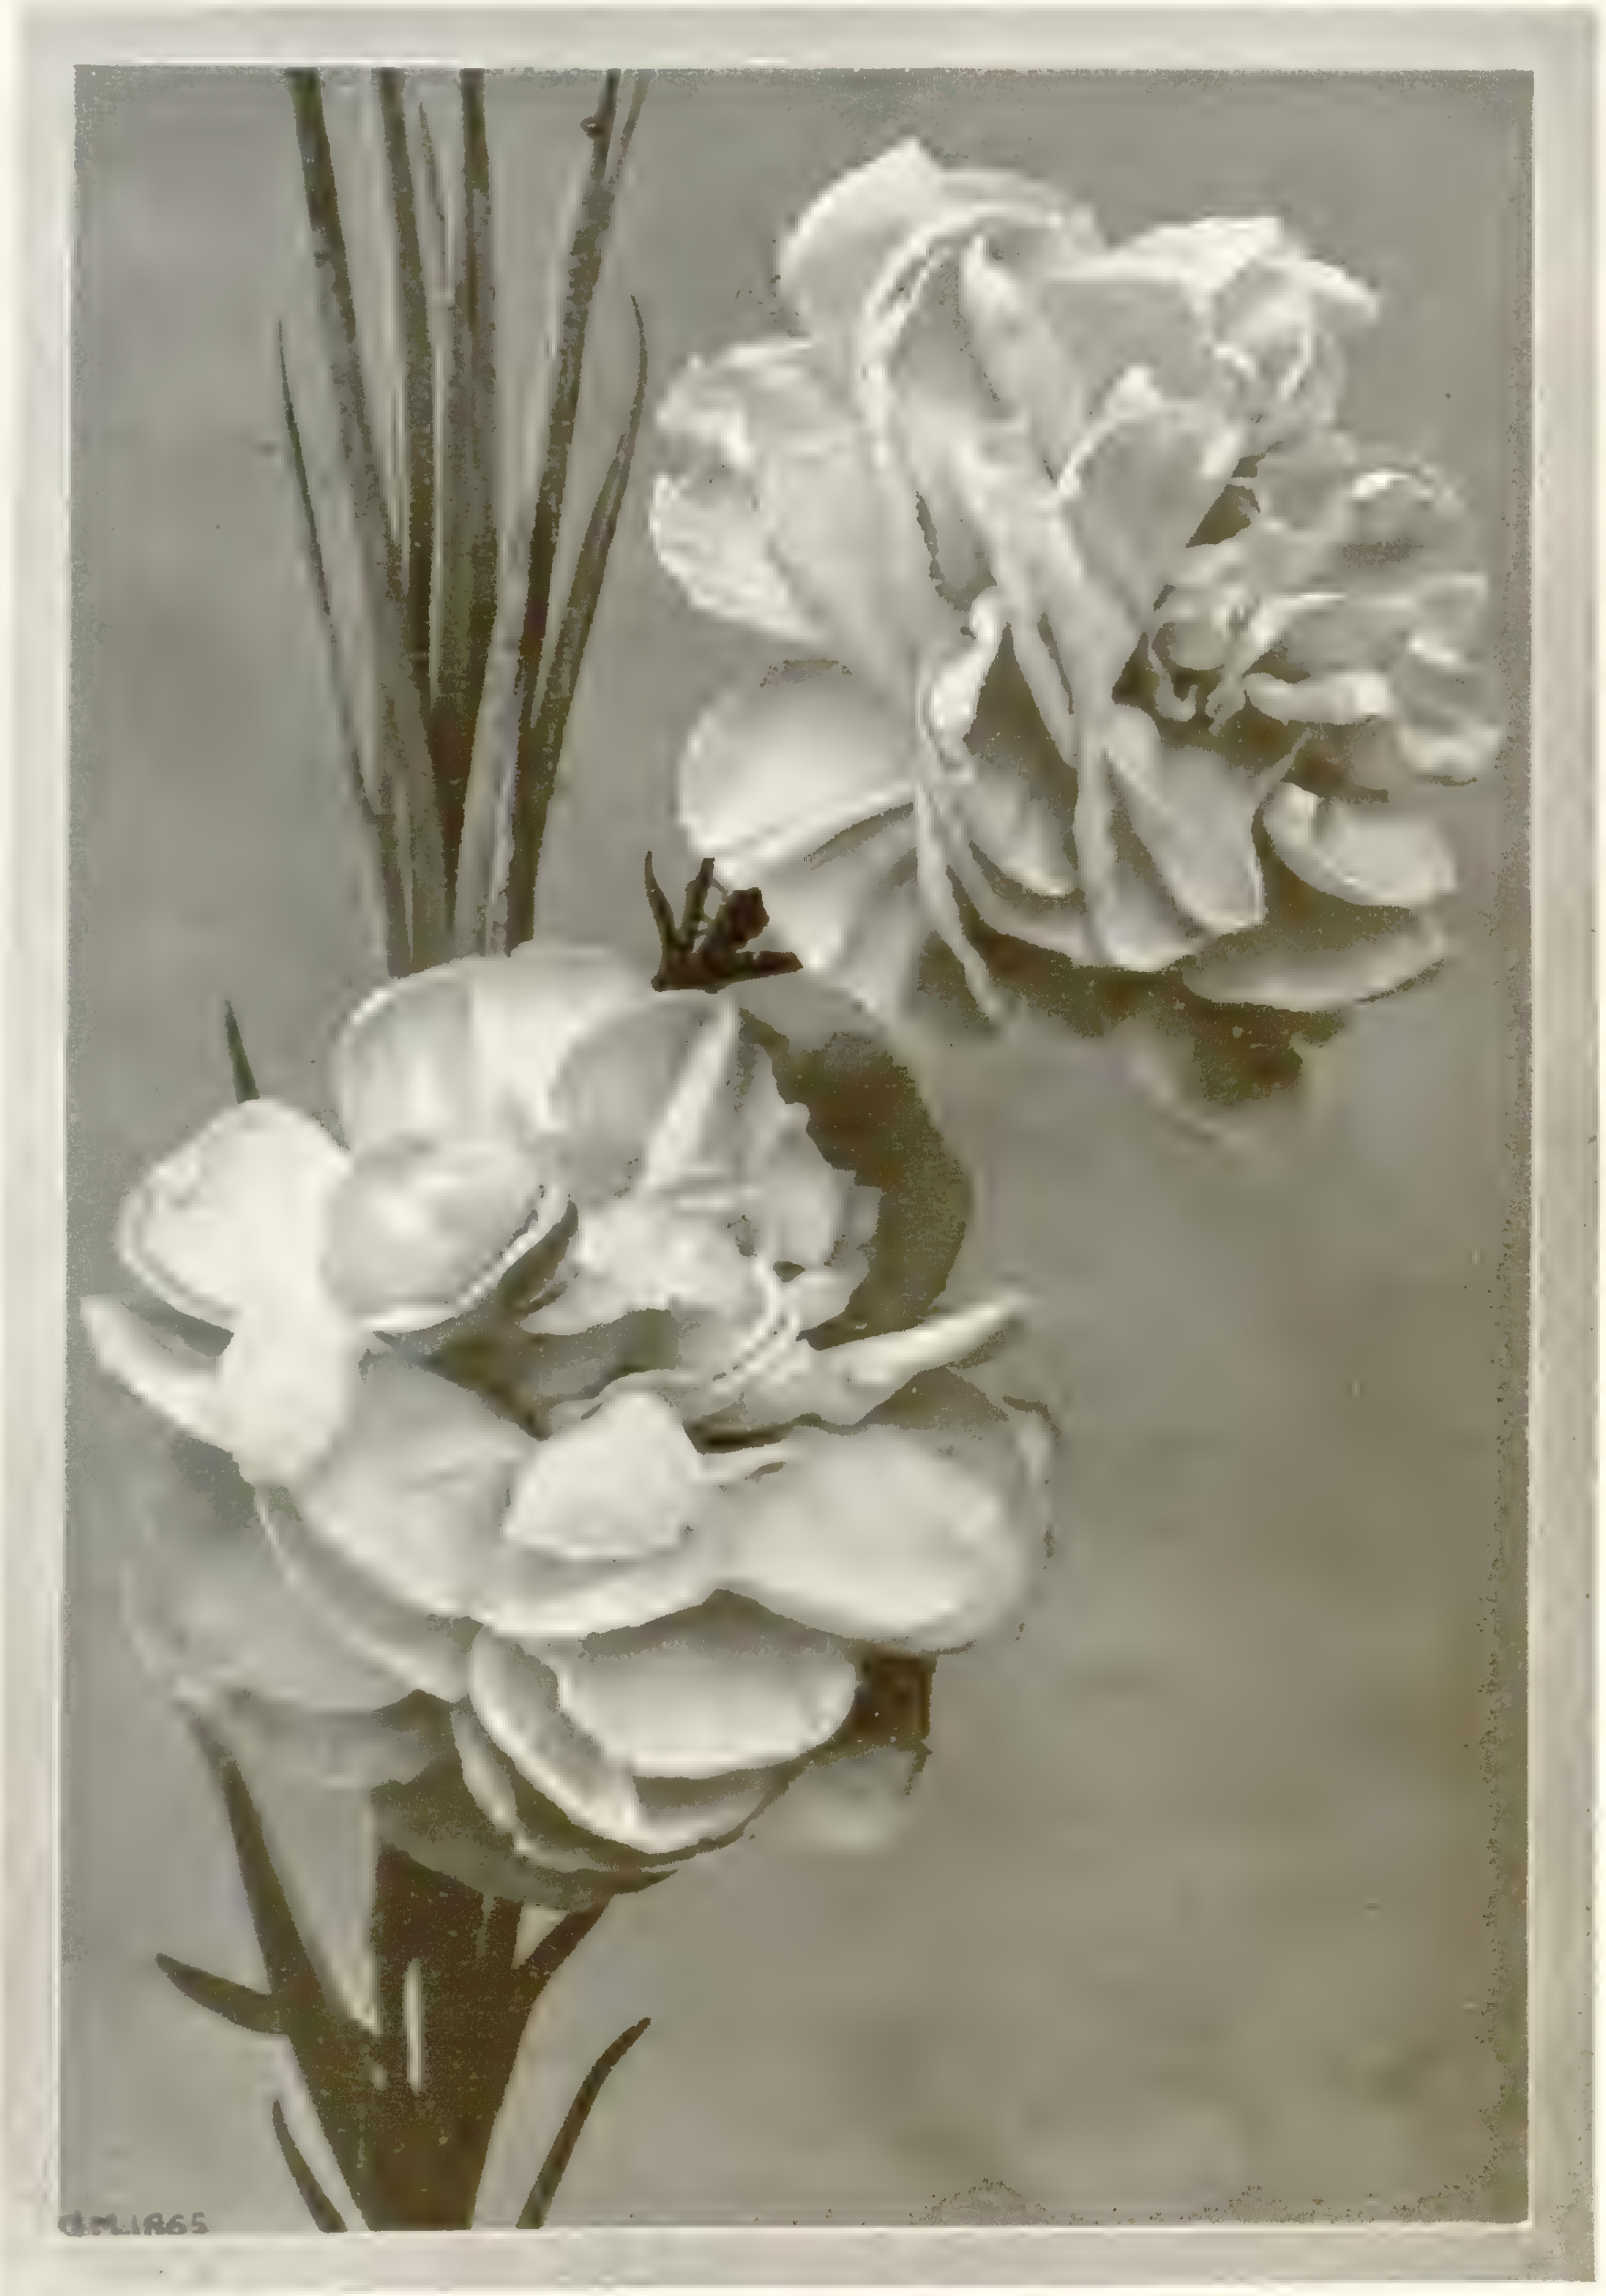
One can raise Boltonia asteroides (a name which, I am glad to see, is still retained even by some American botanists, who are a little fond of taking liberties with established names) by division in spring and summer, and by seeds.

Senecio clivorum.

Like many plants of its class, this bold, though possibly rather coarse hardy groundsel, is a lover of a good supply of moisture, and it makes a handsome specimen by the side of a pond or watercourse, positions its genus seems to lend itself better to than to the mixed border. It is not, however, everyone who can supply it with such a situation, and they can enjoy it in the mixed border, where its handsome orange-yellow flowers strike strongly upon the imaginations of people who have not seen it before. The foliage is bold, though coarse a bit, as I have suggested, and we have many worse plants in favour for border ornamentation than Senecio clivorum. But to do it justice even there it should have a deeply-dug soil, and a liberal supply of manure dug in, so as to support it in periods of weather when the ordinary supply of moisture is insufficient. In times such as this we are at present passing through, when the heat is intense and rain is scarce in the extreme, its leaves look flaccid and unhappy, and a good soaking of water, either pure or in the shape of weak liquid manure works an almost magical change. But this cannot be applied to everything in most gardens, so that when it is given this watering ought to be a really generous one—no grudging supply will be long beneficial. I see S. clivorum seems to be inclined to sow itself rather freely about the garden, and some seedlings are growing well which came up this spring. I am not highly enamoured of Senecio clivorum, yet it has a place in which to serve for the decoration of the garden, and to make it truly decorative it must not be starved or pinched in its supplies of nourishment.

Sidalcea candida.

When well grown and carefully attended to to prevent it from lying about and becoming almost prostrate, the White Sidalcea candida is a really good garden plant, with the beautiful formation of the mallows in its flowers, and with pleasing leaves and good racemes of flowers of a nice satin-like white. I do not think that it is a flower which is too widely known, but it is a good summer-flowering subject, and generally pleases those who have it, either in the border or for cut bloom. I have seen it well shown at exhibitions of hardy flowers, and I would commend it to the lovers of white flowers. It is a plant I have grown for a good many years, and have found thoroughly hardy, and of the most obliging nature in the way of its requirements. I do not suppose it will care for a moist soil, but in a dry one it does excellently, and gives every satisfaction.



CARNATION MRS. ELLIOTT DOUGLAS.
Flowers of large size and good form; golden yellow. A.M., R.H.S., July 18.
Mr. James Douglas, Great Bookham.

Leucojum vernum Vagneri.

May I suggest to lovers of bulbs, who ought to see and decide what they want as early as possible, seeing that bulbs have ripened early this season, the desirability of purchasing bulbs of the fine Leucojum vernum Vagneri? This is the finest form of the spring snowflake, coming earlier than the usual one, and generally giving a greater number of flowers, mostly two to a stem. I believe in the early planting of all very early bulbs, and as this blooms with the snowdrops, it is essential to give it as long a period after planting as possible. It may often be purchased as L. V. carpathicum, but the latter has yellow spots and one flower.

S. Arnott.

NOTES FROM HAMPTON COURT.

Even in the time of Cardinal Wolsey Hampton Court Gardens were remarkable for their flowers, and they have for many recent years justly enjoyed a great reputation for the excellence of their summer bedding, as well as for their other prominent floral arrangements. The dominant feature this season is the extensive use that is made of Humea elegans, as tall, symmetrically-shaped, and exceedingly graceful specimens are employed in large numbers. What is more, the inflorescences are of an unusually deep tone of red, probably owing to the fact that at least up to the present the summer has been particularly clear and bright.

One of the most striking beds is filled with noble examples of this humea springing from an undergrowth of the dwarfer cannas, the whole being edged with a broad band of deep blue viola.

So many of the beds are very attractive that it is difficult to single out any for especial mention, but the few given below cannot possibly be passed over. One is carpeted with Koniga maritima, thickly sprinkled over with that pretty double pink begonia Major Hope, while examples of the dazzling white Leucophyta Browni are employed as dot plants, the whole being edged with Echeveria secunda glauca.

Another of almost, if not quite, equal merit is planted with a mixture of the double red begonia Count Zeppelin with the rarely-seen variegated-leaved Phlox Comtesse de Jarnac, Abutilon Sawitzi, and Centaurea candidissima as dot plants edged with echeveria. Both these beds are low ones, and well designed for positions where they are brought in close contact with the spectator.

Two other designs formed by plants of much the same stature are Begonia Soleil d'Or, yellow, and Ceres, deep pink, carpeted with white lobelia, while Leucophyta Browni, Kochia scoparia, and Centaurea candidissima, and another in which dwarf plants of Leucophyta Browni and Begonia Lafayette present a curiously freckled surface, the whole being dotted over with Kochia scoparia and Fuchsia gracilis variegata. An edging of Saxifraga muscoides completes this arrangement.

A Coronation bed is in such a place as Hampton Court Gardens naturally looked for, and in this respect the seeker will not be disappointed, for there is a very effective one. The central portion has a groundwork of dark coloured alternanthera on which the letters G. R. are traced in a yellow-leaved variety, while the major portion of the bed is carpeted with the silvery-white Leucophyta Browni, on which the Prince of Wales' feathers, formed of a very dark alternanthera, stand out very conspicuously. A crown occupies each corner, and the date is seen very clearly near the edge. Beds of tall-growing subjects, now so popular, are of course freely represented, one of the most striking of this class being filled with large plants of the hoary-leaved Gnaphalium microphyllum, Streptosolen Jamesoni, Asclepias curassavica, and Swainsonia galegifolia, margined with a small pink petunia and edged with variegated anthericum. Another bed admired by many has large plants of the light-coloured Fuchsia Mrs. Marshall, with an undergrowth and edging of the dwarf-growing variety Alice Hoffmann, a bright-coloured flower with a clear white corolla. Among what may be termed the more unorthodox subjects must be especially mentioned a large bed of tall, stately specimens of Gilia coronopifolia, springing from an undergrowth of Arctotis grandis. Of the vast number of different subjects employed for bedding purposes this gilia supplies a tone of colour quite distinct from anything else, and whose identity is at a little distance somewhat puzzling.

Tender subjects do not monopolise the whole of the beds, for there is a very large one planted with the finest varieties of delphinium, the effect produced being very good. Roses, too, are freely represented, though by the middle of July—and that, too, with such weather as we have experienced this year—many of them are past their best. A choice selection of dwarfs, overtopped by standards of the rambler varieties, presents a very pleasing feature. At the time of my visit that charming yellow variety, Lady Hillingdon, was particularly noteworthy.

The beauty of the bedding at Hampton Court is greatly enhanced by the background of large trees, and the specimen yews which are freely sprinkled over the turf, both of which afford a pleasant retreat from the sun's rays, from which the floral display can be viewed in comfort.

Fuchsias are, as they have been for many years, freely represented in the different beds, and very fine many of them are, despite the hot weather, for it is generally recognised that fuchsias are seen at their best during a comparatively cool season. One can but note that, notwithstanding the great number of new varieties sent out within the last decade or so, nearly all those popular for bedding are old kinds. This is, to a great extent, owing to the fact that many of the new kinds are remarkable for their large blossoms, a by no means desirable feature in a bedding fuchsia, as small or medium flowers and large quantities of them are the qualities most sought after. The varieties generally employed for bedding are Mrs. Marshall, Lady Heytesbury, Scarcity, Mrs. Rundle, Marinka, Madame Cornellison, Ballet Girl, Alice Hoffmann, and the coloured-leaved kinds, such as Sunray, Gracilis variegata, and Cloth of Gold. Pelargoniums at Hampton Court are noteworthy from the fact that a trial is given to two varieties that have been a good deal shown this season, namely, Salmon Paul Crampel and the orange-coloured Maxime Kovalevsky. Both are very promising, and will doubtless soon become popular. Of the rest the old varieties fairly hold their own, that popular kind Paul Crampel being unapproached in its own particular colour. Beckwith's Pink, Salmon Vesuvius, and the white Queen of the Belgians are all good in their respective colours. Of ivy-leaved varieties apart from the old and well-known kinds, especial mention may be made of J. T. Hamilton, a deep scarlet flower. It partakes somewhat of the zonal character, and as seen at Hampton Court is decidedly promising.

The isolated beds by no means constitute the whole of the floral display, as the long border which extends from the Palace to the limit of the gardens in the direction of Bushy Park is very gay. The scheme of decoration there followed is to arrange a number of tender subjects (often as large plants) in bold masses or groups with, in some cases, a foreground of annuals, the whole being finished off by an edging of Veronica Andersoni pegged down. Prominent among the subjects employed are Verbena Miss Willmott, Heliotrope President Garfield and Piccoli, Calceolaria amplexicaulis and Burbidgei, fuchsias of sorts, pelargoniums in variety, Bouvardia Humboldti corymbiflora, Begonia Triomphe de Lorraine, a double red-flowered form of B. semperflorens, Swainsonia galegifolia and its white variety, Kalanchoe flammea, rarely seen treated in this way, Salvia Zurich, Salvia patens, Streptosolen Jamesoni, Humea elegans, Abutilon vexillarium variegatum, Cassia corymbosa, lantanas of sorts, Solanum jasminoides, Begonia ascotensis, Begonia fuchsioides, Impatiens Olivieri, Lilium longiflorum, Bougainvillea Sanderiana, Plumbago capensis, Carnation Britannia, and Carnation Mrs. Burnett, this last being quite free from the rust which troubles it in many places.

Of annuals associated with the above may be especially mentioned nemesias of sorts, salpiglossis, schizanthus, chrysanthemums, snapdragons, Brachycome iberidifolia, and sweet peas. Some beds of these last are, in another part of the gardens, very beautiful, while the different varieties of lantana, all in a most satisfactory state, deserve more than a passing notice. The long herbaceous border which extends from the Palace to the river is full of interest. A few of its occupants are now past their best, many are in the height of their glory, while there are a great number that promise to develop later on. One thing worthy of note is the manner in which Phlox Coquellicot flourishes there, for this rich-coloured variety is in some districts rather capricious in its behaviour, the light, warm surroundings at Hampton Court being apparently just to its liking.

These notes might be indefinitely extended, but as space limits, I will, with mention of the beautiful water lilies in the round pond opposite the Palace, draw them to a close.

W. Truelove.

THE HART'S-TONGUE FERN.

It seems a rather strong assertion to state that among all the ferns of the world this by no means uncommon native of Great Britain (Scolopendrium vulgare) stands absolutely alone in its capacity for sporting into innumerable and very diverse forms, but such is really the case. In making this statement, too, we do not take into consideration the many forms which have been obtained by selective spore sowing, but simply and solely those which may be termed purely natural ones, i.e., sports which have been found under quite natural conditions among those of the common, or normal type, which are so abundant in woods, hedges, and on rocks or old walls, wherever the species prevails.

The species itself is peculiar in its adaptation to very different environments. Most species confine themselves more or less to special conditions, some only being found in the chinks and crevices of rocks or old walls, and rarely or never in the soil itself, while others revel in deep deposits of a leafy character where ample root room is afforded. The Hart's-tongue, on the other hand, is equally at home under both conditions, thriving in a naturally smaller state, in the one case, in association with its near relatives, the Spleenworts, and assuming a very robust habit in the other, where those relatives fail to obtain a foothold. Normally, it is one of the simplest of ferns, its fronds being quite undivided, and, as its popular name implies, resembling a tongue, or strap, commencing with a stout stalk, which then continues to form a midrib, which may be as much as a yard long. From this midrib, on both sides, spring a continuous series of veins, at first single and then forked, which continue to the plain edges of the strap which they and the green tissue form. At the lower part, where the strap commences full width, four inches or more in full-sized plants, there are two rounded lobes, like the top half of a heart, and towards the tip of the frond, which is of even width for most of its length, it tapers to a bluntish point, like a sword. The surface is quite smooth, and we may examine many thousands of plants and find these features to be all perfectly constant in every case.

Examining the back of a frond we shall find a very characteristic type of fructification, in the form of long sausage-shaped brown masses of spore pods, arranged herring-bone fashion at short intervals from end to end on each side of the midrib. These masses extend from a short distance from the midrib to near the margins, so that they may be over an inch in length by an eighth of an inch wide, much larger and very dissimilar from the fructification of the rest of our native species. A peculiarity of the small genus to which the Hart's-tongue belongs is that each of these heaps is really a combination of two, which are situated on the twin veins produced by the forking we have mentioned. When the frond first uncoils these future heaps appear as whitish lines of thin semi-translucent skin, the indusia or spore c

These cover the intervening space between the two veins by springing from the inside of each pair, and, growing towards each other, their edges meet in the centre. As the spores grow and mature these covers are lifted, pushed aside, and eventually buried beneath the ripe mass formed by the two spore heaps, the twinship of which is now indistinguishable. In the Spleenworts the spore heaps are in similarly arranged lines, but the cover is single, one vein only being concerned

If we examine one of these brown heaps with a good lens we shall see that each one is built up of many hundreds of shining brown oval pods attached by a stalk, and as each pod contains a score or two of spores, and each frond may carry a score or two of heaps, a little calculation will show that millions, and many millions, are concerned in the annual crop of a full-sized Hart's-tongue.

Naturally, a fern which is so common has attracted the attention of variety hunters, and in Gerard's "Herbal" we find two varieties figured, viz., the frilled or crispum form, and the branched and tasselled. No long search is usually required in ferny districts to find a variety called lobatum, in which the normally single frond tip is split into several, the midrib dividing and carrying the tissue with it to form a sort of tassel. Such tasselling, however, may go much farther, and form either flat fan-shaped or bunched terminals of varied degrees of division. The main midrib also may start dividing lower down, and even from the outset, every grade involving distinct change of form, so that in extreme cases the strap may be transformed entirely, and a mass of almost moss-like foliage be created. Or, as in the crispum already cited, it may become frilled owing to the veins which build the frond forking repeatedly instead of only once, and so carrying the intervening tissue with them until the frond margin may become very much longer than the midrib, and a folding or frilling results. As a rule, this extra growth suppresses spore production, and all true crispums are perfectly barren

These formative veins may also fail to stop short at the normal place, so as to preserve an even edge, and in that case the margin becomes toothed in various ways and degrees, so that there are varieties where the simple Hart's-tongue does its best to imitate divided or pinnate species. The rounded lobes at the base of the frond are also sometimes lengthened, and even tasselled as well, and the very surface itself, in a considerable number of varieties, is broken up into apparent incrustations, marginal and intro-marginal ridges, and so on, accompanied by varying degrees of narrowness and thickness, rendering them very distinct.

Then there is that curious section known as the peraferens or pocket-bearing one, in which the frond ends abruptly with a pocket or pouch at the back or at the front, the midrib projecting as a thorn, and such pouches may appear on the basal lobes as well. Finally, some of these types are combined, and under cultivation many crosses have been effected between them, so that the name of those in collections is legion, all of which, be it remembered, have had their start from a wild sport, since man cannot originate new types but only follow them up and improve them (or otherwise) by selection of their offspring through the spores.

A little consideration, with these facts in view, will, we are sure, convince our readers of the correctness of our opening claim for the simple Hart's-tongue as the most variable fern in the world. The Hart's-tongue is quite evergreen, and makes very handsome pot plants, while in the open, in shady positions, it will make fine specimens. A little lime in the soil is beneficial, but not essential.

Chas. T. Druery, V.M.H.

A PRIVATE FIRE STATION.

The picturesque little building here illustrated represents the estate fire station at King's Walden Bury, Hitchin, the residence of T. Fenwick Harrison, Esq. The building was used as a dairy, and subsequently converted into a residence for one of the estate men. After he left it served as a storage, until it was put to its present use.

In the room shown in the picture the hose and other equipment are kept; the engine is kept in the other room. Just outside the door is an underground tank supplied by a 6in. pipe connected with the lake near by. On turning the valve, water comes quite fast enough to keep the engine going at full speed. Shortly after its purchase from the Messrs. Merryweather, the engine was instrumental in saving the mansion from destruction.

THE PRETTY PRIVATE FIRE STATION AT HERTINGFORDBURY.

Although the estate fire brigade had had but one hour's training, the members got the engine to work, and were throwing water into the rooms within twenty-five minutes from the call by fire-bell, a performance which was highly praised by the captain of a town brigade, who, on arrival, found the fire fully under control. Although damage to the extent of £1,000 was done, at least £30,000 worth of property had been saved; the station has therefore proved useful as well as ornamental.

The brigade consists of gardeners, carpenters, stablemen, and others near at hand. Mr. T. Fenwick Harrison is the captain, and the head gardener, Mr. Hartless, is sub-captain.

More recently another security against fire has been added, and this is a very fine water-tower, with a large tank holding about 15,000 gallons of water, and used as a supply for the gardens and stables. Fire plugs have also been put down around the mansion, stables, and other buildings, and immediately the alarm is given the hoses are placed in position, and the water from the high tank is of sufficient force to cover every necessary point. There is also an oil engine which can be used for pumping direct into the mains in case of fire, or for filling the tank as required. The oil engine can be started in five minutes, and the steam Merryweather fire engine in five to eight minutes.

A. J. H.

THE JUNE-BERRY.

Amelanchier canadensis, the June-berry of North America, sometimes called the Snowy Mespilus, is a conspicuous tree in many parts of the country during April, for its branches are densely laden with racemes of white blossoms. Unfortunately its flowers are rather fugitive, and a heavy rain or strong wind sometimes causes them to fall prematurely. As easily grown as a crab apple, there are few places in the country where it is unlikely to thrive, while in some quarters it is met with between 30ft. and 40ft. high, with a head as far through, and a trunk a foot or more in diameter. Scientists allow the species a wide range of variation, and forms may be noted which differ from each other to a remarkable degree. Perhaps the most distinct of all is the one to which the varietal name of oblongifolia has been given, for it is of bushy habit, and spreads by means of sucker growths. At its best it is about seven feet high. It is a very useful variety, and showy.

Towards June small red berries may be noted on the trees, which are sweet, and eagerly eaten by birds. In America these berries are gathered and used for making into cakes, etc. Autumn adds a further period of beauty to the trees, for it often happens that the leaves turn to a brilliant orange or orange-scarlet colour previous to falling.

W. D.

USEFUL GUIDE TO GARDEN WORK.—A handy all-round guide to work in the garden month by month is the Gardening Year Book, by George Gordon, V.M.H. [illegible] 1s. 3d., from W. H. and L. Collingridge, 148, Aldersgate Street, London. The book is freely illustrated and the cultural [illegible] up to date.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEASONABLE REMARKS.—The exceptionally fine and dry season we have had up to the present time has been particularly favourable to insect pests. If we examine deciduous trees or the flowers of herbaceous and other plants in the borders we find them literally infested with thrips and other insect pests, so that where the orchid houses are situated in close proximity to trees or flower borders the black thrips find their way through the open ventilators, or are carried by rains into the water tanks, and are thus easily transferred to the orchids. We have found that it takes closer observation than has usually been required to detect these pests before they have time to establish themselves under glass. The only safe remedy is to spray the plants overhead about once a week with some safe insecticide, and to give fumigations on alternate weeks. It is at this season there are so many young orchid growths in that stage when they are the most susceptible to attacks from insect pests, and great damage can be done in a short time. Where black or brown thrips have caused injury to cypripediums, for instance, it is best to dip the plants every two or three days for a time and then at regular intervals of about once a week until satisfied that the plants are free from insects. The larva of black thrips are generally deposited on the undersides of the leaves, and as they hatch out at intervals it is well to continue the repressive methods until well satisfied that no more remain.

WOOD-LICE do a deal more damage to young seedlings and the tender points of the new roots of orchids than many people give them credit for. We find that hollowed-out potatoes placed about the staging and possible haunts are a great attraction, and while feeding on the potatoes at night or first thing in the morning they may be caught and destroyed.

SLUGS AND SNAILS, owing to the dry conditions outside, have been attracted in large quantities to our cool houses. These must be kept down at all costs; careful search should be made on the plants, pots, and stages every night and morning. A few lettuce leaves placed on the stages and about the plants will offer a feeding ground, from which they are easily caught and destroyed; little patches of dry bran placed on pieces of glass or broken crocks and laid about the stages will also prove an attraction, and while feeding they may be caught and destroyed. The small flies which lay their eggs in the seedling pots of odontoglossums are among the worst pests we have to contend with, as the destructive maggot frequently destroys the whole seed bed. The outside of the pots should be kept clean and the plants sprayed about once a week.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

PREPARATIONS FOR SPRING FLOWERS.—For the early display of flowers in the conservatory we are dependent to a great extent on bulbs and forced plants in their different sections and varieties. The earlier the bulb order is sent in the better satisfaction will be obtained in the execution of that order. In making out the list of bulbs, etc., required, the grower must be guided in his choice by his requirements. It is almost useless to try to recommend any particular varieties, as these are so numerous, and many possess equal merit. Hyacinths, tulips, narcissi, and freesias are a few that may be grown successfully, and with very little trouble. To obtain the best results it is necessary that they should be potted as soon as received to enable them to make plenty of roots before being subjected to any degree of forcing. The potting soil should be moist but not wet, and pressed firmly round the bulbs with the fingers, but not rammed. After potting, stand them closely together in a cold frame and cover with leaf-soil to a depth of three or four inches. In the case of tulips the cover should be six inches and the growth allowed to grow right through before the plants are removed. This will give a greater length of stem, which is very necessary in this flower. When uncovered, the bulbs should be shaded from strong light until the leaves attain their natural colour. After this they may be taken into a higher temperature in batches to suit the demand. One particular variety of narcissus which can be strongly recommended for producing a good supply of excellent blooms at Christmas is Trumpet Major. In the case of plants and trees for forcing these should also be potted immediately they are received, and stood outside. Plunge the pots in leaves before frost makes an appearance.

SCHIZANTHUSES.—Seeds of these most attractive subjects may now be sown for producing plants to flower in the spring. Sow in a pan of light sandy soil, and place in a cold frame. Shade from sunshine until germination takes place, and when the seedlings appear admit more light and air to strengthen them. Under no circumstances must they be kept close or coddled. When large enough to handle, pot off into thumb pots and place near the glass. Care must be exercised in watering the plants.

MIGNONETTE.—A good sowing of mignonette may be made now for early flowering. It may be either sown in small pots and potted on when ready or sown in the flowering pots and thinned out. In the latter case sufficient space should be left for top-dressing. Lime rubble mixed with the soil is very beneficial to mignonette. Brompton stocks should be sown outside for subsequent pot culture.—A. GRUBB, Porters Park Gardens.

HARDY FRUITS.

EARLY APPLES AND PEARS. — Early pears, and indeed other kinds also, being scarce, it will be necessary to lengthen out their season as much as possible. Jargonelle, Beurre Giffard, and the other early sorts may have their season much prolonged if they are gathered as soon as they part readily at the stem when held firmly and lifted to a horizontal position. No pears, and particularly the earliest kinds, can be said to have their full flavour if allowed to ripen on the trees, hence the desirability of looking over the trees often, and laying the fruit in single layers in a cool, airy fruit-room, where they will slowly gain flavour and finish. Many of the early apples are really at their best if taken from the tree and sent direct to the table. Red Juneating especially, if kept for a few days, will be quite unfit for use, the texture being woolly and the flavour altogether too acid. Trees of Beauty of Bath should be well littered down with hay or grass, and the fruits allowed to drop as they ripen, otherwise it will be necessary to look over the trees at least once a day, or the fruits, finishing as they do in a few hours, will drop to the ground and be spoiled.

WATERING.—Apples are suffering from the continued drought, and where possible, thorough soakings of water will be of great benefit; this should be applied even though a few showers occur, as nothing short of an inch or two of rainfall will moisten the soil deep enough to be of any very material advantage to the apple crop after such weather as has been experienced generally throughout the country. In showery weather opportunity should be taken to apply light dressings of approved artificial manures to any fruits that are required for special purposes. Any large apple or pear trees that were moved during the autumn or winter may have bands of hay or straw entwined around the stems and main branches, to assist the upward flow of sap and ward off the direct rays of the sun.

STONE FRUITS. — Finish tying in the shoots of peaches, etc., allowing only sufficient growth for next year's fruiting. Our chief anxiety now will be to get this sufficiently ripened; any very strong growths should be cut clean away, if this has not already been done, retaining only the medium wood for extension.

RED SPIDER ON APPLES.—Many apple trees are becoming infested with red spider, and watering, if well carried out, may be considered a good remedy. A good dusting of flowers of sulphur may be given early in the morning while the dew is still on the trees. This is best applied with a sulphurator, or bellows-like instrument, which may be obtained from any sundriesman at very little cost, and which no gardener should be without, as it is one of the most useful tools that could possibly be found.

RASPBERRIES.—Now that the fruiting season is over, raspberries should have all the old canes cut away close to the ground, and the young canes tied loosely to trellis or stakes, as the case may be, allowing light and sunshine to ripen the growth. Encourage weakly plants by giving periodically soakings of diluted liquid manure, and keep well mulched.—J. WHITTLE, Cheveney Gardens.

THE KITCHEN GARDEN.

SPRING CABBAGE.—Much depends upon the part of the country, but in most parts one cannot be wrong in making the main sowing of cabbage during the next week or two. Choose a rich, sweet piece of ground. The chief object is to obtain strong plants on sturdy, short-jointed stems for planting out in September to establish themselves before winter. Beginners, as a rule, make the mistake in sowing too thickly, which results in elongated stems and leaves. For this reason I recommend the seed to be sown evenly and thinly, broadcast, so that the plants stand more by themselves than they do in rows. Ellam's Early and Flower of Spring are, to my mind, two of the most reliable varieties grown.

FRENCH BEANS.—If a sowing of French beans is made on a high south border, where frames can be placed over them in September or later for protection, they will form a [illegible] succession to the exhausted crops outside and be found useful for supply through October. Some of the dwarf Prolific varieties are most suitable for this sowing.

WINTER LETTUCE. — This important crop must be now taken in hand. Make a substantial sowing in drills on a warm, [illegible] laying site where they can remain, so that the plants may be thinned out to the desired distance when large enough. The thinnings, too, can be planted then in suitable positions where they are likely to escape injury from frost. The climatic conditions during the autumn vary so much that it is good plan to make two or three sowings at intervals of several days during August, to have plants of requisite size for various uses during winter. Standwell, All the Year Round, and Stanstead Park are three kinds I recommend.

SPINACH.—This, on many soils, is [illegible] a precarious crop, being subject to [illegible] trouble during winter more than su[illegible]. Therefore it is very necessary to do all one can to make the ground as sweet as possible. A plot that has carried early potatoes [illegible] is, as a rule, the one chosen, being [illegible] well stirred for these crops. In making preparations for sowing give the surface a [illegible] dressing of soot, forking it in as the [illegible] proceeds. Draw out the drills from [illegible] to eighteen inches apart. Should dry weather continue water the drills to provide the [illegible]ful moisture for germination.

ENDIVE.—A larger sowing of endive [illegible] the one recommended in last calendar [illegible] now be required; and on a warm site [illegible] to carry a long supply through early [illegible]. As soon as the young plants are [illegible] couple of inches high have them thinned, and the plants that are over, if [illegible] planted in suitable places to grow [illegible]. If plenty of frames are at command a quantity may be planted in them direct [illegible] the lights, which may be placed over as required when frost arrives.—C[illegible] FLACK, Cholmondeley Castle Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

National Rose Society's Provincial Show.

JULY 19.

For the third time in its history the National Rose Society has held its provincial exhibition at Ulverston, and for the third time the officials and exhibitors have had ample evidence that the visits of the society are much appreciated by the northern rosarians and the general public, and that there was a strong desire on the part of the local society to make the show a complete success, and the visit of exhibitors and others concerned a pleasant one. The exhibition was held in Swarthdale Park, which is highly picturesque and well wooded, and may be described as an ideal spot for a flower show, and the long line of marquees that stretched through the valley suggested to visitors as they entered the park that the display was a large one. There was ample justification for any anticipation that might have been indulged in, for the four marquees, each of which had a length of 150 feet, were well filled, and the collections generally highly meritorious. Two of the tents were devoted to sweet peas, dinner-table decorations, and hardy flowers, and these were crowded to their utmost capacity. In the two marquees devoted to roses there were a few vacant spaces, and, having regard to the tropical weather that had been experienced, it is surprising the classes should have been so well filled as was the case on this occasion. For several years past the quality of the roses staged at the provincial shows has been higher than at the Metropolitan exhibitions, but on this occasion quality of the blooms was about equal to that of those staged at Regent's Park twelve days previously. That the show should have been of so high a degree of excellence is surprising, considering there were no roses from the southern counties, from the Colchester district, or from the North of Scotland. Usually the rosarians from Scotland are in strong force, both as regards the number of entries and the development of the blooms, but the effects of the drought have been hardly less severe than in England. The chief honours of the exhibition were taken by the Irish growers, both the challenge trophies going to Ireland. Much to the regret of all rosarians, Mr. E. Mawley, the highly-esteemed hon. secretary, was unable to be present owing to indisposition, from which we trust he will have recovered previous to the publication of this report. Happily, the Rev. J. H. Pemberton, president of the society, was present, and, possessing a wide experience of rose shows, was able to render valuable assistance in dealing with matters of a general character. The arrangements of the exhibition were in the hands of Mr. F. J. Harrison and Mr. F. W. Poole, honorary secretaries of the North Lonsdale Rose Society, and Mr. Mawley's secretary, and they were so admirably carried out as to bring these gentlemen much praise.

ROSES.—NURSERYMEN'S DIVISION.

The most important of the classes in this division was that for thirty-six blooms distinct, in which a fifty-guinea challenge trophy and a gold medal was offered as the premier award The competition was very keen, and in the result Messrs. Alex. Dickson and Sons, of Newtownards, obtained premier awards with highly-developed blooms of Lady Barham Marie Verdier, Edith D'Ombrain, George Dickson, a superb crimson variety, which, in the class for new roses, received the award of the gold medal, Mrs. Foley Hobbs, La Calissier, Earl of Warwick, Mrs. Myles Kennedy, Madame Vermorel, C. J. Grahame, Gladys Harkness, Emperor of India, deep rose-crimson; Mdme. Leon Constintin, Tom Wood, Gloire de Chedane Guinoisseau, Ulster, W. E. Lippiat, Her Majesty, Ulrich Brunner, Dr. O'Donell Browne, a rose-coloured bloom, which was adjudged the best hybrid tea in the trade classes; W. Shean, Xavier Olibo, Frau Karl Druschki, Star of Waltham, Juilet, Marie Baumann, Mrs. C. West, Mdme. C. Crapelet, Horace Vernet, Princess Mary, a light blush rose, the Lyon rose, and Lady Ashtown. The King's Acre Nursery, Hereford, were successful in obtaining second place with excellent blooms. Mr. Hugh Dickson, Belfast, staged a remarkably good set of blooms in this class, but unfortunately had duplicate blooms of one variety. In the set was a superb bloom of Horace Vernet, which was selected as the best bloom of any class other than tea, hybrid tea, or noisette. In the spirited contest for the prizes offered in the class for seventy-two blooms, distinct varieties, Messrs. Alex. Dickson and Sons were again successful in obtaining premier honours. The blooms were uniformly good, and among the varieties represented were Mdme. Segond Weber, C. J. Grahame, Earl of Warwick, La Calissier, Mrs. George Preston, Marchioness of Dufferin, Juliet, Mamie, and Lady Barham. Mr. Hugh Dickson was a capital second, and conspicuous in his collection were Lohengrin, a beautiful blush-coloured hybrid tea, and Mrs. Foley Hobbs, which was selected as the best bloom of tea-scented varieties in the division.

For thirty-six blooms the King's Acre Nursery Company occupied the first place with a stand in which the blooms of Mildred Grant, Dupuy Jamain, Marie Baumann, Captain Hayward, Dean Hole, The Lyon rose, and Frau Karl Druschki were conspicuous. Mr. H. Drew, Longworth followed closely for second place, and staged among others a fine bloom of Mdme. Eugene Verdier. Mr. W. Ferguson, Dunfermline, was third with blooms of average size and remarkable for their freshness. The prizes for twenty-four varieties, three blooms of each were strongly contested, and at the head of the competitors was Mr. H. Dickson, with splendidly developed blooms of Mildred Grant, Horace Vernet, Dean Hole, Mdme. Wagram, Gladys Harkness, Mrs. Stewart Clark, President Taft, Bessie Brown, Caroline Testout, and Captain Hayward. Messrs. A. Dickson and Sons and the King's Acre Nursery Company were second and third respectively. In the class for twelve trebles Mr. G. Prince was first with good blooms, conspicuous among them being Alfred Colomb, Avoca, Mrs. J. Laing, Mrs. David McKee, and Mrs. E. Roosevelt in a high state of development. Mr. W. Ferguson was a close second with a stand in which The Lyon rose was conspicuous.

Tea-scented and noisettes were well represented, and the leading position in the class for eighteen blooms, distinct, was taken by Mr. G. Prince, in whose set were excellent blooms of Mdme. C. Soupert, Niphetos, Mrs. F. Hobbs, Mdme. Jean Dupuy, Mrs. E. Mawley, Medea, Mdme. J. Gravereaux, Nita Weldon, Comtesse de Nadaillac, and Mrs. Myles Kennedy. Mr. H. Drew and the King's Acre Nursery Company were second and third. For twelve teas or noisettes Mr. J. Mattock, won with a box in which E. V. Hermanos, a fine yellow variety, was specially well represented.

Mr. G. Prince scored for twelve blooms of new roses with Jonkeer J. L. Monk, a good deep pink flower, Avoca, Mrs. Herbert Taylor, Margaret, Mrs. Herbert Stevens, The Lyon rose, G. C. Waud, White Killarney, His Majesty, Mdme. Valers, Baurez, and Queen of Spain. For twelve blooms of any new rose Messrs. A. Dickson and Sons were first with grand flowers of Mrs. Foley Hobbs, and Mr. J. Mattock and Mr. G. Prince were second and third. For twelve blooms of any white or yellow rose Mr. H. Dickson and Mr. G. Prince were first and second with Frau Karl Druschki, and Mr. J. Mattock followed for third place with Bessie Brown. A grand box of Her Majesty obtained for Mr. H. Dickson premier honours in the class for twelve blooms of a light pink or rose-coloured rose, and in the class for twelve blooms of any crimson rose the same exhibitor staged J. B. Clarke for first place. In the last-named class the King's Acre Nursery Company were second.

Roses in vases were well shown, and in the class for twelve varieties, five blooms of each, Mr. W. Ferguson won with excellent blooms of Frau Karl Druschki, Pharisaer, Earl of Warwick, Mrs D. McKee, and other well-known varieties. Messrs. Alex. Dickson and Sons were a good second. Mr. Ferguson also scored in the class for nine blooms, to be shown in a vase, of the fine yellow rose Harry Kirk, winning the challenge cup offered as the premier award with well-developed blooms. The King's Acre Nursery Company and Mr. Drew were second and third.

Baskets of perpetual-flowering decorative roses were well shown by Mr. J. Mattock, who was first for seven baskets, distinct varieties, staging Prince de Bulgarie, Simplicity, Jessie, the Lyon Rose, Mdme. Ravary, and Mdme. Segond Weber in excellent condition. Garden roses were largely shown in the trade division, and made a glorious display of colour. Mr. J. Mattock was first both for eighteen and twelve bunches, and Mr. G. Prince was second, the third prize for eighteen being awarded to the King's Acre Nursery Company, and third for twelve to Mr. W. Ferguson. The most noteworthy of the varieties in the several collections included Mdme. Jules Grolez, Lady Waterlow, Le Progres, Irish Elegance, Bardou Job, Margaret Molyneux, Newport Fairy, Dorothy Perkins, Gottfried Keller, White Dorothy, and L'Ideal.

ROSES.—AMATEURS' DIVISION.

The fifty-guinea challenge cup and gold medal offered as the premier award in the class for twenty-four blooms, distinct, created as usual much interest, and gave rise to a keen competition. Here, as in the trophy class, open to trade growers, the premier award was made in favour of roses of Irish growth. The winner of the trophy was Mr. W. H. Calvert, Banchory House, Helens Bay, co. Down, whose number of exhibition roses, does not, he informed us exceed two hundred. To have cut twenty-four blooms in an exceptionally high state of development from so small a number of plants in a season so unfavourable to roses as this may be well regarded as a triumph of cultural skill. The blooms were throughout of large size, well finished, and remarkable for their freshness, but the box was somewhat lacking in effectiveness owing to the absence of high-coloured blooms. The varieties were La France, W. Shean, White Maman Cochet, Frau Karl Druschki, Oberhofgartner Terks, Mrs. D. McKee, Queen of Spain, Lohengrin, Dean Hole, Madame E. Euler, Mildred Grant, Florence Pemberton, St. Rome, Yvonne Vacherot, Mdme. W. Bergin, Earl of Warwick, Maman Cochet, Grace Molyneux, H. Guillot, Souv. de P. Notting, and Mrs. Myles Kennedy, the last-named being selected as the best tea or noisette in the amateurs' division. Dr. Pallett, Earls Colne, occupied the second place with a fine box of blooms, from which Mildred Grant was selected as the best bloom shown by amateurs other than a tea or noisette; Mr. W. Boyes, Middleton-on-the-Wolds, Yorkshire, was third with blooms possessing much merit Not less spirited was the competition in the class for thirty-six blooms, distinct, in which the Rev. J. H. Pemberton obtained premier honours with grand blooms, including a goodly proportion of varieties remarkable for their rich colouring. Bessie Brown, G. C. Waud, Helen Keller, Mrs. J. Laing, Earl of Warwick, Charles Lefebvre, Marshall P. Wilder, Lady Ursula, Hugh Dickson, Lady Ashtown, Melanie Soupert, Marquis Jean de Chataigneraye, Dr. O'Donell Brown, W. R. Smith, Mdme Jules Gravereaux, Avoca, A. K. Williams, Fisher Holmes, Horace Vernet, Leslie Holland, and Countess of Shaftesbury were the most noteworthy. Mr. H. V. Machin, Gateford Hill, Worksop, and Mr. Conway Jones, Hucclecote, Gloucester, who were second and third, staged remarkably good sets of blooms.

For eight varieties, three blooms, Dr. Pallett won with well-known varieties in a high state of development; and Mr. H. V. Machin and Mr. W. Boyes, who were second and third, had blooms of much merit. In competition for the prizes of nine blooms of any one rose Mr. H. V. Machin obtained premier honours with splendidly developed examples of Frau Karl Druschki. Dr. Pallett followed for second place with Dean Hole, and Mr. Conway Jones was second with Oberhofgartner Terks.

The most successful exhibitor in the classes open to growers of fewer than two thousand plants of exhibition varieties was Mr. G. Speight, Market Harborough, who was first for eighteen blooms, distinct, six varieties, three blooms of each, and six blooms of any rose other than tea or noisette. His blooms were throughout of much merit, and included a superb bloom of Horace Vernet, which was selected by the Judges as the best bloom other than tea or noisette shown by amateurs. Mr. F. J. Harrison, Ulverston, also exhibited well in the division. In the classes open to growers of fewer than one thousand plants of exhibition varieties the most successful exhibitors were Mr. Hoffman, Baildon, Yorkshire; Mr. E. Russell, Manchester; Mrs. Henry Balfour, Headington Hill, Oxford; and Mr. M. Whittle, Leicester. Mr. W. Upton, Leicester; Mr. Godfrey Brown, Penrith; Mr. J. M. Tankard, Baildon, Yorkshire; and Mr. E. L. Collinge, Burnley, were also successful exhibitors in the smaller classes.

In the spirited contest in the class for nine new roses the Rev. J. H. Pemberton obtained the first place with a capital set, and Mr. M. Whittle, and Mr. Conway Jones followed closely for second and third places. Garden roses were finely shown in the amateurs' classes, and at the head of the several exhibitors of twelve varieties was the Rev. J. H. Pemberton with a collection of great excellence, and remarkable for the taste evinced in the arrangement. Conspicuous in the collection was the new light yellow hybrid tea Danae, which was awarded a silver-gilt medal at the Metropolitan Show on the 7th inst., and greatly improves on acquaintance. Mr. H. V. Machin was a good second, and Mr. Conway Jones a close third. Mr. R. L. Garnett, Wyreside, Lancaster, obtained premier honours in the class for six varieties, and staged among others a beautiful bouquet of the old moss rose, now so seldom seen at exhibitions.

The local classes, in which the competition was limited to amateurs resident within a specified distance of Ulverston, were well filled, and the several boxes formed a pleasing feature. The most successful of the several exhibitors was Mr. R. L. Garnett, who won the first prize for twelve blooms, distinct varieties, the Mrs. Myles Kennedy cup and silver medal for six blooms of teas or noisettes, the Myles Woodburn trophy and silver medal for the best bloom shown by an amateur, and in addition he was awarded for his collection of twelve blooms the gold cup and silver medal offered for the best box staged in the amateur classes. Mr. F. J. Harrison, Rosedean, Ulverston; the Rev. R. T. Langtree, Mr. J. H. Boolds, Furness Abbey; and the Rev. A. R. Tomlison, Bolton-le-Sands, were also successful in the local classes.

ROSES.—MEDAL AWARDS.

Silver medals for the best blooms were awarded as follows:—To Mr. Hugh Dickson for the best tea or noisette—Mrs. Foley Hobbs—and for the best rose other than tea, noisette, or hybrid tea—Horace Vernet—shown by nurserymen. In the amateurs' division the silver medals were awarded as follows:—To Mr. W. H. Calvert for the best tea or noisette—Mrs. Myles Kennedy—and to Dr. Pallett for the best rose other than tea or noisette, the variety being Mildred Grant.

A considerable number of new roses were shown, and the following awards were made: Gold medal to George Dickson H.P., shown by Messrs. Alex. Dickson and Sons. Silver-gilt medals to Mrs. David Baillie H.T., shown by Mr. Hugh Dickson; to Mrs. Muir Mackean H.T., from Messrs. S. McGredy and Son; and to Lady Dunleith, from Messrs. Alex. Dickson and Sons. A card of commendation was conferred upon Earl of Gosford H.T., Messrs. S. McGredy and Son; Mr. P. le Cornu exhibited under the name of Duchess of Normandy a sport from Dean Hole, which appears to be somewhat paler than that variety.

SWEET PEAS AND HARDY FLOWERS.

The classes for sweet peas and hardy flowers were provided by the North Lonsdale Rose Society. The classes were numerous and well filled, and the flowers in competition for the liberal prizes sufficed, with a few miscellaneous contributions, to fill a tent 150 feet in length and of a corresponding width to its utmost capacity. The quality of the blooms was surprisingly high, considering the trying weather that had been experienced, and the effect produced by the 1,800 vases of flowers was so extremely beautiful that it is not likely to be soon forgotten by those who are interested in these fragrant flowers.

The open classes, in which the prizes were provided by the society were five in number, and in that for twenty-four varieties Mr. R. Bolton, Warton, Carnforth, was first; Mr. R. Wright, Liverpool, second; and Messrs. Bolton and Sons, Warton, third. Mr. John Bryce, High Harrington, was first for twelve and six varieties; and Mr. E. M. Allen, Liverpool, was first for six new varieties. Other successful exhibitors in these classes were Mr. G. H. Garnett-Orme, Skipton; Mr. C. E. Taylor, Over Kellett; and Mr. S. Shackleton, Keighley. The premier award for the best sweet pea not in commerce was awarded to Mr. R. Bolton for an unnamed variety with purple-rose flowers. In the several classes provided by Mr. Mackereth the principal awards were made in favour of Mr. J. Bryce; Mr. J. Keay, Ulverston; Mrs. Atkinson, Croftlands, Ulverston; Mr. E. M. Allen, and Mr. J. H. Boolds. The Breadmore Challenge Plate for twelve varieties was won by Mr. F. J. Harrison. In the local classes for amateurs the last-named exhibitor was first for twelve and six varieties; Mr. E. L. Tosh, Whytam, Ulverston, was first for six bunches to comprise two each of white, red, and blue varieties. As the leading varieties were practically the same as those staged at the National Sweet Pea Society's exhibition, and recorded in our report, it is unnecessary to give the names.

The contributions to the hardy border flower classes were numerous, and for the most part tastefully set up. The finest collection in the exhibition was that of eighteen vases staged by Mr. R. L. Garnett. Miss H. Crossland, Armside, had an excellent collection for second place; and in the smaller classes the leading prizetakers were Mr. G. Anderson, Fair View, Dalton; Mr. E. T. Niven, Leeds; Mr. J. Sharp, Carnforth; and Mr. J. Wilson, Irton, Cumberland.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, July 18.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Sir J. T. D. Llewelyn, Dr. A. B. Rendle, Dr. A. Voelcker, Messrs. J. T. Bennett-Poë, J. Fraser, W. Fawcett, E. M. Holmes, G. Wilson, R. H. Pearson, A. W. Sutton, A. W. Hill, and F. J. Chittenden (hon. secretary).

BOTANICAL CERTIFICATES.—Catasetum reflexum, a new species, from Peru, approaching Cycnoches in some of its characters, was sent from Glasnevin by Sir Fred. Moore. On the motion of Mr. O'Brien, seconded by Mr. Wilson, a botanical certificate was unanimously recommended to this plant.

A new dendrobium, from Java, was exhibited by Sir Trevor Lawrence, Bart. It had been described under the name of D. Annae J. J. Smith, and is nearly allied to D. mutabile, which was shown to compare with it, but about double the size. On the motion of Mr. O'Brien, seconded by Mr. Bennett-Poë, a botanical certificate was recommended.

SCALE ON GRASS.—Mr. E. M. Holmes showed a white scale insect attacking grass from Charing. This scale (Uriopeltis festucæ) appears to be common this season in places, and proves destructive to the grasses it attacks, causing them to become brown.

SWEET PEA ROOTS.—Mr. E. M. Holmes also showed dying roots of sweet pea. These, as is so frequently the case this year, were attacked by the fungus Thielavia basicola. The foliage of attacked plants turns yellow in patches, and finally dies, while the stem is often streaked with yellowish-brown. The fungus also attacks the culinary pea, and produces similar symptoms. In America and Italy it has proved extremely destructive to tobacco, and nothing short of sterilisation of the soil has proved an effective check to its ravages.

PAPAVER ORIENTALE WITH CLEISTOGAMOUS FLOWERS. — Mr. J. Fraser showed Papaver orientale with cleistogamous flowers. It had produced similar ones last year. The petals were linear oblong, not imbricate, and only as long as the sepals. The pollen was abundant, and both stamens and pistil appeared normal.

SPORT IN SHIRLEY POPPY.—Mr. Fraser also showed flowers of Shirley poppy having the usual yellow stamens, but with two of the petals red and the two alternate ones white.

MATRICARIA SUAVEOLENS. — Mr. Bowles showed specimens of Matricaria suaveolens (= M. discoidea), an introduced plant, which has now extended its range into many English counties, and as far north as Aberdeen. The specimens were collected in the neighbourhood of Epping.

CROWNGALL.—Mr. H. T. Gussow sent specimens of crowngall—large swellings on the roots or near the collar of trees, from Canada, where the attack is common. It has been shown by Dr. Erwin Smith to be due to the attack of Bacillus tumefaciens, though others, apparently without recourse to inoculation experiments, have ascribed it to the attack of a myxomycete. Numerous plants of widely distinct families are attacked by the bacillus; but it does not yet seem to be clearly established that it is often productive of great harm to the tree attacked.

FASCIATED ROSE.—Mr. Basham, Bassaleg, sent a fasciated rose-stem over an inch in diameter, and bearing at its apex about nine more or less developed buds.

Newcastle-on-Tyne.

The annual show of the Durham, North-umberland, and Newcastle-on-Tyne Botanical and Horticultural Society, which is one of the oldest societies in England, was held on Wednesday, July 19, and continued for the two following days.

Newcastle Flower Show was for many years one of the best and most popular shows in the country, but its management has passed into the hands of a committee whose members apparently have but little experience in show management. As a consequence there has not been the advancement of late years there might and should have been. Owing to an absurd rule, which excluded the Press from the tents until after judging, our notes were taken with quite unnecessary difficulty. We have never on any previous occasion experienced such treatment as that of our representative at Newcastle where, evidently, a full report is the last thing the society wishes to see.

GROUPS.

The opening class for a group of miscellaneous plants brought good entries, of which that arranged by Mr. T. Be[illegible] gardener to A. E. Bainbridge, Esq., L[illegible] Jesmond Park West, Newcastle, [illegible] His group was bright with orchids, [illegible] crassulas, and other flowering among which the foliage of crotons, caladiums, ferns, etc., showed to advantage. A shapely Cocos Weddelliana occupied the centre in front, and some tall palms and acers were well built up to form a background. The second prize went to Mr. W. A. Holmes, West End Nursery, Chesterfield, who had an effective arrangement of highly-coloured crotons, with a few cattleyas, ixoras, liliums, etc., scattered through to add variety to the colour effect. A wide-spanned arch occupied the background, surmounted by three good kentias with smaller plants in the intervening spaces. The mass of crotons outweighed all else in this exhibit. Mr. H. H. Hillier, Green Park Gardens, Darlington, took third, his group suffering from too much colour, such things as Hiawatha roses, bougainvilleas, carnations, and marguerites being too lavishly used. The fourth prize was awarded to Messrs. Carnegie and Co., Lim., St. Mary's Place, Newcastle.

There were two remarkably good entries for six specimen plants in bloom, and still more remarkable is the fact that both competitors are local pitmen, who showed in a truly professional manner. Mr. Joseph Ellison, 26, Shankhouse Terrace, Cramlington, had in his first-prize group Allamanda Hendersoni, Stephanotis floribunda, Clerodendrons fallax and Balfouriana, Dipladenia amabilis, and Hydrangea hortensis, all beautiful well-flowered specimens; whilst the second-prize collection, contributed by Messrs. Robert Arthur and Joseph Harrison, 55, West Wylam, near Prudhoe, contained a superb specimen plant of Oncidium flexuosum carrying about twenty-five flower stems, as well as good plants of similar subjects to those in the first-prize group. Mr. Ellison also scored for four plants in the class confined to amateurs, the second prize going again to Messrs. R. Arthur and J. Harrison. The best six table plants came from Mr. T. Bell, gardener to A. E. Bainbridge, Esq., Newcastle, who had a nice Phœnix Roebelliana and Pandanus Veitchi, as well as crotons, etc. Mr. H. H. Hillier, Darlington, was placed second, Mr. W. A. Holmes, Chesterfield, coming third.

Sweet peas made a bright display of colour down one side of a tent, the collection of twelve bunches bringing seven very good entries. Mr. Edward Keith, gardener to the Right Hon. Sir George Trevelyan, Bart., Wallington Gardens, Cambo, Morpeth, was a splendid first, his peas being of good size, carrying practically four blooms per stem throughout. Mrs. Hugh Dickson, Thomas Stevenson, Masterpiece, and Edrom Beauty were excellent. Mr. W. Lambert, gardener to the Right Hon. Earl Grey, Howick Gardens, Lesbury, Northumberland, stood second with a dozen vases that carried fine colour, and were beautifully fresh. Elsie Herbert and Marjorie Willis were very well shown; the third prize went to Mr. F. J. Bell, Crescent Nurseries, Whitley Bay, and the fourth to Mr. A. W. Appleton, gardener to Lacey Thompson, Esq., Farlam Hall Gardens, Brampton Junction. Six vases also made a good class, Mr. Edward Keith claiming first place again with a splendidly-grown and shown half-dozen; the second was secured by Mr. S. Russell, gardener to Mrs. Eustace Smith, Manor House, Whalton, Morpeth. Mr. J. Shaw, gardener to B. W. E. Hedley, Esq., Dilston Hall, Corbridge, being third. Mr. Keith won in both Messrs. Sutton and Sons' and Messrs Webb and Sons' classes.

ROSES.

The largest class in this section was for thirty-six blooms in not less than eighteen varieties. Messrs. R. Harkness and Co., Hitchin, were the winners, among their best blooms being White Maman Cochet, Mrs. J. Laing, Lohengrin, and Dean Hole; second place was taken by Mr. Arthur H. Bigg, Ardyng Nook Nurseries, Shipley Glen, Baildon; Messrs. G. Gibson and Co., Leeming Bar, Yorks, third. Messrs. Harkness and Co. again scored for twenty-four roses, Mr. Bigg coming second, and Messrs. Gibson and Co. third. The same order was continued for twelve blooms, no great quality being in evidence.

Eighteen bunches of hardy herbaceous flowers made a brave display, there being five entries, among which Messrs. G. Gibson and Co., Leeming Bar, Bedale, scored a good victory. They had splendid bunches of Gaillardia Carmine Gem, Sidalcea mexicana, Verbascum Caledonia, and other equally beautiful subjects. Messrs. Harkness and Sons, Bedale, had fine delphiniums, liliums, lupins, etc., on their second-prize stand, the other prizes going to Messrs. Longster and Sons, Malton, Yorks; Mr. G. Finley, Darlington; and Mr. F. Edmonton, Newcastle. A class was provided for a collection of cut carnations, the four entries making a very attractive display. Mr. J. E. Hathaway, gardener to J. Brennand, Esq., Baldersby Park, Thirsk, led the way with a bold arrangement of Princess of Wales and blush Malmaisons, Cecilia, Edith Waters, and several other fine varieties. Mr. William L. Lawrenson, Yarm-on-Tees, was second, his perpetual varieties being well shown, but the exhibit lacked the weight of the Malmaisons. The third prize was awarded to Mr. W. Smith, gardener to the Earl of Durham, Lambton Castle; and fourth to Messrs. George Fairbairn and Sons, Botcherby, Carlisle.

FRUIT.

There were three entries in the class for a collection of eight dishes of fruit, the winner being Mr. James E. Hathaway, gardener to J. Brennand, Esq., Baldersby Park, Thirsk. He had nice Madresfield Court and Muscat of Alexandria grapes, Universal melon, Royal George peaches, Lady Sudeley apples, Early Rivers nectarines, Czar plums, and Brown Turkey figs, the fruit being of good size and colour throughout. Mr. W. Parker, gardener to J. Drake, Esq., Oxford House Gardens, Market Rasen, took second, his Buckland Sweetwater and Madresfield Court grapes being stronger than the first-prize winner's, but his other dishes were over ripe throughout. Mr. William Nicholls, gardener to the Right Hon. Lady Beaumont, Carlton Towers, Carlton, S.O., followed for third place, his fruit being on the small side. Mr. Hathaway scored again for four dishes, putting up Nectarine Pitmaston Orange, Universal melon, and the two varieties of grapes as in the other class. Second again went to Mr. W. Parker, who had Dryden nectarine in capital form. Mr. Nicholls came third in this class also.

For four bunches of grapes, Mr. Hathaway secured first, showing Muscat Hamburgh, Canon Hall Muscat, Madresfield Court, and Lady Hutt. Mr. Parker, Market Rasen, was second, showing big bunches of Black Hamburgh, Madresfield Court, Muscat of Alexandria, and Buckland Sweetwater. Third was awarded to Mr. J. R. Gardener, gardener to Lady Cowell, Clifton Castle, Bedale, Yorks. Among five entries for two bunches of Muscat of Alexandria, Mr. G. Shotton, gardener to Mrs. H. F. Swan, Prudhoe Hall, scored, the second going to Mr. J. Snell, gardener to J. Knott, Esq., Close House, Wylam; Mr. W. Mark, gardener to Miss Muschamp, Fernley Hall, Corbridge, being third. Two bunches any other white grape did not form a strong class, but Mr. Hathaway's winning pair of Lady Hutt scored a good first, Mr. J. Snell coming second, and Mr. T. Bell third. Mr. W. Parker had the best two bunches of Black Hamburgh, the other prizes going to Mr. J. R. Gardener, and Mr. W. Lambert, gardener to the Right Hon. Earl Grey, Howick Gardens, Lesbury.

For any other black the prizes were given to Mr. Gardener, Mr. W. Parker, and Mr. W. Lambert, in the order named.

There were six decorated tables, flowers and fruit combined, the test of merit to be beauty of arrangement. Mr. W. Parker, Market Rasen, was the winner, his fruit being good, and his carnations, sweet peas, and francoas were all nice, but the table was heavy throughout. Second was given to Mr. R. Battersby, Hagg Hill, Blaydon-on-Tyne, who used salmon-tinted sweet peas, fern, and other foliage somewhat lavishly, and third prize to Mr. H. H. Hillier, Darlington.

NON-COMPETITIVE.

Trade exhibits of varied and interesting character came from far and near, a good number of Scottish growers crossing the border with choice collections of plants and flowers. Messrs. Sutton and Sons, Reading, arranged a table of vegetables, melons, tomatoes, etc., in their customary first-class style. Calabash gourds, sugar corn, Sunbeam tomato, Twentieth Century mushroom, and other more or less uncommon vegetables were included in the exhibit, the whole stand being beautifully decorated with vases of clarkias, larkspurs, stocks, and other annuals of excellent strain.

Grand delphiniums were staged by Messrs. John Forbes, Lim., Hawick, N.B., who also showed rare collections of phloxes, pentstemons, and violas. Their new Pentstemon King George V., was well shown. It is of great size, brilliant crimson with darker throat.

An interesting exhibit was that put up by Messrs. Laing and Mather, Kelso, N.B. It included hardy perennials, alpines, carnations, both border and perpetual flowering, and sweet peas. Among the perpetual carnations a new one named Guardsman was a finely-formed, smooth-edged flower of rich crimson. This is the type of which we want more.

A capital exhibit of vegetables and flowers came from Messrs. E. Webb and Sons, Wordsley, Stourbridge. The arrangement of plants and cut flowers was bold and striking, there being mounds of gloxinias, tall stands of liliums, hydrangeas, clarkias, etc., and wide-spanned arches furnished with the latest varieties of sweet peas. Fine melons, excellent peas, tomatoes, carrots, and every other seasonable vegetable were staged.

Mr. F. J. Bell, Crescent Nurseries, Whitley Bay, staged sweet peas and violas. The sweet peas were of good quality, and included many of the most up-to-date varieties. Among the violas we particularly noticed Moseley Perfection, Lady Grant, Lord Nelson, and Evelyn Bell, the last-named a new purple self of good form and substance.

Roses were nicely shown by Messrs. Clibrans, Altrincham. A mass of the increasingly popular Lyon Rose made a striking centrepiece, whilst tall stands of such good things as Madame Melanie Soupert, Marquis of Salisbury, and other free-flowering H.T.'s made up a pleasing display.

A miscellaneous group of ferns and flowering plants was arranged by Mr. William Lawrenson, 11, Pilgrim Street, Newcastle.

A small, but admirably-constructed rockery was exhibited by Messrs. Kent and Brydon, Darlington. Natural weather-beaten stone was used with much skill, and many very choice alpines were planted in the niches. Œnothera niparia, Hypericum repens variegata, Campanula mirabilis are but a few of the really good plants noticed.

Included among a choice collection of phloxes shown by Messrs. Charles Irvine and Sons, Jedburgh, we noticed Queen Alexandra, a beautiful white; Mrs. Pringle, and a rich violet-coloured variety named Mrs. Sinton. Delphiniums and pentstemons were also largely shown by this firm.

Messrs. Finney and Co., Lim., Newcastle-on-Tyne, had a big display of early-flowering gladioli, sweet peas, Lilium auratum, tuberoses, etc., the whole making a very attractive exhibit.

Roses and hardy perennials were put up by Messrs. Dicksons, Lim., Chester, the collection of roses being representative of up-to-date garden or decorative varieties.

One end of the big tent was occupied by Messrs. Ord Bros., West Chirton Nurseries, North Shields, who put up a miscellaneous group of useful greenhouse plants.

Messrs. G. Fairbairn and Sons, Carlisle, arranged sweet peas on a table, showing well-grown flowers of popular varieties.

BULBS.—A practical treatise on the cultivation of hardy, hothouse and greenhouse bulbous and tuberous rooted plants is "BULBS AND THEIR CULTIVATION," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

Horticultural Club.

On Friday, the 21st inst., at the kind invitation of Sir Frank Crisp, a party of about eighty members and friends, including a large number of ladies, visited Friar Park and its peculiarly varied attractions, spending, by favour of their host and the clerk of the weather, one of the most enjoyable days conceivable. Taking previously-arranged saloon carriages at Paddington the party proceeded to Reading, where by Sir Frank's generosity a steam launch had been provided to take them down the river to Henley, where they were entertained at lunch, prior to being conducted over the park and its wonders by their host in person. The unrivalled Alpine rockery, with its choice collection of alpines combined with a marvellous representation of Alpine scenery, culminating in a distant view of the Matterhorn, was much appreciated, though the effect of three weeks' burning sunshine and continued drought heavily handicapped the normal freshness and beauty of the prospect. The visitors were then conducted through the underground caves and caverns with their eerie population of gnomes, bats, owls, and other weird creatures, and into the recesses of the ice beneath the glaciers of the Matterhorn, and then along the subterranean streams which connect the lake system of the mysterious country they were traversing. The new Japanese garden was also inspected and the beautiful conservatories, filled with botanical curios, were also not neglected. The beautiful house itself, with its riddles and puzzles deftly wrought into its sculptured walls, also evoked both admiration and amusement. This tour being ended, the visitors were conveyed back to the boathouse, and re-embarked in the launch for a further trip to Marlow, where, after partaking of tea at the Castle Hotel, the saloon carriages were waiting to transport them to Paddington, after what was unanimously pronounced to have been an absolutely ideal outing. To mark the occasion a rhymed and humorous description of Friar Park had been written by Mr. C. T. Druery, and printed by Sir Frank for distribution as a souvenir, but the printer having disappointed him, Sir Frank kindly announced that he would forward a copy to any of his guests on receipt of a postcard bearing name and address. It is needless to say that a most cordial vote of thanks was passed to both Sir Frank and Lady Crisp for their great kindness and to Mr. Harry J. Veitch for undertaking the necessary arrangements.

Liverpool Horticultural Association.

JULY 19.

This society held its third rose and sweet pea show in the Corn Market with an increased entry, and a greatly augmented attendance. The committee would be well advised to secure better means of ventilation both for the exhibits and visitors. The sweet peas were undoubtedly the most popular section, the Welsh exhibits gaining high appreciation, the flowers being good in colour, size, and substance. The roses were, owing to the hot, dry weather, few in number, and of only moderate quality. The herbaceous cut flowers, carnations, and pansies, contained specimens of merit.

In the class for twenty bunches of sweet peas, distinct, the leading award went to Mr. Forder, gardener to Colonel Cornwallis West, for a fine selection, the flowers splendidly developed, and tastefully staged; second, Dr. J. E. Phillips; third, S. Salisbury and Son. The same exhibitors also won in two classes for twelve vases, distinct. For twelve varieties there were only two entries, and the first and second awards were as in the former class. In another class for twelve bunches, Mr. R. R. Anderson scored; and for one vase of Sutton's Queen Mr. W. Bindloss took the lead.

For eighteen roses, distinct, Mr. J. Barker, gardener to F. R. Dixon-Nuttall, Esq., was the first and only exhibitor; his best blooms were Mrs. W. J. Grant, the Lyon Rose, and J. B. Clark. For twelve varieties the leading award went to the some exhibitor; and for six Mr. T. H. Jackson scored.

Twelve vases hardy herbaceous cut flowers, Mr. T. Henshaw took the lead; and for six vases, Mr. A. F. Sloane had the winning collection.

In the class for six varieties of carnations or picotees, Messrs. A. R. Brown, Lim., held their own with meritorious blooms; and for twelve blooms they again occupied the premier position. For six blooms, distinct, Mr. G. A. Turner took the lead; and for the dinner table decoration Miss Newsham secured the coveted position.

In the amateurs' section some pleasing exhibits were staged, and Mr. W. Bindloss secured the premier award for twelve vases of sweet peas, Mr. G. Faulkner for six blooms, and Mr. F. Hindley for six vases. Mr. H. S. Hodgkinson was first for twelve roses, Mr. L. Thomson first for six; and in the second class for six, Mr. F. Hindley obtained premier honours. Mr. L. Thomson was first for twelve bunches of herbaceous flowers, and Mr. W. A. Crippen for cut single begonias and double begonias. Mr. G. A. Turner was first for six carnations and for one vase of three blooms.

Mr. J. R. J. Turner had the best pansies, and Miss Newsham the best dinner table.

The Liverpool Orchid Company received the society's gold medal for orchids, and silver medals were awarded to Messrs. R. P. Ker and Sons, for stove and greenhouse plants, fruits, and vegetables; Messrs. Dicksons, Chester, for cut flowers of hardy plants; Bakers, Wolverhampton, for roses; Messrs. W. Conway and Sons, Halifax, for flowers of herbaceous plants; W. L. Pattison, Shrewsbury, for pansies; Mr. W. Rowland, Wavertree, for roses; Mr. R. Manson, Gateacre, for roses, and Mr. H. Middlehurst, for sweet peas.

Awards of Merit were make to Mr. C. A. Young, for carnations; to Mr. David Little, gardener to J. Smith, for cypripediums; to Messrs. Fishlock Bros., for cut flowers; and to the Covent Garden Seed Company, for herbaceous cut flowers and sweet peas.

ANSWERS TO CORRESPONDENTS.

CROP REPORTS.—J. C. C., Newbury: The following statements may be obtained free of charge, and immediately on publication, by farmers and others interested, on application to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W.: (1) Acreage under each kind of crop and number of each class of live stock in Great Britain. (2) Acreage under Hops in each county. (3) Production of Hops in each county. (4) Production of Corn, Pulse, and Hay crops in Great Britain. (5) Produce of Potatoes and Roots in Great Britain. (6) Reports on Crop prospects at the middle of July, August, and September. Statements 1 and 2 are usually issued about the end of August, Statement 3 about the middle of October, Statement 4 about the middle of November, and Statement 5 about the beginning of December. The reports on crop prospects (6) are issued about the 22nd of the month to which they refer.

LEUCOPHYTA BROWNI.—G. D. A., Apperley: The plant so popular for many years as a suitable subject for carpet bedding under the name of Leucophyton Browni should have been labelled Leucophyta Browni. But if the cultivator nowadays would be up to date in his nomenclature the label should read Calocephalus Browni. Under the latter name you will find it in the supplement to "Nicholson's Dictionary of Gardening," but you may look in vain for it in other dictionaries to which gardeners generally have access. This is the more remarkable when we remember how immensely popular this silver-leaved composite was in the days when carpet bedding was the rage, and how useful it is even now as a carpeting or edging plant.

LOGANBERRIES.—H. C., Burton: Cut out all or nearly all the canes that have borne fruit this year as soon as the crop is finished, and at once tie in loosely all the young canes there is room for. Loganberries pay for generous treatment.

PEACH TREES.—S. H. S., Dorset: In view of the heavy crop the trees are carrying and the long-continued dry weather, we are not surprised the trees are not growing so freely as you wish. The only course you can take for the purpose of assisting the trees in swelling up their fruits is to flood the borders with water two or three times with an interval of a week between the supplies. Previous to the second watering a thin coating of some good artificial spread over the soil will be of considerable value as an aid in the development of the fruit.

EUPHORBIA JACQUINÆFLORA. — J. B. B., Altrincham: Not a few names of plants common in gardens and nurseries are quite incorrect, and in some cases it would be difficult to find a good reason for the retention of the wrong name. Some names fit the plants very well, and hold their place for many years, when some botanical investigator discovers that another name was given previously, and so the older and practically unknown and unused name is given out as the correct one. This sort of thing does seem absurd, but priority of naming is the rule. In the case of the popular winter-flowering plant so well known as Euphorbia jacquinæflora, the better and correct name of E. fulgens has been quite well known for a long number of years to all who take sufficient interest in these matters and consult a good gardening dictionary. The article under the heading of Euphorbia fulgens that appeared in the GARDENERS' MAGAZINE of July 22, had, as you suspect, reference to what you know as Euphorbia jacquinæflora.

SECONDARY GROWTH ON TRAINED APPLE TREES.—D. T. P., Horsham: The secondary growths made since summer pruning should be pinched back to one leaf while soft enough to be dealt with by finger and thumb.

HORTICULTURAL PRESS AND EXHIBITIONS.—R. S., Durham: It is only on rare occasions that any attempt is made to exclude horticultural Press men from the show tent or hall during the time that judging takes place. All the leading societies are too well aware of the value they and their supporters derive from a good report of the show to do anything that would hamper the Press. During the time judging is in progress the horticultural Press have an opportunity of breaking the back of their work, provided the awards are placed on the winning exhibits directly a class is judged. In some few instances antiquated methods of making the awards known are adopted, and where this is so the work of the Press is hampered even when they are allowed in the tents while judging proceeds. Some years ago the committee of a well-known northern horticultural society decided that pressmen should not be permitted to enter the tents until judging was completely finished. As this would have meant their exclusion until the public was admitted, a great loss of valuable time, and an abbreviated report made under extreme difficulty, the pressmen representing all the leading horticultural journals promptly approached the committee and asked permission to do their work with some degree of comfort: this request being refused the scribes issued an ultimatum to the effect that unless the usual facilities were granted them within five minutes every man would return to town, and not a line of report concerning the show would appear. Needless to say, the facilities were granted, and ever since that time the relations between Press and committee have been of the most cordial nature. Pressmen are not out for a holiday when they attend to report flower shows; they are out on business, to provide information for their readers, and incidentally a good advertisement for the society holding the show.

BANKSIAN ROSE NOT FLOWERING.—W. E. S., Chester: It is probable that, in spite of a good position the situation is altogether too cold for the yellow Banksian rose, as this variety delights in shelter and abundance of sunshine to ripen up its growth; and only under these conditions does it flower successfully out of doors.

NEW ROSES.—C. W., Wolverhampton: The variety named Jonkheer J. L. Mock was sent out by Messrs. Leenders and Co. in 1909; it is a red variety, shaded on the outer side of the petals with silvery-pink. It is a fragrant H.T. rose, and said to be a vigorous grower. Mrs. Alfred Tate, from Messrs. S. McGredy and Son, Portadown, is a coppery-red H.T. rose, shaded with fawn, a very pretty decorative variety. Beauté de Lyon is a hybrid briar rose sent out by M. Pernet-Ducher last year; the colour is bright red with beautiful yellow shading. All these varieties can now be obtained through the British rosarians who advertise in our columns. Whether these roses are of first-rate value for bedding and cutting remains to be seen, as there has hardly been time yet to fully determine their value in these connections.

NAMES OF PLANTS.

R. S. R., Rhyll.—1, Olearia Haasti; Gentiana septemfida.

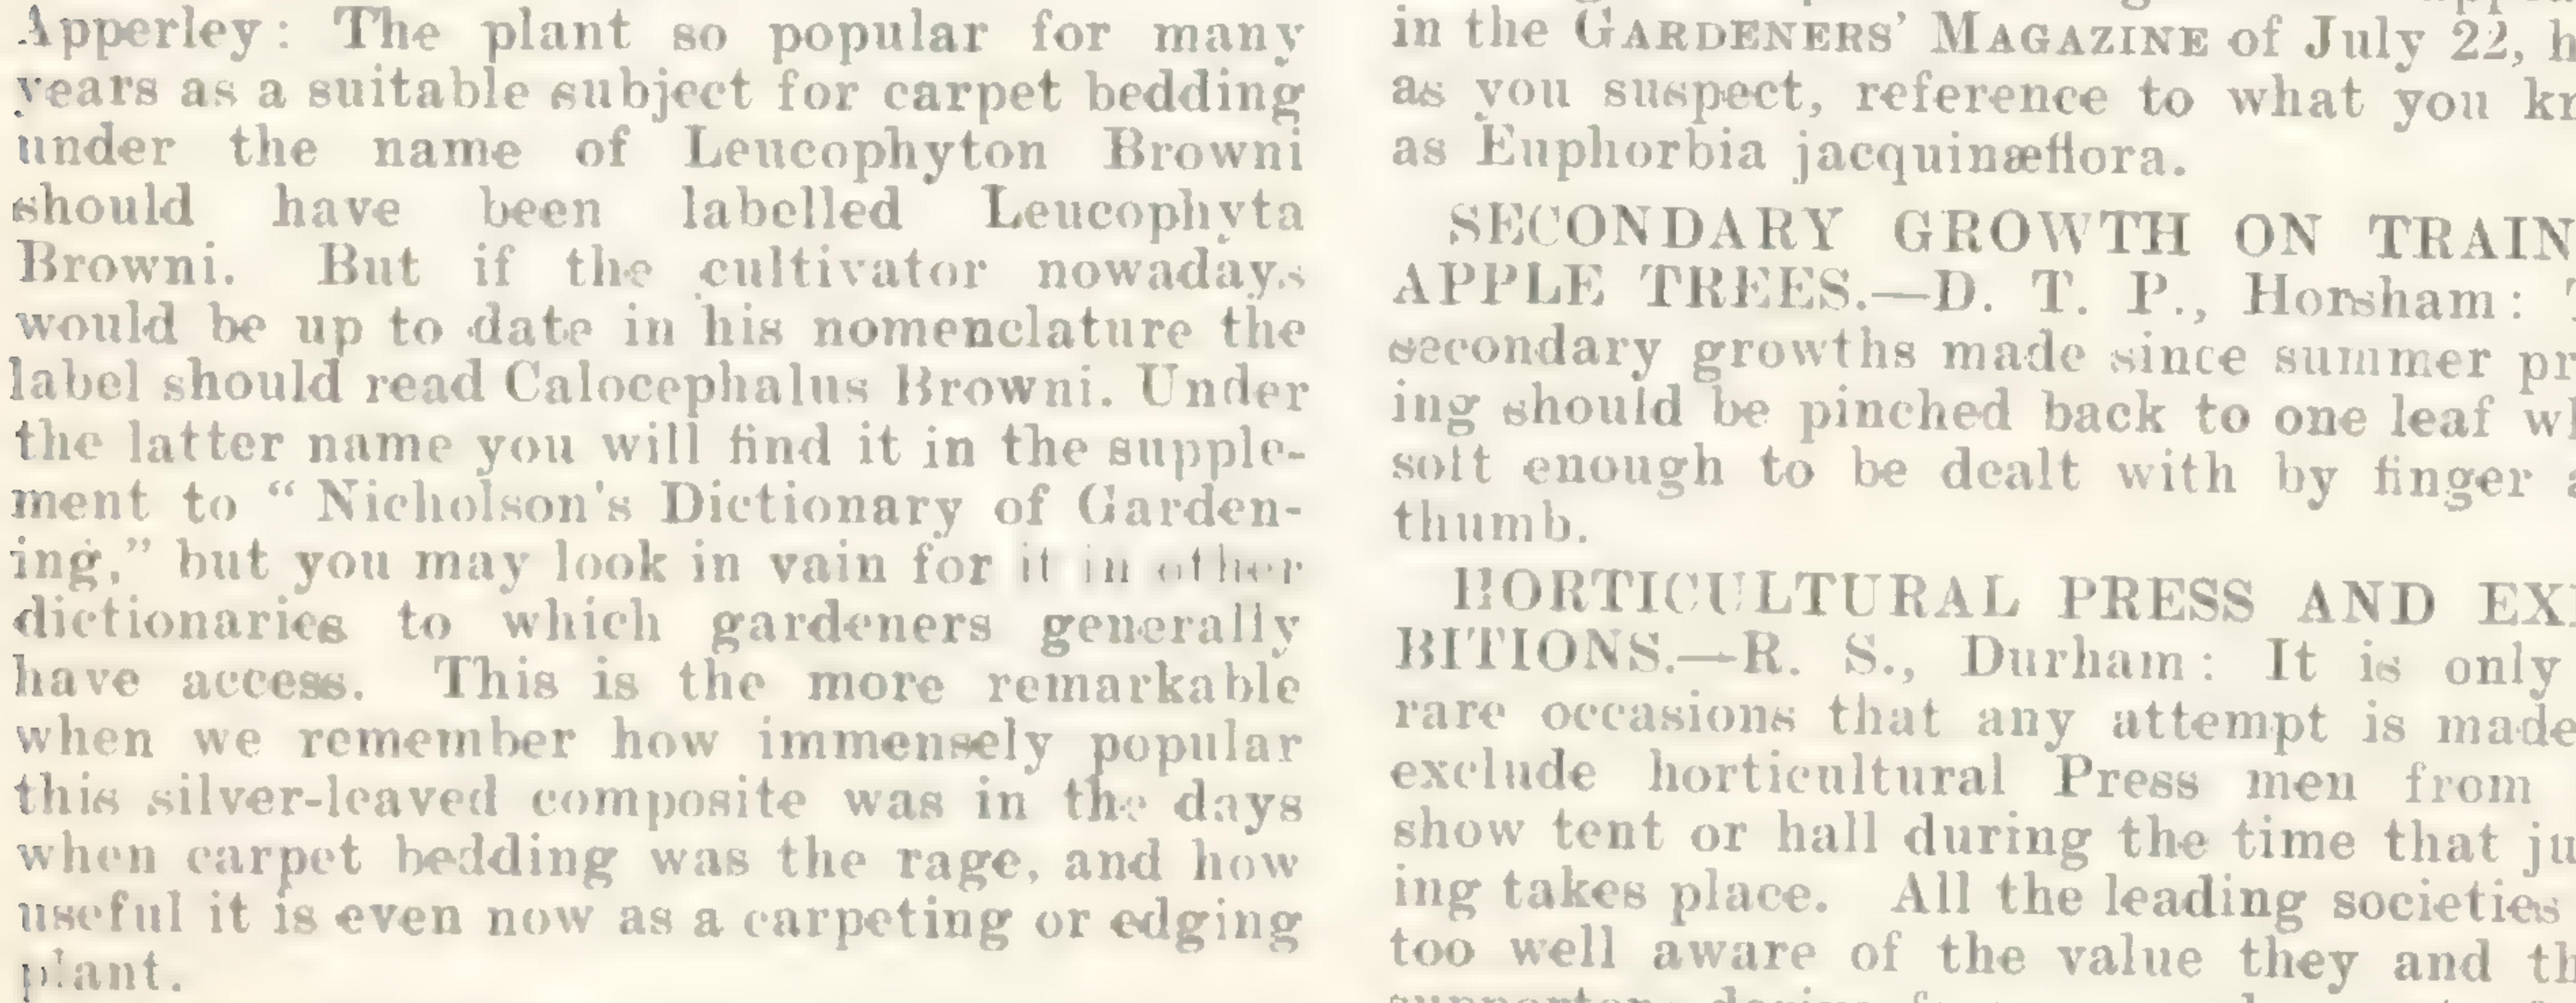
S. C. A., Rodmersham.—1, Veronica incana; 2, Saxifraga oppositifolia.

K. G., Red Hill.—The tree is Ulmus campestris variegata; have you a good photograph of the tree?

B. S. S., Ilfracombe.—1, Sidalcea candida 2, Œnothera Youngi; 3, Sedum anacampseros; 4, Tamarix gallica.

F. E. F., Harrow.—1, Chrysogonum virginicum; 2, Antirrhinum asarina; 3, Calandrinia umbellata; 4, Arenaria balearica.

R. P., Cheltenham.—1, Linum flavum; Swainsonia galegifolia; 3, Rondeletia speciosa; 4, Allamanda Hendersoni; 5, Streptosolen Jamesoni; 6, Campanula pulla.



Of course, it is sometimes necessary to INSIST upon your Ironmonger or Seedsman getting a **PINE SPRAY SYRINGE** for your approval, but it's worth while, and it would be a pity to buy a Syringe at the same price, not so large or well-made, and with none of the Pine Spray's great advantages. The Roses particularly are going sick for the want of relief from greenfly and numerous other pests. Get to work on them at once with a **PINE SPRAY SYRINGE** and **PINE SPRAY INSECTICIDE.**

Insist upon your tradesman sending at once for the former on approval. A large sample tin of Insecticide will accompany it for your acceptance if you approve the Syringe, and you will.

Size of Syringe, 24in. over all by 1¼. **PRICE 10s. 6d.**

MESSENGER & Co. LTD
HORTICULTURAL BUILDERS & HEATING ENGINEERS
LOUGHBOROUGH LEICESTERSHIRE
London Office 122 VICTORIA ST S.W.

MODERN GLASSHOUSES

as supplied by MESSENGER and CO., Ltd., are made of the best materials, and only capable and reliable workmen are employed in the erection thereof.

The following letter was recently received by us on the completion of a contract for a well-known Member of Parliament.

February, 1911.

"I should not be doing my duty to your workmen if I did not at once tell you, on the completion of your work, how pleased I have been with each and all of them.

"They have been most obliging throughout the whole job, and have endeavoured to do everything in an efficient and thoroughly workman like manner, and I must congratulate you upon having such capable employees."

Printed and Published by W. H. & L. Collingridge, City Press, 148 & 149, Aldersgate St., London, E.C., and sold by all Newsagents, and at all Railway

THE GARDENERS' MAGAZINE.

No. 3,014. Vol. LIV. (Reg. at the G.P.O. as a Newspaper, and for Canadian Magazine Post.) SATURDAY, AUGUST 5, 1911. (10/6 per Ann. Post Free. To Foreign Countries, 15/-.) **Twopence**

BARR'S AUTUMN & WINTER-FLOWERING BULBS, including Crocus Species, Colchicums, Hardy Cyclamen, Freesias, Lachenalias, Roman Hyacinths, etc., for early planting. List on appletn. —BARR and SONS, King St., Covent Garden, London.

GISHURST COMPOUND is harmless in use; its soluble Sulphur, etc., has for 40 years cured blight and fungus on plants, and is good for washing unhealthy dogs. Gishurstine keeps boots dry in all weathers; they will polish. Good for harness. Wholesale from
PRICE'S PATENT CANDLE CO., LIM., LONDON.

JAMES GRAY, HORTICULTURAL BUILDER, CHELSEA, LONDON, S.W., has a large number of first-rate Hot Water Men. This is an excellent time for having the Hot Water Heating Apparatus overhauled, and a reliable man can be secured by a postcard, telephone message (201 Western), letter, or wire, "Gray, Chelsea, London."

VOL. LIV.—No. 3,014. SATURDAY, AUGUST 5, 1911.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

New Plants.

New plants, in these days of that abundance of floral and arboreal wealth which enables us to bring together such resplendent exhibitions of bloom and foliage as we have recently enjoyed at Olympia and elsewhere, fall into two distinct categories, viz., those for which we are indebted to the exploration of new regions of the earth's surface by competent botanists, and those which, having been acquired by such exploration in the past, have been modified and improved in type by selective cultivation through their seeds or spores, or through "sports" which have occurred under culture and given rise to new and unexpected strains provided spontaneously by Nature's own devising. Obviously, the first category is intrinsically the more important, since it provides the raw material, so to speak, of the second, while in innumerable instances this raw material is in itself, in the absolutely unsophisticated form, brought about by purely natural evolution, so beautiful as to rank fully equal in value with the best results of human selection. Now it is in this particular connection that the Royal Horticultural Society in the old days of its existence, prior to that decadence from which it has emerged during the last twenty years to such a pinnacle of success, did so much yeoman service to horticulture and arboriculture by commissioning and sending out several competent botanists on exploring expeditions, which resulted in the acquisition of many valuable trees and plants which are now familiar all over the country. Of late years, however, this indispensable branch of horticultural research has been entirely left to trade enterprise, and to it we owe a very large number of new introductions which are being constantly brought forward by leading firms. From the explorers themselves, such as Mr. Wilson and Dr. Henry, we learn that China, and especially the vast mountain area which stretches northward and is practically a continuation of the Himalayan range of India, presents an inexhaustible field of research, of which only the fringe has so far been explored. This partial exploration has revealed the fact that hitherto unknown forms of vegetation, many of great beauty, and all of interest, are found in every fresh area investigated, so that this region alone should well reward extended research, particularly as the climatal conditions, elevation, and latitude contributes to render the plants so found perfectly hardy, and hence of more general popular value than tropical introductions. China, too, is only one region on the botanists' lists which is largely virgin, and, in these days of improved travelling facilities, far more easy of access than in the early days when, despite many perils, and all but insurmountable difficulties, the old explorers managed to find and transmit the treasures we have alluded to above. The moral of all this, i.e., the question which it evolves, is, would it not be well for the Council of the Royal Horticultural Society, in view of its flourishing condition, and now ample funds, to consider the advisability of resuming this function of instituting exploration on the old lines which its pioneers considered so essential, and so effectually carried out? It has now the Wisley Gardens for the raising of seeds and the culture of imported plants, under more favourable conditions than those which obtained at Chiswick, and we have reason to know that many of its Fellows would highly appreciate the taking of such a practical step to introduce new material on its own account, instead of merely lending its aid, in the way of trial and judging of plants already introduced and under cultivation. Such action cannot, in view of the vast field of research we have indicated, clash with the interests of the trade, since new introductions would inevitably have to reach the public on commercial lines. This, however, need not be discussed here, our object is merely to make a suggestion, which has not entirely originated with ourselves, but is the outcome partly of the expression of outside views, with which we entirely agree.

MR. A. GRUBB.

Mr. Albert Grubb, head gardener to Cecil F. Raphael, Esq., Porter's Park, Shenley, Herts, has come prominently before the horticultural world in recent years as a grower of splendid carnations. But his reputation does not depend upon his skill as a cultivator of these popular and beautiful flowers, because he grows other flowers, fruits, and vegetables with equal success, and in addition, acts as steward of the Porter's Park estate, managing all save the farm work. Mr. Grubb hails from Herefordshire, and commenced his gardening career at Holm Lacy, under Mr. Charles Denning; his first move was to Ash Grove, Sevenoaks, and from thence he went to Gopsall Hall, Leicester, to act as carnation grower to Lord Howe, under Mr. Lee, the head gardener. After a stay at Gopsall, Mr. Grubb became head gardener to G. Moore, Esq., at Appleby Hall, where he remained seven years, and then came to Porter's Park, where he has now completed seven years of service. As he is still a young man, we may reasonably hope that Mr. Grubb has a long, useful, and successful career still before him. For melons, for carnations, and for vegetables, he holds high awards from the Royal Horticultural and other societies, and many of our readers will remember the excellent exhibits from Porter's Park that graced the recent Olympia Show.

The Weather of July.—The high temperature and brilliant sunshine for which July was remarkable was continued until the end of the month. Throughout the week ending July 29 the temperature was very high, and on the Monday, the 31st ult., the thermometer registered 82 degrees at Kew and 81 degrees at Kensington and Margate. At the St. James's Park meteorological station the mean maximum temperature was 78.9 degrees, or 6 degrees above the average. This is the highest mean that has been recorded in July during the past forty years, and it has only once been exceeded in any other month. This was in August, 1899, when the mean maximum temperature was 79 degrees. The mean minimum temperature in London was 58.1 degrees, or 3.7 degrees above the average, and the highest mean minimum recorded during the past forty years. The bright sunshine recorded at Westminster during the month amounted to 321 hours, or 140 hours above the average, and 60 hours more than has been recorded in any previous July during the period over which the records extend, and 24 hours more than in any other summer month during the past 28 years. The rainfall in July was very small in the London district; the average for the Metropolis is rather more than 2¼ inches, but at Kew the total was only 0.82 inch, and at Greenwich it was about 0.25 inch.

Sweet Pea Trial at Wisley.—This year a trial of sweet peas has been conducted at Wisley, and as the result of the skill brought to bear upon them the plants have made a vigorous growth, and produced a profusion of flowers of high quality. The varieties included in the trials are growing in clumps on the high ground to the left of the principal walk that intersects the gardens. A sub-committee of the R.H.S. Floral Committee visited Wisley on July 14 for the purpose of inspecting the trials, and in making their awards gave special attention to the value of the varieties for garden decoration. The awards made have been confirmed by the Floral Committee, and granted by the Council. Awards of Merit were made in favour of Helen Pierce, Marie Corelli, Nubian, and Queen of Spain Spencer, all of which were sent by Messrs. Dobbie and Co. The following were given three marks (xxx), and of these six had previously received Awards of Merit: Aurora Spencer, Princess Victoria (A.M., July 9, 1907), Ivanhoe (A.M., June 21, 1910), Elsie Herbert (A.M., July 9, 1907), Dorothy Eckford (A.M., September 2, 1902), Gladys Unwin, Isobel Malcolm, Mrs. Collier, Lady Althorp, Asta Ohn, Etta Dyke, Elfrida Pearson (A.M., July 19, 1910), Apple Blossom Spencer, Tennant Spencer, Dobbie's Sunproof Crimson (A.M., June 21, 1910), and Countess Spencer (true).

International Horticultural Exhibition, 1912.—A committee for Hampshire has been formed for the purpose of creating an interest in the county in the International Horticultural Exhibition which is to be held at Chelsea next year. The Earl of Northbrook is the chairman, and Mr. E. Molyneux, V.M.H., the honorary secretary, and arrangements are being made for holding within a short period a meeting at the Castle, Winchester, for the purpose of discussing the best means of promoting the success of the exhibition. We mention this with more than the ordinary degree of interest, because this, as far as we are aware, is the first time any local committee has sought publicity for its proceedings. Not even when a deputation from the Executive Committee visited York on the occasion of the gala and flower show held in the city does it appear that an endeavour was made by the local committee, or the central body, to make the fact of the meeting being held as widely known as possible. Mr. Henslow, the secretary of the Horticultural Department of the Festival of Empire at the Crystal Palace, has been appointed assistant secretary to the Executive Committee.

Fruit Culture in West Perthshire.—Within a quite recent period fruit culture has undergone considerable development at Auchterarden, and is proving as successful as in the Blairgowrie district, which has for many years past been famous as one of the great centres of the raspberry industry. A few years ago Mr. J. M. Hodge, a member of a firm of solicitors at Blairgowrie, who has devoted considerable attention to fruit culture, purchased the Drumtogle Farm, near Auchterarder, which has an area of 212 acres, and this was divided into fourteen holdings, ranging from two to forty acres each. These holdings were planted with raspberries, with the exception of one holding of ten acres, which is devoted to strawberries. It is of interest that only two of the holders are agricultural labourers, and this fact is attributed to the initial cost of planting raspberries, amounting to about £50 per acre. The holdings are conducted on cooperative principles, and they are managed by Mr. Hodge for the holders. The holdings have their own foremen, weighers, clerks, and pickers, but these are all grouped under the management of superintendents, who, in their turn, are responsible to the general manager. As evidence of the large amount of labour required on an area of rather more than 200 acres, it may be mentioned that during the picking season, which commenced a short time ago, the staff at Drumtogle numbers 68, and the pickers over 1,000. About 17,000 barrels are required for the conveyance of the fruits to the markets and jam makers, and rather more than 2,000 pails for the use of the pickers. One of the difficulties in the management of the holdings is obtaining the requisite number of pickers, but at Drumtogle those responsible for the management have been able to have the help of the boys from two industrial schools in the district in gathering the fruit. Owing to the great heat and prolonged drought the returns this year will be only about half those obtained in a normal season.

A Disease of Broad Beans.—The Bath and West of England Agricultural Society's Consulting Botanist, Mr. J. H. Priestley, is investigating the rust of broad beans (Uromyces fabae) which has been prevalent in the West of England, and the result of the investigations he has made are given in the society's journal. It has been found that the disease first attacks the leaves and haulm, upon which it appears as rusty spots, and the spores rapidly spread to the rest of the field. The fungus parasite is still under observation in the laboratory, but the following facts with regard to it are indicated as being the most important from the practical point of view: 1. Infection from year to year takes place from the diseased spots on the old haulm stored in the rick, so that, if the disease is noted one year, all possible care should be taken to diminish the danger of infection from this source. 2. The disease is seldom dangerous unless it attacks the beans at a very early stage, and in parts of Worcestershire where the trouble used to be serious, it has been almost completely avoided by sowing winter beans. Where this disease has done damage during 1910, early sowing is strongly recommended for later years.

School Gardens in Staffordshire.—The quarterly report of the Staffordshire Education Committee contains some interesting information relative to the progress of technical instruction in horticulture, this department being under the direction of Mr. J. Stoney. With reference to day-school gardens, the report states that during the past quarter the horticultural instructor visited 88 of the 200 classes where gardening is taught. In each case where the class was started this spring he conducted the lesson and gave general advice. Where the gardens have been established several years he found that the practical part of the teaching was all that could be desired, the boys showed skill in the handling of garden tools, were quick in carrying out important work in hand, but in several instances there was a tendency to leave the note-book work in abeyance until the practical work had been brought well up to date. In the majority of the classes, however, sufficient time had been found, while the work was in progress, to make brief notes of important data in rough note-books or slips of paper, and this work had afterwards been extended and correlated with drawing, arithmetic, and composition in the schoolroom. The garden teaching has a marked effect on dull children, and in one class eight of the dullest boys in the school were selected for the work. The teacher found that the boys became brighter after the first few lessons, their composition improved, and they took a deeper interest in general school work. The seeds have, on the whole, germinated well. There have been failures in several gardens with various kinds of plants, but the cause has been either a bad tilth when sowing the seeds, or an attack of birds and insects afterwards. Gardens recently started and those composed chiefly of sandy soil have been severely handicapped by the drought, but, on the whole, the general appearance of most gardens is very satisfactory. Deeper cultivation is practised than was the case a few years ago, with the result that during a dry time the crops have the advantage of the lower layers of the soil.

School of Horticulture at Wisley.—The Rev. W. Wilks writes: The value of the Royal Horticultural Society's School of Horticulture at the Wisley Gardens, Surrey, as a centre for training young men in scientific and practical horticulture, is widely recognised. The next two years' course will commence on September 25. There are now but six vacant seats, and intending students are therefore requested to communicate with the Secretary of the Society, R.H.S. Hall, Vincent Square, Westminster, S.W., as quickly as possible. Young men between 16 and 22 years of age are eligible. The only payment to the society is five guineas for entrance, and students provide their own lodgment in the cottages of the adjoining villages.

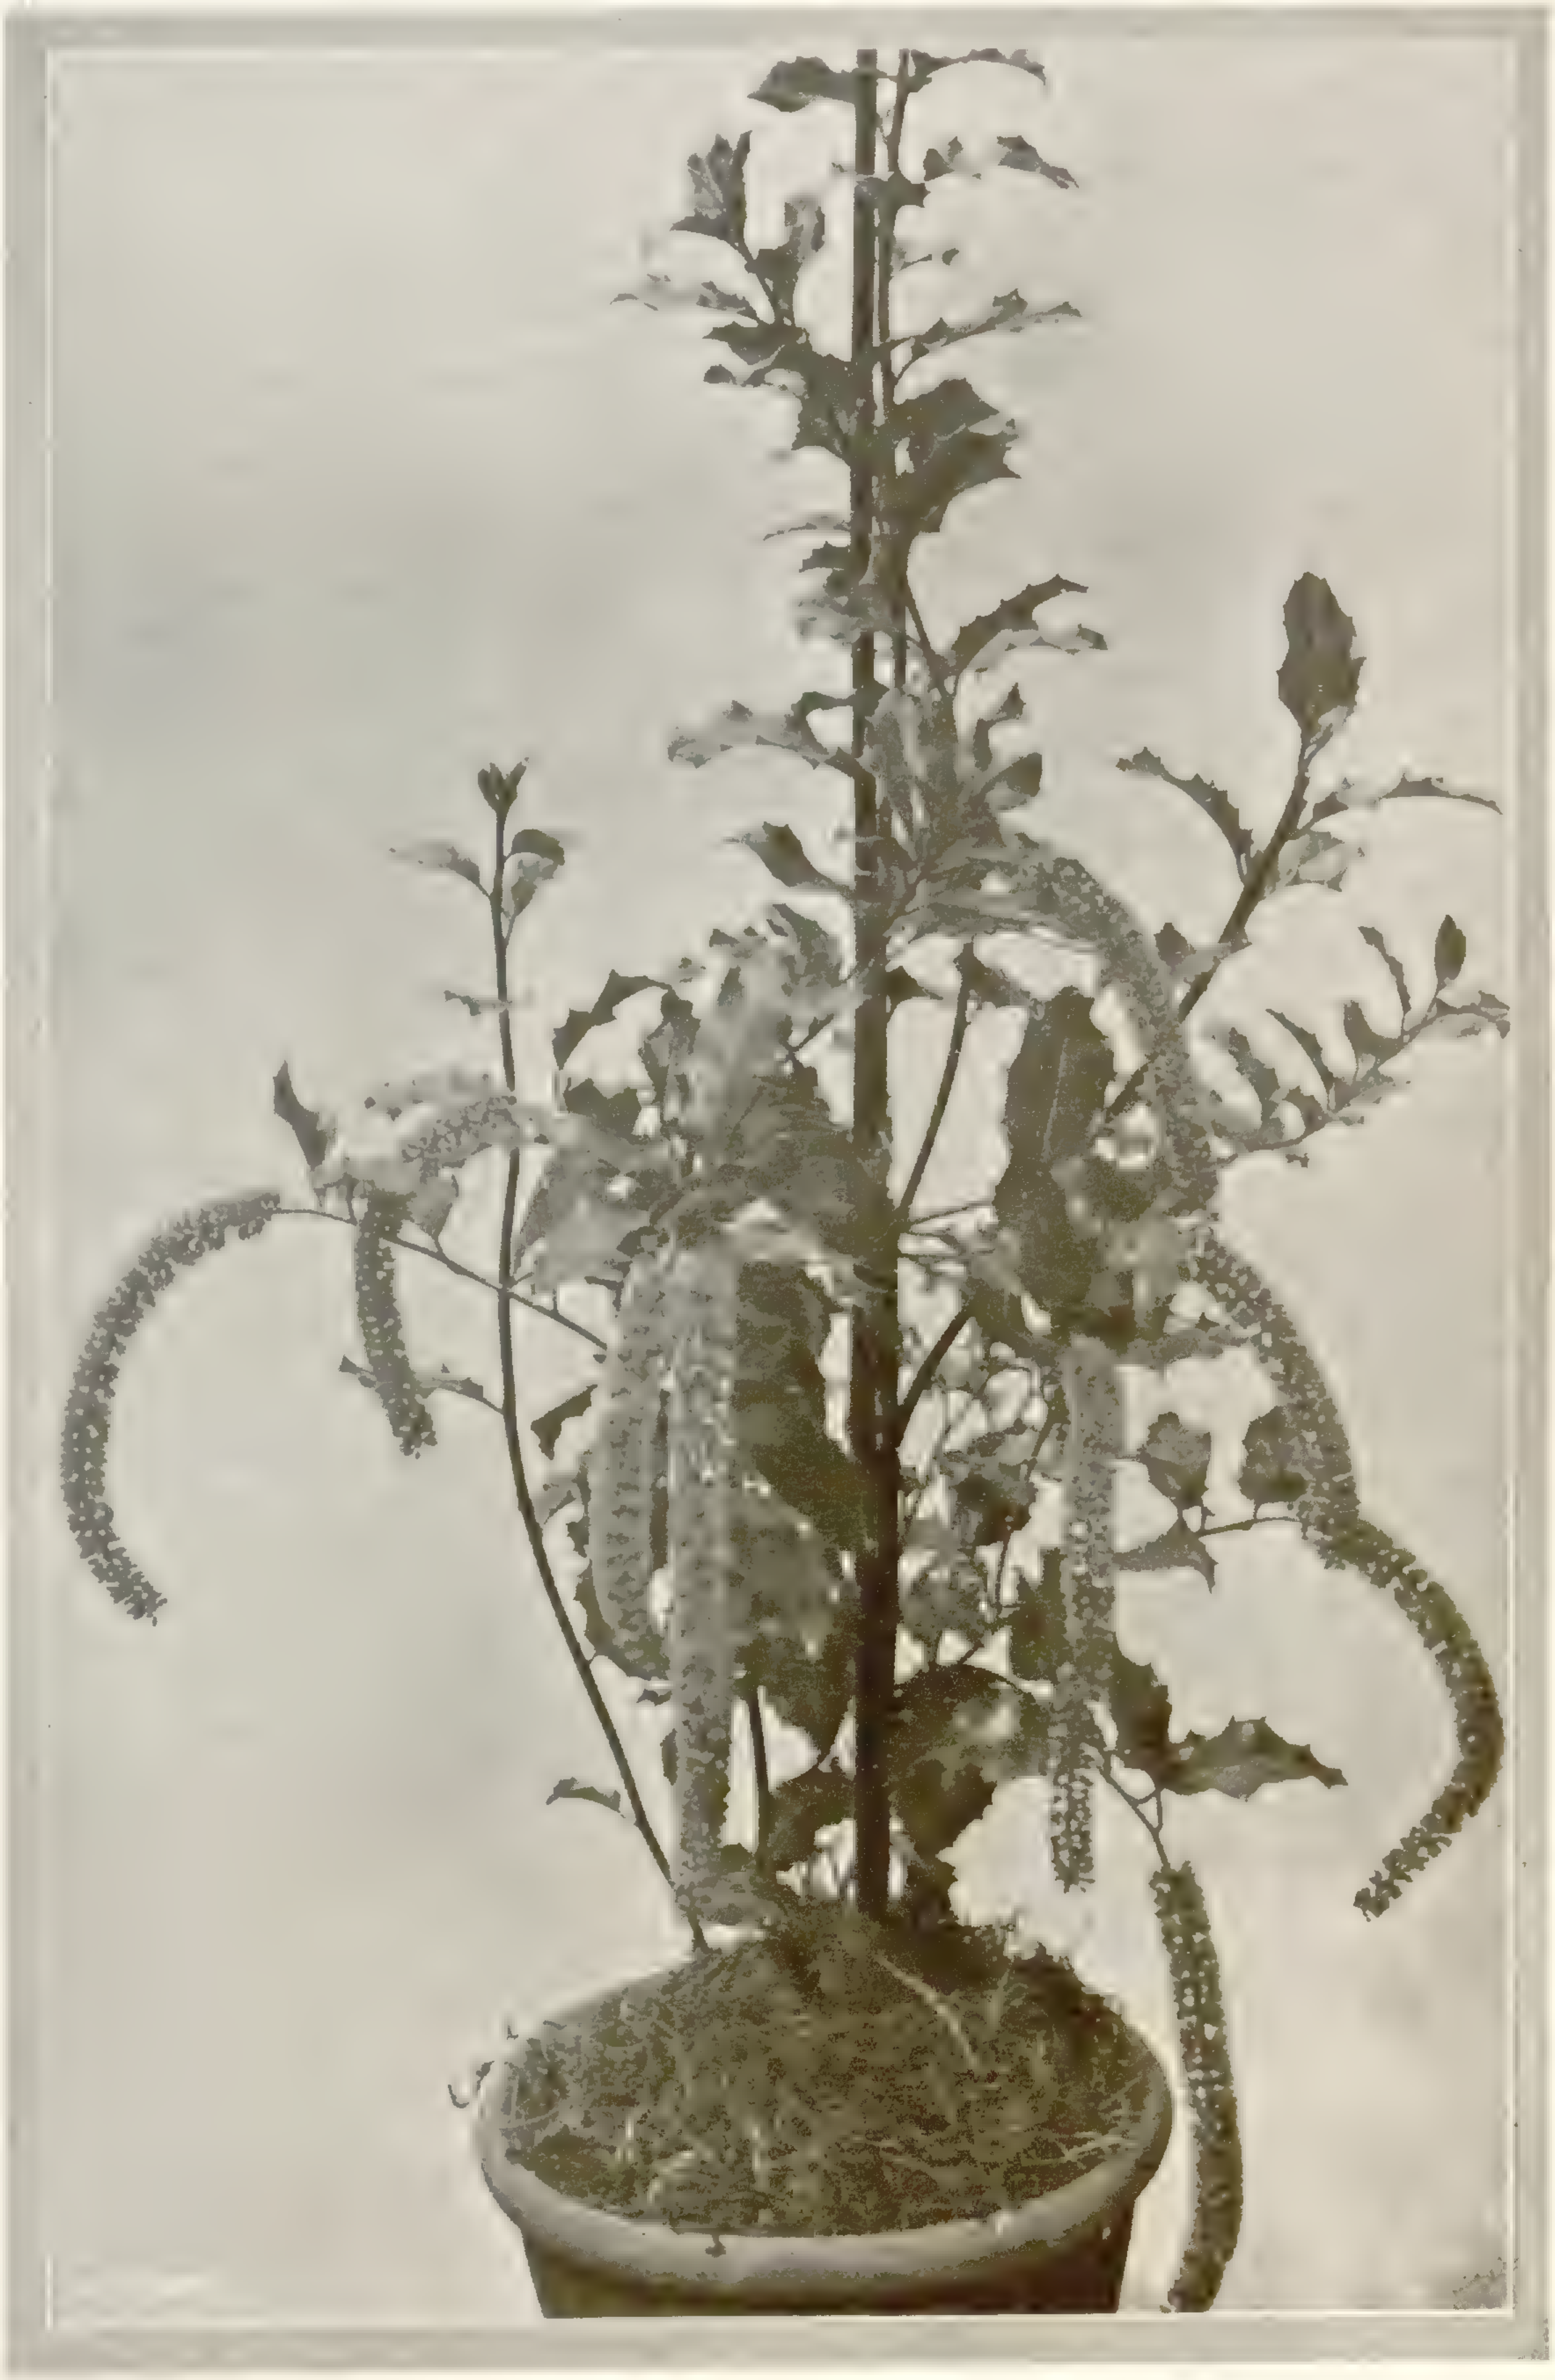
The Hampton Court Vine.—The venerable vine of the Black Hamburgh grape, which has for nearly one hundred and fifty years formed an interesting feature of the Hampton Court gardens, is this year bearing an excellent crop. There are about three hundred bunches, and these are of good size, and have the promise of finishing well. This vine has in some years borne as many as one thousand bunches, but this was much too heavy a crop for the vine to bring to a high degree of fection, and during the past two decades the number of bunches has been reduced, and fruit of much higher quality is obtained. The grapes will be ready for the table in two or three weeks hence, and a portion will, in accordance with custom, be sent by the King to the London hospitals for the use of the patients.

Culinary Pea Trial at Wisley.—A trial of culinary peas has been made at the R.H.S. gardens this year. A sub-committee of the Fruit Committee visited Wisley recently, and made the following recommendations for awards, which have been approved by the Fruit Committee and forwarded to the Council, who have granted the same. The Awards of Merit were made to the following varieties: America, Mr. Holmes, High Street, Tain; Eureka, King Edward, and Matchless Marrowfat, Messrs. Suttons, Reading; Bell's Premier, Messrs. Bell and Bieberstedt, Leith; The Caithness, Mr. Holmes; and The Cottager, Mr. S. Yates, Manchester. An Award of Merit has also been made in favour of the King's Acre Berry, King's Acre Nursery Company, Hereford.

Legacy to a Gardener.—Under the will of the late Mr. E. H. Hill, of Broadwas Court, Worcester, who died on April 19 last, Mr. Thomas Rutter, head gardener at Broadwas Court, has received a legacy of £400.

A Visit of Gardeners to Wilton House.—A few days since the members of the Reading Gardeners' Association visited the famous gardens of Wilton House, Salisbury, the seat of the Earl of Pembroke. The party, which numbered about 100, and was accompanied by the President, F. B. Parfitt, Esq., was, on arriving at the railway station, met by Mr. Challis, V.M.H., who has long had charge of the Wilton House Gardens, and it need hardly be said received a hearty welcome from him. Mr. Challis first conducted the members of the party to the stately mansion, which, by the generous kindness of the noble owner, was open for inspection. Having devoted some time to the inspection of the art treasures, in which Wilton House is especially rich, the party adjourned to the Pembroke Arms Hotel, where, by kind invitation of the vice-president of the Reading Gardeners' Association (Leonard Sutton, Esq.), the members sat down to an excellent luncheon. After luncheon the beautiful pleasure grounds and admirably-kept kitchen garden were inspected. The grand cedars and other ornamental trees, for which the grounds of Wilton House enjoy a well-deserved fame, attracted a full share of attention. Much interest was evinced in the kitchen garden with its numerous glass structures, and in the orchard. The day was drawing to a close before the inspection of the gardens was completed, and, in turning their faces homeward, all who had taken part in the excursion felt a strong sense of satisfaction with what they had seen, and with the excellence of the arrangements that had been made by the officials.

Euphorbias and Mimetic Resemblance.—Everyone who has an intimate acquaintance with plants knows that certain species have a resemblance to others belonging to quite different natural orders. That such is the case was brought out forcibly by Lieut.-Colonel Prain, Director of the Royal Gardens, Kew, a short time ago, at a meeting of the Royal Society, when he exhibited a dozen species of euphorbia, together with the plants that each resembles. E. Berthelotí is like Cotyledon lincolare, E. colletiodes resembles Rhipsalis macrantha, E. dendroides resembles Willow twigs, and E. Intisy has a likeness to Prunus twigs, E. hytrix mimics Cereus insularis, and C. polygonus is mimicked by E. polygona, E. Schimfenana resembles Ceropegia fusca, E. Sipolissi resembles Vitis quadrangularis, E. stapeliodes resembles Stapelia macrantha, while E. Tirncalli mimics Senecio junceus, and E. xyliphylloides resembles Epiphyllum truncatum, and an undetermined species of euphorbia has a likeness to a pelargonium.



ITEA ILICIFOLIA.

An evergreen shrub from China, bearing racemes of greenish flowers. A.M., R.H.S., August 1. The Hon. Vicary Gibbs (gardener, Mr. E. Beckett).

Fruit Trees in Grass Land.—The evils resulting from planting trees in grass, or allowing grass to grow around young trees, are now well known, but the National Fruit and Cider Institute has commenced an experiment to ascertain whether the gain in growth is sufficient to pay for the labour necessary to keep an area round each tree free from grass. Circles of 9ft. and 6ft. in diameter have been kept free from grass round the stems of apple trees of eight varieties since planting, and the effect produced has been measured by the diameter of the stems. The most interesting feature at present is that the advantage of the 9ft. area over the 6ft. area was almost entirely in the first two years that measurements were taken, i.e., the third and fourth years after planting. Each year there has been an appreciable gain with both free areas over the trees planted in grass land, but in the fifth and sixth years after planting it has only been enough to justify the labour of keeping the smaller area free. This leads to the suggestion that instead of planting directly in grass land, as is customary, the better plan may prove to be to plant in cultivated land, which may afterwards be sown to grass, since apparently it is during the first season or two after planting that the tree reaps most benefit from the absence of grass in its proximity.

BOTTLING VEGETABLES.

The system of preserving vegetables by the process known as bottling, though by no means so important as that in relation to fruits, has its advantages. Especially is this the case for long voyages and expeditions, and for enabling us to have many of our choicer kinds at such seasons of the year when fresh vegetables are scarce and almost impossible to produce. Quite the large majority may be treated in this way with the greatest success, and when carefully bottled one can hardly distinguish them from those freshly taken from the garden. Having met with a fair amount of success in this direction, I venture to relate my experience for the benefit of those who may wish to add bottled vegetables to their store.

Appliances.

It is of the highest importance at the commencement to secure the very best appliances, particularly the improved kind of bottles. There are several very excellent makes now on the market, and, though the initial outlay may be somewhat high, the fact must not be lost sight of that the same bottles will last for a considerable number of years if properly taken care of. It is well known that many of the more difficult kinds to preserve, such as peas and beans, for instance, can be easily and more effectively bottled by the use of chemicals, which are often applied, though for various reasons I never use and do not advocate any of such, even in the minutest form.

Selecting Vegetables.

The chief points to observe are to select the various vegetables of the very best quality, fresh and of uniform size. The majority of vegetables are far the best when partially boiled, and afterwards packed neatly and closely together in the bottles when they should be sterilised for an hour and a half. This will apply to carrots, leeks, turnips, celery, and similar kinds; but for asparagus, peas, and beans less time will suffice.

Beans and Peas.

As before mentioned, peas and French beans require very great care, and no vegetables that I am acquainted with are more difficult to bottle. The peas should be matured, but not in the least way on the old side. French beans and scarlet runners should be young and tender, the first-named preserved whole and the latter sliced thinly. Both peas and beans should be partially boiled for five minutes, adding a teaspoonful of salt to each pint of water. Strain off the water, filling the bottles whilst the vegetables are still hot, and fill with water near to the same heat. Stand the bottles when filled in the sterilizer, using water again of much the same temperature. Boil from 30 to 40 minutes, when they should be taken out and examined as to their being perfectly air-tight. Careful observation should be made for several days to be sure these remain so. One of the best varieties of peas for this purpose is Autocrat.

Tomatoes.

One of the most useful for bottling, as well as one of the most simple to preserve, is the tomato. Both the yellow and red varieties are desirable, as they are always appreciated at all seasons of the year, and with every prospect this season of immense crops, both inside and out, the fruits should be bottled in large quantities. Select small to medium-sized fruits of good shape, and arrange tightly in the bottles whole. Fill with cold water, add a teaspoonful of salt to each pound of fruit, and sterilise till the water reaches boiling point. As in the case of other vegetables, it is most imperative the bottles should be perfectly air-tight, when it will be found that they will remain in good condition for almost any length of time. Sunrise (red) and Sunbeam (yellow) are capital varieties for preserving thus, and when entering for competition the fruits of both are telling and attractive.

Asparagus.

This is another important vegetable always appreciated, and can generally be relied upon. At the right season select the finest heads of uniform size, and pack closely together with heads uppermost in the bottles. Cover with cold water, adding a teaspoonful of salt to each bottle, and sterilise for an hour after reaching boiling point.

Carrots and Turnips.

Young carrots are always held in high esteem in the kitchen, though not always so easy to produce at all seasons of the year. Consequently, by bottling these when plentiful, this difficulty is easily overcome. The best varieties for the purpose are those generally known as Shorthorns. These should be selected when about the size of one's thumb. Boil till tender, when the skins should be carefully removed, and then arrange them in the bottles. Turnips when quite young may be treated in the same way except that they should be peeled before boiling. The French variety with the long white roots, is best for this purpose. I have mentioned those that are generally regarded as most serviceable, though, if desired, nearly every kind of vegetable may be successfully treated in this way.

(Mrs.) E. J. Beckett.

SUMMER PICTURES IN THE GARDEN.

Day by day, week by week, month by month, we see outspread before us the pictures that the great artist Summer, inspired by God, paints for our delight within the four walls, fences, or hedges of our gardens. It seems marvellous that so short a time has passed since the bare scenes of winter were outspread in place of floral canopies and foregrounds. It seems equally incredible that in but a few months more the blossoms will have passed, the leaves fallen, the sunsets shifted, the light begun to fail, the birds have vanished with the bees and the butterflies, the earth be wrapped in frost and snow.

To thoroughly enjoy the present is every gardener's duty, whether he labour for pleasure, profit, or honourable wage, his flowers should be his joy and pride, his failures his accepted lessons for the future, his successes the rewards of a conscience well at rest. Yes, that is the grand secret: having worked, let us be at peace, not discontented, though our floral achievements have fallen short of the triumphs we desired, but gazing our full at every loveliness, not allowing days to pass without our paying the world our tribute of homage for its excellence. Restlessness, repining belongs to man alone; the beasts, birds, and insects pursue their avocations with a philosophical calm and gladness we should try to imitate, fulfil their little destinies gaily, and are gone:

"Grand is the leisure of the earth:
She gives her happy myriads birth,
And after harvest fears not dearth,
But goes to sleep in snow wreaths dim."

Turn where we will, even in the smallest garden, some fair picture greets us. Blue delphiniums against the paler azure of the sky, stand erect among the masses of fluffy white gypsophila all studded over by red-brown butterflies; the scarlet geums, heavy headed after rain, lie over the grass that seems marvellously greener just there by contrast, and have interlaced their buds, too, with the stiffer growth of snow-white marguerites; the yellow herbaceous scabious towers, with a splendour of form peculiar to it, over a bed of purple and mauve candytuft, one of the cheapest, easiest to cultivate of all our annuals, but a grand note of colour always.

Rose gardens have their unexpected beauties as well as those which have been prepared and coaxed into being; indeed, the former seem often fairer and more numerous than the latter. I knew one garden in which hundreds of trees were planted without any arrangement of colour, because the purchaser had never grown roses before, and did not consult a catalogue before placing them. Ramblers sprang up, yards high, here and there, in sides of beds, or border edges, as they chose, and were given stakes to support the lavish growth just as necessity demanded; Rugosas straggled half over the walks, small teas lived high on banks, and bent to show their blooms to passers-by; sturdy hybrid perpetuals appeared against house walls, so were nailed up to them, bushes of chinas and briars filled the places usually allotted to prim standards along the lawn sides. Was the result a failure? Assuredly not. Perhaps the excellent climate and soil were largely instrumental in the creation, but that rose garden remains one that provides the very grandest of summer pictures, painted in hues of pink and red, yellow and gold, cream, apricot, carmine, and deep maroon, copper, and salmon, scarlet, and blush.

Hollyhocks and sunflowers are landscape flowers beyond all others except climbing roses, but Lilium giganteum and Chimney campanulas aid them well, with delphiniums, of course, tall chysanthemums and Michaelmas daisies later on, and I would give the Oriental poppy the palm for a vivid splendour of colour in its early season. To have once seen a bank all covered by this poppy is to realise what vermilion can do to assert itself in a view across parklands and lawns. Hollyhocks are too seldom grouped in large numbers: we want a more royal style of planting before we shall form the most noble summer pictures. It seems as though we could not get rid of a cautious avoidance of bright colours, yet hollyhocks are never garish or vulgar, toned down as their tints are by a prodigality of foliage. There are few of their varieties, even among hybrids, that are inharmonious; the spectacle of a low-walled white cottage, surrounded by these stately blossoms save where the windows peep forth, is a picture of purest charm, whether the morning rose, the mid-day blue, the sunset gold, or evening grays and indigo are painted on the heavens above.

There are small as well as large pictures worthy the loving notice of the gardener who rests: a slope of pansies on a shady bank, backed by waving plumes of golden rod, glorify some nooks where seats are set beneath tall trees; the sun-blest crannies and slabs of rockeries are waving fairylands with the delicate pink and white alpine poppies; little pools are able to reflect the true forget-me-not, and the ground beyond is lilac with the moisture-loving annual Ionopsidium acaule. Then perhaps the figures of children, unconsciously graceful always, the gambling antics of pet dogs, or the dignified passage across the lawn of a Persian cat, will help to make a picture of interest.

M. H.

ROSES AT BRANCHES PARK SUFFOLK.

To breathe the rich fragrance and feast upon the lavish colours of the rose is a temptation no ordinary mortal can resist, and when the "Queen of Flowers" marshals her battalions to the strength of ten thousand, the sight, if not entirely unique, is at least worthy of record as being not altogether commonplace.

Branches Park, in the county of Suffolk, is the property of G. A. Tonge, Esq., and is distant from Newmarket some eight miles, being situated amidst richly wooded and pastoral scenery. The mansion is a stately Georgian structure, having an extensive frontage to the south, and opening upon spacious lawns that are clearly defined on either side by walks set at right angles to the main frontage, and parallel to each other. The architectural straight lines are likewise continued in an extensive border of perennials, and a retaining shrub border on the east and part of the south side, while on the west side the arrangement of the rose garden is equally in sympathy with the general scheme.

The collection of shrubs and border flowers is worthy of the best traditions of English gardens on a large scale, being alike extensive and thoroughly representative in character. But on the occasion of my visit the glamour of roses overpowered all else to such extent that other features appeared to be of minor importance.

As in other famous gardens, the dominant note appears to have been touched at quite an early stage, as the original rose garden is still in evidence, and bears testimony to the initial success with roses. The natural soil is a stiff, cold clay, exceedingly retentive of moisture in winter. In preparing this for the later and larger extension of the rose area resource has been made to the time-honoured practice of burning the soil, and one cannot view the results without acknowledging the wisdom and virtue of this practice, which, if expensive, becomes eventually the most economical method of treating such a soil. With the soil of each bed has been incorporated burnt ash, road grit, farmyard manure, and a liberal allowance of bonemeal, the whole being thoroughly mixed and aerated previous to planting. A striking feature is the manner in which the beds are raised, the soil being built up some nine inches above the level of the lawn. This method safeguards the plants from stagnant moisture in winter, and no drought appears to strain them in summer, as little or no mildew was in evidence.

The scheme of planting comprises regular oblong beds planted with one variety, each bed averaging forty-six plants. On three sides beds run the entire length of the garden; on the east side one variety only is employed, namely, Caroline Testout, numbering about 450 plants. On the south side three varieties are employed, in lines, giving a screen-like effect in crimson, the varieties being Marquis of Salisbury, Francois Crousse, and Gruss an Teplitz, the latter behind, as being tallest. At the north end a similar effect is obtained with Gloire Lyonnaise, Madame Ravary, and Bouquet d'Or, the colour effect being coppery-yellow. At regular intervals are arranged upright poles, with climbing varieties trained to form pillars, while an enclosing series is also arranged, but with chain connection, thereby forming a living floral festoon.

At the south extremity a lateral extension of the rose garden is devoted to old and new sorts of Bourbon, single, China, Provence, and other roses; part of this ground extends along the margin of the lake, hence the opportunity has been taken advantage of to group free rambling roses, allowing them to form tangles of luxuriant growth and a wonderful profusion of fragrant blossoms.

It is impossible to enumerate every variety that succeeds here, but of outstanding merit among bedding varieties were the following: Admiral Dewey, Antoine Rivoire, Celia, Corallina, Countess Cairns, Captain Hayward, Caroline Testout, Enchantress, Frau Karl Druschki, Florence Pemberton, Gottfried Keller, General McArthur, Hugh Dickson, Konigin Carola, Kaiserin Augusta Victoria, Lady Ashton, La Tosca, Le Progres, Madame Leon Pain, Madame Jenny Guillemot, Madame Abel Chatenay, Mrs. E. C. Hill, Mons. Paul Lede, Madame Jules Grolez, Pharisaer, Rhea Reid, Richmond, Reine Marguerite d'Italie, Souv. de Madame Eugene Verdier, Ulrich Brunner, and Warrior.

A WATERSIDE GROUP OF ROSES AT BRANCHES PARK.

The varieties depicted are Caroline Testout, the Garland, and Polyantha grandiflora.

Of rambling roses displayed on pillar, arch, or in tangled mass, the following were best: American Pillar, Alberic Barbier, Blush Rambler, Debutante, Dorothy Perkins, Elisa Robichon, Gardenia, Joseph Billard, Leopoldine d'Orleans, Psyche, Rambling Rector, Sweetheart, The Garland, The Farquhar, Tausendschon, Mrs. F. W. Flight, Rubens, and White Dorothy Perkins. With regard to the latter the stock was obtained from a sport that occurred in the gardens at Branches Park.

To secure such notable success as obtains at Branches Park with roses drawn from every class of this great genus, entails unremitting care and attention, with cultural ability of the highest order; not only is such everywhere in evidence, but in giving expression to the character of the various roses, Mr. C. W. Paxton—the gardener—has laboured after a natural effect, and has achieved results much above the average. Thomas Smith.

TREES AND SHRUBS SUBJECT TO SUNBURN.

His solar majesty has given us distinct proof of late that he still retains his power to scorch, and it is fairly safe to assume that our climate will go a long way towards retrieving its unenviable reputation and character this season. The burnt and badly disfigured foliage of many trees and shrubs that may now be seen serves to remind us that it is a huge mistake to plant species susceptible to injury from the direct rays of the sun in open and exposed situations. It is found that trees which possess golden or variegated leaves are the greatest sufferers, and, further, that sunburn is almost entirely confined to deciduous subjects.

I noted just recently specimens of the golden oak which presented a woebegone appearance and seemed to suggest that they had either been struck by lightning or that a fire had passed through them. Distress was written upon the golden sycamore which rejoices in the name of Acer pseudo platanus Worlei, while the Golden Elm (Ulmus campestris Louis Van Houtte) was badly hit. The same applies to other variegated varieties, and in a lesser degree the variegated beech, Fagus sylvatica albo marginata; Corylus avellana aurea and atropurpurea; the variegated horse chestnut, Æsculus hippocastanus fol. variegatis; Fagus albo marginata; Fraxinus americana variegata; and the sweet chestnut, Castanea sativa aureo marginata, have all suffered.

Other than in town gardens the golden elder appears unhappy, while it is positively painful to witness the sorry plight of the brilliant Diervilla japonica Looymanniana aurea. In a season such as we experienced in 1910, nothing, however sensitive, would be likely to suffer, but the present summer has served as a rude reminder that it is necessary to use careful discrimination and judgment in the allocation of sites for the trees and shrubs under notice. Walter H. Aggett.

TREES SUITABLE FOR EXPERIMENTAL FORESTRY.

In a highly interesting contribution to the current issue of the "Kew Bulletin" on trees suitable for experimental forestry, Mr. W. Dallimore suggests the following trees, all of which are natives of America, as worthy of a trial by those who are desirous of increasing the number of kinds grown for profit. We have found it necessary to materially abridge Mr. Dallimore's notes, and refer those of our readers who need fuller particulars relating to the economic value of the trees to the contribution as it appears in the publication mentioned.

Tulip Tree.

The Tulip Tree (Liriodendron Tulipifera, L.), is one of the most important broad-leaved timber trees of North America, and a large amount of timber finds its way annually into the markets of the United Kingdom under the names of yellow poplar, white poplar, canary whitewood, and white wood. The wood is described as being light, fine and straight-grained, easily worked, and yields a good finish. Some qualities are white, others pale yellow, and others marked with brown. It is in request for many of the uses to which the better classes of deal are put in the interior finish of houses, such as doors, panels, wainscoting and casing for electric-light wires, while it enters largely into the cabinet trade both as a foundation for veneer and for constructive purposes.

A BEAUTIFUL BED OF CAPT. CHRISTY ROSE AT BRANCHES PARK.

The species has a wide distribution in North America, for it occurs from Southern Canada to North Florida and South Alabama. Average-sized trees would appear to be from 100 to 125 feet high, with a diameter of from 3 to 6 feet, the boles being clear of branches for two-thirds of their height. Under the most favourable conditions, however, when growing in the valleys of the Southern States, it is found from 160 to 190 feet high with a trunk up to 10 feet in diameter.

For purposes of comparison, trees grown under ornamental conditions in the British Isles have been recorded from 80 to 107 feet in height, with girths ranging from 10 to 17 feet at 5 feet above the ground. These dimensions may be considered to compare with those of average-sized American trees. The largest specimens are met with from the North Midlands to the South of England, but good examples have been noted in Scotland. It is difficult to form an accurate idea of the age of the larger trees, but they probably range from 100 to 150 years. This would place the maturing age in England about on a level with that of beech.

A full account of the tulip tree and its behaviour in the British Isles, together with particulars of many large trees, is given in "Trees of Great Britain and Ireland," i., pp. 65-74. The largest tree mentioned, now dead, grew at Stowe, near Buckingham. Mr. Elwes found this tree to be 107 feet high with a clear bole of 30 feet and a girth of 13 feet at 5 feet from the base, and 21 feet 4 inches near the ground. A tree growing at Leonardslee, the seat of Sir E. Loder, Bart., near Horsham, when measured in 1903, was 97 feet high, with a clean straight trunk of from 25 to 30 feet. It was at that time considered to be about 90 years old. A fine tree nearly 100 feet high was noted at Margam in S. Wales a few years ago.

The best trees are found growing on well-drained, loamy soil, where plenty of moisture is obtainable, but good examples are to be met with on both clayey and very light soils. It does not thrive on wet, badly-drained ground, neither is it a success in soil of a limy character. Specimens at Kew may be noted growing on both light and heavy land. The old specimen near the north end of the Rhododendron Dell is on sandy ground, whilst the position occupied by a tall tree in the Azalea Garden is marked by the soil being of a clayey nature.

A "Forest Planting Leaflet," Circular 93, on this tree, has been published by the United States Department of Agriculture. In it the tree and its requirements are fully described. For the benefit of possible planters the following notes have been extracted. Seeds are produced abundantly nearly every year, though only 5 to 10 per cent. are fertile. Those sown as soon as ripe germinate the following spring, but if the seeds are kept and sown in spring they have a tendency to lie in the ground a year before germinating. Seedlings should not remain in the nursery for more than two years, for after that time they are difficult to transplant successfully. The tree is intolerant of shade and prunes itself well with even moderate side shade. Seedlings can endure moderate shade, but more light is demanded as the trees grow older. At maturity they are usually taller than their associates, and their crowns are fully exposed. Growth is rapid for 50 years, after which it gradually decreases. Spacing is recommended at 6 feet apart each way, and mixed planting is preferred to a pure stand. On rich land in sheltered valleys it is used as the predominant feature of plantations, but in more exposed positions other species are planted in excess. Any shade-enduring hardwood with white pine and Norway spruce are recommended as companion trees. For planting in this country it is probable that Scots or Corsican pine and spruce would form good nurses. An account of the species and details of its distribution in America may be found in the "Silva of North America," i., pp. 19-20.

Black Walnut.

There is reason to believe that the Black Walnut (Juglans nigra, L.) will be worth growing for its timber in certain parts of the British Isles, for it thrives in many localities, and appears to be no more susceptible to late spring frosts than the common walnut. American-grown timber is imported in large quantities, and is put to many purposes connected with the manufacture of the better classes of furniture. It is dark brown, or sometimes almost black, in colour, and may be obtained in wide boards or logs. The wood is often clean and straight-grained, though it may be finely figured. Burrs are produced, as in the common walnut, and these, and the best marked logs, command fancy prices for veneer. Elwes, in "Trees of Great Britain and Ireland," ii., p. 270, says that English-grown wood is quite equal to imported wood in colour, and when properly seasoned is as good as the best Circassian or Italian walnut.

This favourable opinion appears to have been formed by a London timber merchant also as long ago as 1883, for in a note in "Woods and Forests" for December 5 of that year, he recommends the tree to the attention of foresters as a suitable subject for forest planting. With regard to a tree growing at Syon, he gives the length of the trunk as 25 feet and its quarter girth as 24 inches, its market value being £25 or 5s. a cubic foot. At that time the tree was about 50 years old. He also refers to another black walnut as follows: "Singularly enough, I bought one as an elm out of a garden not 300 yards from my sawmill, so I am fortunately able to send you a specimen of English-grown wood; it was about 15 feet long by 20 inches quarter girth, and had forty annual rings. You will note that the wood has obtained from our English soil the very character American wood is so deficient in, viz., hardness and weight, approaching in this respect the character of Italian walnut, or what is represented by the words 'good quality.' I am now making from this tree a sideboard which will, I think, be a beautiful specimen of woodwork." A section of Kew-grown timber on view in the Forestry Museum, shows that the wood is capable of taking a high polish.

Juglans nigra is a native of N. America, being found widely distributed from Southern Ontario to the Southern United States. Details of its distribution and botanical charactistics are to be found in Sargent's "Silva of N. America," vii., pp. 121-124, while other information on these points, together with notes on the behaviour of the tree in this country, may be derived from "Trees of Great Britain and Ireland," ii., pp. 262-270. It is said to vary considerably in size, mature specimens being met with from 50 to 150 feet high, the girth varying from 6 to 20 feet. In England the largest trees vary from 80 to 116 feet in height, with girths from 10 to 14 feet. Two of the largest trees known are in Marble Hill Park, Twickenham, and Syon House Park, Brentford. The former when measured by Mr. Henry was 98 feet high by 14 feet 3 inches in girth, and the latter as recorded in "Trees and Shrubs at Syon House," 1910, 116½ feet high by 13 feet 7 inches in girth.

The cultivation of the black walnut in this country would probably need to be carried on below an elevation of 500 feet, the more sheltered positions being selected, and preference given to land such as may be expected to grow good oak. Planted 7 feet apart, with a silver fir or hornbeam between, should prove to be a suitable arrangement. Providing it is found possible to cultivate the species successfully under forest conditions, its timber ought to be more remunerative than that of oak, if present prices can be taken as a guide. Fertile nuts are produced freely by the older trees in this country. As an illustration of the rate of growth on light soil, a transverse section of a trunk measuring 2½ feet in diameter, grown at Kew, shows 95 annual rings.

White Ash.

As seen under cultivation in England, even when growing as an isolated tree, the white ash (Fraxinus americana, L.) rises with a clean, straight trunk to a considerable height, the branches being small and the head narrow. Compared with common ash, F. excelsior, L., growing under similar conditions at Kew, it is of more rapid growth, and appears less susceptible to attacks by scale insects. Several moderately young, healthy examples may be noted in the vicinity of the Azalea Garden, one isolated tree being 66 feet high with a girth of 2 feet 9½ inches at 5 feet from the ground. It has gained 3 feet in height and 4½ inches in girth since measured by Mr. Elwes in 1907. Unfortunately its age is not known, but, judging from its growth during the last 15 years it is probably about 40 years old. Two older specimens are to be seen on the south side of the mound near the Cumberland Gate. Both are upwards of 80 feet high and girth 8 feet 5½ inches and 8 feet respectively at 5 feet above the ground.

White ash timber may be used for all the purposes to which the wood of the common ash is put, whilst David Denning, in "The Art and Craft of Cabinet-making," 1891, says that "it is superior to English ash for furniture as it is usually of better colour." It is imported largely for numerous purposes. There is no reason to believe that it would command a better price than English ash, though it may be suitable to plant on account of its rapid and vigorous growth. "Forest Planting Leaflet," Circular 84, issued by the United States Department of Agriculture, is devoted to this tree, and the following remarks bearing upon its habit and growth are extracted therefrom. Its average height is from 70 to 80 feet with a diameter of from 2 to 3 feet. Plantations are found to give the best results in protected valleys on sandy loam that is light and easily worked. It will thrive, however, in less favourable and even in adverse localities. A porous subsoil is essential, and a water table at a depth of 10 or 12 feet is of decided advantage. Mature trees can endure only a moderate amount of shade, while young seedlings will start in dense shade but require considerable light for their perfect development. Its economic uses are referred to as follows: "The wood of the white ash is of great economic value. Its most valuable qualities are strength and elasticity, and these, combined with its ability to take a good polish and to season without injury, make it a timber of first rank for furniture, car, and vehicle construction, interior woodwork, agricultural implements and tools."

American-grown seeds would need to be obtained for starting a plantation, and care should be taken to order from a firm able to supply the true tree and not one of its near allies. The percentage of fertile seeds is said to be low, hence the necessity for rather thick sowing. Young trees are planted in permanent positions in America when a year old. In some instances it is planted as a pure crop, allowing spaces of from 4 to 6 feet between the trees, and at other times it is planted as a mixed wood; black walnut, black cherry, hackberry, hardy catalpa, Scots pine, and European larch being recommended for companion trees. It is probable that pure plantations in this country might be made at 3 or 3½ feet apart with success, whilst a mixed plantation might contain hornbeam and Corsican pine. Anywhere where ordinary ash grows would suit the white ash, and it might also be planted on lighter soil than that usually allotted to F. excelsior.

CHRYSANTHEMUMS.

Early and Late Buds.

The experienced cultivator of chrysanthemums will now be able to form a fairly good idea as to whether the greater number of his plants are bearing buds at the right time or not. The inexperienced grower will be very uncertain on this point. Last year the early crown buds proved to be the most satisfactory, generally; the second crowns were too late, and lacking in substance in many instances. The weather during the whole of the summer was cool, cloudy, and wet.

Readers of the Gardeners' Magazine know quite well how hot the present summer has been. The buds of some varieties are, as a result, showing very early, while those of others do not appear to have been hastened on at all.

Last year some plants of the variety Hon. Mrs. Lopes were stopped early in the first week in May; others early in the second week of that month. Result: The latest-stopped plants showed crown buds one month later than those stopped early in the first week of May. This year I can already see that there is to be much irregularity in the appearance of crown buds of this noble variety, but I feel sure that there will be finer blooms of it than was the case last year. Willie Rawlings will also bear more refined buds this year, many buds were taken too early last year. That charming variety Francis Jolliff is showing buds consistently with the stopping of the plants; some buds will be available the first week in August, others at intervals until the third week in the month. Grand buds of G. Rivol and Mdme. P. Radaelli should also be forthcoming on plants stopped early in the season. Purity, Master James, Master David, Mrs. R. H. B. Marsham, R. Vallis, F. S. Vallis, Lady E. Letchworth, Pockett's Crimson, and similar reliable varieties, are very promising, and should supply exhibitors with good blooms during the first half of November.

With regard to the treatment of the plants and buds, it is necessary to point out that both leaves, bark, and wood being rather harder than during the past two years, daily syringings will prove very beneficial. Towards the evening of a fairly hot day a thorough syringing will do more good than a watering, unless the soil be very dry; this applies especially in cases where plants have already lost many lower leaves. The syringing should be done on hot days, whether the plants are watered at their roots or not, as it softens hard buds, especially early crown buds, and so induces a freer growth—the buds swell more kindly.

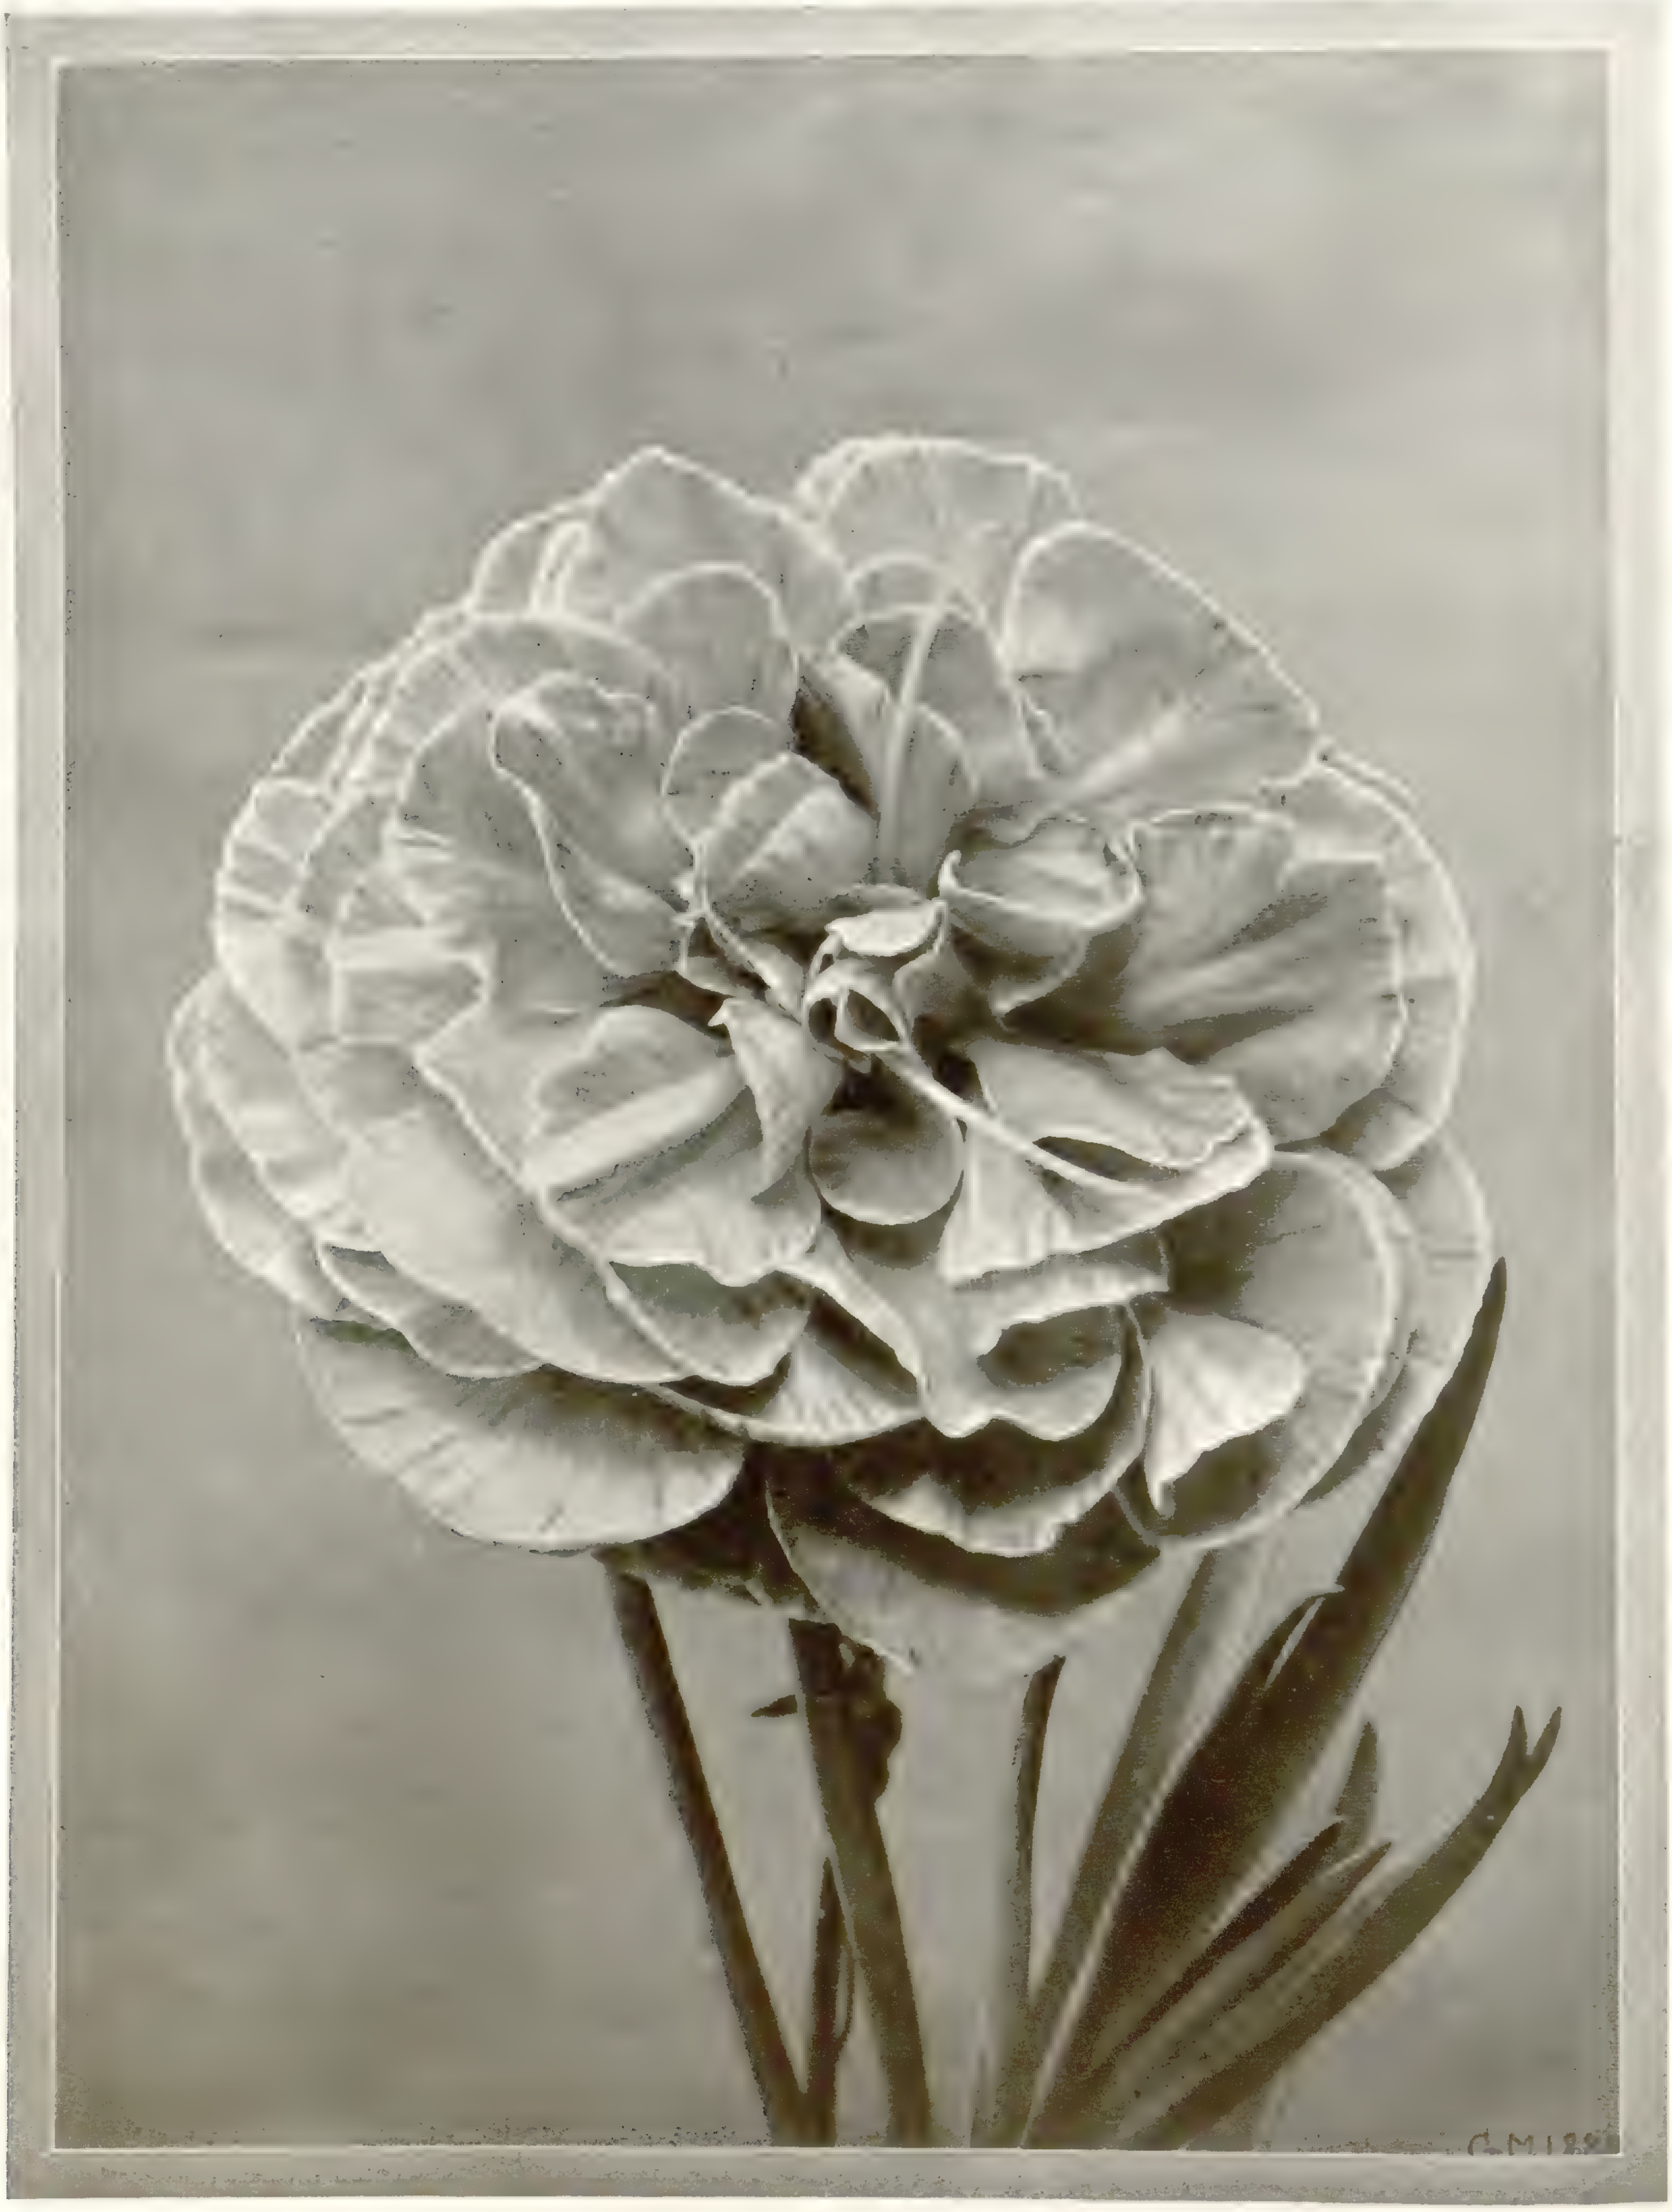
It is important that all points of shoots and newly-formed buds be kept quite free from green and black aphis. Earwigs eat away the sides of the buds, and the stems of the latter, and then the resultant flowers are nearly always one-sided or otherwise deformed. Trap and destroy the earwigs early in the morning and late at night. The shoots surrounding a bud must not be pinched off at one time; allow a period of about one week, removing one or two shoots each day, and directly it can be seen that the buds are swelling freely feed in earnest but judiciously. Geo. Garner.

FESTOON OF ALBERIC BARBIER AND LEOPOLDINE D'ORLEANS ROSES INSIDE THE WALLED GARDEN AT BRANCHES PARK.

Hydrangea Hortensis.—The present is a good time to insert cuttings to produce plants that will bear single heads next spring. Select only the strongest short-jointed shoots which have not flowered for this purpose. One cutting placed in a small pot is preferable to five or six in one of a larger size. Place them in a cool frame, and keep close for a time. When rooted, the amount of ventilation may be increased. Plants which carried single heads this spring may be potted on to make specimens.—A. G.

FANCY CARNATIONS.

Within recent years the improvements made in the yellow-ground fancy carnations have been such as to add immensely to their value both for exhibition and the garden, and to greatly increase the interest in carnations generally. There is yet another point in their favour, and that is the usefulness of the flowers in a cut state for the decoration of indoor apartments. In the earlier days of the yellow-ground fancy carnations the members of the household did not take very kindly to the flowers for use in floral arrangements; but now they are first favourites, and the selfs, which had long been held in the highest estimation, have lost some of their popularity. This point is mentioned as evidence of the usefulness of the fancies where cut flowers are in request, and not for the purpose of exalting them at the expense of the selfs, which I continue to hold in the highest estimation, notwithstanding the attractiveness of the many beautiful fancies. I grow the two classes in about equal numbers, endeavour to cultivate both as successfully as the time at my disposal will permit, and certainly an equal amount of pleasure is derived from the two classes.



FANCY CARNATION PASQUIN.

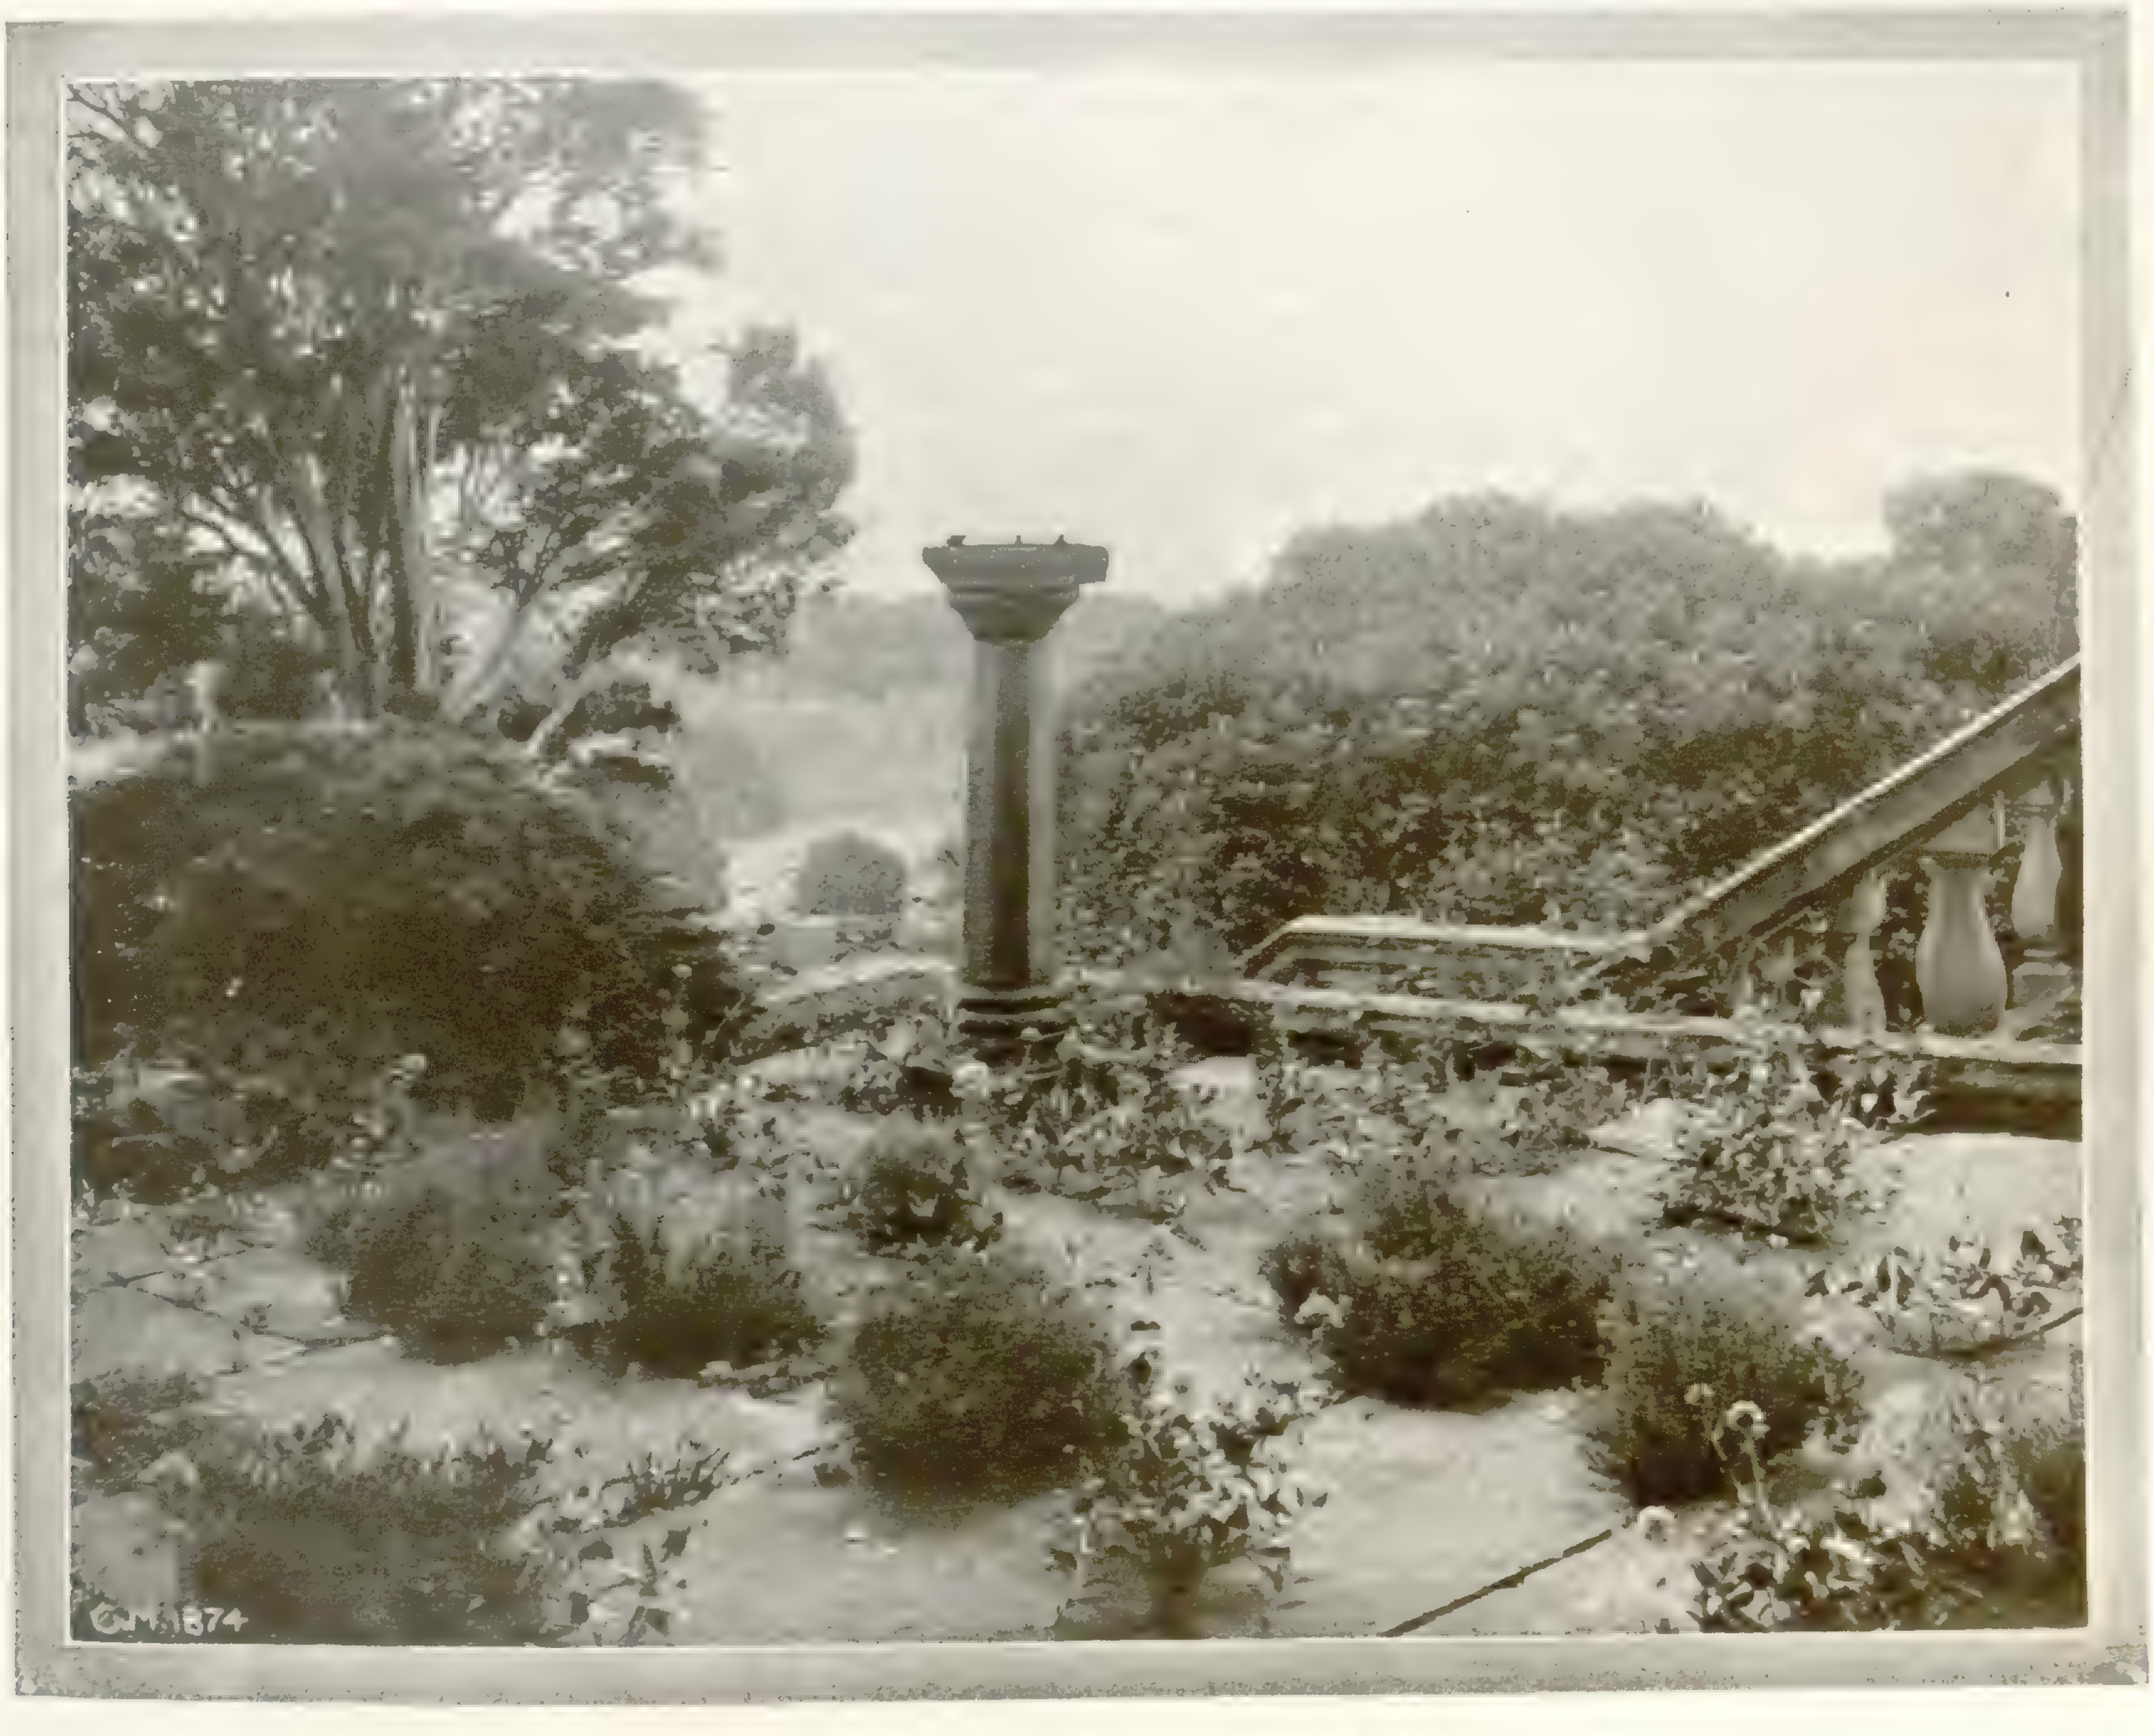
The premier bloom in the class for fancy carnations at the National Carnation Society's Exhibition. Shown by Mr. J. Douglas.

The advances in the development of the yellow-ground fancy carnations have been rapid as well as great, and to keep well abreast of the improvements that are being made it is necessary to revise one's selection at rather frequent intervals. Hence it is that I readily comply with the request to give a short selection of varieties that have in the course of my experience been found to possess exceptional merit. It is not an easy matter to make a short selection, because of the number of really high-class varieties that are at the command of cultivators, but the following twelve can be mentioned as of much value for forming the nucleus of a collection, for they are distinct as well as meritorious: Constantine, deep yellow-ground edged and suffused rose-red; Donald Macdonald, an effective flower, large in size and high in quality, the colour brilliant carmine-red with soft yellow ground; Erl King, bright yellow ground, richly margined and suffused rose; Elaine, a large finely-formed flower, freely marked with red and pale purple on yellow ground; Hercules, a finely formed flower, bright rose-red on yellow ground; King Solomon, rich scarlet and maroon on an apricot-coloured ground; Linkman, rich yellow with margin and markings of bright scarlet; Lord Steyne, a handsome and popular flower with margin and markings of purple-maroon on yellow ground; Margaret Thurstan, a superb variety freely coloured with scarlet on yellow ground; Mandarin, a distinct and attractive variety with rich rose-coloured markings and margin on light yellow ground; Pasquin, one of the finest of all the fancy carnations with yellow ground, the blooms are of the largest size, perfect in form and attractive in colour, the ground is a soft yellow, edged, marked, and suffused with lavender-blue and rose-pink; Sam Weller, marked with scarlet and maroon on a deep yellow ground. A. B.

Orchard House.—Trees in pots, as soon as divested of their fruits, can be put into the open, plunging the pots to the rims or they will become baked by the sun. The pots become quite hot unless protected, and will burn and destroy the small roots. Attend to watering and syringing twice daily. Pears and plums still ripening must be well supplied with liquid, and be kept clean by syringing.—W. A. COOK.

PAVED GARDEN AT POWIS CASTLE.

Many and varied are the features found in British gardens nowadays, and these vary in interest as much as they do in design and style. There are so many tastes to be considered that when space and opportunity permit most of these can find expression, and therefore we find in the large gardens of the land some features that are very beautiful, others that are wonderful, others quaint, some reminiscent of olden times, and some that scarcely seem to come within the scope of horticulture, notwithstanding the width of that scope in these times. In some instances the central walk of a rock garden is paved with flat stones, and suitable plants are planted in the crevices and between the loose joints of the stones, and such pathways are a delight when the paving is not too formal. The paved garden has followed and usually occupies a sunny position, forming a sheltered and pleasant spot in which to rest awhile in early spring or late autumn, when the air in the open garden is chill or damp, though the sun be still shining. Such a garden has been established at Powis Castle, Welshpool, the residence of the Earl of Powis, and the illustration given herewith shows a portion of the garden, with its sheltering trees, sun-dial, beautiful outlook over the estate and away to the distant hills, and also shows the thyme, valerians and dwarf veronicas growing between the broad flagstones that provide a dry footing in the wettest of weather. In certain cases a somewhat similar garden is devoted entirely to herbs.



THE PAVED GARDEN AT POWIS CASTLE.

PEACH TREES ON OPEN WALLS.

The interesting article on the above subject, on page 517, by Mr. Prinsep, is very much to the point, and I agree thoroughly with the writer's views. It must be admitted that it is a difficult matter to make outdoor peach and nectarine culture a success in some parts of the country, while in other districts the crops are a success even with comparative little care. In this neighbourhood there is much difficulty in growing peaches well in the open, as there are several conditions which do not favour their successful culture. The preparation of suitable borders is a matter within the reach of all, but atmospheric conditions are not so easily overcome.

Situated on the borders of the Cotswolds, at a height of 700 feet above sea level, we invariably experience cold biting winds about the time the trees are breaking into growth, and it is during that period that our trees suffer most, in spite of protection being afforded them. Many of the leaves blister very badly, and a number of the young shoots shrivel and die away just at the time when one thinks the trees are going to break away evenly. I am acquainted with outdoor peaches in several parts of the country, but do not know of any locality where they suffer so much as in this district. When once summer comes the trees do well, and make healthy growth, but there are always several gaps to be made good as a result of this perennial spring trouble. Perhaps some reader would be good enough to suggest a remedy.

J. GARDNER.

PRIMULA CAPITATA.

In view of recent additions to the genus Primula, which of late have been on a somewhat liberal scale, the beautiful Primula capitata has in no wise suffered by comparison with these newcomers. Introduced from the Himalayas in 1850, it is a replica in miniature of P. denticulata in all but colour, and, if anything, more refined; the round heads of intense violet flowers, sharply accentuated by the white farina that clothes the stems that spring from rosettes of leaves of a deep green shade, single it out as a subject of distinct merit. It succeeds under similar conditions to P. sikkimensis; a good loamy soil, well drained, yet holding abundance of moisture during the growing season, and planted in a position where it enjoys some shade. Seed ripens freely, and may either be sown at once or in the ordinary course in spring, as this species vegetates freely at all seasons. Seedlings are transplanted in due course either into boxes or to the open ground, and subsequently to their flowering position in early summer or autumn.

P. capitata is one of the finest species to grow in pots, succeeding to perfection in a cold frame or alpine house; it must not be subjected to fire heat or close confined conditions, as in a greenhouse, but must always enjoy the maximum amount of fresh air. T. S.

THE SCHIZANTHUSES.

There are few, if any, more useful flowering plants during the spring months than the schizanthuses. Their elegant habit of growth, the diversity of their colours, and the ease with which they can be grown, render them indispensable for decorative purposes in the conservatory and the dwelling house. There are several distinct forms possessing numerous charming shades of colour. The grandiflora hybrids are especially attractive, and are of compact habit, producing flowers that range from white to crimson and purple. Wisetonensis is a lovely dwarf type, and forms elegant specimens in quite small pots. S. Grahami possesses bright red and orange flowers, while S. retusus is erect in growth, and bears brilliant scarlet and orange flowers, and, on account of its erect and sturdy growth, is one of the best for supplying cut flowers. S. retusus Rosy Gem, is a very desirable addition. S. grandiflorus oculatus is a large-flowered variety with purple and mauve blossoms. S. pinnatus affords numerous shades of colour, and is capable of being grown into quite large specimens, plants six or eight feet in height being by no means uncommon in some gardens.

To have specimens of good size for early spring flowering seeds should be sown at the present time in an unheated frame, taking care to shade the seed pans lightly until after germination takes place. When the seedlings are large enough prick them out in small pots filled with a light, porous compost, and grow them on in a cool house. When they become well established give air freely on all favourable occasions, and lightly spray them during bright weather. When nicely rooted shift them on, using 48 or 32 size pots, in which they may be allowed to flower. If extra sized specimens are required, shift into pots one size larger. A suitable compost is one consisting of two parts good fibrous loam and one part leaf-soil, to which should be added some coarse road sand, and a 6-inch pot full of some approved fertiliser to each bushel of the compost. Do not pot too firmly, and take care not to allow the soil to become very wet, it being advisable to keep it rather on the dry side until root action becomes active in the spring.

The plants can be stopped by pinching out the points when about four inches high, and again later, to form extra sized specimens, or to regulate the flowering period. During the winter a perfectly cool house suits them best, a temperature of 45 degrees being quite sufficient, and a position near the glass is essential to ensure a short-jointed, vigorous growth. During the spring it is an advantage to syringe between the pots on bright days, and occasional doses of liquid manure and soot-water are helpful. Stake the specimens with neat bamboo canes, and tie carefully with green raffia, taking care not to draw the strands too tightly. It is not advisable to shade the schizanthuses until they are in full flower, as such treatment results in weak growth.

J. GARDNER.

THE VALUE OF THE GARDEN.

An oft-heard reproach against English national life is, "that we take our pleasures sadly." This may be partly true, but not altogether so, though the fact remains that we do not make the most of the possibilities afforded us in the attainment of healthful pleasure.

The doctrine of "making the most of life," is especially applicable to the garden, and its relationship and influence upon human life. The one great hindrance to garden appreciation to-day is the failure of many to take the garden at its full value, and this in itself is a factor which militates against the true pleasure of the frequenter of the garden. I would like to see more of the spirit of the American garden-lover, whose desire is that the garden shall be a living part of the home, and in its season the "best" part.

Properly considered, house and garden should be planned, if possible, to meet each other's needs. By this, I mean that the garden, with its living beauty, should be a place to "live" in, when the weather permits, an extension of the home without the confining walls and restraint of the house. In this matter the Americans are far in advance of us. Their extended use of wide verandahs, loggias, garden-rooms, pergolas, etc., is only a sign of their appreciation of a garden and its uses. To keep in touch with the garden; to obtain the utmost value from it, both in health and pleasurable enjoyment, seems to be a great aim with them, and the English garden-lover would do well to keep these ideas in view.

With all the progress made in horticulture and garden art, we are in danger of losing a good deal of our love of beauty. By this I mean, that, although colour effects, brilliant displays, and kaleidoscopic borders are studied, and brought to a large degree of perfection, yet many are losing their love of a beautiful outline, a pleasing form, or a dainty hue, which may be noted in the single blossom, but which is never seen in the mass. A hasty view of a garden will but reveal a mass of colour here, a blending of hues there, until the mind is satiated with a constant change of colour and outline, without fully realising any good points or appealing groupings which may happen to exist. On the other hand, a careful detailed study of the thousand and one treasures a good garden possesses will prove a mine of delight for many hours. The watching of dainty hues, of individual forms, the critical survey of leaf, bud, blossom, and seed, of rising stems and habit of growth, of fragrance and of effect, will afford a greater amount of real pleasure than any other pursuit extended over the same length of time.

The value of a garden lies, not in the monetary value of the land it covers, nor in the ornate embellishments or lavish expenditure which may be showered upon it, but simply in the return it gives to its owners of added health and enlivening interests. The garden should be an open-air dining hall, a place for recreation or for study; and, above all, a place for rest. A few hours culled from the exhausting demands of modern life are not wasted if spent in the quietude of the garden.

The resting of mind and body, bringing into repose a system subjected to a full strain in everyday life, is of the greatest benefit. These pauses in the quiet backwaters of life are of infinite value, and tend to revitalise one with a full meed of energy. It is sleep without the unconsciousness, or dreams without weakening the orderliness of the brain.

Among the haunting fragrance of carnations, stocks, sweet peas, roses, and other delightful summer blossom, with the accompaniment of the notes of feathered songsters, the flashing wings of dragon fly and butterfly, and the myriad hues and forms of the blossoms, one can realise to the full the value of the garden.

A collection of old masters, of Sevres and Dresden china, of statuary and antique armour, of tapestry, and valuable furnishings, are dull and lifeless compared with the living, changing beauty of the garden. Comparisons are sometimes odious, and leaving these thoughts in the mind of the reader, may I but utter the plea for a greater appreciation of the gardens of England, an appreciation which shall embrace every vestige of life and floral beauty in its comprehensive grasp.

I have rejoiced at the increasing sway of the natural garden, with its pleasant phases of lily pools and heath-clad slopes, its rugged flower-draped rocks and fern-clad dell, its wilderness of jungled growth, and marshy, flower-gemmed streams.

The widening of the garden beautiful to embrace the foregoing, together with the progress made in adapting the American and Japanese gardens to our English requirements, is good. The great thing needed now is to utilise these ideas to the full and closely study individual plant life.

And if I may further trespass upon the kindness and patience of my readers, it will be to voice the charms of the garden at eventide. To live in the garden at the hour of the setting sun, and later when the twilight deepens into starry night, is to "live indeed." Ushered in by the evensong of the birds, the blossoms again redole the fragrance of which the sun has robbed them in the day. The air alive with the swift movement of swallow and swift, which as the twilight deepens give way to the dusky bat and the droning of flying beetles, is heavy with the scent of stocks and mathiolas, of fragrant nicotianas and clove-laden carnations. Mignonette, sweet peas, roses, and a host of other charming subjects exude their sweetness for the evening zephyrs.

One loses from the vision the heavy-hued blossoms first. Purples, crimsons, dark blue, vanish under the deepening shadows, until at last the white blossoms alone attract through the night air. White masses of stocks, of alyssums, of scented tobacco, of ox-eye daisies, etc., gleam out in the garden of eventide, surely a suggestive hint for the maker of gardens. A white moonlight garden, a garden of fragrance and delight, in itself a striking testimony (if one were needed) of the value of the garden.

P. S. HAYWARD.

HERBACEOUS CALCEOLARIAS.

Only occasionally does one come across these plants in gardens nowadays, but when well grown they possess several distinctive features which attract attention. One of the finest batches of these plants I have seen for some time was at the Mote Park, Maidstone, the entire front stage of a long house being filled with fine specimens that included all the well-known shades of colour generally seen, as well as several new shades, which I do not recollect seeing before. The plants were splendid examples of good culture, compact in growth, with large blooms, both selfs and spotted forms, making up a charming display.

The strain is a selection of Mr. Bacon's, and, as these flowers appeal to his employer, he aims, and succeeds, in growing them well. The present day fashion of having to grow flowers chiefly for cutting has in many gardens pushed out these herbaceous calceolarias, but where large show houses have to be filled with flowering plants, these can still hold their own in the matter of display. Cool treatment from start to finish is essential, and where this cannot be given them the plants are not seen at their best. The condition of the gardens at Mote Park reflect great credit on Mr. Bacon, who excels in more than one branch of gardening.

Paul T. More.

VERONICA GENTIANOIDES.

A capital border plant is the Gentian-like veronica, and one that does not demand a particular position or possess a liking for a specially prepared soil. Any good garden soil suits it. One point to be remembered is that, as this veronica spreads with fair rapidity, it must be lifted and replanted frequently in light soils, otherwise it fails to realise its full beauty. A plant that produces tall, graceful spikes of porcelain blue flowers during May and June is worthy of attention, particularly when it is remembered that such a plant is one of the cheapest the nurseryman has to offer. A companion plant to this is Veronica gentianoides variegata, which has the leaves prettily marked with creamy-white, but otherwise it differs scarcely at all from the type, though, if anything, it is a trifle more robust. In either case the spikes rise to a height of about eighteen inches, and they are abundantly produced. The accompanying illustration represents the variegated form, and the spikes were photographed in May at Messrs. T. S. Ware's nurseries at Feltham.

More than one hundred years ago the "Botanical Magazine" contained an illustration of Veronica gentianoides, and the accompanying text contains the following passage: "This ornamental species of Veronica is a hardy alpine plant, of easy culture, and readily propagated by parting its roots; it was found by Tournefort and Forskohl in Cappadocia, by Buxbaum in Armenia, by the wayside and the margins of fields, and by Sibthorp on his journey to the East. Flowers in May and June. Communicated by Mr. Loddiges in 1805, who raised it from seeds received from Mount Caucasus."

"CARNATIONS, PICOTEES, AND PINKS" will tell you plainly how to propagate and grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams as to layering, taking cuttings, fertilising blooms, etc. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

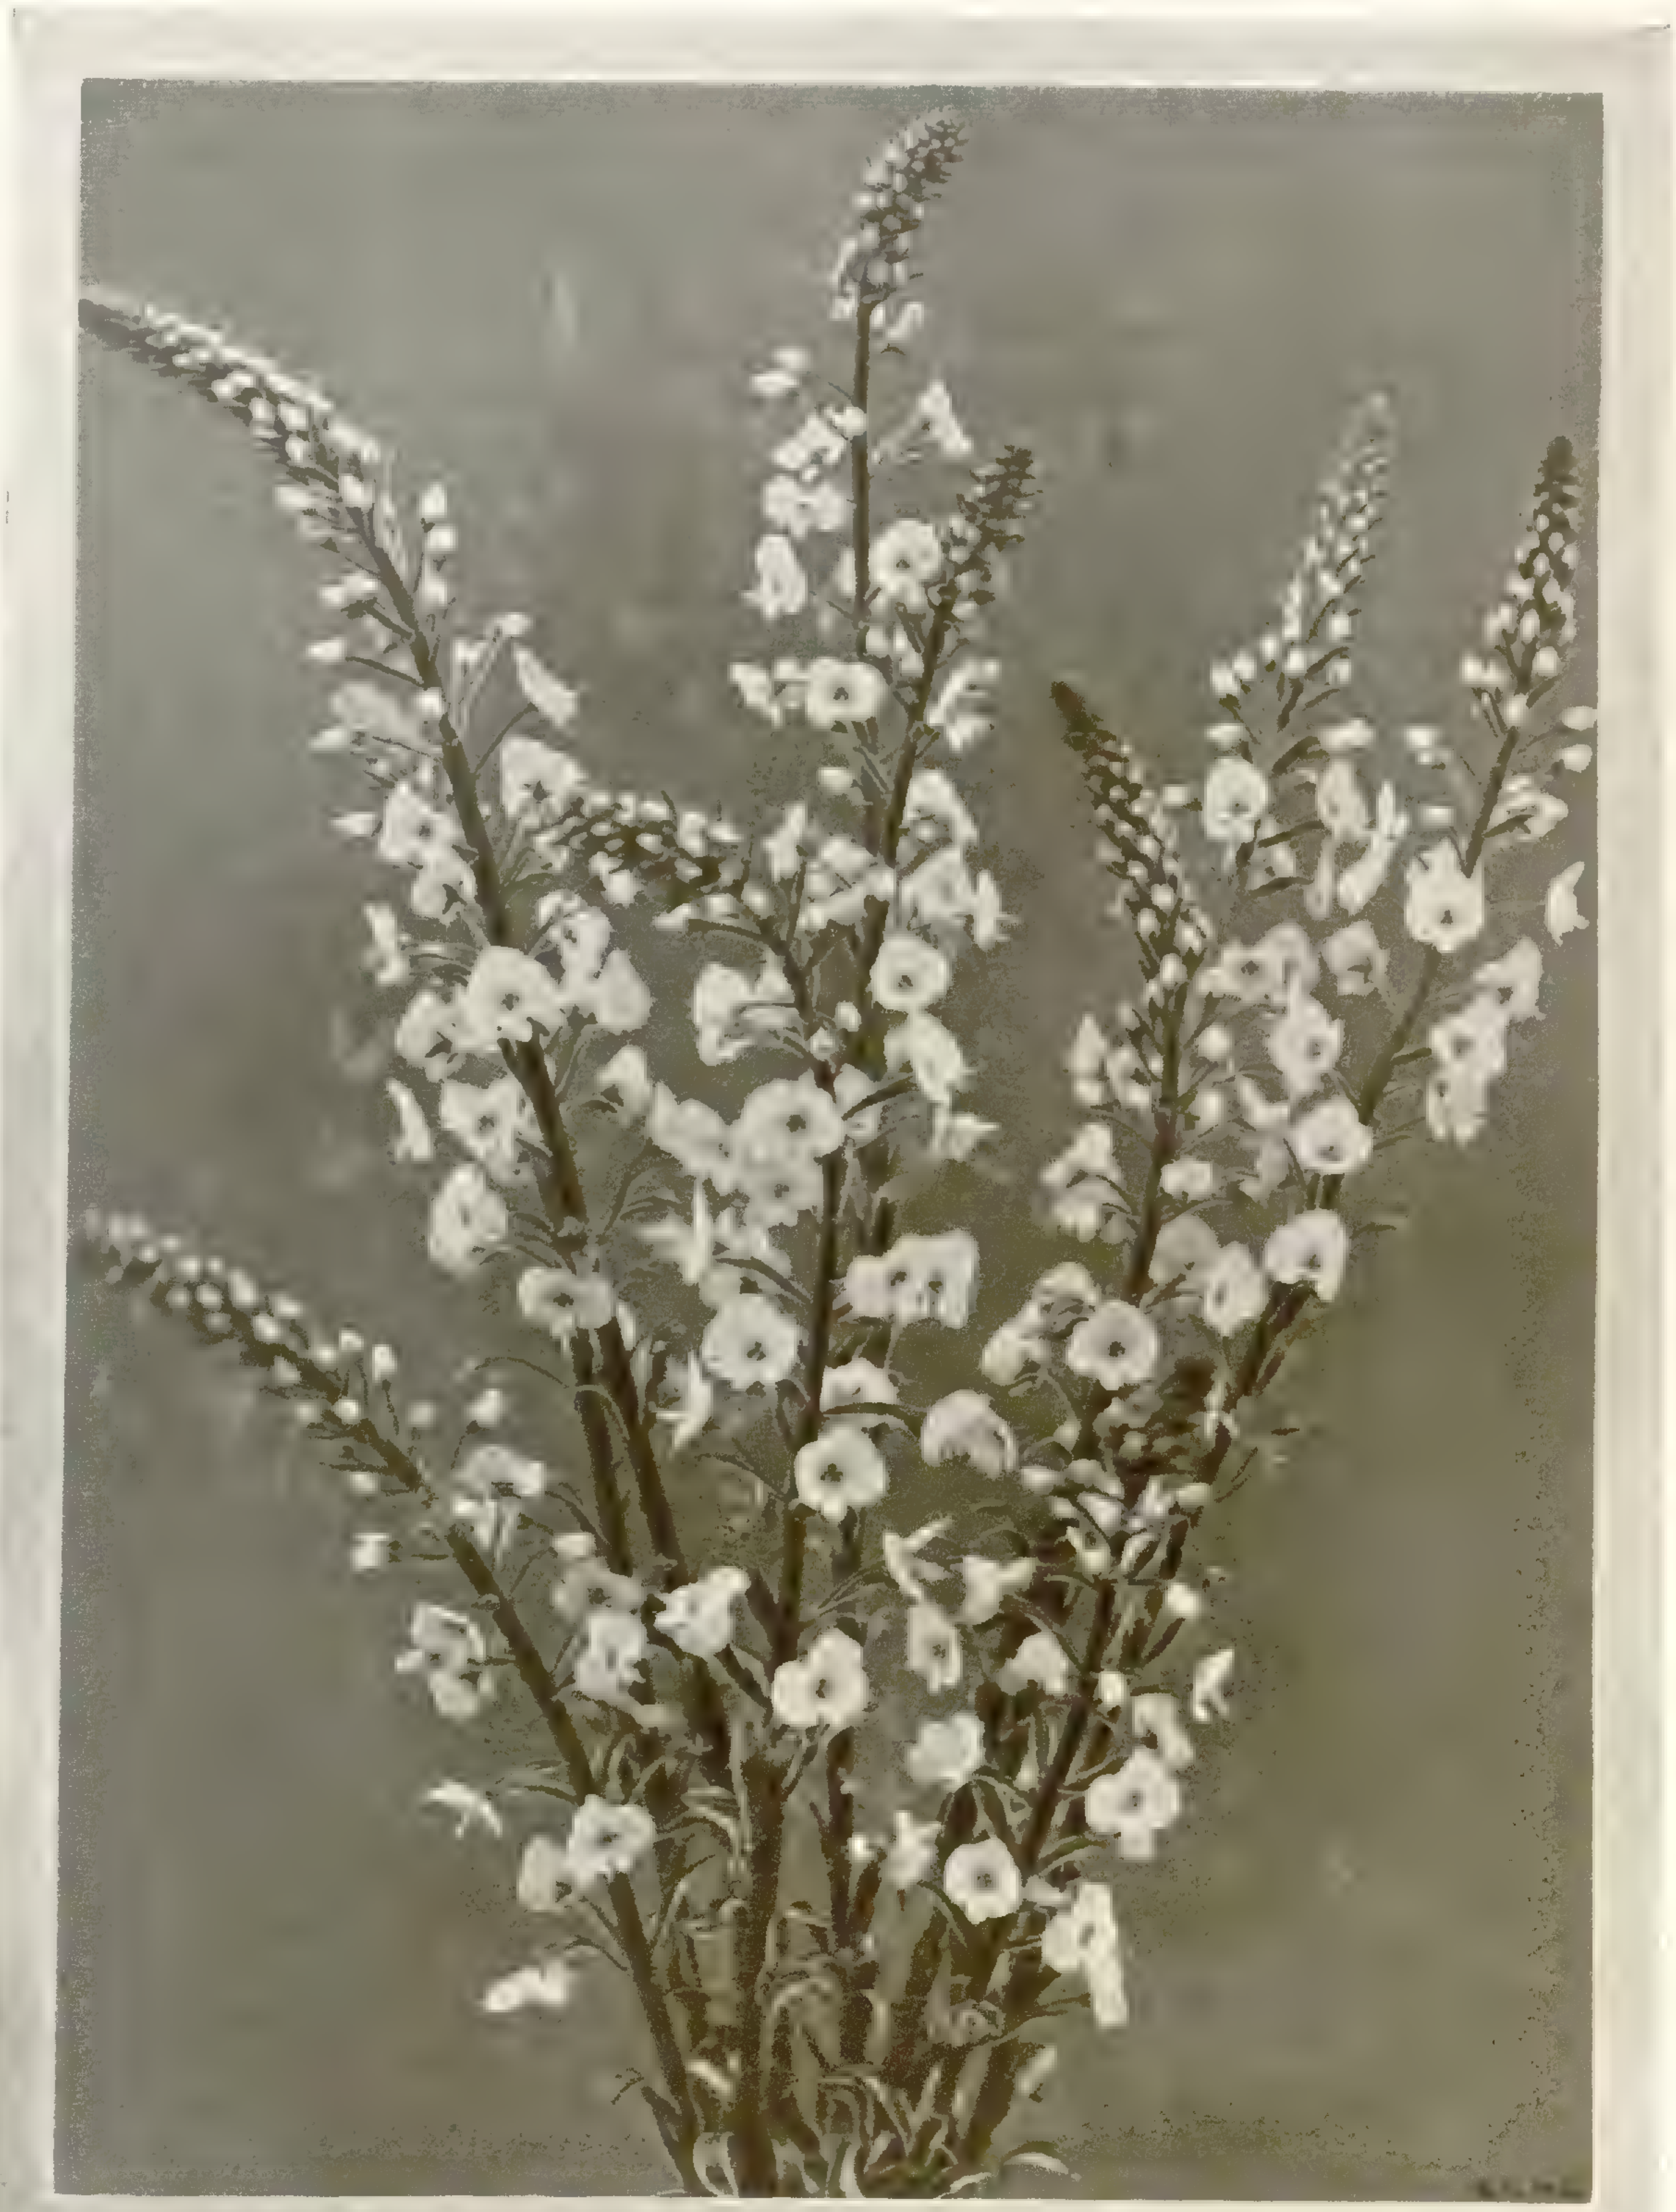
ROBINIA NEO-MEXICANA.

The several species of robinia are all handsome, free-flowering trees or shrubs which are popular for decorative gardening. Several have been known and grown for a long space of time, but the one under notice has not been in general cultivation for very many years. It is found in the Rocky Mountains, where it grows into a small-headed tree. Here it is of quite as rapid growth as the common False Acacia when young, and has been known to produce shoots six feet long in a single season. Its flowers are borne on shoots formed during the current season, and they are arranged in dense, more or less globular heads, the individual blossoms being larger than those of R. pseudacacia, and almost as large as those of R. hispida. They are a soft shade of rose, and very showy. The normal flowering period is June, but usually a second crop of flowers appears during August and September. The leaves on vigorous plants are from nine to twelve inches in length, and made up of twenty or more leaflets. As is the case with the common robinia, it is not fastidious regarding soil, for it grows quite well in poor sandy ground, though the best results may be expected from trees planted in heavier and richer land. D.

PERPETUAL CARNATIONS OUTDOORS.

The experience of another season in the cultivation of perpetual carnations in open beds and borders goes to show their value as outdoor bedding plants. In spite of the hot, dry weather experienced for so long a period, the plants are doing remarkably well, and producing a continuous supply of blooms. On a border facing almost due north we have a batch of 200 plants, some of which flowered during the winter in the houses, and have continued to bloom since November. There are now over 300 blooms fully expanded, and we are continually cutting from these for indoor decoration. The plants were put out in May, and no other attention has been given them beyond keeping them tied and supplied with water as required. The varieties that bloom most freely outside at Batsford Park are Britannia, Fair Maid, Enchantress, Winsor, Lady Bountiful, White Perfection, Harlowarden, and Harry Fenn. It is a good plan to strike cuttings from plants grown outside during August, as these take root and become well established in large 60's before winter, and are ready to pot on at an early date in the new year.

Batsford.



VERONICA GENTIANOIDES VARIEGATA.
Flowers porcelain blue; leaves green and creamy-white.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEED SOWING.—Capsules of seeds that are ripening at this season often require to be cut from the plants and suspended in a light, moderately dry position to enable them to dry out any sappy matter contained in the husks. It is advisable to sow the seed ripening at the present season as soon as possible after it can be shaken from the seed-pod. After the end of the present month the days begin to draw in very rapidly, and seeds sown during the closing season do not germinate anything like so rapidly as is found to be the case in the early months of the year. In the case of cattleyas, lælias, and others of the epidendreæ family, the conditions of the close propagating case are desirable. Failing this convenience choose a box partly filled with cocoanut-fibre refuse placed on the hot-water pipes or in a hot, humid house; in this the seed pans should be plunged, and a sheet of glass placed over the top will be found of great assistance to germination of the seeds. In the case of cypripediums, phaius and other terrestrial orchids, the seed may be sown on reasonably good surfaces of older plants of their own particular kinds. I do not consider it is advisable to sow any seed on newly-potted plants, and even where seed beds are prepared, the work should be done some considerable time before they are wanted. It is also advisable that the seed beds should be well watered some hours before the seed is sown; this will give time for the superfluous water to drain away, and yet leave the bed sufficiently moist to permit of the seed adhering to the surface after it has been shaken.

GERMINATION, ETC.—In the case of odontoglossums and allied genera, the season has with us been altogether too dry; every precaution has been taken, and nothing has been spared to procure suitable conditions. Other seedlings have given every satisfaction, but the odontoglossum seeds sown late in the spring have not made the progress one could have desired; in fact, I have seen the same class of seedlings make more progress in a few weeks in previous years than has taken place in as many months this season. Germination has been painfully slow, but as the seeds appear to be growing we may hope that a few days' moist weather outside will supply the needful conditions for more rapid development. The plants from the winter and autumn-sown seeds are making good progress, and those who have young plants developing the second or third leaf will do well to take advantage of the first moist weather to pot off what plants are required, selecting the most robust, permitting the others to remain until later in the season.—J. Chapman, Oakwood Gardens.

STOVE PLANTS.

PANCRATIUMS.—These bulbous plants have nearly all completed their flowering season, and may be brought to a state of rest by gradually withholding water, and allowing a free circulation of air, with more exposure to the sunshine. After they have undergone a thorough ripening process, they may be turned on their sides with the bulbs in a dry position. A temperature of 60 degrees will be found suitable for winter storage. The bulbs should be examined from time to time with a view to watering should they show any signs of excessive dryness or shrivelling. Should any pests, such as thrips, mealy bug, etc., be found, give a thorough cleansing with insecticide at intervals during the winter months, as time permits.

IXORAS.—These are now producing a valuable display of bloom, the colours being much appreciated. To provide stock for next summer's flowering, cuttings of half-ripened wood should be selected and placed singly in thumb pots, taking care that the cutting base rests firmly at the bottom of the hole made by the dibber. Give sufficient water to settle the soil, and plunge the pots up to the rim in tan bark or cocoanut-fibre refuse, with a bottom heat of 75 to 80 degrees. Keep the propagating case close for a few weeks until root action has commenced, afterwards admitting air gradually until the cuttings are hardened off sufficiently for removal to a position near the glass, where a more sturdy growth and short-jointed wood will be obtained. Ixoras are not disposed to branch out freely unless the tips of growth are occasionally removed. During the early stages of growth ample rooting space should be provided, but allow the plants to become well rooted before their season for flowering begins. A neat green stake should be provided for the centre of each plant, and the young shoots looped carefully to it. From cuttings taken at this season and required for early summer flowering, pots six or seven inches in diameter are quite large enough. Use a good compost of loam and peat in equal parts, with sufficient broken charcoal and lime rubble to render this open and porous. Pot moderately firm, and shade well afterwards until the plants have recovered from the check. Should larger specimens be required they may be obtained more quickly if a season's bloom is sacrificed and the plants shifted into larger pots as required. Another excellent plan is to pot up small plants immediately after flowering, prune back the flowering shoots to make them shapely, and grow them steadily throughout the winter. Mealy bug is by far the most troublesome insect pest, being almost inseparable from the growth of ixoras. It must be kept in check, or, as the flowering season appears the clusters of flowers become infested so badly that it is almost impossible to clean them without some injury. A thorough syringing with insecticide at intervals will greatly assist the grower in retaining a clean healthy stock.

GENERAL REMARKS.—All the stocks of winter-flowering subjects may now be allowed more ventilation, and as the season advances, be given more exposure to the sunshine. This will greatly assist the ripening of the wood ready for flowering. Liquid farmyard manure, well diluted, and soot water, may be used alternately with some approved chemical fertiliser as a change of diet; this treatment should be continued at weekly or fortnightly intervals until the plants develop their blooms. — John Donoghue, Bardon Hill Gardens.

FRUITS UNDER GLASS.

GENERAL REMARKS.—During the early part of July the sun was very powerful, and I am afraid in some cases the heat brought the dreaded red spider in to many vineries; it comes into the best regulated houses in such hot, sultry weather, and in many cases from outside sources, and that is the reason that I have mentioned the matter. I have traced it coming through the bottom ventilators, so I strongly advise the quick clearance of all leguminous crops, which invariably in their decline become a prey to red spider. I have several times suggested remedies for red spider, but the remedies must be persistently used in spite of pressing work, or the pest soon makes havoc of the foliage, and acts against the proper ripening or colouring of the grapes. It is a pitiful sight to see a house of grapes spoilt by this pest.

LATE GRAPES.—These should be examined occasionally to see that the berries are not pressing each other; a few may yet be removed, if it is necessary, as they have a long period yet before them. Keep the laterals well pinched, though during the bright sunny weather they need not be pruned quite so hard, as a little more shade is thus provided, and is necessary; but should the weather suddenly change, then more shortening will be necessary.

EARLY PEACHES.—Keep the foliage well syringed and the border supplied with moisture, and, also admit as much ventilation as possible day and night. Keep all laterals removed, and allow no more wood to remain than is really required. The branches will be more fully mature, and it is better to have a few branches ripen well than a mass of unripened shoots to be removed at the winter pruning. The only way to success with peaches is to have thoroughly ripened wood. Later and successional houses must have copious syringings, and even when ripe fruit is on the trees it is possible to syringe all around them in hot weather without at all damaging the fruit; all other portions of the house should be thoroughly damped in order to keep down pests. Gather all fruits as they become ready, carefully placing them on wood wool in a cool fruit room.

MELONS.—Plant out the last batch in the early house, where plenty of fire-heat can be use to ripen the fruits thoroughly in the early part of October; make the soil as firm as possible by ramming. Attend to stopping and tying those fruiting now, especially those in frames; melons have been most welcome this season, and have been easy to grow owing to the abundance of sun heat.

STRAWBERRIES.—Finish the strawberry potting, and stand the pots on a firm base; syringe the plants morning and night to keep them clean and growing.—W. A. Cook, Leonardslee Gardens.

THE FLOWER GARDEN.

SEEDLING CARNATIONS as a rule are healthier and stronger than plants propagated by layers, and it has been proved in many gardens that when the latter have failed, the former have been a success. Of course, one has to chance the varieties, and also to put up with a few singles, which, by the way, are very useful for decorative purposes. At the same time, an excellent range of colours is obtained, and an abundance of flowers. These will now be ready for planting, and may be given a little more room than the layers.

ANTIRRHINUMS.—The dry, hot weather experienced last month suited the antirrhinum wonderfully well, and the beds are a mass of flowers. They are, undoubtedly, excellent plants for bedding purposes, providing a grand display for some considerable time. When the centre spike shows signs of seeding it should be removed, thus throwing more strength into the side shoots. In fact, all spikes should be cut out immediately they finish flowering. By following up this method the plants remain in bloom longer. The intermediate forms are the most suitable for bedding purposes, and the improved strains come very true from seed as a rule; Orange King, Fire King, Coral Red, and Carmine Pink are splendid varieties.

DAHLIAS.—As growth advances the shoots will require extra ties to prevent the wind and rain from breaking them off. If blooms are required for exhibition purposes the buds must be thinned to one on each shoot. Much damage is sometimes caused by earwigs, and an inverted pot with some dry material in it should be placed on the top of a stake to form a trap.

PROPAGATION. — During the coming fortnight this operation will demand much attention, and it is essential that everything should be in readiness when a start in taking the cuttings is made. Pots and boxes should be filled with sandy soil and made firm. The growths of pelargoniums are in good condition this season for cuttings, being short-jointed and firm, and there should not be much difficulty in rooting them. Lobelia that is required for supplying cuttings should be cut down to induce the plants to make new growth. Heliotropiums, Salvia patens, and gazanias may be propagated at once, and the pots placed in a close cold frame. Cuttings of heliotropiums quickly root, and can be potted up singly into three-inch pots in which they may be wintered. When fresh growth commences early in the year these plants should be shifted into larger pots, when good sized examples will be obtained.—E. C. Pooley, Gnaton Gardens.

OBSERVATION.

He took such cognizance of men and things,
If any beat a horse you felt he saw;
If any cursed a woman, he took note;
Yet stared at nobody—you stared at him,
And found, less to your pleasure than surprise,
He seemed to know you and expect as much.
Browning.—"How it Strikes a Contemporary."

It is only of things that really interest us that we take observant note, most things passing before our gaze and leaving no more impression upon our minds than the fields of barley and rye upon that of the Lady of Shalott as she glided down the river to Camelot. The most familiar illustration of this is the manner in which a mere man is nonplussed when asked how a lady was dressed compared with the wonderfully detailed report which the same question will elicit when addressed to a lady. We learn from this not only that we must be interested in a thing, but that we must cultivate the faculty of observation, if we are to take accurate note of what we see. Doctor Johnson once remarked that few people could gather correct impressions from what they heard, and fewer still could convey those impressions correctly to others. The difference between the mental impressions we receive through the eye and those we receive through the ear is not great.

Few of us, perhaps, realise the important part observation plays in the education of the gardener, but when we do we see how necessary it is that a man should really love plants, for when this is the case he will be always looking at and observing them—there is a great difference between the two, almost that between the passive and the active—even getting off his cycle when passing a cottage garden to look at something which strikes him, and, if the opportunity offers, making inquiries about it, while Nature's own gardening is not without its influence upon him.

In this way a vast store of knowledge is obtained, and upon it the gardener, amateur or otherwise, can always draw when confronted with new problems. However valuable books may be, nothing can take the place of that accumulation of the results of observation which we call experience. This store will be increased every day by experimenting in different methods of cultivation with various kinds of plants, and taking careful note of the results. We want to know all about a plant's habitat in a state of nature, not only in regard to the part of the world in which it grows, but the aspect, elevation, kind of soil, etc., besides its manner of rooting and the climatic conditions to which it would be subject. Even then we shall not have obtained knowledge which will enable us to grow successfully all the members even of one species in some cases, so great is the diversity and individuality among varieties. Especially is this the case with the growth of fruit trees, there being as much difference in the family, for instance, of Worcester Pearmain, Bramley's Seedling, and Stirling Castle, as between a plum and a peach, and this has to be learned by observation of the results of different kinds of practice.

Observation of plant life means the end of the reign of rule-of-thumb practice, by which is understood the adoption of certain methods from habit or hearsay without knowing anything of the principles upon which they are based, and they often disappear when the reasons for them are inquired into and found wanting. When we study the growth of a plant, its roots, stem, leaves, flowers, and fruit, we get to know when it is best to do some things and avoid others. If several dwarf apple trees, for instance, are carrying heavy crops of fruit, and they are all fed alike in August, it will probably be found that the flavour of the early varieties among them is impaired and the size and quality of the mid-season varieties is increased; also that the stimulus given to the late roots will result in growth continuing so late in the autumn that the fruits will not finish properly, and consequently in February and March, when they should be just in season, they will be shrivelled as if picked a month too soon. A man who has had this experience—supposing him to be observant enough to associate cause and effect—will abstain from feeding some, if not most, varieties of apples in the latter part of the summer, not because he is told it is best not to do so, but because he knows it from past experience. This illustration is sufficient, and is applicable to the whole field of growing practice. But when we have collected the results of many years of observation, it depends then upon our inherent capacity to distil out of them that which is above rubies. Tennyson says that,

"Knowledge comes, but wisdom lingers,"

and we remember learning in our school days that a King of England was described by one of his contemporaries as "the most learned fool in Christendom."

We may fitly close these remarks with the lines of Cowper:

Experience, slow preceptness, teaching oft
The way to glory by miscarriage foul,
Must prompt him, and admonish how to catch
The auspicious moment.

Alger Petts.

LUCULIA GRATISSIMA.

This exquisitely fragrant subject was introduced into our gardens from the Temperate Himalyas as far back as 1823, and throughout the whole of this period it has been considered a "miffy" sort of shrub, and not by any means of easy propagation.

Failures to cultivate this winter-flowering shrub successfully are not rare, and the best flowered and finest specimens that have come under my notice have been planted out in a cool greenhouse, and against the ends of a peach house. It is now clearly understood that the plant resents transplantation or root disturbance, and, further, is exceedingly susceptible to extremes of any kind.

Whether planted out or grown in large pots or tubs, very thorough and efficient drainage is required, and as a medium nothing better can be found than equal parts fibrous peat and loam, with leaf-soil, charcoal, and sand added.

The luculia yields up its inflorescence at a season when choice and fragrant flowers are none too plentiful, namely, from October to January, and when its beauty is past the growths should be shortened but not severely dealt with, and, dating from this time until late in April, water should be sparingly applied. About that time the border should be top-dressed, and the supply of water be very gradually increased, with a view to the production of strong and vigorous growths that will be responsible for the next winter's display. I cannot call to mind any plant that so soon shows the ill-effects of insect attack as the luculia, hence cleanliness must be observed, including the sponging of the leaves from time to time to remove dirt deposits.

With regard to propagation experience goes to show that the cuttings should be inserted immediately they are removed from the parent plant, and be placed in a propagating case with a fairly strong bottom heat. While engaged in a well known nursery we experienced no difficulty in the matter when treated in this way. H. A.

HIBISCUS SYRIACUS.

This is a beautiful free-flowering deciduous shrub that should be grown in every garden where flowering shrubs are appreciated. It may not flower as freely in the northern as in the southern counties, but there is no question about its free-flowering propensities in the latter, and as there are in many gardens very dry banks and borders, where such subjects must be grown, I wish to draw the attention of readers to this species. I had several very fine specimens which flowered profusely every year for many years, and made moderate growth each season; the wood ripened well, of course, and this condition meant plenty of flowers. The soil, or, rather, rubble, in which one (the best) plant grew, was extremely poor, and I was surprised that so much growth and so many flowers appeared every year. The bush really seemed to depend upon the rains for sustenance, and on this account I recommend these free-flowering plants for poor soils. The flowers of H. syriacus are double, and, in appearance, closely resemble those of several varieties of show pelargoniums, being purple and white. Cuttings root freely if inserted in sandy soil under a handlight in August. The glass must be kept on until next spring. G. B.

THE NATIONAL VEGETABLE SOCIETY'S TRIALS.

Below will be found the society's official report on early peas sent for trial to the Times Experimental Station, Sutton Green, Surrey, and which were inspected by the committee on June 19, 1911.

The total number of stocks sent for trial was fifty, supplied by twenty-two diverse seedsmen. The sowings took place on March 19, in rows 20 feet in length, all being admirably grown and staked. For purposes of comparison the varieties were divided into dwarf and tall, the former ranging from 15 inches to 24 inches in height, the latter ranging from 2½ feet to 4 feet in height. Of the dwarf section three marks or highly commended were awarded to Daffodil, from Messrs. James Carter and Co.; The Laxton, from Messrs. Laxton Brothers; English Wonder, from Messrs. Dobbie and Co.; Peter Pan, from Messrs. Watkins and Simpson; and Little Marvel, from Messrs. Webb and Sons and Messrs. Barr and Sons. Of taller varieties Pilot, 3 feet in height, received three marks or highly commended, from Messrs. Dickson, Brown, and Tait, Messrs. Webb and Sons, Messrs. Alex. Dickson and Sons, Messrs. Hurst and Sons, and Mr. Yates, of Evesham. Three marks were also awarded to Gradus, 3½ feet, from Messrs. Dobbie and Co., Messrs. Dickson, Brown, and Tait, Messrs. Watkins and Simpson, Messrs. Alex. Dickson and Sons, and Robert Sydenham, Limited. Three marks were also awarded to Ready Reckoner of the Pilot type, from Mr. W. G. Holmes, Tain, N.B.; Early Primo, from Messrs. Dickson and Robinson and Messrs. Watkins and Simpson; Talisman, from Messrs. Sharpe and Co., of Sleaford; First and Best from Messrs. Dickson and Robinson; Ideal, from Messrs. Sutton and Sons; Glory of Devon and Western Express, from Messrs. Robert Veitch and Sons. Two marks were awarded to Giant Lightning, from Messrs. Barr and Sons; Vanguard, from Messrs. Sharpe and Co.; and Snowdrop, from Messrs. James Carter and Co.

A number of varieties sent were of the round-seeded, small-podded order, and these were greatly deficient in cropping qualities and in flavour. But, as almost one-half the whole number secured high commendation, it is obvious that the standard of edible peas is to-day a long way superior to what it was some thirty to forty years since.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

There was a holiday air about the meeting held at Westminster on August 1, and very few people seemed to take things seriously. The exhibition was a small one, visitors were few, and most of the regular habitués were away for their holidays. A scaffolding up under the roof of the hall, and other tokens, showed that the work of redecoration was in progress, and seemed to suggest that the show was a bit of a nuisance.

Some interesting plants were on view, but the groups were not of a very high quality.

FLORAL COMMITTEE.

A bank of hardy flowers from Messrs. T. S. Ware, Lim., Feltham, was notable for its sheaves of phloxes, scabious, Sedum maximum purpureum, Crinum Powelli, and Liatris spicata; in the centre of the group were large numbers of spikes of the old Agapanthus umbel atus and its white form.

In the contribution from Messrs. Jas. Veitch and Sons, Chelsea, the cannas were very gorgeous, and the variety named Terra Cotta (A.M.), with a great spike of orange-tinted terra-cotta-coloured flowers was a notable one; Begonia Lucerna with great pendant trusses of deep red-pink flowers; the red bracted Mussænda erythrophylla (A.M.); and the graceful Thalictrum dipterocarpum, some of the spikes of small bluish flowers being 10ft. high.

Cannas were well shown by Messrs. H. Cannell and Sons, Swanley, leading varieties being J. B. van. der Schoot, Gladioliflora, Mephisto, Juanita, and J. S. Boosig; with the cannas came large bunches of fruiting branches of Rubus palmatus.

One of the largest exhibits was that of herbaceous phloxes from Mr. James Box, Lindfield, who staged quantities of George A. Strohlein, Le Mahdi, Freifraulein Von Lassberg, the pink Lindfield Beauty, Dr. Konigshofer, a new deep salmon scarlet; Frau Hornung, Baron von Dedem, deep salmon, and the good Old Meteor.

Some excellent gloxinias, the results of seeds sown on January 3, were arranged in the centre of the hall by Messrs. Jas. Carter and Co., Raynes Park, and represented their Invincible Prize strain; the rich purples, pure whites, soft pinks, pretty lilacs, rich crimsons, and cherry reds were all greatly admired for the purity and substance of their colouring.

Messrs. Webb and Brand, Saffron Walden, showed their splendid double hollyhocks, staging individual flowers on boards in front of tall, stately spikes of fine blooms. Olive Chater, pink; Salmon Queen, salmon; Miss Lizzie King, yellow; Luna, cream white; Mulberry Gem, maroon; Crimson Queen, deep red; and Alba Superba, white, were among the best of the named sorts.

Old dwarfed Japanese trees in fancy pots were contributed by Mr. G. Koizum, 35, Bessborough Gardens, S.W.

Mr. G. Reuthe, Keston, brought up many interesting things, notably the double gypsophila, Crinum Powelli, Chelone barbata, Phygelius capensis, and Stokesia cyanea.

A collection of cut verbenas, set up by Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, stood the heat badly, but it served to show the wide range of colouring in these useful flowers. From Aldenham came Itea ilicifolia (A.M.), an interesting Chinese shrub, with long pendant tassels of green flowers, acalypha-like, borne on an osmanthus-like shrub. Another good shrub was Cornus paucinervis (A.M.), an evergreen, with neat leaves, closely set on freely-branched reddish stems; the flattened inflorescence consists of a large number of cream-white flowers.

From the Tully Nurseries, Kildare, Mr. Paine brought over a large collection of gladioli, filling a large table with the spikes of showy flowers; a new deep crimson was named Sir Fred Moore, and a new salmon variety, with crimson and red blotches was named Lady Moore.

Mr. Batley, Shelton Castle, submitted a salmon-buff border carnation named Mrs. Wharton (A.M.).

Campanula isophylla, and C. i. alba were both well shown in pots by Messrs. H. B. May and Sons, Edmonton; these are capital window and window-box plants, and should not be despised because they are old.

Tunica Saxifraga alba fl.-pl., a particularly elegant and free-flowering hardy plant, with small double white blossoms, was contributed in quantity by Messrs. Bakers, of Codsall, Wolverhampton; this firm set up their flowers in a large mound, which attracted a great deal of attention. The plants secured an A.M. in August, 1909.

Messrs. H. Homan and Sons, Nordwyk, Holland, sent some pretty gladioli, the violet-purple Baron Hulot, the pale-yellow Primrose Queen, and the pure white Mont Cenis being three of the best.

Messrs. Paul and Son, Cheshunt, displayed a goodly collection of herbaceous phloxes, but the spikes nearly all succumbed to the heat quite early in the day.

ORCHID COMMITTEE.

A beautiful exhibit and one that attracted a great deal of attention by reason of its beauty and novelty, was the display of the grand old Disa grandiflora put up by Mr. A. Taylor, grower to Mrs. Bischoffsheim, Warren House, Stanmore. There were about a hundred pots, and about a hundred and ten spikes, each spike carrying from two to six splendid blooms. As shown, they displayed this grand orchid at its best, and must have inspired many of those present to take up its culture. Some variation in colour was evident, but those which had vivid orange segments, and some with unusually rich veinings on the big lip, were particularly fine.

The beautiful Anguloa eburnea, with white aromatic flowers, was conspicuous in the small group of orchids submitted by Messrs. Charlesworth and Co., Haywards Heath; Oncidioda Charlesworthi, the old Bollea cœlestis, and fine plants of Zygopetalum Roeblingiana, Lælio-cattleya Callistoglossa, and Cattleya gigas were also included.

A cultural commendation was granted to Mr. Alexander, orchid grower to Sir G. Holford, Westonbirt, Gloucester, for a splendid plant of Phalænopsis violacea Clifton var.

Mr. R. G. Thwaites, Chessington, Streatham Hill, presented about a dozen flowering plants of Odontioda Thwaitesæ, some of them carrying flowers of very deep purplish hue.

The few plants sent by Mr. E. V. Low, Haywards Heath, included Cypripedium Faire Maud, Cattleya Lord Rothschild var. splendens, and a fine C. Hardyana.

A number of interesting things were shown by Mr. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate, notably Catasetum Cliftoni (A.M.), Cycnoches chlorochilon, Eulophia maculata, Cirrhopetalum pulchrum, Spathoglottis Fortunei with yellow flowers, and the old but rather rare Lælia monophylla.

From Sir Trevor Lawrence's collection at Burford Lodge, Dorking, Mr. White brought up Eria mysorense and Lælia Bella.

Cattleya Warscewiczi was grandly shown by Messrs. Sander and Sons, St. Albans, a dozen fine plants making a great show of gorgeous blooms; C. Rex, C. Queen of Sheba, and Cypripedium Maudiæ.

Mr. G. E. Day, gardener to H. S. Goodson, Esq., West Hill, Putney, had a fairly large group of orchids on this occasion, and showed Cattleya Warscewiczi, C. Hardyana, C. Mdme. Melanie Beyrodt, Sophro-lælio-cattleya Elissa, Lycaste Skinneri, Odontioda Thwaitesæ, Anguloa uniflora, and Cypripedium Maudiæ.

A pretty little set of Disa grandiflora came from Mr. W. H. Smith, gardener to W. James, Esq., West Dean Park, Chichester; all the plants were well grown.

Odontoglossum Rolfeæ, Cattleya Hardyana, C. Lord Rothschild, and C. fulvescens were the chief subjects exhibited by Messrs. Stuart Low and Co., Enfield.

FRUIT AND VEGETABLE COMMITTEE.

Some unusually fine fruits of a yellow tomato named Golden Glow gained for Mr. E. Beckett a well-deserved Cultural Commendation; and an Award of Merit was granted to a yellow-fleshed kidney potato, named Arduthie Early, from "Mr. Smith."

AWARDS OF MERIT.

No first-class certificate was awarded on this occasion.

Award of Merit.—To Itea ilicifolia and to Cornus paucinervis, from the Hon. Vicary Gibbs (gardener, Mr. Edwin Beckett), Aldenham House, Elstree; to Carnation Mrs. Wharton, from Mr. Batty, Skelton Castle, Yorks; to Mussænda erythrophylla, and to Canna Terra Cotta, from Messrs. Jas. Veitch and Sons, Chelsea; to Catasetum Cliftoni, from Sir Jeremiah Colman, Bart. (gardener, Mr. Collier), Gatton Park, Reigate; and to Potato Arduthie Early, which, according to the official list, was sent by "Mr. Smith."

MEDALS.

Silver-gilt Flora.—To Mrs. Bischoffsheim (grower, Mr. Taylor), Warren House, Stanmore, for group of Disa grandiflora.

Silver Flora.—To Mr. Paine, Tully Nurseries, Kildare, for gladioli; to Messrs. H. B. May and Sons, Edmonton, for campanulas and ferns; to Mr. Jas. Box, Lindfield, for phloxes; to Messrs. Jas. Veitch and Sons, Chelsea, for greenhouse flowering plants; to H. S. Goodson, Esq. (gardener, Mr. Day), West Hill, Putney, for orchids.

Silver Banksian.—To Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. H. Cannell and Sons, Swanley, for cannas; to Messrs. Jas. Carter and Co., Raynes Park, for gloxinias; and to Messrs. Sander and Sons, St. Albans, for orchids.

Bronze Flora.—To Mr. G. Reuthe, Keston, for hardy flowers; to Messrs. Thos. S. Ware, Lim., Feltham, for hardy flowers; to Messrs. Webb and Brand, Saffron Walden, for hollyhocks.

Bronze Banksian.—To Messrs. Stuart Low and Co., Enfield, for orchids.

Haywards Heath.

A society that has not as yet received the publicity its operations merit is the Haywards Heath Horticultural Society. It held its twenty-third annual exhibition on Wednesday, July 20, when the public Victoria Park was the venue. This undulating park, with its abundant trees and larch woods, is an excellent place in which to hold a show, and it afforded also ample space for roundabouts and the impedimenta of a country fair, as well as a clear and level area for carrying out the excellent programme of sports conducted by the Haywards Heath Athletic Club.

The exhibits were accommodated in several tents, so grouped that one almost opened into another. The schedule consisted of [illegible] classes, and especially large provision was made for herbaceous and other hardy flowers, including the inevitable sweet peas and roses. Vegetables formed a good portion of the show, and the number of classes was almost bewildering, as gardeners, single-handed gardeners, amateurs, and cottagers were catered for, and there were a few open classes. The table decorations are judged by a ballot of the visitors, a method that may prove satisfactory at Haywards Heath, but one that is not, as a rule, eloquent of good judgment. The children were not forgotten, and there were three classes for wild flowers, and one of these was especially interesting, as wonderful collections of the local flora had been made, well set up, and duly labelled with popular and scientific names.

GROUPS AND PLANTS.

Instead of groups arranged on the ground, the prizes at Haywards Heath are given for a collection of plants arranged for effect upon a table 8ft. by 4ft. The chief award fell to Mr. G. Smith for a pleasing group of schizanthuses, begonias, gloxinias, ferns, palms, and selaginellas; Mr. W. F. Elvey, gardener to R. Foster, Esq., Summer Hill, Lindfield, second; and Mr. J. Sands, third. In the local class for a table of plants, a space of 6ft. by 4ft. was allowed, and Mr. A. E. Mays was the first-prize winner, as he also was in the somewhat similar class open to single-handed gardeners and amateurs. In several instances the exhibits in these classes lacked finish, that is to say, more attention should have been paid to the provision of suitable plants for the edging of the tables.

Plants were not particularly good; Mr. G. Smith, gardener to S. T. D. Throwgood, Esq., Clevelands, Haywards Heath, led for caladiums; Mr. J. Sands, gardener to T. Bannister, Esq., Limehurst, had easily the best coleus, big, bright, bushy specimens; Mr. G. Smith scored for a dozen gloxinias with large freely flowered plants of a good strain, and he was first for four begonias and second for six begonias and first for six gloxinias.

CUT FLOWERS.

The silver challenge cup given by Sir Alexander D. Kleinwort, Bart., for the best eighteen bunches of hardy perennials, was won by Mr. J. E. Shirley, gardener to the Rev. T. G. Wyatt, St. Wilfrid's Parsonage, Haywards Heath, and his collection was as fine as one could wish to see; he had famous big bunches of Watsonia Ardernei, Erigeron speciosa, Achillea eupatorium, Lathyrus The Pearl, Bocconia cordata, Lilium chalcedonicum, Chrysanthemum maximum Rev. H. Sanders, Gladiolus America—magnificent; Crinum Powelli, Spiræa Silver Sheaf, Phlox Aphrodite, gaillardias, helianthuses, and pentstemons. This was a collection that would have done credit to any society in the kingdom. Mr. H. Cherriman, gardener to Lady Giffen, Chanetonbury, Haywards Heath, was second with a good set.

Mr. H. Cherriman annexed the chief award for a dozen bunches of hardy flowers, and he had fine lots of Helenium Bigelowi, Rose Dorothy Perkins, and Chelone barbata; Mr. G. Clarke, Glenthorpe, Haywards Heath, second; and Mr. A. E. Mays third. Mr. H. Rowland, of Cuckfield, had the best nine vases of phloxes, three spikes of each; this, by the way, is a good class, and would be a great success in an ordinary season.

Roses were poor, but the boxes from Mr. P. T. Davis, Burgess Hill; Mr. E. B. Lehmann, Ifield Lodge, Crawley; Mr. J. E. Shirley and Mr. E. Rutland, gardener to G. A. Hammond, Esq., Burgess Hill, were of fair quality for so late a date, and they all secured awards.

The silver cup presented by Mr. J. Box for the best eighteen bunches of sweet peas was won by Mr. F. Beech, gardener to Mrs. Kensington, Uckfield, with some good flowers of Mrs. W. J. Unwin, Helen Grosvenor, Etta Dyke, Audrey Crier, Clara Curtis, George Stark, finely waved, and Helen Lewis; Mr. W. H. Smith, Hailsham, second; and Mr. E. B. Lehmann third. For six bunches of sweet peas the awards fell in order to Mr. A. Hounsell, gardener to Major G. Talbot, Balcombe; Mr. H. Marchant, Lindfield, and Mr. R. Durrant, Lindfield; there were ten entries.

FRUIT AND VEGETABLES.

Mr. H. Lazell, gardener to H. Mansfield, Esq., Beech Hurst, scored for white grapes, with good clusters of Muscat of Alexandria, while Mr. Grubb, gardener to L. M. Schleisinger, Esq., Bedales, was second, but he was first for black grapes with finely berried Madresfield Court. Mr. Lazell beat Mr. Grubb for peaches with good examples of Bellegarde, but Mr. Grubb scored for nectarines with River's Orange, Mr. E. Fairbrother, gardener to Lieut.-Colonel Dudley Sampson, Buxshalls, coming second. Mr. Lazell had the best melon.

Mr. G. Mortimer, gardener to Mrs. Wrighton, Ockenden, Cuckfield, led for tomatoes with splendid examples of Comet. Gooseberries, red and white, red and black currants, and cherries were all largely and well shown. Dr. Walters, Haywards Heath, was the leading prize-winner. In Messrs. J. Cheal and Sons' class for eight kinds of vegetables Mr. C. H. Jenden, Horsham, led the way with good produce, and Mr. J. E. Reeves, gardener to Captain H. Acton Blake, Rusper, was placed second.

Messrs. Sutton and Sons' prizes for a collection of vegetables were secured by Mr. J. E. Shirley; Mr. H. Manton, gardener to W. A. Sturdy, Esq., Paxhill; and Mr. E. Fairbrother, Lindfield, in the order of mention. Mr. Shirley was first in the local district class for six kinds of vegetables, while in a similar class open to single-handed gardeners Mr. Harris was first.

TRADE DISPLAYS.

The trade displays are arranged in two classes, those on a ground space and those on staging, and medals are awarded according to order of merit. In the case of those on staging, the gold medal fell to Mr. C. F. Waters, Balcombe, for a beautifully arranged exhibit of perpetual and border carnations; the silver-gilt medal to Mr. J. Box, Lindfield, who had a very bright exhibit of hardy flowers, in which gladioli, Watsonia Ardernei, and phloxes were very fine features; and the silver medal went to Mr. Frank Woollard, Cooksbridge Nurseries, near Lewes, for roses.

Only one exhibit arranged on the ground came into line with the schedule, and this was a charming one, composed of sweet peas, fresh and bright, and unusually well arranged by Mr. J. Box, Lindfield; it was awarded a gold medal.

Messrs. J. Cheal and Sons, Crawley, contributed hardy flowers, and Messrs. William Cutbush and Son, Highgate, presented a striking group of stove and greenhouse plants, flowering and foliage, with large vases of perpetual carnations rising well above the lower plants. A special award of a gold medal was made to the Highgate firm, although the extent of their display placed them outside the competition already noted.

Handsworth Floral Fete.

The twenty-seventh annual exhibition of this society was held in the public park, Handsworth, and it was rendered additionally auspicious by its synchronising with the Corporate Union of Handsworth with Birmingham, and having Alderman Bowater, the Lord Mayor of Birmingham at the opening ceremony.

Despite the long-continued tropical-like weather and drought, the quality of the exhibits generally maintained the traditions of the society, but there was a falling away numerically, more especially in the non-competitive classes, owing partly to the unfavourable season, and to the number of exhibitions that were being held elsewhere on the same dates.

The open class for a group of plants arranged for effect, not to exceed 300 square feet, with double straight fronts, tempted three well-known cultivators to enter the lists, namely, Messrs. J. Cypher and Son, Cheltenham; Mr. J. V. Macdonald, gardener to Sir George Kenrick, Edgbaston; and Mr. W. Vause, Leamington. The first-named firm scored with one of their oft-repeated, well-known tasteful arrangements. Messrs. Cypher obtained by their taking first place the final possession of the silver challenge cup in addition to the first prize of £20. Mr. Macdonald was an excellent second, with a somewhat lighter arrangement than usual that evinced much artistic ability. Mr. Vause also arranged an excellent example of floral art. In the class for twelve stove or greenhouse plants Messrs. Cypher easily led with some of their mammoth specimens; second, Mr. W. Vause; and third, Mr. A. Cryer, gardener to Mr. J. A. Kenrick, Berrow Court, Edgbaston. Mr. Cryer was successful in the gentlemen's gardeners' and amateur classes (five mile radius).

There was a keen contest in the class for table decorations (orchids excluded), and more than one contestant was severely handicapped by the effect of the combined strong current of wind, air, and high temperature on their flowers prior to the time of adjudication. The premier prize was awarded to Mrs. Newbold, Derby; second, Mrs. Winchester, Rubery; third, Miss E. Reeves, Balsall Heath; and fourth, Mr. W. J. Mattock, Oxford. Roses, pinks, carnations, and sweet peas were severally laid under contribution by the winners. Vegetables were creditably staged by several of the leading growers. For nine kinds Mr. A. T. Rainbow, Northfield; Mr. E. Deakin, Hay Mills; and Mrs. E. Winchester were the respective winners.

Roses were very well staged, and for twenty-four varieties Messrs. Perkins and Sons, Coventry, were an easy first, with good and fresh blooms; second, Mr. W. H. Frettingham; and third, Messrs. Chapman and Collins, Leicester. Extra prizes were awarded to Messrs. W. and J. Brown, Peterborough; and King's Acre Nursery Co., Hereford. For a collection of roses, arranged in a space 8ft. by 4ft., for effect, Mr. J. Mattock, Oxford, and Messrs. W. and J. Brown were the first and second respectively, with tasteful arrangements. Bowls of roses were well staged by Messrs. Perkins and Sons, Mr. J. Mattock, and Mr. W. H. Frettingham. For twelve roses Messrs. W. and T. Mattock, Messrs. Perkins and Son, and Mr. Frettingham were the successful competitors. For twelve bunches garden roses, Messrs. J. Mattock, W. T. Mattock, and W. and J. Brown were the prize-takers. In the class for twelve tea roses distinct, the awards were made in favour of Mr. W. T. Mattock, Mr. J. Mattock, and Messrs. Chapman and Collins.

Carnations formed an interesting section. For twenty-four varieties, to be shown in vases, as grown, with own foliage, Messrs. A. R. Brown, Lim., King's Norton, were a capital first; second, Mr. J. C. White; third, Mr. W. H. Clements. For twelve border carnations, the foregoing winners repeated their success in the order named. Violas were well shown. For twelve bunches with foliage, Mr. F. Velly (a new exhibitor), King's Heath; Messrs. W. Pemberton and Sons, Bloxwich; and Mr. Howard Allen, Handsworth, were the respective winners. Sweet peas were for the season fairly well staged. For twenty-four bunches in not less than twelve varieties, twenty stems, arranged with suitable foliage in a space 6ft. by 4ft., Mr. R. Wright, Formby, led, with Mr. G. Deakin and Mr. W. Marple, Wolverhampton, following. In the class for twenty-four bunches hardy border flowers, the contest was keen, and the successful winners were Messrs. Bostock and Sons, Moseley; Messrs. Pemberton and Sons, Bloxwich; and Mr. C. Holder, Erdington.

Coleuses and caladiums are always in splendid condition at Handsworth. Mr. A. Cryer, gardener to Mr. J. A. Kenrick, Berrow Court, Edgbaston, scored for coleus. Mr. Joe Winter, gardener to Mr. C. A. Palmer, Handsworth, and Mr. J. Boston, Handsworth, being second and third. For six caladiums Messrs. A. Cryer and J. Winter were the successful competitors.

There was a number of classes provided for gentlemen's gardeners and amateurs within a radius of five miles of Handsworth Park, and in competition for the prizes for a group of plants arranged for effect Mr. Robert Usher, gardener to Mr. J. Archibald Kenrick, Harborne House, Harborne— a new exhibitor at Handsworth—scored with a highly creditable arrangement, and in which a fine specimen of cattleya was an outstanding feature. Mr. J. Winter and Mr. J. Boston second and third.

For six stove or greenhouse plants, Mr. A. Cryer, gardener to Mr. J. Arthur Kenrick, Berrow Court, led with meritorious examples; second, Mr. J. Waite; and third, Mr. A. Sanders. For six exotic ferns, Mr. A. Cryer won; Mr. J. R. Shand and Mr. J. Winter following closely; and for three ferns Mr. A. J. Rabone, Mr. R. Usher, and Mr. J. Boston were the respective winners. Zonal pelargoniums were well shown by Mr. J. Boston, Mr. A. Cryer, and Mr. R. Usher. For six gloxinias Messrs. A. Sanders, J. Boston, and R. Usher were the prize-takers, staging good examples. For six double begonias Messrs. R. Usher and A. Cryer annexed the prizes. For six single begonias Mr. A. Sanders and Mr. A. Cryer won. Liliums were well shown by Mr. A. Cryer and Mr. A. Hudson.

A silver cup, value five guineas, was awarded to Messrs. Artindale and Sons, Sheffield, for a display of carnations and violas, and a silver-gilt medal to Messrs. Young and Co., Cheltenham, for carnations; to Messrs. Simpson and Sons, Birmingham, for sweet peas; to Messrs. Grove and Son for herbaceous flowers.

Forestry at the "Highland" Show.

It was at the Highland and Scottish Agricultural Society's Show at Inverness in 1901 that a commencement was made with a forestry section, and since that time the "Highland" has not been without interesting exhibits organised by the Royal Scottish Arboricultural Society, whose president now is Sir John Stirling Maxwell, Bart. The results of these fine displays at the various centres at which the society's shows have been held have done much to increase the interest in arboricultural matters. This year the forestry exhibition, which was once more at Inverness, was one of the finest ever organised by the Royal Scottish Arboricultural Society. The exhibits were of a very practical character, designed to instruct the forester as to the trees he ought to plant, the soils most suited for different kinds of trees, and the various conditions that have to be taken into account in the successful production of timber.

Pride of place must be given to the Darnaway estate for the comprehensive and complete nature of its exhibits staged by Mr. Scott and his assistant, Mr. Watt. The display was most interesting and instructive, and included over 50 varieties of cones, and nearly 40 varieties of the finest quality of native-grown timber. The collection of plants, too, was very fine. There was a cut from a Pedunculate oak which was 200 years old when cut down, and a plank of a Spanish chestnut 114 years old, one of English elm of the same age, of Scots pine 130 years old, and a section of larch 95 years old. What added not a little to this fine entry was a series of some 30 photographs taken by Mr. Watt, which were greatly admired.

A most useful and interesting entry was that of Mr. Gilbert Brown, forester to the Countess Dowager of Seafield. The specimens shown were all grown in the famous Abernethy forest. Six sections of larch, three of which indicated decayed heart rot and the other three sound timber, showed to a certain extent the effect that different soils have on the health—and therefore on the quality—of timber. Those specimens showing heart rot were taken from trees grown on ground with a thin upper layer of medium forest soil with a very indifferent under-layer, this layer being either rock, pan, or gravel. It is not suggested that all the larch grown on this soil suffered from heart rot, but it is maintained that on areas which intersect woods containing soil of the nature just described, heart rot is common. The sound specimens were all taken from trees grown on soil that had a certain amount of depth, and with good natural drainage.

The composition of the soil varied. While, on the one hand, it was absolutely pure soil, on the other it was good soil with a certain amount of broken rock, and yet not close enough to check the growth of the tree in the least. The trees were all grown at an altitude of from 700 to 800 feet above sea level. Mr. Brown also showed samples of turf taken from localities being prepared for natural regeneration. These samples were divided into four classes: (1) Showing the effect of grazing in preparing the ground for natural regeneration by keeping the heather short, and otherwise breaking up the turf. (2) Showing the natural condition of the work and the herbage thereon after the cattle have been removed for a few years—the heather and moss having increased considerably. (3) Showing the condition of the wood after the cattle had been removed for about ten years—the plants are about 4ft. high, and the heather had grown so strong that natural regeneration with such a covering of herbage became impossible. (4) Samples of made soil from the natural woods. The judges thought very highly of Mr. Brown's display.

There were also on view some fine specimens of Scots pine, larch, and Norway spruce from the Earl of Moray, the Marquis of Graham, Lochiel, Captain Stirling of Keir, Sir William Gordon Cumming, Bart., Mr. C. W. Dyson Perrins, of Ardross, and Mr. David Leckie, Kippinross. Several of those gentlemen had also on exhibit splendid specimens of ash, elm, and oak. Two 50ft. specimens of the popular Japanese larch were on view from Beaufort Castle, Lord Lovat's Scottish seat. The Ardross estates were strongly in evidence in every section, showing fences, gates, sawn timber, cones, and diseased seedlings. Messrs. Howden and Co. contributed a particularly interesting and efficient collection of newest and best forest tools. The Durris estates (near Aberdeen), over which Mr. Crozier is forester, sent a fine display of over sixty varieties of exotic timbers. Altogether, it was a most interesting and instructive collection, and reflected the highest credit on all concerned.

Broughty Ferry Horticultural Association.

The members of this association, along with a few members from Dundee Horticultural Association, thoroughly enjoyed an outing in the picturesque and historical gardens and policies of Panmure House, kindly thrown open to them by the Earl of Dalhousie. At the east entrance Mr. John Simpson, head gardener, and Mr. William Davidson, head forester, received the visitors, and escorted them to the gardens, where Mr. Simpson conducted them through the extensive glass ranges, where there was a display of fruit and flowers which created much interest, the famous corridor coming in for a good deal of praise. In passing through the gardens a general halt was made at a brake of young roses budded last year, the newest and best in hybrid teas and teas being represented at their best. These are intended to augment the previous year's stocks already looking well in the flower garden, which, by the way, Mr. Simpson is converting into a rose garden of his own design. At the old castle ruins just outside the gardens the party had a commanding view of the picturesque glen with its winding stream and well-wooded slopes. Those interested in the historical associations of Panmure took a keen delight in inspecting the foundations and ruins of the old castle, which was razed to the ground in 1304. Tea was afterwards served on the lawn at the modern residential house of Panmure, a noble pile inhabited only by the caretakers. A ramble in the grounds under the charge of the forester, Mr. Davidson, revealed some eccentric mementoes of the noble barons who ruled. Before leaving, the President, Mr. James Bethel, expressed the company's thanks to the Earl of Dalhousie and his factor Mr. Robertson, for their kindness in throwing the gardens and grounds open for inspection. Mr. James Slater likewise returned thanks to Mr. Simpson and Mr. Davidson for their guidance and attention. Mr. Davidson replied for all, and expressed the pleasure with which they all welcomed the visitors.

Dundee Horticultural Association.

The members of this association, along with those of Broughty Ferry Association, had an enjoyable outing recently to Cortachy Castle (the residence of Lady Airlie), near Kerriemuir, an inland town made famous as "Thrums" by J. M. Barrie.

The party made the journey by motor 'bus, motor car, and cycle, and on arrival were conducted round the gardens and beautiful grounds by Mr. W. Reid, head gardener. The leading features noted in the rambles were the topiary work and yew hedges in the gardens, and the magnificent old specimen trees in the grounds, as well as those more youthful with every appearance of vigour. The castle is a splendid pile, resting on wide reaches of well-kept lawns near the brink of the South Esk, which at this part rushes wildly over the huge boulders in its course to the sea, and when in spate it must be a glorious spectacle from the windows. A ramble along its banks proved a treat to the botanist, geologist, artist,and angler, each of whom could help his neighbour to enjoy himself, or in turn exchange their thoughts and knowledge with each other for mutual benefit. Picnic tea, a little speechifying, and then homeward bound, filled with happy thoughts of another memorable Saturday afternoon well spent amid ennobling scenes.

The "Daily Mail" Sweet Pea Show.

The sweet pea competition instituted by the "Daily Mail," and held at the Crystal Palace, Sydenham, on July 28 and 29, excited much interest throughout the country, and there was an enormous number of entries, these coming from practically every part of the British Isles, and some 38,000 bunches were received.

It was a great and interesting show, and well managed. A committee of judges were working nearly all Thursday night selecting out the ten thousand best bunches, and this selection was staged in the broad transept of the Crystal Palace. At 8 a.m. on Friday morning a committee of ten judges set to work on the 10,000 bunches, and presently selected the 1,003 best. They then made a provisional selection of the best 103, and subsequently made their final selection. By about twelve o'clock the task was completed, but as the public was not admitted to the sweet pea show until 3 p.m., they did not see all the flowers at their best.

The £1,000 prize went to Mrs. J. H. Fraser, The Manse of Sprouston, Kelso, whose varieties were King Edward Spencer, Mrs. Hugh Dickson, John Ingman, and Nubian; second prize (£100) fell to Mr. H. W. Richards, Westridge, Ryde, Isle of Wight, who had bright flowers and neat, pleasing spikes of Nettie Jenkins, Thos. Stevenson, Clara Curtis, Mrs. Hugh Dickson, and Etta Dyke; the third prize (£50) was awarded to the Rev. D. D. Fraser, The Manse of Sprouston, Kelso.

The first reserve bunch came from the Rev. Harold Mayall, The Parsonage, Comrie, Perthshire; the second reserve bunch was sent by Miss Elsie Price, Craven Heifer Inn, Skipton, Yorks; and the third reserve bunch by Miss Kate Trotter, Langton Grange, Darlington.

These three latter were included in the one hundred bunches that secured silver medals, and then followed nine hundred bunches, to each of which bronze medals were awarded. Among the medalists were many amateurs well known in the sweet pea world as strong competitors, but evidently the long drought as well as the severe test of carriage through the post had distressed the flowers greatly. On the whole the Scottish and North of England flowers stood the journey best, and in many cases more care in packing would have placed the flowers in close contest with the best half dozen.

The only non-competitive exhibit of sweet peas was a large and delightfully fresh one from Mr. W. J. Unwin, Histon, Cambs., who contributed beautiful blooms of Nettie Jenkins, and Mrs. W. J. Unwin, as well as many of the older and very popular sorts.

From the Gardeners' Magazine Office came an exhibit of horticultural handbooks, including, of course, "Sweet Peas and Their Cultivation," farm and garden handbooks, and a selection of coloured plates that have appeared in our contemporary, "Amateur Gardening."

Into the children's competition one could read a vast amount of patient care, unremitting attention, and not a little pathos. Connie Bedford, 26, Polton End, Berkhamsted, won the premier award, and Herbert Quinton, 12, Rosebery Road, New Catton, Norwich, won the second prize.

The artificial sweet peas staged were not, in the opinion of many sweet pea experts, a great success.

Eastbourne Sweet Pea Show.

The show held in the Floral Hall at Devonshire Park last week was a great success. One contributing feature was the magnificent and suitable building in which the flowers remained fresh until the end of the second day, due to the cool temperature. With such excellent conditions prevailing and a magnificent array both of honorary and other exhibits, and the summer weather, there was a large and fashionable gathering of flower-lovers.

Among the trade exhibits that of Messrs. Sutton and Sons, was considered the best; it comprised handsome pyramids of clarkias, melons, and vegetables, and in addition to the gold medal award, won the special silver bowl given for the most meritorious display in the show. Mr. C. F. Waters, of Balcombe, Sussex, was also awarded a gold medal for a fine display of carnations. Silver-gilt medals were awarded to Mr. James Box, Lindfield, for a handsome group of herbaceous plants; Messrs. Young and Co., of Cheltenham, for carnations; and Messrs. G. and A. Clark, of Dover, for a picturesque rock garden exhibit.

Silver medals were awarded to Messrs. H. G. White and Co., of Eastbourne, for a tasteful arrangement of sweet peas and English fruit, including good dishes of pineapples, figs, peaches, and nectarines; Mr. T. Durrant Young, also of Eastbourne, showed roses, which were remarkably well staged and none the less well grown, and included all the best varieties. Mr. C. W. Breadmore, of Winchester, gained his medal for sweet peas.

Other exhibits which gained awards were those from Mr. Wm. Knight, Hailsham Nursery; Mr. G. T. Scott, Upperton Nurseries, and Mr. Chilvers, gardener to Cecil Chandless, Esq., of Berwick, each of whom contributed exhibits that were much admired.

In the open classes, trade excluded, the principal prize for sweet peas was won by Mrs. Kensington, Uckfield (gardener, F. Beale), who, in addition, won a silver bowl presented by Mr. Roland Burke. Mr. J. Allan, gardener to C. A. Morris Field, Esq., second, and Mr. G. Whitehorne, gardener to C. Diplock, Esq., Polegate, third. There were numerous other exhibits and classes provided for sweet peas, and, considering the drought, excellent examples were to be seen. The prizes for table decorations for ladies were keenly contested, and the several arrangements proved quite an attraction, there being eleven or twelve entrants.

Bristol Gardeners' Association.

The usual monthly meeting was held on July 27, at St. John's Parish Rooms. Mr. Perry presided over a good attendance. An interchange of lectures with Brislington was inaugurated, and Mr. W. J. Pollard, who represented that society gave a lecture on "Begonias." The lecturer advised sowing seed early in January, transferring to boxes when the seedlings are very small. Then he suggested transplanting them to other boxes when the plants have attained a good size, and bedding them out in summer quarters at the end of May. He advised mulching the beds heavily. For indoor decorations the tubers should be started in boxes, and put into pots when growing freely, and potting firmly at the final shift. A good discussion followed, the chairman and Messrs. Binfield, Bastin, Morse, Jennings, Garnish, Woodward, Shaddick, and Willcox took part. For four bunches of sweet peas Mr. Harford was first, and Mr. T. Clark second. Mr. Jennings was awarded three points for Odontoglossum tigrinum, and Mr. Garnish a certificate for the new double marguerite Mrs. F. Sanders.

Southampton Carnation Show.

The thirteenth annual exhibition of carnations and sweet peas was held on the Royal Pier, on the 28th ult., but no doubt owing to the extreme dry weather experienced of late, was short of entries, rendering the display less attractive than usual. A comprehensive schedule of prizes had been arranged, no fewer than thirty-three classes having been provided.

In Division I. nine classes were "open to all," five of these being for dressed flowers. For twelve distinct, flakes and bizarres, two entered, and Messrs. A. R. Brown, Lim., Wyehall Nurseries, King's Norton, were easy winners with fairly good blooms of Reliance, Mrs. T. Lord, Ethel Macrae, George Rudd, W. Prescott, and Cleopatra; Mr. Hayward Mathias, Medstead, second. The same exhibitors occupied similar positions for twelve fancies, distinct, Devonian, Alice Byron, Pasquin, Attraction, and Orlando were the more prominent blooms in the winning set. Messrs. Brown were also first for a dozen selfs, distinct, Daffodil, Hadzor, Aleppo, Major Galton, Alderman, and Iberia being especially noteworthy. For twelve yellow-ground picotees Mr. Hayward Mathias scored over his strong opponent with finely-developed blooms of Lady Douglas Galton, Gloria, Libra, Carona, and other well-known varieties. Messrs. Brown secured the leading award for a dozen white-ground picotees, and staged Silas Osbaldiso, Lady Ethel, Lottie, and Fair Maid in excellent condition.

The contributions to vase classes were highly attractive. For three distinct varieties, five blooms of each, three entered, the best coming from Messrs. A. and R. Brown, Lim., Canopia, Cambria, and W. H. Parton being the most noteworthy. Mr. W. H. Parton, Moseley, Birmingham, was second with good blooms of Margaret Thurston, Gaiety, and Clement. Messrs. Brown won for three fancies; Mr. Hayward Mathias occupying a like position for three yellow-ground picotees. In a small entry Messrs. A. R. Brown, Lim., obtained the premier award for twelve vases of selfs, fancies, and yellow-ground flowers; Mr. Hayward Mathias was a good second.

In the amateurs' section, Mr. W. H. Parton was the most successful exhibitor, winning for six fancies, six selfs, and six yellow-ground picotees, with medium-sized, neatly-dressed flowers. In the vase classes also Mr. Parton was invincible, securing first place for selfs, fancies, yellow, etc., flowers. Mr. J. H. Linnington, Newport, Isle of Wight, had the best of three entries for a vase of yellow self carnations, and also for a vase of blooms of a terra-cotta self.

American or tree carnations were well shown by Mr. F. Chandler, 75, Shirley Road, Southampton, who was first for six vases, three blooms of each.

The premier flowers were: Bizarre—Reliance, Messrs. A. R. Brown, Lim.; flake—Mrs. T. Lord, Messrs. A. R. Brown, Lim.; fancy—Hecla, Mr. Hayward Mathias; yellow-ground picotee — Lady Douglas Galton, Mr. H. Mathias; white ground picotee—Lady Ethel. Messrs. A. R. Brown, Lim. For a dinner table arrangement of carnations and picotees, with any foliage, Mrs. E. Ladhams, Shirley, was an easy first; Miss Taylor, Bemerton Rectory, Salisbury, second. Mrs. Bealing had the best stand or epergne of carnations and picotees, and also obtained the premier award for a table decorated with sweet peas.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

DISCOLOURED VINE LEAVES.—A. W. E., Holmwood: The discoloration of the vine leaves is due to the action of strong sunlight. In the earlier part of the season cold, dull weather necessitated the use of considerable fire heat; and, as a consequence, the leafage did not assume that firmness of texture which brighter light and less fire heat would have produced. The result is that the recent spells of brilliant weather have made the leaves blotchy. Double fish netting spread over the roof would have broken up the sun's rays; while a thin spraying of whitening over the roof-glass would have served a similar purpose. It is not too late to adopt either of these methods, and if dull weather should come, such thin shading can be removed in a few minutes.

VISIT TO LONDON PARKS AND GARDENS.—A. C., Notts: You should certainly allow yourself a full day for an inspection of the Royal Gardens, Kew; you would find much of interest and of educational value in the summer-bedding at Hyde Park, Regent's Park, Battersea Park, and Hampton Court. To the Royal Botanic Society's Gardens, Regent's Park, admission is by payment or by Fellow's order; the gardens contain many interesting trees and plants.

NEW SWEET PEAS.—D. T. H., Chesterfield: You cannot do better than place your orders at once for the new sweet peas you have selected as desirable, and if you do so, placing them with the several firms interested, you will then stand a chance of getting seeds early, provided the variety or varieties are to be sent out this autumn.

SANVITALIA PROCUMBENS.—J. B. C., Charlbury: Both the type and the double variety of Sanvitalia procumbens are very useful half-hardy annuals, the double form being especially good for planting in considerable masses on the rock garden, or for forming an edging to a border. Grown under the conditions so generally adopted for half-hardy annuals the sanvitalias are in no sense difficult to cultivate, and as they are low-growing and free-branching, they are not easily damaged by wind and rain, but soon cover a fair space. The flowers are deep yellow, and resembling small rudbeckias; and as these are produced freely, an attractive display is provided. So far as our experience goes, the sanvitalias are not utilised to the extent that they well might be in gardens, but this applies to almost all annuals, though, unfortunately, the present severely hot and dry season has shortened the lives of many, and consequently reduced their value.

CORDON GOOSEBERRIES.—C. E. L., Hull: A month ago the shoots should have been pinched back to within five or six leaves from the base. It is not too late to do the work now, but a knife will be needed, whereas finger and thumb would have sufficed before; further, the fullest possible development of the fruit buds at the base cannot now be obtained. However, do the work as soon as you can, and if any secondary growths advance presently pinch them back to one leaf before they are more than a couple of inches long. If summer pruning is practised the winter pruning consists in cutting back the shoots close to the basal clusters of fruit buds.

POTTING ARUM LILIES.—Y. C., Lincoln: The business of potting up arum lilies that have been rested should be taken in hand as soon as the foliage has quite died down, usually about the middle of August. If the old soil is at all tenacious it will be a good plan to give it a good watering a few hours before shaking it away from the roots, as this will save possible damage to new roots that have already formed. When the tubers are freed from the old soil, remove all side tubers, and set these aside for insertion in boxes to provide new stock. See that the tuberous root-stock is quite clean and healthy, and if any portion is diseased or damaged, remove it with a sharp knife and apply a dressing of powdered charcoal. Then proceed to the potting, using deep pots and substantial soil, but leaving room for a subsequent rich top-dressing. A layer of old manure over the crocks and a handful of sand immediately round the tuber will materially enhance the prospects of success. After potting, plunge the pots in ashes in a cold frame or out of doors, in a position that does not receive the full force of the sun; administer water with the greatest care until advancing growth and abundant roots demand a full supply.

NITROGEN IN ANIMAL MANURES.—H. H., Taplow: Writing in general terms, a ton of cow manure contains about 6lb. of nitrogen; a ton of horse manure, about 9lb.; a ton of sheep manure, about 11lb.; a ton of pig manure, 12lb.; and a ton of fresh hen manure, about 32lb. of nitrogen. Hen manure should be kept in a dry shed and mixed with a little finely sifted dry soil; it can then be finely broken down for use after a short period of storage.

LARGE FUNGUS ON POPLAR BRANCH.—M. E. M., Sevenoaks: The fungus is probably Polyporus sulphureus. Cut the affected branch well back—not less than six inches—behind the fungus, and at once paint the cut surface with tar. Take care that the tools used are disinfected before they are again utilised for cutting live trees.

COMPOSITION OF PEAS.—H. B. L., Exeter: The ash of pea straw contains about 21.8 per cent. of potash, 5.3 per cent. of soda, 7.7 per cent. of magnesia, 37.9 per cent. of lime, 7.8 per cent. of phosphoric pentoxide, 5.6 per cent. of sulphuric trioxide, 5.7 per cent. of silica, and 6.1 per cent. of chlorine. The ash of pea seeds contains the following percentages of the above constituents, taking them in the same order: 40.4, 3.7, 8.0, 4.2, 36.3, 3.5, 0.9, and 2.3. From these figures it will be gathered that potash, lime, and phosphates are needed in large measure for pea production.

BROWN VINE LEAVES.—T. B. H., Dulwich: The browning is probably due to the action of great heat and brilliant sunshine upon leaves, to which the roots could not supply sufficient moisture. Evaporation has been tremendous, and the roots of the vines have not yet become sufficiently numerous to meet the unusual demand. Rather heavy cropping would also account in some measure for the trouble.

RENOVATING VIOLAS.—R. T., Henley: Cut the plants over rather closely with a pair of small sheep shears, removing the greater part of the old growths and all dead flowers and seed pods. Thoroughly soak the beds with water, give a light dressing of some good fertiliser, hoe it in, mulch with leaf-soil or old manure, and water again. By this means the plants will be renovated and come again into bloom.

NAMES OF PLANTS.

L. G., Epsom.—1, Meconopsis Wallichi; 2, not recognised.

J. J., Hereford.—1, Populus tremula; 2, Juniperus chinensis.

J. S., Durham.—1, send when in flower or fruit; 2, Deutzia crenata fl. pl.; 3, Lysimachia thyrsiflora.

S. R. N., Birmingham.—1, Olearia Haasti; 2, Aloe verrucosa; 3, Francoa sonchifolia; 4, Leycesteria formosa.

H. C. W., Southall.—1, Cypripedium Lawrenceanum; 2, Struthiopteris germanica; 3. Pelargonium crispum.

W. S. B., Sidmouth.—1, Kalanchoe flammea; 2, Sedum pulchellum; 3, Azara microphylla; 4, Galtonia candicans; 5, Fuchsia Riccartoni.

F. T., Cheltenham.—1, Chelone barbata; 2, Erigeron speciosum; 3, Bocconia cordata; 4, Senecio clivorum; 5, Cochlioda Noetzliana; 6, Saxifraga oppositifolia.

Taunton Deane Flower Show.

Prendergast Horticultural Society.

Border Horticultural Society, at Coldstream.

OBITUARY.

◆

MR. J. J. WILLIS.

It is with much regret that we record the death of Mr. J. J. Willis, which occurred at his residence at Harpenden on July 26. For a long period Mr. Willis occupied an important position at the Rothamstead Experimental Station, and possessed a remarkable knowledge of crop values, the influence of various manures upon crops, and especially their influence upon pastures. He took a keen interest in the practical side of his work, and also in the scientific aspects of horticulture. Mr. Willis has during the past twenty years been a regular and much valued contributor to the Gardeners' Magazine, and at all times was ready to place his wide knowledge at the disposal of our readers.

GARDENING ENGAGEMENT.

Mr. H. Nicholson, who has occupied the position of foreman in the gardens of Haldon House, Exeter, has been appointed head gardener to W. A. Glynn, Esq., Seagrove, Seaview, Isle of Wight, and enters on his duties on August 5.

The charge for an Advertisement INCLUDES A FREE ENTRY ON THE REGISTER. Immediate Notice must be given when an engagement is secured.

A List of Gardeners on the Register will be supplied to employers only upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.

Situations Wanted.

GARDENER (Head, where several are kept); thoroughly experienced in all branches, Inside and Out, Grapes, Peaches, Melons, Stove and Greenhouse Plants; 4½ and 11 years' excellent references as head; married, family out. E. STONE, 13, Coniston Road, Addiscombe, Croydon, Surrey.

GARDENER (Head Working); thoroughly experienced in Fruit, Flowers, Vegetables; Inside and Outside work, where two or three are kept; well recommended. Apply F., care of Messrs, Charles Turner and Son, Royal Nurseries, Slough, Bucks.

GARDENER (Head Working).—H. ESSAM can with confidence recommend his Foreman, where several are kept; life experience in all branches; age 31; married when suited; excellent references. Address, Closes Hall, Gisburn, Clitheroe.

GARDENER (Head Working).—CAPTAIN USHER highly recommends R. Appleby as above; life experience in all branches; thoroughly understands Planning and Laying Out; also Land and Stock; many years' excellent character. Address APPLEBY, care of Captain T. Clemine Usher, Little Wymondley, Stevenage.

GARDENER (Head Working).—Mr. WATSON can highly recommend C. WALLIS, where two or three are kept; been here six years as Second of five; age 31; married, two children. The Gardens, Bushey Down, Tooting Common.

GARDENER (Head Working). — Mr. PHILIP ASHWORTH wishes to recommend W. H. SHAW as above; life experience; accustomed to large establishment; especially good at Laying Out new grounds; also Flowering Shrubs and Herbaceous Borders; married, family; many years' excellent character. Apply W. H. SHAW, The Lodge, Horsley Hall, Gresford.

GARDENER (Head Working).—F. W. FLETCHER, Esq., can highly recommend his Head Gardener as a thoroughly trustworthy experienced good all round man; age 45; married; one girl 14 years. F. GREENGRASS, 40, Primrose Terrace, Browning Road, Enfield, Middlesex.

GARDENER (Head Working, where several kept); life experience in good establishments, Inside and Out; well up in all branches, including land and stock; married, no family. M.C., c.o. Haxton, Melton Road, Hampton-on-Thames.

GARDENER (Head Working); South preferred; one or more under; life experience Fruit, Vegetables, Flowers, Glass; knowledge of Cows, Poultry; 32; married, three children; 3½ present place, seven and two previous; good references; photo. S. WAGHORN, Uppingham.

GARDENER (Head Working). Mr. THOMSON can with confidence recommend S. KNIBB as above; 4 years here as Head; life experience in all branches of horticulture; age 32; married. KNIBB, Pollards Wood Gardens, Chalfont St. Giles, Bucks.

GARDENER (Head Working); life experience in all branches; excellent characters; Head and Outside Foreman; age 33; married, small family. HUDSON, Wood Hall, Cupid Green, Hemel Hempstead.

GARDENER (Head Working, where several are kept); 22 years' practical experience in large establishments; highest references, character, ability; age 37; married. KING, Avenue, Stoke Prior, Bromsgrove.

GARDENER (Head Working); thoroughly experienced in all branches, desires Situation; certificated R.H.S.; formerly with Mr. E. Beckett, V.M.H.; married, no family; good characters. JOHN TAYLOR, The Gardens, Latchmere, Ham Common, Richmond, Surrey.

GARDENER (Head Working); life experience; 6½ years in last place; thoroughly understands Vines, Melons, Peaches, Flowers, etc.; knowledge of Stock; age 35; married, one child. GARDENER, Llangrwyney, near Crickhowel,

GARDENER (Head); good Single or Fruit Gardens Manager; Budder, Grafter, Pruner, Cucumbers, Melons, Vines, Chrys., Bedding Plants, Roses, Mushroom, ridge or flat; Kitchen, Lawn, Flower Garden. Special prize 1910. W. BLOOMFIELD, Staplehurst, Kent.

GARDENER (good Single-handed or otherwise); life experience; good all-round Man in all branches; aged 45; married, one child; would take very moderate wage with cottage for a comfortable place. Excellent testimonials; willing to be useful. F. OSBORNE, 48, Bradshaw Road, Watford.

MR. A. LINDLEY recommends A. SIMMONS as GARDENER (First of two or Single-handed); life experience Inside and Out; two years present situation; six years previous; age 35; single. Apply, 6, Little-Roke, Kenley, Surrey.

WANTED, Situation as GARDENER, Single-handed or otherwise; handy, willing to be useful; single; life experience in all branches; understands horses, ride and drive; 5 years last situation. A, GRAY, Brookside Villa, Longham, Wimborne, Dorset.

GARDENER (Single-handed, or with Son to help); life experience in all branches; age 37; disengaged; good references. E. LIMEHOUSE, 11, Charleville Road, West Kensington.

GARDENER (Single-handed or otherwise); 14 years' general gardening; used to gas engine; married, 2 children, youngest 4½; age 31. J. MOONEY, The Stables, East Moor House, Harpenden.

GARDENER, 40; Single-handed preferred; thoroughly experienced; excellent character; active worker; Inside and Out with early vegetables; abstainer; married. A. BISHOP, Windmill Hill, near Hailsham.

GARDENER (Single-handed, or with help); experienced, Inside and Out; age 30; married, no family; good references. H. CATLEY, The Lodge, Pilgrim's Holt, Margery, nr. Reigate, Surrey.

GARDENER (Single-handed or Second) seeks SITUATION; understands Fruit, Flowers, Vegetables; age 25; single; good references; seven years last place. STRUTT, 70, Croft Street, Ipswich.

GARDENER (Single-handed) seeks SITUATION; 16 years' experience in flowers, fruit, vegetables; excellent references; age 30; single; disengaged. F. HYDER, 7, Stamford Road, Watford, Herts.

GARDENER or SECOND; in good place; well experienced in Fruit and general Plant routine; excellent references; married, one boy age nine. LEWINGDON, 26, Brighton Road, Earley, Reading.

GARDENER, Second (Inside or Out) well recommended by Head Gardener; age 26; married when suited. F. EAST, Kent Cottage, Chiswick House, Chiswick, S.W.

JOURNEYMAN, age 20, two years' good character; both Inside and Out; Bothy preferred. W. MEW, Bury Hall Lane, Alverstoke, Hants.

AS GARDENER; used to pony; over two years in present situation; age 24. Near London preferred. Apply J. SCOTT, 51, Manor Park Road, East Finchley.

MR. C. E. CRAWSHAY, of Gilstead Hall, South Weald, Brentwood, Essex, wishes to recommend his GARDENER (Under); five years' character, and leaving to better himself. Apply FRED. FURBANK, address as above.

UNDER GARDENER. — Respectable man, good references, requires employment; understands planting, bedding out, etc. Can look after horses.—P., 55, Bryanston Street, W.

IMPROVER, age 19, seeks SITUATION Inside; 4 years' experience in Garden Life; 3 years in present situation. Apply F. RICHARDS, Barlaston, Stoke-on-Trent, Staffs.

YOUNG MAN (21) seeks SITUATION under good Gardener; 8 years' experience, chiefly Outside; three years last place; willing to take duty. W. LEA, 18, Junction Road, Bath.

YOUNG MAN seeks SITUATION in Gardens (Inside and Out); height 6ft. 3in.; good references. Apply A. MAWSON, Mill House, Askham Richard, York.

YOUNG MAN, 28, single, seeks SITUATION, Inside and Out, or Kitchen Garden and Pleasure Grounds; Bothy preferred. Good references. Apply C. AVIS, Selsfield Common, West Hoathly, Sussex.

WANTED, Situation as GARDEN LABOURER, or as Single-handed; good experience; well used to garden work; married, no family; disengaged; good character. W. LING, Hunger Hill, Westcott, near Dorking.

YOUNG MAN (20) wants place in Houses; 6 years Outside, including over 3½ years last place. W. MONK, Lower Street, Stansted, Essex.

YOUNG MAN seeks SITUATION to look after Electric Light and Garden; well up in all branches; nine years last situation. EDWARD VILLA, Street Cobham, Surrey.

Situations Vacant.

HEAD GARDENER Wanted in September, where eight are kept; must be intelligent and possess special ability in Flower and Fruit Growing. Send copies of testimonials from employers only (present or past); originals will not be returned. Abstainer preferred. State wages, age, number of children, and age of eldest and youngest, to D. H., care of Street, 30, Cornhill, E.C.

WANTED, strong, active YOUNG MAN for Pleasure Grounds and Kitchen Garden; able to use Scythe and make himself generally useful under Gardener (Head Working); wages 16s. Apply, stating full particulars, to Kimsbury House, Gloucester.

BULB and SEED TRADE. — Wanted, ASSISTANT, accustomed to putting up Bulb orders; must be smart and with good references. Apply by letter with full particulars, stating age and wages expected, BARR and SONS (Private), 12 and 13, King Street, Covent Garden, London.

KELWAY'S MANUAL OF HORTICULTURE is the best of all Garden Books. 2s. post free, from KELWAY and SON, LANGPORT, SOMERSET.
Capt. ———, Londonderry.
10th February, 1911.
"I have received your Horticultural Manual, and on looking through it, I felt compelled to write and thank you for it. To an enthusiastic amateur gardener like myself, who, through reading the weekly papers on the subject, is familiar with many of the names but not with the corresponding flowers, this book must be absolutely invaluable, and the artistic way in which it is got up, and the beautiful photographs with which it is embellished, make it a treasure well worth having. I have had the Catalogues of most of the leading firms sent to me, but nothing compares in the remotest way with yours."

ORDER TRELLIS-WORK NOW.—Get our Book on Trellis-work, showing screens, wall panels, window surrounds, arches, arbors, etc., post free. BOULTON and PAUL, Ltd., Norwich.

VOL. LIV.—No. 3,015. SATURDAY, AUGUST 12, 1911.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Drought.

The almost unprecedented spell of dry weather which we have recently experienced, and which, indeed, has only partially been broken so far as the whole of Great Britain is concerned, has given us a very vivid idea of the vital necessity of water to vegetative existence. In a temperate climate like ours, and in ocean begirt islands like ours, it is rare indeed for conditions to prevail which preclude the deposition of rain for so long a period. Our seasons are not determined as in many tropical and sub-tropical Continental areas into alternate wet and dry ones. Taking the year round, the monthly rainfall is fairly even on the average, and hence to experience practically a whole month at a stretch with no appreciable record, and that in the hottest period of the year, constitutes almost a calamity, since when the heat is greater and growth naturally more rapid, the drain upon the reservoir of soil moisture is at its maximum, and its exhaustion over large areas cannot possibly be combated by artificial means of irrigation. The heat of the sun, too, raises the temperature of the soil to such an extent that even at nightfall, under clear skies, the radiation is insufficient to induce that deposition of dew which does so much in ordinary seasons to maintain vegetative life and enable it the better to withstand the daily drain induced by transpiration. Hence it is that at present we see the normally green pastures in many places bare, brown, and scorched, while the cereal crops are precociously ripened, short strawed, and ready to shed their precious seed weeks sooner than the farmer would desire. The trees, too, having drained the soil of its moisture, display a liberal sprinkling of dead foliage, and dead leaves, which should still be exercising their function of wood forming and fruit maturing, are dropping in all directions as if it were autumn instead of practically mid-summer. Even the air-loving roses and their host of sister flowers have had short shrift as regards their period of perfection, the burning rays of the sun, unmitigated by clouds or refreshing showers, having all too speedily hastened their blossoming period, shrivelled their petals, and replaced their brilliant masses of colour with brown, unsightly débris. Fruits of many descriptions, through lack of the liberal sap supply through the roots and the check upon foliage growth induced by the same cause, are prematurely ripening or dropping from sheer exhaustion of the needful moisture supply. The horticulturist and garden lover have been sorely put to it to battle with these conditions, for the hose and watering-can are poor substitutes for the refreshing rain from heaven, since the thirsty soil, baked and cracked deeply by the persistent sunshine, is apt to absorb but little the bulk of the water passing away through the cracks into the subsoil leaving the intervening masses of soil pervaded with famishing roots as dry as a bone. Given, however, a steady rain of a whole night's duration, such as some favoured districts have enjoyed, and how different is the result. Every drop is absorbed where it falls upon the soil, the bone-dry masses gradually become thoroughly moistened and swell, until the cracks are filled up, the thirsty roots, instead of being rock-bound, find themselves in moist, soft, yielding material, and then the plants are revivified; and a little observation will show the rapid growth which results, as though the pent-up energies, released at last, were anxious to make up for lost time. It is, indeed, marvellous how Nature contrives to facilitate such work. In the tropical countries, where droughts are normal, and are followed by drenching rains, travellers are always struck by the fact that a few days suffice to cover apparent barren wastes with bush vegetation of which no sign was previously apparent. Seeds and dormant roots have, however, pervaded such areas, all ready at the first dash of vivifying moisture to germinate or revive, and to do their best to profit by the improved conditions. Even at home, those who have been blessed with the rain sufficiently abundantly recently, may note similar results, sickly-looking, stunted plants having vigorously grown, rapidly making sturdy growth with almost tropical speed, under the influence of the resumed sunshine and heat, now accompanied by abundant and sufficient humidity in the soil beneath. Even the worst sufferers by excess of sunshine may, however, in many cases, console themselves by the consideration that, as each year is largely dependent upon the amount of wood-ripening sunlight in the preceding year for its fruit crops, any deficit this season may reasonably be expected to be followed by an increased produce in the year to follow, and, in any case, it is far better to be philosophical and optimistic than to be despondent and grumble at what cannot possibly be remedied.

MR. EDWARD KEITH.

Mr. Edward Keith is exceedingly well known in the North of England as a very capable gardener and as an enthusiastic and instructive lecturer on horticultural subjects. He is head gardener to the Right

Hon. Sir George Otto Trevelyan, Bart., at Wallington Hall, Cambo, Morpeth, Northumberland, and has been in charge of the gardens for twenty years. He has a wide experience in all branches of horticulture, and he is able to present the results of that experience in first-rate practical form in the gardens he manages, and in an entertaining manner to a horticultural audience. For several years he has obtained wider notoriety because of his success as a cultivator and exhibitor of sweet peas. Probably no one has done more to extend the cultivation of the Queen of Annuals in the northern counties than Mr. Keith. Even as far south as London he has on several occasions won prizes for his sweet peas in the keen competition that attends the National Sweet Pea Society's exhibition, but usually the London show is a week or two too early for him. In the northern counties, however, Mr. Keith is a most formidable opponent, and anyone who can beat him for sweet peas may be justly proud of their achievement. Early in the present year a severe attack of influenza left Mr. Keith very weak for a considerable time, therefore his many friends were glad to see him well and as keen as ever at the great Metropolitan sweet pea show on July 11 and 12. Mr. Keith is a great worker, keen, quick, and observant, and modest withal; therefore, it is with much pleasure we give his portrait in the present issue.

"Gardeners' Magazine" Gold Medal at Harrogate.—At the great exhibition of the North of England Horticultural Society to be held at Harrogate on August 15, the Gardeners' Magazine Gold Medal will be added to the cash award as first prize for a circular group of not more than three kinds of hardy plants, arranged to show the bedding value of these subjects. Either cut flowers or pot plants may be used. As already noted in these columns, a deputation from the Royal Horticultural Society will attend the show, and award medals, etc., to meritorious exhibits. Lady Kathleen Pilkington will present the prizes during the afternoon.

Royal International Horticultural Exhibition, 1912.—The revised schedule for the International Exhibition, to be held at Chelsea in May next, is now ready for distribution, and copies may be obtained, post free, from Mr. T. Geoffrey W. Henslow, secretary, Royal International Horticultural Exhibition, 7, Victoria Street, Westminster. A preliminary schedule was distributed some months ago for the purpose of affording exhibitors some indication of the general nature of the competitive classes, but it was not possible at that time to enumerate the awards. These latter include presentation cups offered by his Majesty the King, the Duke of Portland (President of the Exhibition), and others, also a very large number of gold and silver medals. In some of the more exacting classes money prizes accompany the medals, in order that exhibitors may be compensated for expenses necessarily incurred. The present schedule contains this information, and it is therefore indispensable to those who contemplate making some contribution to the show.

Botany at the British Association.—The programme of Section K (Botany), at the meeting of the British Association, commencing at Portsmouth on August 30, is as follows: Presidential address, Professor F. E. Weiss. Joint meeting with Sections C and E on the relation of the present plant population of the British Isles to the Glacial period, opened by Mr. Clement Reid. Discussion on the principles of constructing phyto-geographical maps. Semi-popular lecture, by Mr. Francis Darwin. Papers: Some petrified Jurassic plants from Scotland, Profesor A. C. Seward; recent work on the Jurassic plants of Yorkshire, H. H. Thomas; the structure of the oldest known synangium, and its bearing on the origin of the seed, Dr. M. Benson; on the mode of formation of the Pettycur material as gathered from internal evidence; a fifteen-year study of advancing sand-dunes, Professor H. C. Cowles; new proposals in ecology, Professor F. E. Clements; phytogeography as an experimental science, Professor Massart; the vegetation of pebble beaches, Professor F. W. Oliver; the brown seaweeds of a salt-marsh, Miss S. M Baker; the Swiss National Park and its flora, Professor C. Schröter; the water-content of acidic peats, W. B. Crump; the wilting of moorland plants, W. B. Crump; the presumptive hybrid Anagall's carnea, Professor F. E. Weiss; the morphology of leguminous nodules, Professor Bottomley; nuclear osmosis as a factor in mitosis, A. A. Lawson; nuclear division in Spongospora, A. S. Horne; the polyphyletic origin of the Cornaceæ, A. S. Horne; the transference of sugar from the host plant to a parasitic Cuscuta, S. Mangham.

A Brilliant Holiday.—Throughout the greater part of the country splendidly brilliant weather prevailed during the "week-end" that included August Bank Holiday. In London there were 12.8 hours of bright sunshine, and the thermometer registered 81 or 82 degrees in the shade in the metropolitan area. Notwithstanding the hundreds of thousands who have recently gone to the seaside, into the country, or on the Continent, there were great crowds in all the London parks and open spaces, while the places of amusement where there is ample outdoor space were well patronised. Over 115,000 people visited the Royal Gardens, Kew, on the Bank Holiday; 200,000 spent their holiday on Hampstead Heath and Parliament Hill Fields; 60,000 went to Hampton Court; 200,000 found pleasure at the Crystal Palace, and there were big attendances at the White City and Earl's Court Exhibitions.

Sir Albert K. Rollit, the well-known member of the council of the Royal Horticultural Society, and president of the National Chrysanthemum Society, was the arbitrator appointed by the London Labour Committee and Conciliation Board to determine the points in dispute between the National Transport Workers' Federation and the shipowners, a dispute that gave rise to the Dock Strike in London. Sir Albert's award was in favour of the dockers, but at the time of writing it has not ended the strike.

Suggested Park for Shadwell.—A strong movement is on foot for the purpose of securing the Shadwell Fish Market estate of about eight acres as a riverside park for the East End of London. The proposal is to include such new park in the scheme for a memorial to King Edward VII. This fish market has never fulfilled its mission, notwithstanding its great cost and apparently good position. The market estate would provide a fine riverside park in a position where it would do an immense amount of good. So far the authorities concerned look favourably on the scheme.

Posthumous Care of Burial Ground.—The late Mr. Frederick J. Myers, of Charlton Lodge, Northants, left estate to the value of £119,955. From this estate he bequeathed to the vicar and churchwardens of Charlton £200, in trust, the income therefrom to be devoted to the upkeep of the new burial ground, "as though it were my garden, that the shrubs, conifers, and such-like trees be clipped or tied up, and the young deciduous trees removed before they shall do harm to the Irish yews, and, further, that the grass avenues shall be kept mown during the summer with a lawn mower to a width of not less than ten feet, and the rest of the grass kept short with the scythe."

Clusia grandiflora, a stove shrub from Guiana, is strikingly illustrated in the current issue of the "Botanical Magazine"; at the Cambridge Botanic Gardens it flowers annually, the male blooms being about four inches across, and having eight broad, rounded petals that are white, shading to rose; round a yellow centre are grouped about 500 white stamens. Other subjects figured in the same issue are Torenia atropurpurea, a purple-flowered Malayan perennial stove plant; Landolphia Petersiana, an East African climber, bearing panicles of fragrant white flowers, the five corolla segments having ciliate margins; Mormodes revolutum, a showy Peruvian orchid, producing spikes of deep red, yellow-lipped flowers; and Mutisia Clematis, an interesting and beautiful climbing composite from the high ranges of the Tropical Andes; it is a greenhouse subject, and bears pendulous flower heads, in which the broad, recurved ray florets are of a brilliant red colour.

The Effect of Grass on Apple Trees will be discussed in the Agricultural Section of the British Association at Portsmouth, by Mr. Spencer U. Pickering. Other subjects to be dealt with, and of interest to horticulturists, are cider sickness, bacterial diseases of plants, bacterial diseases of celery and swedes, bacterial diseases of the potato plant in Ireland, and experiments on the wart disease of potatoes.

Heath and Forest Fires on Bank Holiday.—As one result of the dry weather, coupled, doubtless, with the carelessness of holiday-makers, there were a number of fires at holiday resorts on August Bank Holiday. A large area, composed of gorse and tree, was burned at Epping Forest, close to Theydon Bois; on Mitcham Common and Blackheath there were several fires, while at Sidcup and Beckenham grass, heather, and trees suffered from the flames.

The Fruiting of the Tamarisk.—Mr. Clement Reid, F.R.S., of Milford-on-Sea, Hampshire, writes, in a letter to "Nature": "This exceptional season is having strange effects on many of our native plants and animals, and naturalists would do well to note these before it is too late. For many years I have tried without success to find Tamarix anglica in fruit in Britain. The absence of fruit, and the rarity of the tamarisk, except where obviously planted, seemed to support the idea that it was of fairly modern introduction. A few years ago, however, fragments of rope, found in Roman Pevensey and sent to Kew, were pronounced to be formed in part from the inner bark of tamarisk. This seemed to favour the inclusion of the tamarisk in the British flora, though rope found in a Roman seaport may quite well have been manufactured abroad. This season the negative evidence yielded by the absence of seed has also broken down; and if a plant seeds once in its lifetime, it may hold its own, and establish its right to a place in our flora—as the Cornish elm has done. I planted last spring some young tamarisks on a steep bank of loose sand in my garden at Milford. During the long drought they received no water; they are now seeding freely, and the winged seeds are being dispersed by the wind. If the plant reproduces itself from these seeds, sown under natural conditions, the cycle will be complete; but the garden is a quarter of a mile from the sea, and the test may be too severe a one. Tamarisk is essentially a desert and sea-coast plant, and it would be worth while to examine any tamarisks growing on sand-dunes, to see whether they also are seeding, and to see whether seedlings come up. Possibly the tamarisk may be a survivor from times when desert or "loess" conditions extended over Western Europe. We have found the fossil remains of many of the desert animals, but plants decay in porous deposits of dust, and desert plants are seldom washed into ordinary alluvial deposits."

Wimbledon Common Extension.—A few days ago the Lord Mayor of London formally dedicated to the public thirty-one acres of ground that have been added to Wimbledon Common as a result of the energy, business ability, and generosity of the residents in the surrounding districts. This additional area cost £7,840. The subscribers have also secured the option of purchase over a much larger area, for which £52,000 is required, and towards which about £14,000 has been promised already. The Lord Mayor promised to bring this larger scheme before the City Fathers, and expressed a hope that the London and Surrey County Councils and the Wandsworth Borough Council would assist it. The thirty-one acres now added to the fine common and heath will save both banks of the Beverley Brook from building encroachments.

New Park for Hemel Hempstead.—A few days ago Alderman William Randall, J.P., opened a new park and recreation ground at Hemel Hempstead. The park was his own gift to the town, and he also contributed £600 towards laying it out.

Mr. William Sim, of Cliftondale, Mass., has been elected president of the National Sweet Pea Society of America, in succession to Mr. W. Atlee Burpee. This society held its annual meeting and exhibition at Philadelphia on June 29. The members had an "outing" to the Fordhook Farms, where there were 900 trials of sweet peas.

Suggested New Stock for Pears.—Attention has lately been called by one of the Fellows of the R.H.S. to a new stock for pears—viz., Pyrus ussuriensis (=P. sinensis). We understand that it has hardly (if at all) been tried in this country, although for some years past hundreds of thousands of seedlings of it have been raised in the United States of America for grafting purposes, which fact alone would suggest that it must be in some way superior, or our very practical American cousins would not be so keen for it. It has also been somewhat extensively used in Australia, and is not unknown in South Africa. The United States alone is said, according to the "Commonplace Notes" in the "Journal of the Royal Horticultural Society," to take twelve to fifteen hundred pounds weight of seed a year. It is a fairly common plant in the Northern Island of Japan, from whence the seed is exported. It is described as being "a strong, healthy, vigorous-growing tree with good foliage calculated to withstand diseases and pests," and it is these qualities which, it is suggested, make it such a favourite stock in the States. We are a little sceptical of its merits, but it should certainly be tried in this country. We understand that sample seeds can be obtained from Mr. Unger, Schlierbach, Heidelberg, Germany.

NOTES FROM KEW.

Clematis.

The practice that prevails at Kew of allowing many of the clematis to ramble over a few rough sticks enables a collection to be grown on a piece of level ground, and in this way the prominent characteristics of each can be readily seen. In the spring the rose-coloured variety of Clematis montana forms an annual feature, and just now several striking kinds are at their best. That striking variety of Clematis flammula known as rubro marginata is now laden with blossoms, and there are several pretty forms of Clematis Viticella, notably C. Viticella alba; C. Viticella fl. plena Lamartine, with large pale blue double flowers; C. Viticella rubra grandiflora, whose comparatively large blossoms are of a showy red tint; and C. Viticella cærulea plena, less double than Lamartine. Other notable species are C. orientalis tangutica, with distinct yellow flowers and silky seed clusters; C. globosa, like a purple-flowered form of C. coccinea; and C. Durandi, with comparatively large purple blossoms.

Tamarix pentandra.

Some beds of this, in different parts of the gardens, and particularly one near the old Water Lily House (No. 15), serve to show what a desirable shrub it is for flowering during the latter part of the summer. The plants at Kew are cut back hard in the spring, under which treatment they form bushes about four feet in height. These are now freely laden with their pretty bright pink-coloured blossoms, which at a distance present the appearance of a rosy cloud. Unfortunately, this delightful tamarix has been given more than one name; and it is more often met with in gardens and nurseries as T. hispida æstivalis, or T. Pallasi rosea, than the name of T. pentandra, which it bears at Kew.

Origanum hybridum.

This member of the Marjoram family, and a near relative of the dittany of Crete, is very rarely seen employed for greenhouse decoration, but in the greenhouse it is very pretty when treated in this way. It is a plant of a neat, freely-branched habit of growth, thickly laden with clusters of pink flowers. The flower heads contain several large bracts, exactly as in the common hop; indeed, in some of the Surrey villages, where I have seen the allied Origanum dictamnus grown as a window plant, it is popularly known as the pink hop.

Isoloma hirsuta.

The various gesneraceous plants available for indoor decoration include this isoloma, of which quite a large group is in flower in the greenhouse. The plants are from two feet to two and a-half feet in height, the blossoms being freely borne on the upper part. The flowers, which are in shape a good deal like those of the garden varieties of tydæa, are of an orange-crimson colour, with the interior of the throat marked with yellow. The entire plant, leaves, stems, and flowers, is clothed with reddish hairs.

Vinca rosea.

This well-known tropical plant, introduced to our gardens over a century and a-half ago, used to be very often grown and exhibited as a specimen stove plant. It is just now, at Kew, employed as an edging to the border in the old Water Lily House, and very effective it is in this way. It forms a broad band, fifteen inches or so in height, thickly covered with its pretty pink blossoms. The variety grown at Kew seems to be an unusually fine form. K.

ANNUAL FLOWERS AT READING.

In common with other classes of flowering plants that are utilised in beautifying the garden during the summer months, these of annual duration have suffered appreciably from the great heat and long period of drought that have been experienced during the present summer. Some have not produced so great an abundance of flowers as usual, and not a few have had a shorter season than is customary; but where the plants have been given sufficient room and have had the advantage of other conditions favourable to their full development, they have as a whole been highly satisfactory. Visiting Messrs. Sutton and Sons' trial grounds at Reading a short time since we were much impressed with the rich display of colour that the annuals and other plants grown under similar conditions were producing. That there was an abundance of bloom is of some practical importance, because annual flowers are frequently described by those whose knowledge of them is of a superficial character as ephemeral under ordinary conditions, and quite unable to pass through a season that is distinctly unfavourable to their well-being. The season could not well have been less favourable to plants that pass through their life cycle within a period of eight or nine months, yet at Reading, where the soil is comparatively light, and not of exceptional depth, the majority of the kinds have given, and are giving, a very good account of themselves.

In this reference to the annual flowers and the other plants that are grown as such at Reading, it will not be possible to direct attention to any considerable proportion of the many kinds included in the trials, because of the large amount of space that would be required; and therefore nothing further will be attempted than to mention a few that appear to be of special importance at the present time. One of the first of the many beautiful kinds to attract attention was the antirrhinum, or snapdragon, in its many varieties. There are large breadths of antirrhinums which have bloomed freely and continuously from early in the season until the present time, and promise to give a succession of their attractively-coloured flowers until quite the end of the summer season. These useful flowers have undergone considerable improvement within recent years, and their value for garden ornamentation largely increased. The cultivator has now at his command varieties ranging in height from six inches to three feet, and the range of colouring is so wide as to be sufficient to satisfy a great diversity of tastes. The Tom Thumb varieties, of which Crimson King, White Queen, and Yellow Prince should have special mention, are admirably adapted for filling small beds or forming marginal bands to large ones. The tall varieties are useful for grouping in the mixed border, because of their attractive colouring and the length of their season of flower. The intermediate varieties, however, appeal the most strongly to cultivators, for the plants range from twelve to eighteen inches in height, are compact, and free branching, and bear finely developed flower spikes. For beds of average size, and for the front of mixed borders, they possess a value that would be difficult to overestimate. Especially noteworthy among the intermediate varieties are Apricot, pink, orange, and yellow; Coral Red, rose-red; Carmine Pink, colour indicated by its name; Fire King, orange-red with white throat; Orange King, brilliant orange-scarlet; and Rosy Queen, rose-pink on cream ground. Antirrhinums are, of course, biennials, but at Reading they are raised from seed sown early in the year, as in the case of annuals usually raised under glass.

Annual chrysanthemums have been so greatly improved of late years that they now form a group of much value. According to the evidence obtainable from the Reading trials, they suffer rather more from drought than some other of the plants of the same duration, but in all but the most exceptional seasons they can be depended upon to bloom freely and continuously throughout the summer months. The number of varieties possessing merit of a high order is considerable, but the "star" varieties are the most useful. There are Morning Star, primrose; Eastern Star, rich primrose-yellow; Evening Star, golden yellow; and Northern Star, ivory white with sulphur zone. The double-flowered clarkias have afforded this season ample proof of their being able to withstand the effects of drought, and a temperature far above the average, for they flowered freely and continuously for a long period, and are now producing a rich colour effect. The fine strains of Clarkia elegans that Messrs. Sutton and Sons have introduced within recent years are especially attractive in the open quarters at the present time, and their value is not limited to the displays of colour produced in the open. Plants raised from seed sown next month, and grown in a cool frame, will form bushes three or four feet in height, and be most useful for the conservatory in May. The colours include salmon-pink, white and pink, and crimson. The varieties of C. pulchella are also highly meritorious.

Coreopsis were also flowering freely, and of these the most effective were the deep yellow and chestnut C. Drummondi, the golden C. grandiflora, and the yellow and brown C. tinctoria, all of which are not less useful for the supply of cut flowers in quantities for indoor decorations than for the production of colour effects in the garden. The brilliantly coloured Orange Daisy (Dimorphotheca aurantiaca) has this season afforded further evidence of its value in the garden. Throughout the cold, wet summer of last year it was simply a blaze of colour at Reading, and we can speak from personal knowledge, and this season it is flowering not less freely. The fine form of the pot marigold known as Orange King, which also has orange-scarlet flowers, is producing a brilliant display of colour, the dry weather not having seriously affected the plants.

Very attractive were the great breadths of godetias at the time of our visit to Reading, for they had grown vigorously, if less robust than in the last summer of 1910, were blooming profusely, and the rich colouring of the flowers had suffered less from the scorching effect of the strong sunshine than might have been expected. Conspicuous among the many fine varieties in the collection were Sutton's Afterglow, Crimson King, Dwarf Pink, Ladybird, and Scarlet Queen. Afterglow and Ladybird grow to a height of six or seven inches, and have scarlet-crimson and white and crimson flowers respectively; the other varieties have an average height of twelve inches, and the colours are sufficiently indicated by the names; Duchess of Albany and its white form, which have an average height of twelve and six inches respectively are godetias of much merit.

Several of the mallows were so finely in bloom as to attract immediate attention, and of these note was made of Lavatera rosea splendens and L. alba splendens as being so highly attractive as to deserve the most widely extended culture. The plants attain a height of about three feet, and produce their large, handsome flowers freely and continuously throughout the season. The flowers of the two forms are bright pink and pearly white respectively, and when cut stand well in water. Very attractive also were the annual lupins, which now afford a considerable range of colours, the predominant shades being light and dark blue, pink, carmine, and red. Sunflowers, of which there are now a great diversity of forms, ranging from twelve inches to twelve feet in height, have withstood the heat and drought without injury, and demonstrated their claims to consideration in the planting of mixed borders. Primrose Perfection, Sutton's Earliest of All, and Sutton's Double are attractive varieties, attaining a height of about six feet; Stella, Stella Primrose, and Sutton's Miniature are three good forms with a height of about four feet. Highly interesting and attractive also was Sutton's Dwarf Miniature, which attains a height of about twelve inches, and produces in great profusion medium sized blooms of the richest yellow.

MODERN STRAWBERRY CULTURE.

The cultivation of strawberries for market has been a prominent industry in certain districts for the past twenty years. Hampshire, Kent, Sussex, Cambridge, and a few other districts are important centres of this culture. In Hampshire, for example, it is evident that the crop has proved a remunerative one to those early pioneers who prospected around the New Forest and in the southern parts of the county, for we discern on all sides abundant evidence of prosperity and advancement. Moreover, it is significant that since these early days of the strawberry-growing industry, considerable tracts of land have been put under the culture, even during the year that is just past. Southampton and the districts around, including Botley, Swanwick, Bursledon, Wickham, Fareham, and Sholing, etc., are now all important strawberry centres in Hampshire. The magnitude of the industry is but little known to the ordinary person, but one can judge of its importance by a perusal of the figures published in the report of the Swanwick and District Fruit Growers' Association, Lim. In the year that has just passed we understand that from one station of the London and South-Western Railway Company's line, Swanwick, over 115,000 baskets of strawberries were carried in a single day. Further, it is said that during the month of June, from that station alone, the railway company carried 1,107,350 baskets. It is also noted that during the month of June the L. and S.W. Railway Company also dealt with, and dispatched, over 3,000 tons of fruit from Botley and Swanwick Stations.

Yet, in spite of these astonishing figures from the Southampton district, the year 1910 is described as one of the worst of three successive bad years, from which it will be inferred that a plentiful season is not always a profitable one. Prices have been as low as ever, which gives every indication that the supply has been equal, if not greater than, the demand. It stands to reason that if strawberries are sold on barrows in the streets at 3d. and 4d. per lb. only a few days after the Southampton crop has made its first appearance on the market, there can be but small returns going into the pockets of the growers. It is said, on good authority, that if it had been remunerative to gather all the crop the year 1910 would have been a record one, but the prices were so low that for the last two weeks of the season it did not pay to pick, and tons of fruit were left to rot on the ground.

The methods of packing, transit, and marketing of strawberries have undergone many changes of late. The need for some improvement in this direction has manifested itself again and again, and there is even still further room for improvement. A difficulty which has been removed to a great extent in the marketing of this fruit is the varying capacity of the baskets and their disposal when empty. The slender wicker-handle basket is commonly used in the Southampton district but the basket has not yet been introduced that will enable the grower to provide the salesman with a guarantee as to the net weight of the fruit, the baskets used being of uniform size. The L. and S.W. Railway Company may charge additional rates for the transit of these handle baskets, for they have to fit up special vans with shelves to carry this sort of traffic, but the fact remains that there is considerable less injury to the fruit than where flat peck baskets are used; the latter are commonly employed in Kent and Sussex, and are of the ordinary flat market shape, as used for peas and other bulky crops. They contain 12lb. of fruit, and, of course, take up much less room, weight for weight, than the handle baskets The fruit, however, invariably arrives at its destination in a more or less damaged condition. Regarding the chip baskets, the Swanwick and District Fruit Growers' Association report that many growers have complained of the heavy bills which they have had to meet out of their diminished profits, for chip baskets, for which they say they get no return. The cost of these baskets works out at about a penny each when purchased in fifty-gross lots. But if it is possible to adopt the Continental custom of selling the fruit together with the baskets at an inclusive price, the cost of the latter will then be returned to the grower. Whether or not the chip can be made a chargeable package remains to be seen. At all events, it is the best-known form of package for strawberries. If wicker baskets are used it is essential to have a distinguishing mark upon them, and the growers should have a distinct and properly executed agreement with the salesmen for the return of their own baskets, or their value.

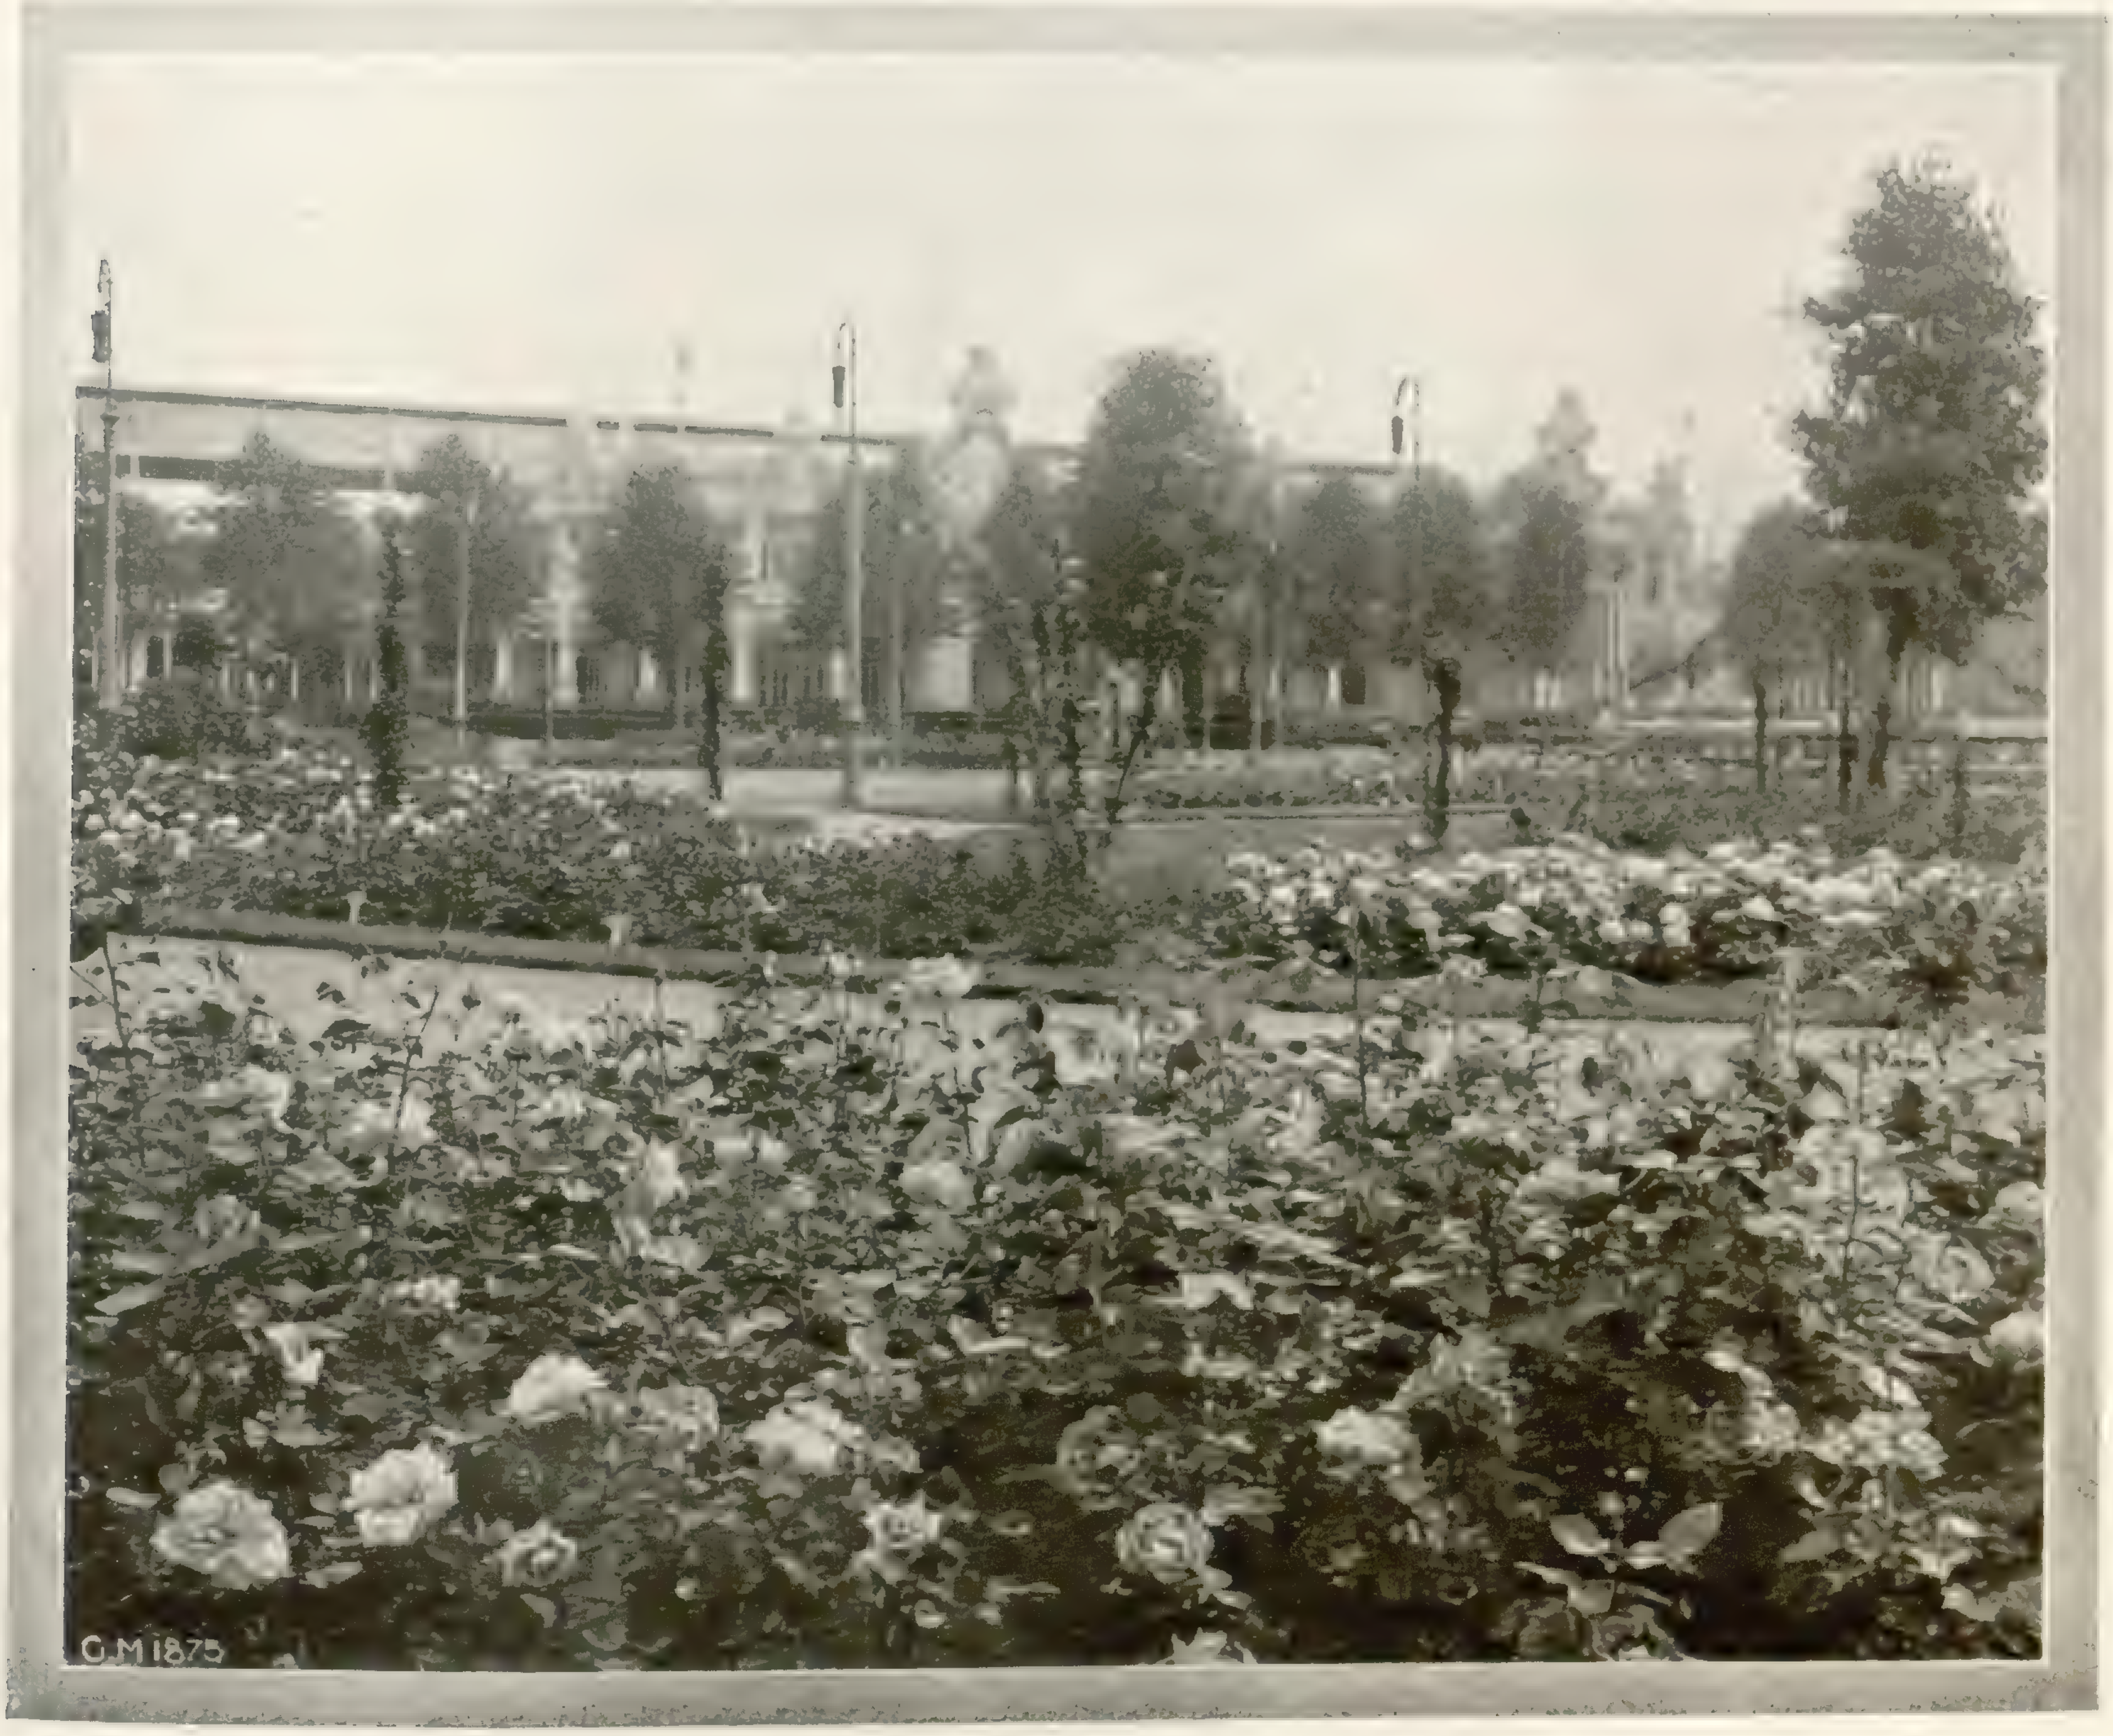
The Hampshire strawberry grower is invariably first on the market with his produce. The extensiveness of the culture in the Southampton district has necessitated special railway facilities, and the system now adopted is to arrange the towns to which fruit is sent into groups, but there seems to be a grievance regarding the short space of time between the departure of trains to the several groups. The growers find that they cannot return for another consignment in the allotted space of time, especially as they are sometimes kept for more than an hour before they can unload. Every facility, however, is being put in the way of the growers by the railway company, and the unloading and dispatching of fruit is now conducted with very little loss of time. The various centres to which fruit is sent include London (Covent Garden), Aberdeen, Belfast, Cardiff, Blackpool, Dundee, Glasgow, Leeds, and Manchester, etc. London takes about half the crop, while the rest goes to the large towns of the Midlands and the North.

The varieties of strawberries chiefly grown in the Hampshire districts are: Bedford Champion, Royal Sovereign, Laxton, Sir Joseph Paxton, and Leader. Of these, Bedford Champion, a variety that is distinguished for the immense size of its fruit, has gained much favour amongst growers of late. It is quite a distinct and vigorous-growing variety, the flesh being red throughout, and the outer skin of a glowing crimson colour. It also possesses a firm flesh, and therefore travels well. The Laxton, a cross between Sir Joseph Paxton and Royal Sovereign, is undoubtedly a good variety. It is early (though not quite so early as Royal Sovereign), prolific, a large handsome fruit, and excellent in flavour. Royal Sovereign is a variety of immense value to both field and garden cultivators. It is earlier than Sir Joseph Paxton, and has large, finely-coloured fruit, with firm flesh, which means that it travels well. It has been said by more than one authority that Royal Sovereign is the most valuable all-round strawberry now before the public. As a late kind, Givon's Late Prolific is a most meritorious variety.

(To be continued.)

ROSES AT THE WHITE CITY.

Visitors to the great exhibition at Shepherds Bush, London, popularly known as the White City, will have been struck by the fine development that has taken place this year in the horticultural features. The trees and shrubs, and the summer bedding, have been a great success, but perhaps the roses, especially those by the Club gardens, have proved more attractive than all else. Of course, the rose is our national flower, and it is very popular among all classes, whether they grow roses or not; but even a popular and national flower must be presented to the public attractively if it is to continue popular. The display at the White City could not have been in better hands than those of Messrs. William Paul and Son, of Waltham Cross, and, needless to say, this firm has spared no pains to make, and keep, this rose garden beautiful. The beds of roses, containing a large number of first-class varieties raised at Waltham Cross, as well as old tried sorts of home and Continental origin, have been grand; growth was rather late in the spring, but presently it came along sturdily, and a week or so ago, when photographed for the purpose of the above illustration, the plants presented a wonderful wealth of floral beauty, accompanied by the sweetest fragrance. Not only are the beds of dwarf roses a success, but the festoons, arbours, pillars, tripods, umbrellas, standards, and half-standards have added to the beauty of the scene, and given that diversity of height and form so essential in gardening. At the same time these various methods of training roses have proved a feature of considerable educational value, and one that visitors have not been slow to make note of. Altogether it must be conceded that the rose garden planned, and planted, and cared for, by Messrs. William Paul and Son, is one of the chief attractions at the White City, and one that horticulturists should not miss on any consideration.



THE ROSE GARDEN AT THE WHITE CITY.
Planned and planted by Messrs. Wm. Paul and Son, Waltham Cross

HELENIUMS.

The various members of the genus Helenium form an important and showy group of hardy herbaceous perennials, without which no garden is complete. They are plants of free growth, succeeding in ordinary garden soil that is thoroughly prepared by digging and manuring previous to planting, and beyond the routine work necessary to keep the plants clean and staked, little further attention is necessary; triennial lifting and division of the crowns is advisable in order to secure the maximum development, as increase is generally of a lavish character, and after the period named the size of the flowers begins to deteriorate on established plants.

Heleniums are most effective when planted in clumps of three or more of a kind, and as the mass of colour when in flower is great, they should not be lumped together when staking, but spread out lightly, supported by twiggy sticks, or tied out singly on light bamboo canes.

The earliest to flower is H. Hoopesi, a dwarf species, with golden-yellow flowers; this is followed by H. Bolanderi and H. Bigelowi, both yellow-flowered species, the first-named having a brown centre; these vary in height from one to two feet. None of them rivals H. pumilium magnificum in floriferousness; this subject attains a height of two feet, and begins to flower in June, continuing for about three months; the flowers are of a large size, soft rich yellow in colour, and with crimpled petals; it is altogether a first-rate and reliable plant for garden decoration, and grows to a height of three feet.

H. Riverton Gem shares all the good qualities of the last-named, but differs in the colour of the flowers, which are golden-yellow flushed by a clear shade of terracotta. Helenium autumnale and its varieties are conspicuous subjects in the autumn garden. H. cupreum commences to bloom in July, and continues until late in autumn; in height it rarely exceeds two feet, forming dense bushes, and bearing flowers of a lively copper-yellow colour. H. grandicephalum striatum is a taller-growing edition of the last-named, and flowers later, generally beginning in August; it attains a height of five feet, and has yellow flowers heavily striped with dark red. H. superbum produces self flowers of a beautiful yellow, and grows from five to six feet tall, being in season from July till September.

All the species and varieties of helenium are valuable for house decoration, being of great service where quantities of cut flowers are required, and particularly for large vases.

Thomas Smith.

WHITE GROUND FANCY CARNATIONS.

Although, as a class, the white ground fancy carnations are not so effective, either in the garden or on the exhibition stage, as the yellow ground varieties, they are by no means wanting in attractions or usefulness. So far from this being the case, they are so exquisitely beautiful that some of the finest varieties should be grown wherever carnations are cultivated in proportion to their merits, and their charms fully appreciated. The proportions in which the two classes should be represented in any one garden is a matter that must be determined by the owner, for much of the enjoyment of a garden depends upon it containing plants which one appreciates the most highly. A large selection will not in any case be required, and twelve varieties may be regarded as ample for a garden in which carnations are cultivated on a comparatively large scale.

The following are all of much merit, and may be suggested as the most suitable for forming a collection adapted to the requirements of the general body of cultivators. Carnace, a charming variety, the flowers of good form, and attractively marked with rose; Cæsar and Pompey, a very attractive flower, richly marked with crimson and maroon; Dainty Lady, a pleasing variety, flushed with rose; Lady Desborough, a finely formed flower of large size, the broad smooth petals freely marked with pink; Hon. Dorothy Legge, a charming variety, the flowers of medium size and fine form, well marked with rose; King Edward VII., a variety of great excellence, the flowers large, of fine form, and with scarlet and maroon margin and markings; Merele, an attractive flower, of average size, and effectively marked with scarlet; Mrs. W. H. Taylor, a pleasing variety, the flowers of average size, and marked and edged with scarlet; Millie, one of the most beautiful of the white ground fancies, the flowers are of fine form, and marked with pale rose-red; Queen Mary, a charming variety of recent introduction, the flowers are of full size and good form, with light red markings; Rhoda, a distinct variety, the flowers of fine form and attractively marked with lavender and rose; and The Nizam, which may be described as one of the finest of the white ground carnations. It has blooms of large size, good form, and lightly marked with bright red. The flowers of this variety, herewith illustrated, are those for which Mr. F. W. Goodfellow, of Walsall, was awarded the first prize for three undressed blooms of a white ground fancy carnation at the recent exhibition of the National Carnation Society.

CARNATION THE NIZAM.

A beautiful white ground fancy, for which Mr. F. W. Goodfellow, Walsall, was awarded the first prize in the class for undressed blooms of any white ground carnation at the National Carnation Society's exhibition.

AMONG THE ALPINE FLOWERS.

July draws to a close as this is written, and with the end of the month we are again in the midst of cloudy and showery weather. After a more congenial time for the flowers, drought again supervened, and plants suffered much. The rain which had fallen had not penetrated far into the soil, and it is wonderful how some flowers retained their lives, to say nothing of their beauty. Some of the saxifrages suffered considerably, and brown patches showed all too frequently among these favourite plants. The dry summer has left indelible traces on some of our masses of these saxifrages, especially the mossy ones, and it will be necessary to propagate a good number and to raise young plants which will be free from the burned patches in the centre.

Some other things show the stress they have undergone, and we shall have occasion to regret their diminished beauty for another year. It is hopeless to attempt to water a large collection, and we must, perforce, only attend to those which stand most in need of it. Yet nothing compensates for a natural supply, and we are glad indeed to see less trying times for our flowers.

Mimulus Burneti.

Among the many plants which disliked the drought, and required some care to keep supplied with water, was Mimulus Burneti, which hails from the North of Scotland, where it was raised by a gentleman named Burnet, and was, I understand, the result of a cross between Mimulus luteus and M. cupreus. In its way it partakes of both its parents, being very hardy, as is M. luteus, and with the stature of the latter rather reduced, but showing a portion of the colouring of M. cupreus. It likes a fair amount of moisture always, and in this respect seems very much akin to M. luteus, which, in some parts of the country, has become naturalised along the banks of rivers and streams. M. Burneti is a good doer, and a satisfactory plant for the moister parts of the rock garden or the little bog. It increases freely enough, and is one of the best growers among the hardy mimuluses. It would be interesting to know how far it reproduces itself from seeds—if it bears such, a point about which I have grave doubts.

Geranium lancastriense varieties.

It is somewhat venturesome to discuss this geranium under this name, inasmuch as authorities say that it is simply a variety of G. sanguineum. I am not disposed to cavil at their dictum, but it is for convenience that I adopt the present subtitle. The ordinary G. lancastriense has long been a favourite with me, and I have regarded it as practically fixed, seeing that seedlings invariably came true to the parent with me. Some time ago, however, I heard of some variations being found on Walney Island, the original home of G. lancastriense, and I had an opportunity of seeing more than one of these lately. They come considerably nearer G. sanguineum than G. lancastriense, but are of a prettier colour than that of the somewhat aggressive one of G. sanguineum. A very pretty one was in the Craven Nursery, and another in the garden of my friend, Mr. T. O. Walker, of Carnforth. These were both taller than G. lancastriense. Rather to my surprise on my return home I discovered, close to a plant of G. lancastriense, a seedling which apparently came between G. sanguineum and the former. It is slightly taller than G. lancastriense, and is of a warm, yet pleasant red. I have no plants of the typical G. sanguineum in my garden, so that the one must either be the direct progeny of G .lancastriense, or of G. sanguineum album, of which I have a good many plants, but which, up till now, has also always come true from seed. I am interested in this seedling, which will, I hope, turn out to be useful in the rock garden.

Rather curiously, a seedling from G. sanguineum album has just flowered beside a plant of this white variety of the blood-red Cranesbill, and it, again, is almost the colour of G. lancastriense, but has more the habit of G. sanguineum album, although dwarfer. These two give promise of adding to the beauty of the rock garden.

Erodium cheilanthifolium.

It is a surprise to see how few representatives of the charming erodiums, or Heron's bills, are to be met with. Not that they are generally unrepresented in good collections of alpines, but the wonder is that more members of the genus do not appear. It is hard to select among them for notice, so pretty is almost every one, although E. Manescavi, and a big one which passes by the name of E. hybridum (a name of which I have always grave doubts), are rather aggressive in their magenta tones. But I think that E. cheilanthifolium deserves a word or two when we are looking through our alpines to see which are flowering at a season when the rock garden is less interesting than at an earlier date. The fern-grower is possibly better able to give an opinion respecting the appropriateness of the specific name of cheilanthifolium, but it appears to a mere lover of alpine flowers that the lace-like, finely-divided leaves are not unlike those of some of the genus cheilanthes, lovely as are these ferns in their formation. With this dainty foliage we have the charm of a low-growing plant with its white petals prettily veined with dark purple.

Other Flowers.

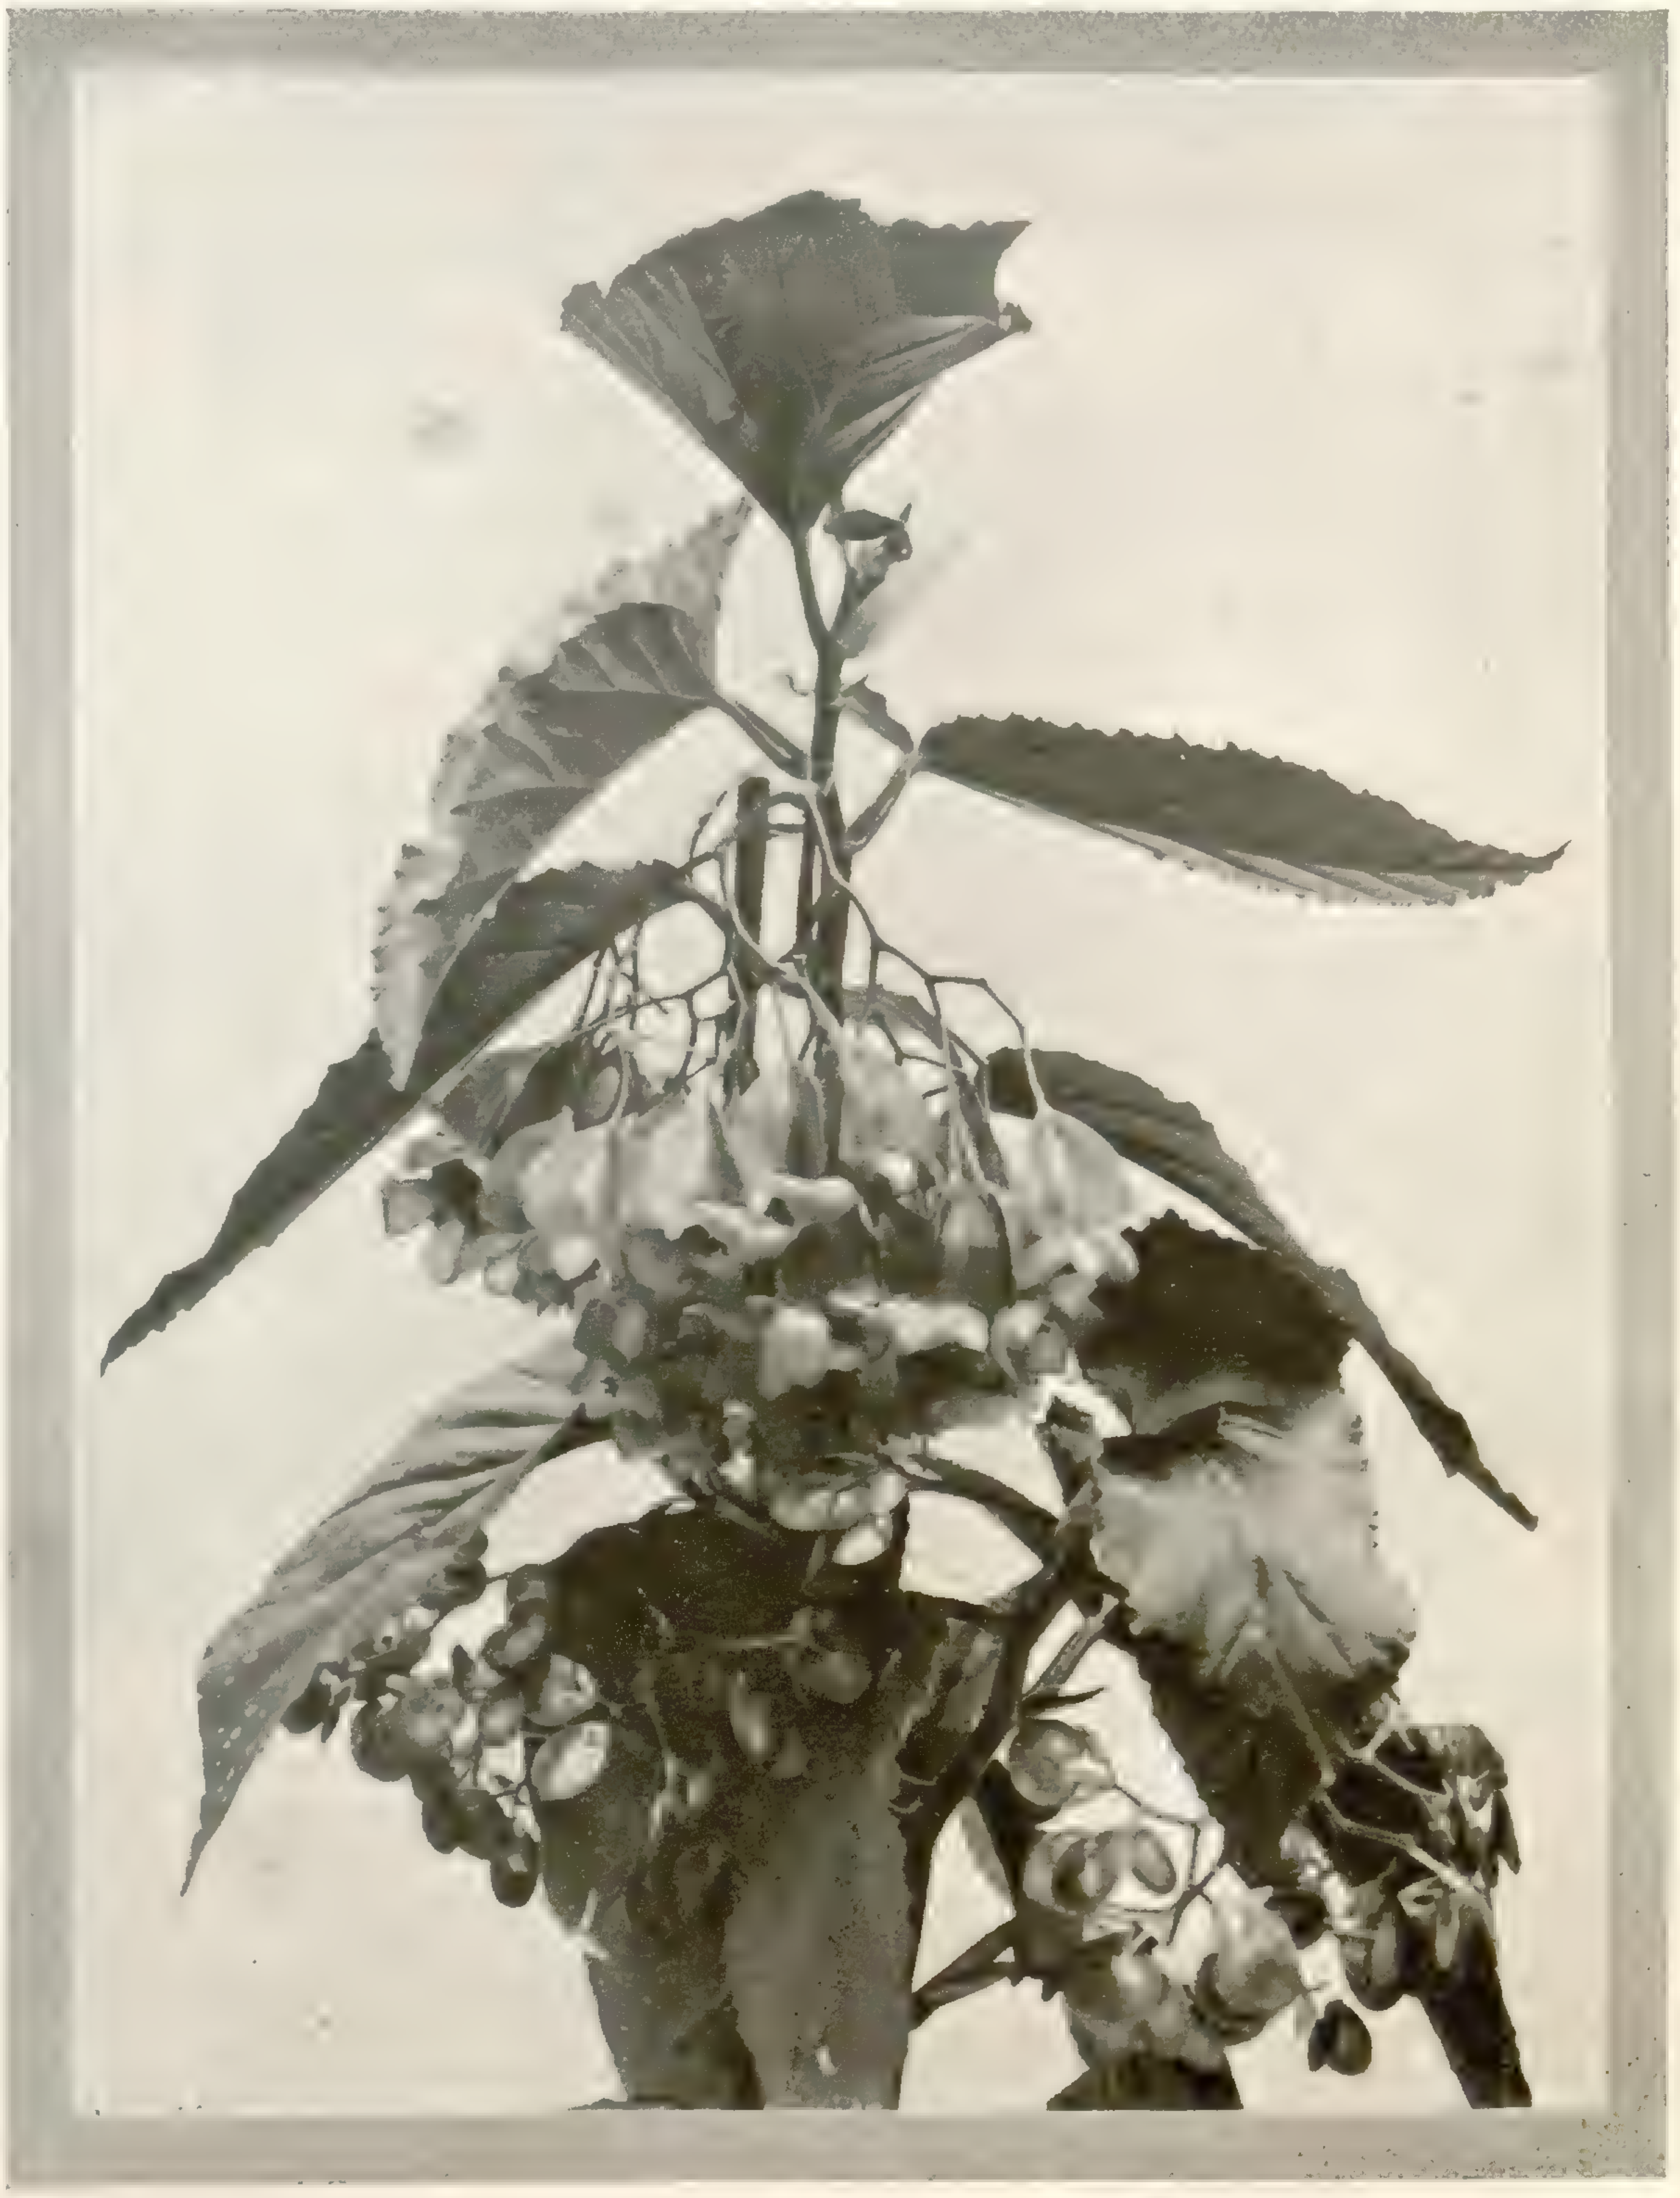
There are still numbers of flowers which, despite the stress of the times, give us much delight. There are yet some helianthemums, though the vast majority have bid us farewell for the year, or only yield us a few scattered blooms, as a reminder of their former glories, when they gave sheets of brilliant flowers; there are all the sisters of the geranium and the erodium referred to just now; there are dianthuses in great beauty still, although some of these, also, have bid, or are just in the act of bidding, us farewell. We have the dainty little Tunica saxifraga, some of the alpine gypsophilas, such as, for example, the spreading G. repens monstrosa, alpine bellflowers in considerable numbers, and fascinating as ever. Little St. John's-worts give us bright yellow blooms, and their taller sisters of more shrubby habit afford a bigger and brighter show of flower. Some of these hypericums have well-nigh finished their season's course, but others are keeping up the tale of the flower of St. John. Linarias, of several kinds, are pretty as of yore, and the collection of hardy heaths maintains its almost unbroken succession of flower. Earlier heaths have not finished, and now we see the varieties of Calluna vulgaris coming into blow, among them a nice dwarf white one—a gem for the rock garden.

These and many more gladden us as we pass through the garden, finding ever many of our favourites to welcome us, and to give us our daily delight in their beauties.

S. Arnott.

BEGONIA LUCERNA.

A begonia that has achieved a great deal of popularity for warm house cultivation is B. President Carnot, a variety raised on the Continent some years ago. Of somewhat similar habit is B. Lucerna, and it may be grown in the same way, and for the same purposes as B. President Carnot. The pendant trusses of bloom are very large, and the bright carmine-scarlet flowers cluster thickly together, as shown in the accompanying illustration. Although as a pot plant B. Lucerna is very effective, as evidenced by the handsome examples shown before the Royal Horticultural Society recently by Messrs. James Veitch and Sons, of Chelsea, the best way to grow this begonia, as in the case of B. President Carnot, is trained to a rafter or pillar in an intermediate house, as so well exemplified in the greenhouse at Kew, where plants of some age are trained to pillars eight or more feet in height, and are blooming with great freedom. Under this method the handsome panicles of bloom are shown off to the fullest advantage. In the greenhouse at Kew it is grown with much success. B. Lucerna offers no difficulties in the matter of culture, and can be easily managed along with other evergreen warmth-loving kinds. It is certainly a fine begonia.



BEGONIA LUCERNA.
Flowers carmine-scarlet, freely borne in large pendant trusses.

BULBS.

The experienced bulb grower can tell whether a bulb is a good one or not directly he sees it, but he rarely trusts to his eyesight, and therefore carefully handles it. The inexperienced cultivator may at once favour the large bulb, and, in due course, be disappointed with the result. A large bulb, if of good form and well matured, is almost sure to prove satisfactory. As a rule those bulbs, especially of hyacinths, that are rather over medium size, of good shape, and very heavy and firm, give us the best results. When bulbs of named hyacinths are of irregular shape they often throw up two spikes, and although a number of good spikes are appreciated growing from a Roman hyacinth bulb, two spikes from a named hyacinth bulb are rarely appreciated.

Although the inexperienced grower is right in ordering early, he must not allow the bulbs to remain unpotted for a long time after they come to hand. Lilium and narcissi bulbs deteriorate sadly if so kept. Potting in reasonably good time means early and steady growth, strong stems, and numerous roots. Such bulbs are mostly satisfactory, whether they be hard forced or allowed to grow slowly in a cool temperature, and there are very few failures.

Geo. Garner.

CEANOTHUSES.

The majority of the species of ceanothus, of which about a score are cultivated in our gardens, are not sufficiently hardy to plant in the open garden or border. It is quite true that many of the more tender kinds luxuriate in South Devon, Cornwall, and other favoured parts, but, speaking generally, these require the protection of a wall. The ceanothuses are well known as being very free flowering, and the best examples I have seen have occupied fully-exposed and very hot positions.

I have seen finely-flowered examples of C. azureus in the Peckham Rye Park in September, which indicates that this popular species is a good town shrub, more especially as the neighbourhood of Peckham is a very congested one. Both this and C. americanus, with their garden forms, have long occupied prominent positions in the shrubbery, and each and all flower from the current season's growth, while several varieties bloom continuously over a long period. C. Arnoldi is a very vigorous kind, and altogether very desirable, but perhaps the most beautiful of all is Gloire de Versailles, in colour light blue. It presents a very beautiful picture when literally smothered with its delicate inflorescence. There are several other varieties of varying merit, but none to equal the foregoing.

As regards the species that produce their flowers from the previous year's growth, we possess a number that bloom in the spring, including C. Veitchianus, C. dentatus, C. papillosus, and C. divaricatus. Both C. velutinus and C. rigidus also bloom in April and May. The first-named has pure white flowers that are borne in large-sized panicles, while C. rigidus is a dark shade of blue, and this colour in its various shades is seen in the majority of the species. Early in June C. thyrsiflorus is seen at its best in Southern England, and may be coupled with C. divaricatus as being sufficiently hardy to grow satisfactorily in the open border. It may be added that the ceanothuses are indigenous to North America, and for the most part natives of California, which boasts perhaps the finest and most equable climate in the world. In consequence it will be readily understood that they are more or less susceptible to the conditions that obtain in the English winters. We are glad to know that several have become acclimatised, and settled themselves down as naturalised British subjects with a good grace, and this without any protection whatever, while others suffer to the point of extinction if exposed, and these should occupy and are well worth the protection of a wall or fence and a warm position. Touching upon soil, they are not by any means fastidious. Turfy loam and short manure is usually employed, while the sites selected should be well drained, which, in conjunction with full exposure to the sun, will result in vigorous and thoroughly matured wood.

I heartily commend the ceanothuses to the attention of amateurs as being amongst the most delightful of shrubs of more or less large growth, and, in conclusion, must explain that the species which bloom on the previous year's growth should be rather severely pruned immediately after flowering, while the others should be cut back rather closely in March.

Walter H. Aggett.

THE PENSIONERS' GARDENS AT CHELSEA HOSPITAL.

BUDDLEIA VARIABILIS MAGNIFICA.

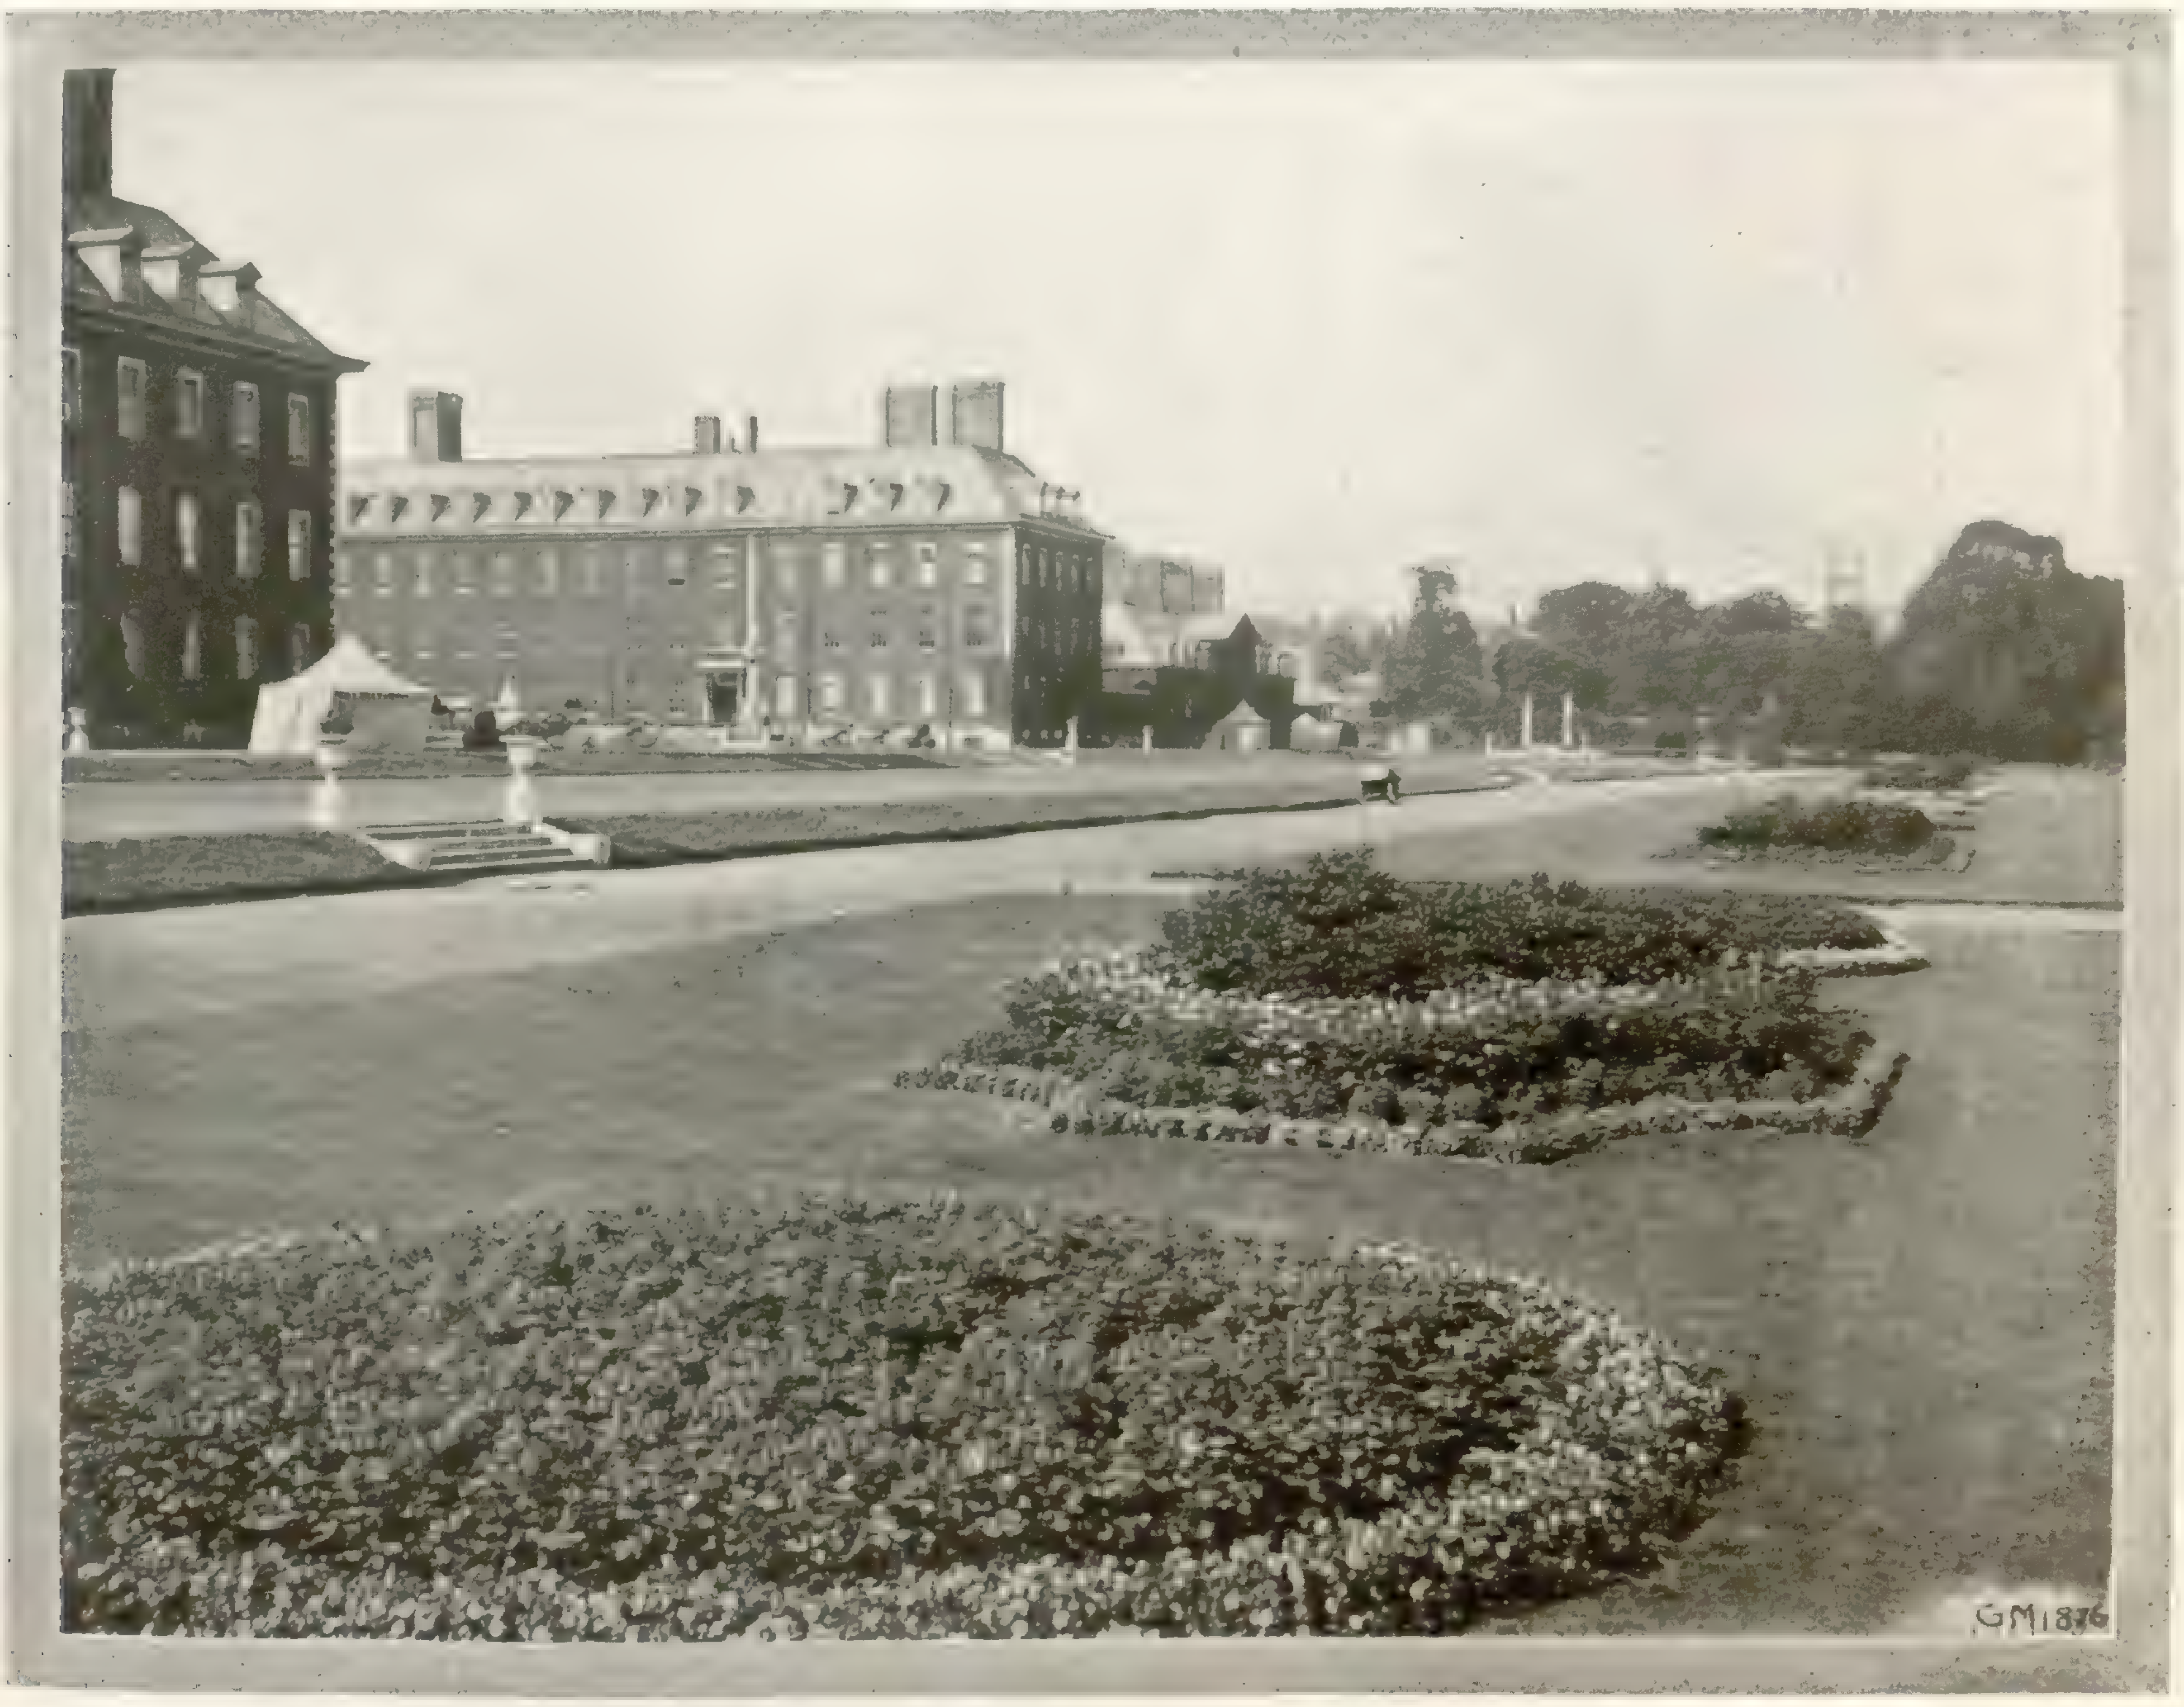
This is a really fine acquisition, and is worthy of a place in every garden where there are large borders. It is not suitable for very small borders, as it grows to a height of six feet or seven feet in a few years. A single specimen in a garden looks charming. The variety is very free flowering, nearly every well-matured young shoot bearing a flower spike. Strong branches have flower spikes eighteen inches long, the colour being blue-grey, very beautiful when seen in a subdued light, and in the evening.

In the southern counties I have seen fine plants growing in quite open positions, subjected to all the winds that blow. A deep friable loam forms a suitable rooting medium. Every autumn the plants must be cut hard back, as then strong shoots are produced, the flowers being borne on the current year's growths. Stock may be raised from seeds, or by inserting cuttings of ripened shoots at the end of August or during September. G. B.

Layering Thyme.—Very old clumps of thyme are not worth retaining in their present form, but where there is not any new stock the old clumps may be very successfully and simply made to provide one in a very short period. All dead stems must be carefully removed, and the healthy ones spread outwards in circular form, leaving the centre quite open. Equal proportions of good loam, leaf-soil, and sand should be passed through a half-inch sieve and be well mixed. First put a layer of the new compost under the thyme, and then well fill up the centre. If the whole, after being made firm, is kept nice and moist, nearly all the layered shoots will form roots.—G. B.

CHELSEA HOSPITAL GARDENS.

Although for a long number of years the gardens attached to the Royal Hospital, Chelsea, have been well known to many horticulturists, they occupy a position somewhat off the beaten track followed by those who inspect the horticultural features of the Metropolis, and, consequently, are not so well known as they deserve to be. They secured some prominence in 1905, when the Royal Horticultural Society held its summer show in them, but that prominence sinks into comparative insignificance before the glamour that already surrounds them as the venue of the great International Horticultural Exhibition of 1912, towards which we are all looking.



THE GARDEN FRONT AT CHELSEA HOSPITAL.

Everyone knows that the Royal Hospital, or Chelsea Hospital, as it is popularly called, is the home of the Chelsea Pensioners, all old warriors, who, after good service for their country, and having a blameless character, are here cared for in every possible way. The hospital and its surrounding gardens cover an area of about sixty acres, the whole forming a little town conducted on military lines, and comprising some 600 or 700 souls. The gardens and grounds are nearly all open to the public during the greater part of every day, hence they are a great boon to the people of Chelsea and Pimlico. But, being private property, in the sense that they belong to the hospital, the authorities may close the grounds at any time and for any purpose they think fit, and so it comes about that, subject to a handsome donation to the hospital funds, the forthcoming great exhibition will be held there.

The garden front of the Chelsea Hospital is quite private to the inmates. This is terraced, and on the upper terrace are tennis and croquet courts. Below is a broad roadway, and then another wide expanse of lawn, in which are cut large and imposing flower beds, some filled with rhododendrons, others with summer bedding plants. Beyond the beds is a long shrubbery border, with trees behind, these effectually enclosing the 800 feet long terrace, and keeping it quite private.

Visitors will notice at once that the grounds are divided from end to end by a broad roadway, that passes under an avenue of ancient pollarded lime trees, supported by lines of plane trees. Going towards the river, the open park-like expanse spreads away to the right, and is encircled by fine old plane and other trees. On the left-hand side of the avenue lies the Ranelagh Gardens, one of the best examples of Gibson's landscape work, and one that will add immensely to the interest and beauty of the forthcoming exhibition. The ground is laid out in undulating fashion, and there are many fine old beech, lime, plane, and elm trees. There is a splendid cut-leaved alder, a number of rare old thorns, ailanthuses, and dimorphanthus; hollies abound and stand the London heat and smoke well. The grouping of trees and shrubs is very fine, but in years gone by little attention was paid to thinning, and so many of the subjects have become spoiled by crowding. It is now a difficult matter to rectify this mistake without making unsightly gaps, but as far as circumstances permit, Mr. T. W. Turner, the garden superintendent, has effected many improvements in this direction. At one time the Ranelagh Gardens were a fashionable pleasure resort, and the creeper-covered summer house that now occupies a fairly central position is on the site of the old Rotunda, a building famous under the old régime.

Besides these interesting portions of the grounds there is a section, near Mr. Turner's house which must not be forgotten. It consists of one hundred and seventy plots, each one in charge of an old pensioner, and each one gardened according to the taste of its owner. Beyond keeping the broad walks in order, and caring for the surrounding trees and shrubs, Mr. Turner has nothing whatever to do with these plots, save that his advice is occasionally asked for, and given, to these old warrior gardeners. Some of the plots are evidently cultivated for the pleasure of gardening, others are very obviously managed with a view to profit. All are well tended, and the spirit of friendly rivalry is keen among the old pensioners. Some grow popular hardy flowers, and find no difficulty in selling their produce; a few give special attention to small salads; some specialise in dahlias, and others do quite a little business in pot plants. In most cases the impelling force appears to be tobacco, for many of these old soldiers are rare smokers, and the sum they obtain from the sales of garden produce enables them to add to their enjoyment in this direction.

Our readers will no doubt remember that the fine old soldier, Sir George White, the hero of Ladysmith, is the Governor of the Chelsea Hospital. C. H. C.

RODGERSIA PINNATA.

A member of the great Rockfoil family, one that has a greater likeness to the astilbes than to the saxifragas, and of special value to those who contemplate the formation or improvement of bog or water gardens, is Rodgersia pinnata. For a long number of years the only cultivated species of rodgersia was the Japanese R. podophylla, but during later times other species have been found in China, and R. pinnata is already becoming fairly popular. It is a plant that has many points of merit. The leaves are handsome, long-stalked, and divided into from three to five leaflets, the whole leaf being as large as that of a horse chestnut, but peltate rather than palmate. Sometimes the larger leaves have one or more of the lower leaflets divided, so that a leaf may appear to have six, or occasionally seven, lobes of leaflets. To the elegance of the leafage must be added rich green colouring, which changes in late summer and autumn to bronze and bronzy-purple. The inflorescence is a bold and yet graceful panicle, borne at the end of a leafy stem, that rises to a height of about three feet or four feet. The small flowers are crowded, astilbe or spiræa fashion, and are of a beautiful soft rosy-pink shade, and they last fairly well, and are followed by seed vessels that are themselves no mean attraction. There is a form with white flowers, now catalogued as R. pinnata alba.

RODGERSIA PINNATA.

A bog plant of great beauty, with pinnate leaves and large panicles of soft rose-pink flowers. The specimen shown is in a little bog in the Rock Garden at Kew.

A large plant of R. pinnata in the boggy, peaty soil close to the Dripping Well that is a feature of the rock garden at Kew, has done remarkably well this year, and is shown in the illustration given herewith. Moist peaty soil, a semi-shady position, and some slight shelter from strong winds, all aid the development of this handsome hardy plant, and a top-dressing of old manure or of leaf-soil when the leaves die down will serve as a winter protection, and also as food for the roots.

C. B.

OWN-ROOT ROSES.

Few phases of rose culture have been more discussed than that of "own-root" roses; and the variations of opinion are, indeed, great. Still, I think there can be little doubt that some roses thrive better in this form than when upon foster roots. Let us take the Chinas and most of the dwarf-growing polyanthas, for example. These can now be rooted very freely, and with the undoubted advantage of avoiding all stock suckers. Indeed, I think it is often the question of suckers from the various stocks roses are worked upon that has prejudiced many against roses so worked. At the same time, one must not lose sight of the fact that the nature of the soil has much to do with the benefits or otherwise, of own-root versus worked roses.

But it is not my wish to go deeply into this vexed question. I simply desire to call attention to the present as an excellent time for increasing such varieties as one may decide shall be grown in this way. Owing to the dry summer we have a larger amount of semi-ripened wood than usual, and this is the best possible material for our purpose. Take off portions of semi-ripened growth from almost any free grower, and insert these in a sandy loam. Always see that the base of the cutting is immediately below an eye or leaf; or else it should have a heel, i.e., a small portion of the older wood from which the lateral was produced.

It is not a good plan to take too large or long a portion of growth, or we are apt to get a somewhat leggy plant when placing the rooted cuttings into their permanent quarters. By the way, I would never put a rose cutting into what I intended to be its permanent quarters, as one cannot be certain of the percentage that will strike root. Besides this, we naturally want to supply a somewhat richer compost to the rooted plant than would be conducive to the striking of cuttings; as the latter have a great objection to rich, manure-laden soil at the first. Another reason is we can put a much larger number of cuttings in the space needed for permanent plants.

Do not select a border facing due south, as such a position is apt to be too drying for rose cuttings at this time of the year. On the other hand, one should avoid a wet and cold north border. Most gardens contain some little piece of ground between these extremes, and this would be the best position to choose. Always make the cutting firm, and be sure the base rests upon the soil. Should the soil not work very well, let a little sand be placed in the bottom of the hole you are putting the rose cuttings into. In any case, a little sand is a great help towards callusing and subsequent rooting. There is no need to remove all of the leaves from the cutting. I fancy a few of these help in many cases. But let the bottom one or more be taken off according to their closeness one to another. Upon no account allow the cuttings to become dry, while avoiding any suspicion of stagnant moisture. The distance apart must depend upon the nature of growth. For example, we should allow three times the room for Frau Karl Druschki and Dorothy Perkins as would be needed for the dwarf-growing polyanthas and Chinas. The latter may be three inches apart in the row, and rows about fifteen inches from each other. I know of some who put the rows closer than fifteen inches, but we cannot then use the hoe between them to the same advantage or safety; and it is very essential to keep them clean and the soil stirred all through the following summer.

The above advice refers to cuttings that can be obtained from the open ground, but many may be taken from ripened or semi-ripened wood upon plants in pots. These I would prefer to put into pots or pans, placing several around the edges. If kept close for a time, and the sun is not allowed to parch the cuttings, they quickly form roots; and, of course, it is only a matter of general culture after this. Personally, I should prefer the rooted cuttings in pots to remain there until ripened before any further disturbance takes place. In the case of those rooted in the open they should be ready for transplantation the following autumn from insertion, when each variety can be transplanted to its permanent quarters, according to its own strength and characteristics, at the same time affording a much stronger compost than would have been advisable for the unrooted cutting.

A. P.

CLEMATIS DURANDI.

People who have found any difficulty in growing the many garden varieties of Clematis Jackmani would do well to discard them altogether and try the variety under notice, for although it does not give such a range of colour as the Jackmani varieties it has a better constitution, and grows quite well in places where the other varieties fail to exist. Its leaves are larger and more robust than those of many garden varieties, and the whole aspect of the plant betokens strength. The bluish-purple flowers are four inches across, and borne freely during July and August. In the open ground it succeeds on a group of rough posts, whilst it is also well adapted for planting against a fence or trellis. A variety called pallida may be obtained. It has paler-coloured flowers than the type, otherwise it is a very similar-looking plant. As is the case with other kinds of clematis, it succeeds best in loamy soil which contains a fair amount of lime.

D.

NEW PLANTS, ETC.

ITEA ILICIFOLIA.

Among the many plants collected in China by Mr. E. H. Wilson, few can claim to be more striking than Itea ilicifolia. This is a shrub that can hardly be regarded as quite hardy, but it will evidently thrive against a warm wall in most parts of the country, while in the warmer southern counties it may prove successful out in the open. At Aldenham it has survived two winters out of doors, but the tips of growth have been sometimes injured. For the winter garden and large greenhouse it may also prove useful. The leaves are like those of some hollies, or like those of the well-known Osmanthus ilicifolius, but the inflorescence is very distinct, being long, spicate, and pendant, forming dense tassels of small green flowers. Imagine the tassels of a green-flowered Acalypha hispida placed at the ends of the growth of a loose holly-like shrub, and one has a very fair idea of the general appearance of this new Itea. A.M., R.H.S., August 1. The Hon. Vicary Gibbs (gardener, Mr. Edwin Beckett, V.M.H.), Aldenham House, Elstree. (See illustration in our issue of the 5th inst.)

CORNUS PAUCINERVIS.

This promises to be a useful shrub, and its dense evergreen habit and splendidly hardy constitution suggest its suitability for hedges, when it becomes plentiful. The narrowly lanceolate leaves are about an inch and a-half long, and closely set on reddish stems. The plant branches as freely and densely as a thorn or privet. The flattened heads of flowers are composed of numerous creamy-white blossoms, each with four segments, these heads are three or four inches across. Cornus paucinervis is also one of Mr. Wilson's finds, and hails from China. A.M., R.H.S., August 1. Hon. Vicary Gibbs (gardener, Mr. E. Beckett), Aldenham House, Elstree.

MUSSÆNDA ERYTHROPHYLLA.

The genus Mussænda (order Rubiaceæ) is widely distributed, species coming from Socotra, Sumatra, India, China, and Tropical Africa. The species under notice is a stove plant that should appeal to many growers because of the great beauty of its fairly large leaf-like bracts, these measuring about three inches across, and rather more deep. They are of a lovely bright carmine, or reddish pink shade, and most effective. The flowers are about an inch across, cream-coloured, with a rich deep crimson centre. A.M., R.H.S., August 1. Messrs. Jas. Veitch and Sons, Chelsea.

CANNA TERRA-COTTA.

This is not a new variety, if we remember rightly, but it is a fine one, and well worthy of recognition. The growth is strong, and the spike long and effective, the flowering portion being well filled with large flowers of a bright orange-shaded terra-cotta hue. Some recent varieties have more shapely flowers, but few carry a larger or more attractive spike. A.M., R.H.S., August 1. Messrs. J. Veitch and Sons, Chelsea.

CARNATION MRS. WHARTON.

This is a strong-growing border variety with flowers of good size and shape; the colour is salmon-pink overlying buff. A.M., R.H.S., August 1. Mr. Batty, Skelton Castle, Yorks.

CATASETUM CLIFTONI.

An attractive species that varies somewhat, and one that has been well shown on previous occasions. The flowers are large, fleshy, aromatically fragrant, and of a soft yellow colour, sometimes with a deeper orange-yellow shading in the centre. A.M., R.H.S., August 1. Sir Jeremiah Colman, Bart. (gardener, Mr. Collier), Gatton Park, Reigate.

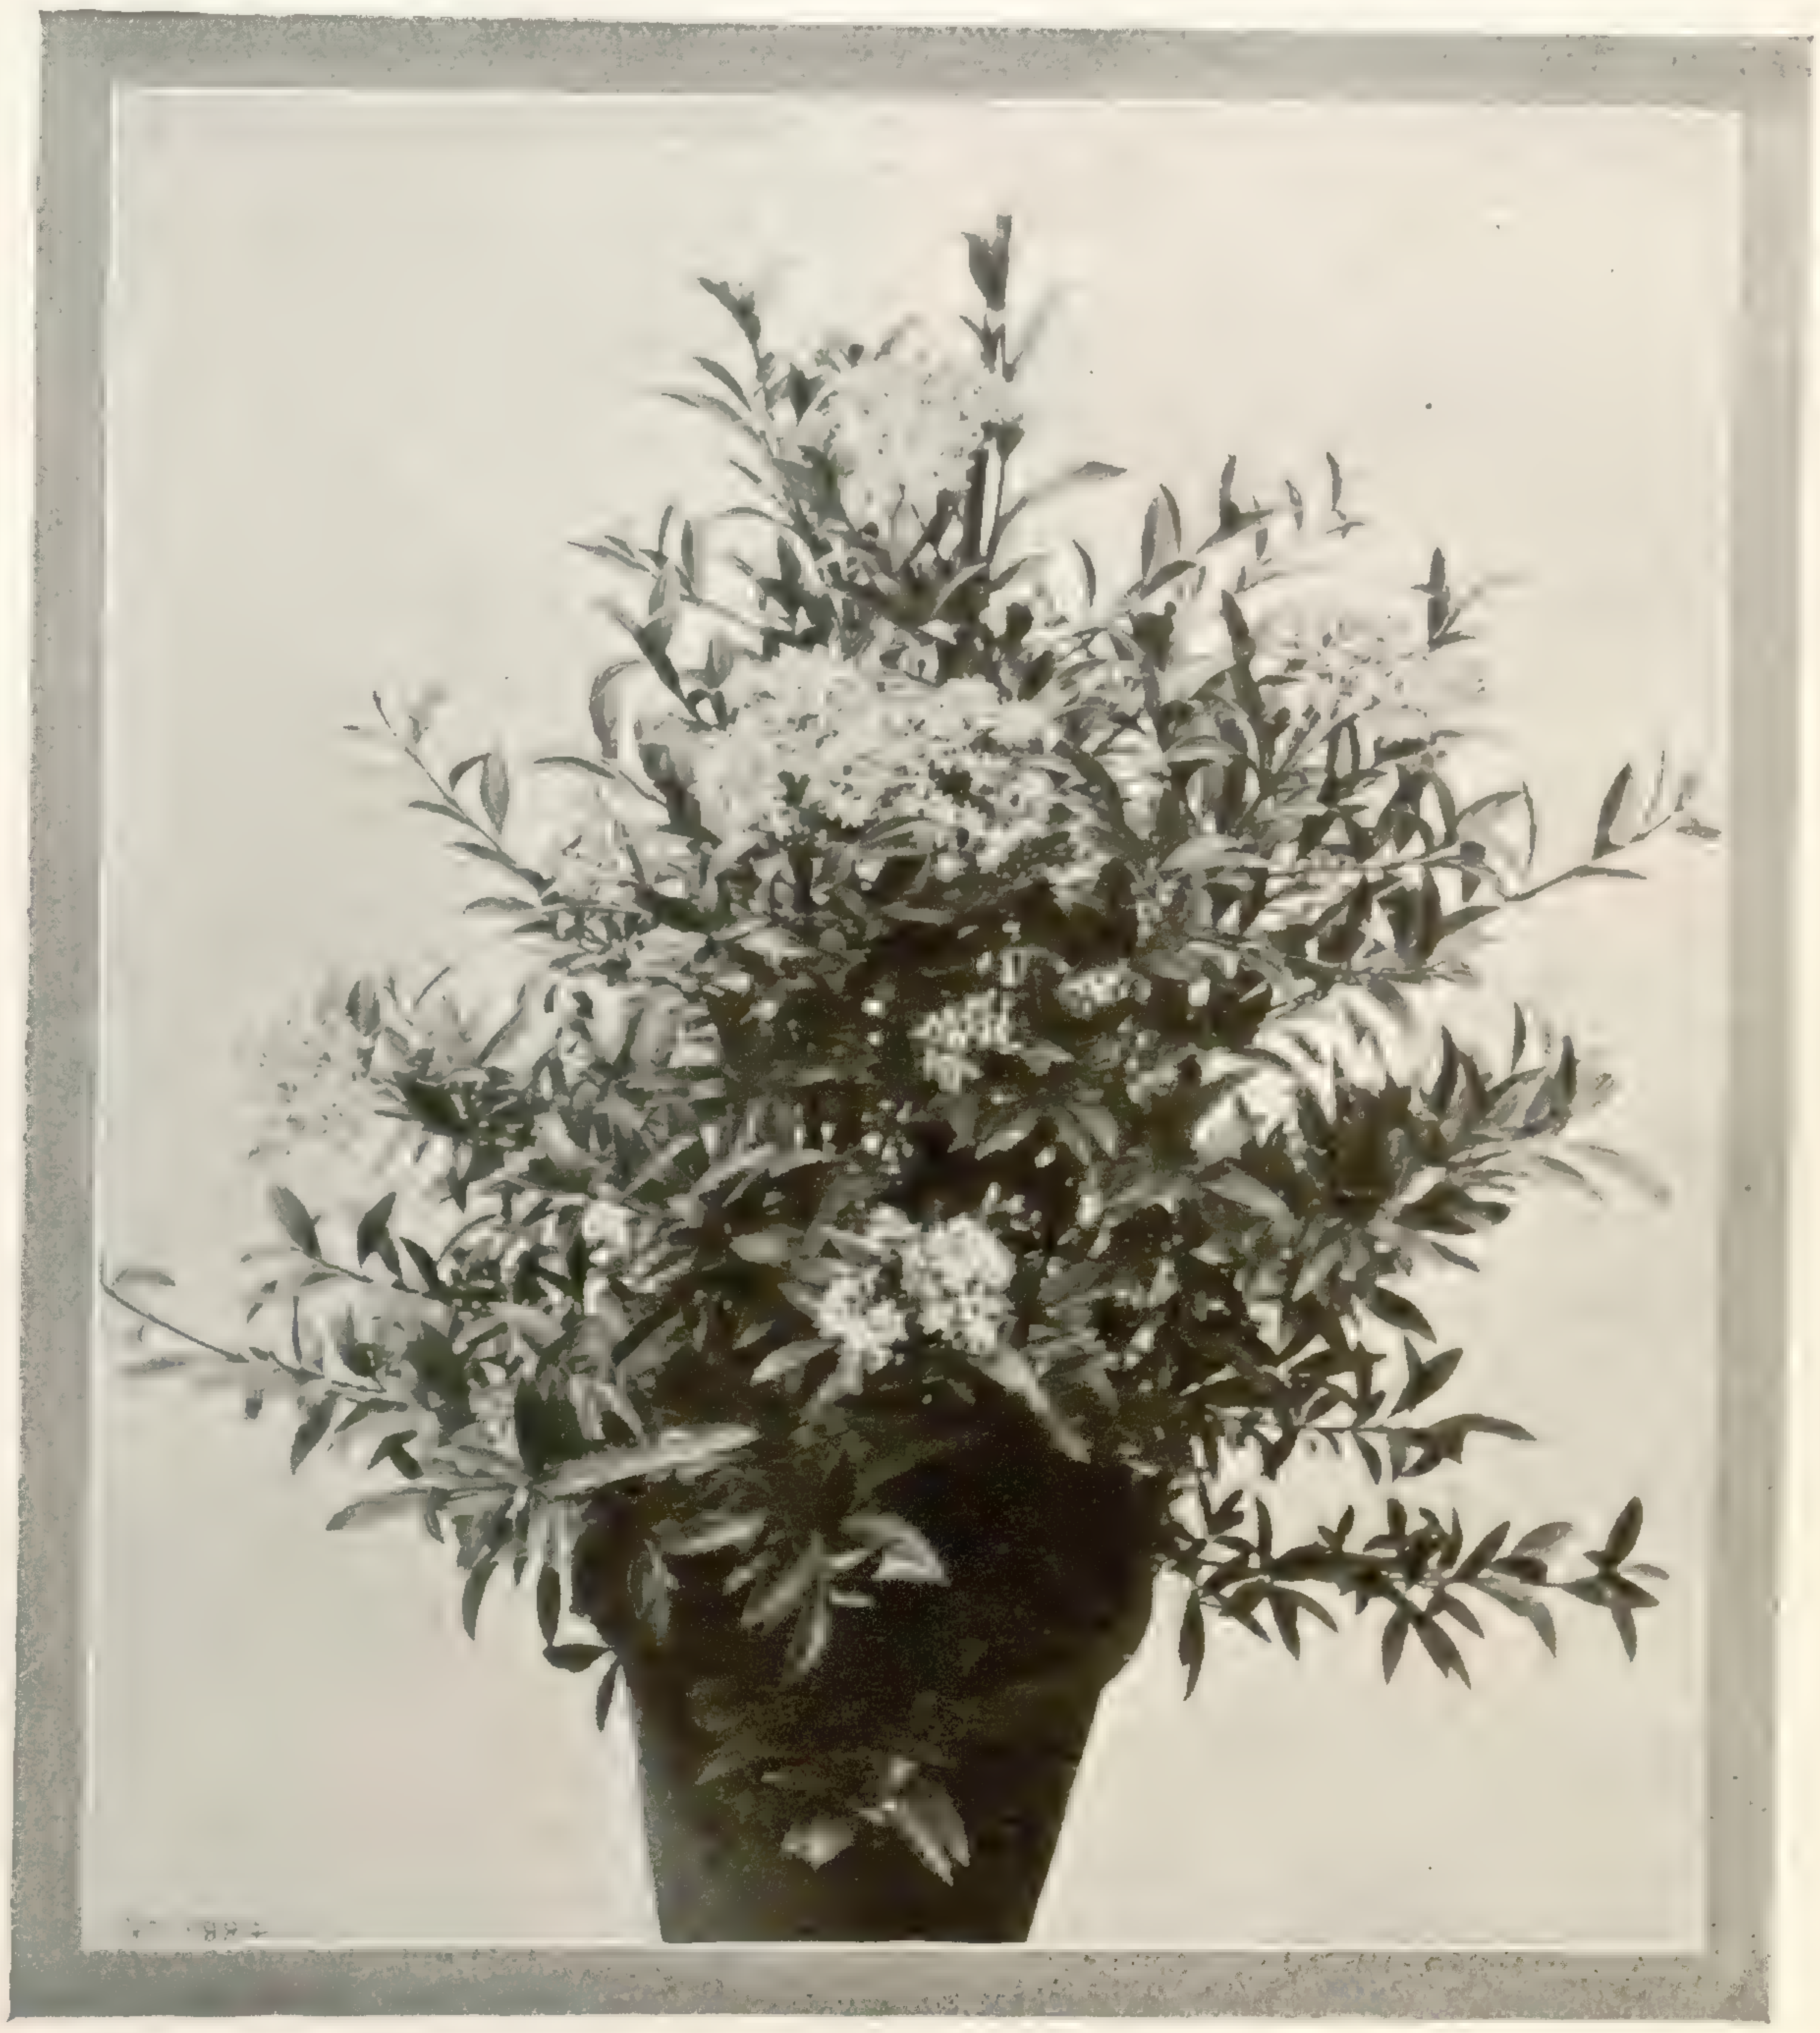
BLISTER-CANKER OF APPLE TREE.

The genus Nummularia is cosmopolitan in its distribution, and generally occurs under the form of black, hard, crust-like patches on dead bark or wood. These patches are usually quite flat, and more or less circular in outline, hence the generic name. N. discreta is readily distinguished from other species by the thick raised edge surrounding each patch or fruit-body, and by the compressed circular dark brown spores with an equatorial paler line. It occurs in France, Germany, Italy, United States, and Cuba, and was first met with in this country during the past year, on the fallen branch of an apple tree, at Sandsend, near Whitby, Yorkshire. As a rule the fungus is a saprophyte on various trees, as elm, magnolia, Judas tree, apple, etc., and is not recognised in Europe as a dangerous parasite, but in the Mississippi Valley apple-growing region of the United States it is a constant source of danger as a true parasite. The disease is usually found upon the larger branches, and, the mycelium being perennial in the tissues, a wound once formed continues to increase in size, until eventually the branch breaks away at the wounded part, and in many instances the entire tree is killed outright.

The first indication of infection is a brown and more or less sunken appearance of the bark in patches, which are usually scattered over a considerable area. These patches eventually become dry, cracked, and blackened, and the black fruit bodies of the fungus appear, at first as small globose bodies, which gradually expand into shallow saucer-shaped structures with a thick raised margin. Eventually the dry, dead bark falls away, but the fruit bodies of the fungus remain firmly attached to the wood. The mycelium present in the wood gradually encroaches on the surrounding healthy parts from year to year, hence the canker continues to increase in area until the branch is completely girdled and consequently dies.

The fungus is a wound parasite, and as spores are produced by the fruit-bodies in great abundance, the chances of infection through wounds caused by atmospheric agencies, birds, insects, etc., are unlimited.

Owing to the fact that this fungus has proved so destructive to apple trees in the United States, it is imperative that it should be removed and destroyed when met with in this country, as judging from analogy a fungus that has hitherto been known only as a harmless saprophyte may at any moment become a dangerous parasite.—"Journal of the Board of Agriculture."



CORNUS PAUCINERVIS.

A hardy Chinese shrub, with panicles of creamy-white flowers. A.M., R.H.S., August 1. Hon. Vicary Gibbs (gardener, Mr. E. Beckett), Aldenham House, Elstree.

Winter Onions.—About this date, to ensure the plants being of sufficient size to go satisfactorily through the winter, it will be necessary to make a sowing. Onions are perfectly hardy, yet it is wise to select a somewhat sheltered position on a border for their wintering, so as to have fine early stuff for planting in the spring. In preparing the seed bed make it firm by treading, and do not sow the seeds thickly. The present crop will be maturing their bulbs, especially on light soils, after the extreme heat. When they have finished growing have them pulled up and placed in a position to dry previous to storing.—C. F.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

ODONTOGLOSSUM HARRYANUM.—This late summer-flowering species is one of the most useful of the cool house orchids, and when well grown the plants produce large racemes of flowers that are exceedingly fragrant, and useful for exhibition and decorative purposes. There are only a few growers who succeed in growing the plants satisfactorily. I have on previous occasions pointed out in my notes to the Gardeners' Magazine that undoubtedly the want of success in the cultivation of O. Harryana has been caused by too cool treatment generally. We have found that a temperature of about 55 deg. suits the plants best. If the temperature is allowed to fall much below this, we find that not only do the leaves become spotted, but they diminish, and a weakly constitution follows. We find it advisable to repot annually, and this is best done immediately they pass out of flower, but as the roots are usually well advanced at such a period, it requires considerable care to prevent injury in the potting process. A compost consisting of about equal portions of fibrous peat, osmunda fibre chopped fine, and sphagnum moss, with sufficient broken crocks and sand added is a good mixture. The plants should be carefully shaded from strong light for a few weeks after repotting, and a humid atmosphere should be maintained until the roots get hold of the new compost.

HYBRIDS obtained from the use of O. Harryana form a race of robust and desirable additions well worthy of cultivation; the secondary hybrids display equal vigour, and as they have more or less lost the deflexed character of the petals of O. Harryana they are much more attractive than the primary hybrids, and also in cases where both parents have been hybrids there is an exceedingly wide variation in colour, which renders them all the more attractive and valuable. In the treatment of this section of hybrids we find that they, too, like the warmer conditions afforded O. Harryanum, and like reasonably moist and shady conditions, especially through the hottest months of the year. The reason shady conditions are mentioned is that the thick, fleshy leaves, are very liable to turn a reddish-brown colour, and if they become "over done" in this respect they quickly fall, and a considerable proportion of leafless pseudo-bulbs is not desirable in any odontoglossum. The hybrids and secondary hybrids flower at various seasons of the year, so that potting must be seen to according to the state of growth. There is one rule which may be followed with safety, and it is: Repot the plants that require attention as soon as the new roots make their appearance.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CHRYSANTHEMUMS.—These having now filled their pots with roots must receive manurial assistance. It is advisable, when possible, to frequently vary the manure to enable the plants to benefit from the different properties each manure contains. Manure of any description should not be applied when the soil is dry, or more harm than good will be done. The "taking of the bud" or disbudding of those plants intended for large blooms, will now require regular attention. The smaller buds surrounding the main one must be removed as soon as possible, and also all side growths when in a small state. See that the main flowering growths are securely tied to the stakes. Earwigs are a great pest, and must be kept down by regular examination of the plants. They may be trapped by placing pieces of hollow bamboo amongst the foliage, in which they will hide themselves; examine the traps first thing in the morning, and drop the pests into a pail of hot water. Bush plants must be kept regularly tied to enable them to become uniform in shape and present a tidy appearance.

SHOW PELARGONIUMS.—The old plants should now have fully ripened their wood and be ready for pruning. Cut them back close to the base of last year's wood, and stand them in a frame, keeping them exposed to all fine weather. Syringe the stems daily, but give little or no water until the new growths appear, and then only sufficient to keep them plump. When the new growths have attained an inch in length, turn the plants out of their pots, and reduce the ball of roots to about one-half. Cut away all the longest roots, and repot, using a pot just large enough to allow a small quantity of new soil to be placed round the roots. Replace them in the frame, but do not keep them too close. When they have recovered from the check occasioned by potting, and have again commenced to grow, air should be freely admitted. If an increase of stock is necessary, this may be obtained by utilising the shoots which have been cut off the old plants as cuttings.

PERPETUAL - FLOWERING CARNATIONS.—These are now growing freely, and will require support. One strong stake placed in the centre of the pot is quite sufficient, to which the growths may be tied as they advance. Fortnightly sprayings should be given to prevent rust making an appearance. This is best done in the evening, as is also syringing with soot water. See to it that the plants do not suffer from dryness at the roots, but at the same time do not allow the soil to become sodden. Careful attention at this time of the year will bring its own reward in strong, healthy plants, capable of producing first-rate blooms. — A. Grubb, Porter's Park Gardens.

HARDY FRUITS.

SUMMER PRUNING.—The summer pruning of all apples may now be taken in hand, commencing in the case of bush and trained trees at the top at the first operation, leaving the lower half for the second operation, which may be done a week later. This will not only mean a less severe check than would be the case if the trees were stopped from top to bottom, but will direct the flow of sap to the lower and weaker branches. All useless side growths should be stopped by breaking them off with the knife, there being no necessity for clean cuts in this instance, it being taken for granted that all growth requiring summer pruning will also require shortening at a later date. The operator should be quite conversant with the habit of growth and mode of fruiting of each variety. The subject of pruning is often taken lightly, but experienced fruit growers will admit that in the case of apples especially, many of the varieties depend entirely on the way pruning is carried out to bring them to a fruitful condition. Bramley's Seedling, Newton Wonder, Lady Sudeley, and many others carry the finest fruit at the tips of growth that may at the present time be furnished with at least a dozen leaves, thus proving the futility of advising the stopping by summer pruning at the sixth leaf. Exhibitors of apples will have noticed that year after year the very finest specimens will be found on the same branch, and even on the same spur or growth, hence the advisability of the best attention being paid to both summer and winter pruning. It may safely be said that with judicious pruning the fruit crop throughout the country could be easily doubled. The weakness for a cleanly-trimmed-up, "nicely pruned" tree is the cause in many instances of less fruit being produced than would be the case if it were allowed to run wild.

NUTS.—All wands and sappy growth should now be cleared, if this has not already been done, giving the trees as much light as possible right to the centres. In Kent, where many acres are devoted to nut culture, the trees are trained vase-shape to about 7ft. in height; the land is well cultivated and manured, and in good seasons the crop well repays attention thus given.

SWEET CHERRIES.—In garden culture a certain amount of pruning will be necessary to keep these within bounds. This is best carried out at the present time; the trees being full of sap, and the foliage still vigorous, knife wounds will soon heal over and all will be well. If the pruning should be deferred until winter, much damage would probably be caused by gumming, cherries being the most impatient of all fruits to the use of the knife.

MORELLO CHERRIES.—The trees are bearing heavy crops this year, and will need relief as soon as the fruit is ripe, part of the crop may be picked and sent to the kitchen as convenience offers, covering the remainder with wasp-proof netting, where it will remain in good condition until late in September or the beginning of October.

FRUIT ROOMS.—An early opportunity should be taken to set the fruit room in order. The walls should be limewashed, defective shelves and drawers repaired. Keep the room entirely open in order to have it dry and well aired.—J. Whittle, Cheveney Gardens.

THE KITCHEN GARDEN.

RUNNER BEANS.—These are moisture-loving plants, and during summers like the present they do not set their flowers properly unless help is given. I have seen numerous cases this season already which show the necessity very plainly, and the loss that is experienced where watering is not carried out. If thorough soakings are given the plants now, accompanied by manurial help, there will probably be a plentiful supply of beans through September, especially if a mulching is applied to the surface to conserve the moisture in the soil.

WINTER GREENS.—The Brassica crops that were planted out last month will now be established in their permanent beds. Much benefit will be given if they are lightly forked through, slightly earthing-up the stems as the work proceeds. Should there be any gaps in the rows, this will be found a convenient time to fill them up from the nursery beds, giving an ample soaking of water to settle the roots as soon as planted.

TOMATOES.—Outside tomatoes are very satisfactory this year where properly planted; they are fruiting very heavily, and not making much useless growth, consequently the plants require more than the usual attention in the matter of assistance with water, and with applications of manure to swell up the heavy crops. The plants that were raised for fruiting in pots during winter should be potted on before they are too tightly packed with roots, or it will weaken them. Subject them also to an open position to ensure sturdy growth. Good loam made porous with mortar rubble and sand is the best potting mixture. Allow space at the top for top-dressings of soil when placing them in their final pots.

EARLY POTATOES.—Potatoes, owing to the forcing weather we have experienced, will mature their tubers earlier than usual, and where it is found the crop is ripe, have it lifted and stored in the cool for use; the tubers will then eat much better than if allowed to remain in the heat. Sets that are required for planting next year should be selected at this time. These may be exposed for a little while until their skins are hardened and ready for storing in boxes for the winter.

HERBS.—Many of the herbs will be in condition for harvesting. With some cooks this is an important item, the demand being heavy for particular kinds. The kitchen gardener will do well to consider what is likely to be in demand the most, and arrange his quantities accordingly.

GENERAL REMARKS.—The present season has been a very difficult one for kitchen gardeners. Those that have been blessed with a good water supply have been fortunate. With late crops do everything possible by mulching and watering to carry them on till rain comes. Disturb the surface soil as often as practical where it can be carried out, and whenever seeds are sown give a thorough soaking to the ground previously.—Charles Flack, Cholmondeley Castle Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C

EXHIBITIONS AND MEETINGS.

◆

Leicester Flower Show.

AUGUST 7 AND 8.

The exhibition held in the Abbey Park, Leicester, on Tuesday and Wednesday last was, as usual, eminently successful, and fully maintained the traditions of the town in its relations to flower shows. There was a big display of plants, flowers, fruits, and vegetables; the arrangements were, as is customary, remarkable for their completeness; the weather was all that could have been desired, except that the temperature was abnormally high, and the spacious Abbey Park, of which the Leicester people are justly proud, was crowded throughout the whole of the period over which the exhibition extended. It is a point of some interest that the Leicester flower shows are under the direction of a committee consisting of members of the Corporation, with Mr. Councillor Collier, the chairman of the Parks Committee, as chairman, and, judging by the results, no better governing body could be desired. The shows are in no way associated with the rates, but are wholly self-supporting, and the profits, which are usually considerable, are devoted to the improvement of the public parks. Mr. J. Staynes is the hon. secretary, and Mr. J. Burton the superintendent of the Leicester Public Parks and Gardens, is the superintendent of the flower shows, and the manner in which the committee and these two officials perform their respective duties is such as to deserve, as indeed it receives, the highest praise.

The exhibition, as already stated, was a great success, but, as in the case of other shows held during the past fortnight, there was evidence of the injurious effects of the great heat and prolonged drought upon some products of the garden. This was especially marked upon roses and sweet peas, which have for a long run of years formed two important features of these great gatherings. Roses, if considerably below the average of previous years, both in numbers and development, were sufficient to form a large and attractive feature; but sweet peas, which for some years have required a huge marquee for their accommodation, were not represented by more than a dozen collections in the several classes, and these, although much care and attention had been lavished upon them by the exhibitors, were much below the high average of former years. Carnations and picotees were practically over at the beginning of the week in all parts of the country, and were consequently but sparingly shown. Fruit and vegetables were staged in immense numbers, and in exceptionally fine condition, and were certainly equal to the high average of previous years.

CUT FLOWERS.

There was a spirited contest for the prizes offered in the trade class for twenty-four roses, and, considerin gthe season, the blooms were throughout of high quality. The premier award was made in favour of Mr. Hugh Dickson, Belfast, who had superb blooms of George V., a dark crimson hybrid perpetual, which has the promise of becoming popular; John Ruskin, Mdme. Hausmann, Avoca, Caroline Testout, Lohengrin, Cardinal, George Laing Paul, Lyon, Comtesse Ludre, Earl of Warwick, and Her Majesty. Mr. W. H. Frettingham, Beeston, followed closely for second place with blooms of medium size and excellent finish, the bloom of Mdme. Prosper Langier being of remarkably high quality. Messrs. Perkins and Sons, Coventry, were third with an even box of blooms. The class for twelve blooms of any one variety was well filled, and Mr. Hugh Dickson was again first with grand blooms of George V. Messrs. Perkins and Sons were second with medium-sized, fresh, and well-coloured blooms of The Lyon, and Mr. W. H. Frettingham was third with an excellent box of Mrs. J. Laing. In competition for the prizes for twelve blooms of any tea rose, Mr. W. H. Frettingham and Messrs. Perkins and Sons were first and second, both staging richly-coloured blooms of Maréchal Niel.

This year a class was provided for arrangements of tea, hybrid tea, and noisette roses, and the two collections in competition formed a delightful feature. Mr. J. Barrow, Oadby, Leicester, was successful in obtaining premier honours with an arrangement characterised by much taste, Irish Elegance, The Lyon, and Gruss an Teplitz being used with good effect. Mr. Hugh Dickson was a close second, with an arrangement remarkable for the high quality of the blooms, but rather heavy.

There was a considerable falling off in the entries in the classes for roses, in which the competition was limited to amateur cultivators, but the number of blooms staged was sufficient to produce an effective display. The first prize in the class for twenty-four blooms was taken by Mr. G. Speight, Market Harborough, with an even set of blooms. The same exhibitor was first also for twelve blooms, followed by Mr. Weston for second place with blooms of good quality, but not well staged. In a second class for twelve roses, Mr. R. Clark, Beeston, was a capital second. The best box of six teas and noisettes was shown by Mr. W. Upton, who had neat blooms of well-known varieties. The second award was made in favour of Mr. G. Speight, and the third prize was awarded to Mr. Weston. Mr. M. Whittle, Leicester, occupied the first place in the class for six blooms of any one variety with well-finished examples of Frau Karl Druschki, and Mr. R. Clark was the second with Mrs. J. Laing. The class for four varieties, three blooms of each, was an interesting one, and Mr. R. Clark was a capital first with good blooms of The Lyon, Alfred Colomb, and Frau Karl Druschki. Mr. Weston second.

The classes filled by gardeners resident in the county of Leicester contained some of the finest roses in the show. Mr. M. Whittle obtained premier honours in the class for eighteen, with blooms of good size, fresh, and otherwise meritorious. Mr. W. Upton followed for second place. Mr. G. Speight occupied the first place for twelve, Mr. W. Upton was a good second, and Mr. M. Whittle third. Mr. Upton, who was first for six distinct, staged blooms of high quality, and Mr. M. Whittle had a good set for the second place. The exhibitor last named had the best box of six teas, and Mr. W. Upton the second best. The best six blooms of any one tea-scented variety were contributed by Mr. G. Speight, the variety being Maman Cochet.

Sweet peas have so fallen away during the past fortnight that but few of those who had entered were able to fulfil their entries. In the class provided by Mr. W. J. Unwin for twelve bunches, Mr. E. Lee, Kibworth, was first, and Mr. J. W. Woodsend, East Bridgeford, second.

In the class for six varieties, in which Robert Sydenham, Lim., provided the prizes, the first and second awards were made in favour of Mr. C. Illston, Barkby; Mr. J. Hudson, and Mr. Mayes.

In competition for the prizes given by Robert Sydenham, Lim., for twelve bunches, Mr. R. Hallam was first with small, but fresh flowers.

Hardy flowers were so largely and well shown as to form an attractive and highly interesting feature. Messrs. T B. Grove, Wyndly, Sutton Coldfields, was first for a collection with an exceptionally fine group. In the set were very fine vases of Achillea ptarmica The Pearl, E. eupatorium, and Liatris pycnostachya, Veronica subsessilis, Montbretia crocosmæflora, Tritoma lachesis, Eryngium Oliverianum, Statice Smithi, phloxes in variety, and Ligularia stenocephala. Messrs. J. Wright and Son, Leicester, were a capital second; and Mr. C. F. Oliver, Leicester, third. The collections were throughout too crowded to admit of the several subjects being seen at their best.

Carnations and picotees were more strongly represented than might have been expected. Messrs. A. R. Brown, Lim., King's Norton, were first for twelve yellow ground carnations, twelve white ground picotees, twelve selfs, and in a number of other classes. Carnations and picotees were liberally contributed to the amateurs' classes for these flowers, and the principal prize-takers were Mr. R. Makepeace, Mr. F. G. Duffey, Mr. J. Lumley, Mr. J. Rudkin, and Mr. J. H. Hill. Violas were less plentiful than usual, but those staged were of good quality. Messrs. W. Pemberton and Son, Walsall, were first for twelve varieties. These were attractively arranged in vases, but the whole of the flowers were unnamed, and the exhibit thereby lost much of its usefulness.

FLORAL ARRANGEMENTS.

Floral arrangements were plentiful and good. Messrs. Perkins and Son were first for a basket with an arrangement in which orchids and crinums predominated, these being relieved by narrow-leaved crotons and Asparagus plumosa. The same firm was first also for a hand bouquet and for a bride's bouquet, in which exquisite arrangements in orchids were freely used.

Floral decorations were also largely shown by amateurs in the local classes, and the best of the half-dozen baskets in competition was that shown by Mr. J. W. Barker. Mr. H. Widdowson was a close second. Mr. Barker was also successful in a strong competition in taking the first prize for a hand bouquet and also for a bride's bouquet. Bowls of roses were particularly meritorious, and the premier place was occupied by Mrs. C. Burton, 148, Harrow Road, with a beautiful arrangement of The Lyon. Mrs. H. Lloyd was a capital second, and Mr. Stephen Sims, Borrowash, was third.

GROUPS AND PLANTS.

As in previous years the contributions to the group classes filled a large marquee, and formed a glorious feature. Messrs. J. Cypher and Son, Cheltenham, were first with an arrangement equally remarkable for its richness of colouring and lightness. As a centrepiece Messrs. Cypher had a rustic arch embellished with ferns, palms, crotons, and various flowering plants, and at intervals along each side were tall, narrow-leaved, high-coloured crotons. The intervening spaces were filled with orchids in variety, lilies, and vallotas. Mr. A. Holmes, Chesterfield, was second with a remarkably good arrangement, the design being somewhat similar to that of Messrs. Cypher's; Mr. R. Manning, Dudley, third, with an arrangement possessing much beauty, and Mr. Vause, of Leamington, fourth. In the local class for groups Mr. Weston was first with a somewhat formal arrangement.

Zonal pelargoniums were shown as large bushes, and were throughout splendidly flowered. Mr. H. Rogers, Leicester, was first with huge, splendidly flowered specimens. Mr. C. Ward was second, staging two fine doubles, and Messrs. J. Wright and Son were third, also with specimens possessing much merit. Exotic ferns were of much merit, and for six specimens Mr. Weston, Hughenden, Leicester, obtained premier honours with finely developed specimens. Mr. H. Rogers, who was second, also staged well-grown specimens. Tuberous begonias were well shown in the class for four, and Messrs. J. Wright and Son, and Mr. W. H. Allen, who were first and second respectively, staged large, finely-flowered specimens.

The class for eight miscellaneous plants brought out a strong competition, and Mr. A. Grace, who obtained premier honours, had zonal pelargoniums, begonias, ferns, and fuchsias in a high state of development. Mr. J. Moore was a very close second, having for his best plants Asparagus plumosa and A. Sprengeri.

FRUIT AND VEGETABLES.

The tables of dessert fruits were more numerous than usual, and on the whole were of high quality. For six kinds Mr. T. Ireland, Newstead Abbey, Notts, occupied the post of honour with Madresfield Court and Muscat of Alexandria grapes of high quality, and excellent peaches, nectarines, and plums. Mr. Parker, gardener to J. Drake, Esq., Market Rasen, was a capital second; and Mr. J. H. Goodacre, Elvaston Castle, Derby, third. The exhibitor last named was first for nine dishes with magnificent clusters of Muscat of Alexandria and Madresfield Court grapes, and excellent peaches, nectarines, and figs. Mr. Parker was first also for the floral arrangements of the table, as in the preceding class. Mr. Ireland, who was second, also staged well, and Mr. J. H. Goodacre was third.

Grapes, peaches, nectarines, melons, and apples were largely and well shown in the single-dish classes, the principal prize-takers being much the same as in the classes for dessert tables.

Vegetables were staged in immense quantities and of a high degree of excellence. In a strong competition for the prizes offered by Messrs. E. Webb and Sons for six kinds, Mr. J. Hudson, Leicester, was a splendid first with fine examples of Ailsa Craig onion, Webb's Emperor tomato, Defiance Marrowfat pea, and other well-known kinds. Mr. Owen Hartshorn, Thurmaston, was a good second, and Mr. N. Buxton, Gidling, Notts, third. Very keen was the competition in Messrs. Sutton and Sons' class for six kinds, and the premier place was occupied by Mr. J. Hudson, who had Gladiator potato, Sutton's A1 tomato, New Red Intermediate carrot, and peas at their best. Mr. J. Knight was a good second, and Mr. E. Jackson third. The contest was spirited in the class for ten kinds, in which the prizes were provided by Messrs. Harrison and Son. Here, as in the other classes, Mr. J. Hudson received the premier award for produce of exceptional merit. Mr. J. Cauk was second with a collection representing cultural skill of a high order.

The competition in the society's class for twelve distinct kinds was not less spirited than in those mentioned above, and the produce generally was exceptionally good for so trying a season. Mr. J. Hudson added to his many honours by taking the premier award with vegetables of the highest quality. The more noteworthy dishes were those of Centenary pea, Gladiator potato, New Red Intermediate carrot, Ailsa Craig onion, Matchless cucumber, Tender and True tomato, and pink celery.

MISCELLANEOUS CONTRIBUTIONS.

A magnificent collection of hardy flowers was exhibited by Mr. Frank Bouskill, Market Harborough, the hon. secretary of the Hardy Plant Society. The collection, arranged at the end of one of the large marquees, proved immensely attractive, and afforded a conclusive proof of the value of good cultivation in a season such as this. Very fine were the gaillardias, erigerons, tritomas, and single and double perennial sunflowers.

One of the most noteworthy of the many miscellaneous contributions to the exhibition was the magnificent collection of flowers and vegetables exhibited by Messrs. E. Webb and Sons, Wordsley. Especially conspicuous in the collection were Hero of Lockinge, Queen Victoria, Emperor, Sensation, and Viceroy tomatoes; Long White and Moore's Cream vegetable marrows; Reliance and Satisfaction beets; Webb's Distinction, Stourbridge Marrow, and New Defiance peas; Webb's Market Favourite and Defiance carrots; Masterpiece and Ringleader onions; Webb's Chieftain and Progress potatoes. Chief among the flowers used in beautifying the stages, in association with the vegetables, were the sweet peas. Messrs. Clibran, Altrincham, staged a large collection of sweet peas. Mr. F. E. Riddle, an amateur cultivator, 31, Belgrave Gate, Leicester, had collections of well-grown stocks and sweet peas. Messrs. Harrison and Son exhibited annual flowers, including sweet peas in great variety, and a large gathering of gaillardias, including Lady Rolleston, a distinct and attractive variety with large yellow flowers. In this class Mr. W. A. Ballard, 201, Abbey Lane, Leicester, exhibited an extensive collection of early-flowering chrysanthemums, which was tastefully arranged, and formed an attractive feature.

Exotic ferns in great variety were admirably shown by Mr. H. N. Ellison, West Bromwich, the newer varieties of the Nephrolepis exaltata being especially noteworthy for beauty and high culture. From Mr. L. S. Harbuth, Charnwood Street, Leicester, came a large and attractive collection of hardy flowers. Mr. Charles Warner, Abbey Nurseries, Leicester, staged a comprehensive collection of phloxes, in which the varieties were represented at their best. Messrs. J. Wright and Sons, Leicester, exhibited a tastefully arranged collection of plants at one end of the marquee devoted to groups. At the other end Mr. H. Rogers had an effective arrangement.

CUP AND MEDAL AWARDS.

Silver Cup.—Messrs. E. Webb and Son, for vegetables and flowers.

Gold Medals.—Messrs. J. Wright and Sons, for miscellaneous plants; Mr. C. Warner, for cut flowers and shrubs; Messrs. Clibran, for sweet peas; Mr. H. Rogers, for miscellaneous plants; Mr. F. Bouskill, for hardy flowers.

Silver Medal.—Mr. H. N. Ellison, for exotic ferns; Mr. F. E. Riddle, for cut flowers; Mr. A. W. Ballard, for early chrysanthemums; and Messrs. Harrison and Sons, for sweet peas, etc.

Bury.

AUGUST 3-7.

The third horticultural show held under the auspices of the Royal Lancashire Agricultural Society, in conjunction with their annual exhibition at Bury gave evidence of the season in a decrease of entries, although the quality generally was excellent.

In the class for a group of miscellaneous plants, Messrs. James Cypher and Sons, Cheltenham, occupied their usual leading position with a combination of great charm and brilliance. The crotons were highly coloured, and were the most prominent feature; these were backed up by caladiums, palms, and alocasias, with ixoras, cattleyas, and liliums as flowering plants. Mr. W. A. Holmes, Chesterfield, was second.

For twelve stove or greenhouse plants, the Messrs. Cypher again took the lead, staging fine plants of Croton Flambeau, C. Warreni, Kentia Fosteriana, K. australis, Latania borbonica, Chironia ixifera, Clerodendron Thomsonæ, Erica obbata magnifica, Statice intermedia, Rondoletia speciosa major, etc. For twelve stove or greenhouse plants, in pots not exceeding ten inches diameter, the Cheltenham firm was again first with good plants. Mr. W. Holmes scored for six exotic ferns, and showed a splendid plant of Adiantum cuneatum elegans. Messrs. Cypher and Sons were to the fore with six orchids, staging Cattleya Gaskelliana, Cypripedium Curtisi, Vanda cærulea, etc.

The class for a table of cut flowers, 100 square feet, led to a difficulty, as roses were competing against herbaceous and border flowers. Mr. Hugh Dickson, Belfast, was adjudged the winner of the silver cup and first prize for a splendid array of roses; and Mr. J. Saul, Preston, also scored with a fine table of liliums, gladiolus, etc.

Sweet peas were present in quantity, and in some cases of good quality. For eighteen varieties, Mr. F. Hindley, Lymm, was first with an excellent lot, and he also won for twelve varieties. In the amateurs' section Mr. Edgar M. Allen, Formby, had the best twelve varieties, and for six varieties was first with a grand lot, securing the silver cup for the best sweet peas cultivated in the county. In other classes, Messrs. C. E. Taylor, F. J. Smith, G. Laywell, J. N. Fell, and J. Howarth were first prizemen.

Mr. C. F. Waters, Balcombe, led for a collection of cut perpetual carnations, and Mr. J. Gibson, Bedale, led for hardy perennials with a grand lot. Roses were in fine form. For twenty-four, distinct, blooms, Mr. Hugh Dickson, Belfast, took the lead, whilst Messrs. Alex. Dickson and Sons led for a dozen blooms. In the amateur section, Mr. J. B. Walmsley, Bromley, took the lead, also securing the silver cup for the best in the county. Messrs. H. Clark, Leeds, secured four firsts with dahlias.

For twelve dishes of fruit, Mr. J. Gibson, gardener to the Duke of Portland, Welbeck Abbey, had the premier lot, with good Madresfield Court grapes, Crimson Galande peaches, Humbolt nectarines, etc.; Mr. G. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, second.

Gold medals were awarded to Messrs. Dickson, Brown, and Tait, Manchester, for a splendid collection of tomatoes, cut, and in pots, comprising about 100 varieties; to Mr. R. Bolton, Carnforth, for sweet peas; to Messrs. H. B. May and Son, Edmonton, for ferns; and to Messrs. Alex. Dickson and Sons, Newtownards, for a fine display of cut roses. Silver medals were awarded to Mr. H. Middlehurst for sweet peas; and to Messrs. Bolton Bros. for ferns.

The following firms made displays at their own pavilions: Messrs. Clibrans, vegetables and sweet peas; Messrs. Dicksons, liliums, gladiolus, and vegetables; Messrs. Toogood and Sons, gladiolus, spiræas, etc.; and Messrs. Dickson, Brown, and Tait, scabious, carnations, gladiolus, etc.

National Carnation Society.

(MIDLAND SECTION.)

Midland carnation growers had a woeful time on Wednesday, August 2, when their annual show was opened in the Botanical Gardens, Edgbaston, Birmingham. The season throughout has, as everyone knows, been one of the most trying on record, and not only have flowers opened early, but they have lacked the substance necessary to withstand great heat. This has, of course, resulted in a scarcity of flowers.

Notwithstanding these untoward circumstances, the display of flowers was a very attractive and interesting one, capable of exciting the enthusiasm of the gathering of keen florists who doted over their flowers and discussed their individual points and charms after the manner of the old-time florist, who, after all, will not become extinct in England so long as the Birmingham enthusiasts remain with us. Needless to say, the show was admirably managed, and everybody appeared to be very happy in spite of their struggles to keep their flowers in form.

DRESSED BLOOMS.

The first class in the schedule was for twelve blooms of selfs, distinct, shown on cards. There were five entries, the winning exhibit being staged by Messrs. A. R. Brown. Lim., King's Norton. Considering the season, the flowers were creditable examples. Sam Hathaway, Cambria, and Iberia were the yellows; Mrs. F. J. Johnston, W. H. Parton, and Mrs. Geo. Marshall, crimsons; the latter being of good size, beautiful rich colour and substance. The other flowers on the stand were Everest, Alfonso, Elizabeth Shiffner, Mrs. R. B. Waite, Sidney, and Royal Velvet, the last-named being a new purple of fine quality. Second prize went to Mr. C. J. White, Walsall, who showed passably good flowers of John Knox, Blazer, Medox, and others. Mr. C. H. Herbert, Acocks Green, was third; fourth going to Mr. H. Mathias, Medstead, Hants; and fifth to Mr. C. F. Thurston, Wolverhampton.

Twelve fancies saw Mr. A. W. Jones, Stechford, come to the front, his flowers being large, and shown in good style; the varieties were Mrs. Leo. Hunter, Erl King, Pathfinder, Linkman, Lord Steyne, Billy Barlow, Father O'Flynn, Gloriosa, Linkman (sport), Liberte, Hengist, and Queen Eleanor. Messrs. A. R.

Brown, Lim., made a good fight for second place, Westfield Seedling being particularly good on their stand. Third was taken by Mr. H. Mathias; and fourth by Mr. C. H. Herbert; Mr. C. J. White, Walsall, being fifth.

Mr. H. Mathias scored for twelve yellow-ground picotees, showing some good-petalled flowers of nice quality, and clean. Corona was good, winning premier in its class. Messrs A. R. Brown, Lim., were again second, their blooms being slightly smaller than those staged by the winner. Mr. C. H. Herbert claimed third, fourth going to Mr. C. F. Thurston, and fifth to Mr. C. J. White. In the white-ground picotees the winning dozen came from Messrs. A. R. Brown, Lim., who showed very neat, clean flowers of John Smith, Muriel Stevens, Lavinia, Duchess of York, and other varieties of up to date quality. Second went to Mr. C. H. Herbert, who had a nice bloom of Amy Robsart, and a pretty Carrie Goodfellow on his stand; the other prizes went to Mr. C. J. White and Mr. H. Mathias. Messrs. A. R. Brown maintained their lead in the twelve flakes and bizarres, being followed by Mr. C. F. Thurston and Mr. H. Mathias in the order named.

VASE CLASSES.

For the first time the open class for undressed flowers were all arranged in triplets of distinct varieties, the winners in the self class being Messrs. A. R. Brown, Lim., with a nice stand of blooms. Cambria, the perfectly formed and clear-coloured yellow, was well staged; the other varieties being Mrs. Geo. Marshall, Crystal, Miss Alley, Signal Light, and Ayesha. Mr. C. H. Herbert took second place, his blooms showing signs of suffering from the heat.

The Messrs. Brown could not be wrested from their leading position in the class for six fancies, although Mr. C. J. White showed very creditably for second place. Again, for both yellow and white ground picotees, the Messrs. Brown came off victorious. In the white-grounds the triplet of Lady Sybil was really exquisite. Mr. C. H. Herbert took second in the yellow-grounds, and Mr. H. Mathias third.

SECOND DIVISION (AMATEURS ONLY).

There was not the competition in this section we are accustomed to see, several well-known growers being unable to show this year. However, the display was not unworthy of praise, the real wonder being that growers could find flowers at all.

For the six selfs on cards, first prize went to Mr. F. W. Goodfellow, Walsall, with Blazer, Angelia, W. H. Parton, Hadzor, Miss Willmott, and Elizabeth Shiffner. Rev. C. A. Gottwaltz, Droitwich, second; and Mr. C. F. Budenberg, Marple, third.

Mr. Goodfellow scored again with six fancies, Erl King and Pathfinder being good. Rev. C. A. Gottwaltz still kept second place with neat flowers of nice quality; third place was given Mr. C. F. Budenberg, and fourth to Mr. E. J. Price, Bournville. Three entries for yellow ground picotees brought first for Mr. Goodfellow, Mr. C. F. Budenberg and Rev. C. A. Gottwaltz being second and third. Mr. Goodfellow took still another first for six white picotees, the second being claimed by Rev. C. A. Gottwaltz, and Mr. Budenberg bringing up the rear.

In the second division the undressed flowers were shown in triplets, three varieties being required in each class. Mr. C. F. Budenberg won for selfs with Elizabeth Shiffner, Mrs. George Marshall, and Daffodil; the second prize lot was staged by Rev. C. A. Gottwaltz, his varieties being John Pope, Sir Galahad, and Mrs. George Marshall. Mr. Budenberg came first again for three triplets of fancies, with Father O'Flynn, Mandarin, and The Seer. Mr. F. W. Goodfellow had Hidalgo, Linkman, and Mandarin for his second prize exhibit; Rev. Gottwaltz being third. Mr. Budenberg had the best yellow ground picotees, and also the best whites, but there was little real quality in either class.

THIRD DIVISION.

This division is open only to amateurs who do not employ a gardener regularly, nor advertise plants for sale; it might still be reckoned a section open only to specialists, for the amateur carnation grower, especially in the Midlands, is far removed from the ordinary amateur gardener. He knows his flowers as parents know their children, and stages with the utmost care.

Seven entries were forthcoming in the class for six white ground fancies or picotees on cards, Mr. J. B. Willetts, Yardley, leading with a neat stand. Mr. J. T. Sinister, Denstone was second, and Mr. W. Rogerson third.

Six selfs brought eleven entries, and there were a few fairly good flowers staged. Mr. J. H. Camm, 46, Broomfield, Smethwick, scored, Daffodil being quite a good flower. Mr. W. C. Flanders, Derby, was second, and Mr. W. Rogerson third. Mr. J. H. Camm led once more in the yellow grounds; second, Mr. J. B. Willetts, and third, Mr. J. L. Sinister.

In this section there were classes for six single blooms, distinct, shown in separate vases. Eight competitors staged in the six selfs, among whom Mr. W. Rogerson, Mellor, was first with Conrad, Elizabeth Shiffner, and other good varieties. Mr. J. B. Willetts stood second, and Mr. W. H. Clements, King's Norton, third. Among nine entries for the six fancies the winner was Mr. J. B. Willetts, second going to Mr. W. H. Bailey, Erdington, and third to Mr. W. Rogerson.

There were classes for triplets of any one variety, the best self being Elizabeth Shiffner, shown by Mr. J. B. Willetts. Mr. Rogerson showed Hidago in the fancy class, with which he secured first. Togo won the yellow picotee prize for Mr. W. C. Flanders, and W. E. Dickson was the winning white ground put up by Mr. W. Rogerson.

PREMIER BLOOMS.

The premier awards given for the best blooms staged in each separate section always create a great deal of interest, and it is here that one realises the intensity of the true florist's love for his flowers. Every grower and exhibitor hovers round the premier bloom in the class that claims his special affection, and it may be said that every petal of a winning flower is subjected to the closest inspection. The premier blooms on this occasion were as follows:

Dressed Flowers.—Bizarre: Robert Holgrave, exhibited by Mr. C. F. Thurston. Flake: George Melville, from the same exhibitor. Heavy-edged white ground picotee: Mr. F. W. Goodfellow's Clementine, who also had the premier wire-edged white ground in Fair Maiden. Mr. H. Mathias scored for both heavy and light-edged yellow grounds, the former being a good flower of Corona, the light-edged being Exquisite. Mrs. Leo Hunter was the premier yellow ground fancy, staged by Mr. A. W. Jones, Mr. J. H. Camm's Daffodil being given pride of place among the selfs.

Undressed Flowers.—Daffodil again won the selfs, the exhibitor being Mr. C. F. Budenberg. The best fancy was Hidalgo, staged by Mr. C. J. White, Exquisite again winning in the yellow ground picotees for Mr. H. Mathias, the award for white grounds going to Messrs. A. R. Brown's Lady Sybil.

The silver medal for most points in the first division was won by Messrs. A. R. Brown, Lim., who scored 204 points, Mr. C. H. Herbert winning the bronze medal with 84 points.

In the second division Mr. Budenberg took silver medal with 116 points, Mr. Goodfellow securing the bronze with 96 points.

Mr. J. B. Willetts received the silver medal in the third division, scoring 68 points against Mr. W. Rogerson's 60 points for second place.

Messrs. Gunn and Sons, Olton, were awarded a silver-gilt medal for a bright and attractive display of garden roses, a silver medal being allotted to Messrs. W. H. Simpson and Sons, Birmingham, for a big table of sweet peas.

Scottish Horticultural Association.

The August meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 1st inst. Mr. Massie, the president, was in the chair, and there was an attendance of 70 members.

Mr. Thomas Hay, Greenwich Park, late of Hopetoun Gardens, contributed a paper on "The Perpetual-flowering Carnation," which, in his absence, was read by the secretary. As regards a structure in which to grow and flower these plants, Mr. Hay considered a span-roof house, with side stages and a centre path running north and south so as to get the full benefit of the sun's rays in the autumn and winter months, to be the best. The stage should be covered with gravel or ashes, and there should be sufficient height at the back of the stage for the plants, which, when in flower, were from three to four feet high.

The best way to propagate was by cuttings taken with a "heel," and placed near the edge of a 3½in. pot, in a compost of loam, leaf-soil, and sand. These he placed in a temporary case on a melon-house stage, with a night temperature of 60 degrees, and after they were rooted they were potted off using 2in. pots, and placed on a shelf near the glass, where they remained for another three weeks, when they were removed to a cooler house. When about 6 to 8 inches high the growths were stopped, pinching hard so as to get well-shaped specimens, and when the young shoots were about an inch long the plants were shifted into 3½ or 4in. pots, a larger proportion of loam and a pinch of soot being used in the compost. At this stage an ordinary greenhouse would suit them, and in a month or six weeks the earliest rooted plants would be ready for their final potting 6, 7, or 8in. pots being used. Strong growers like Britannia and Mrs. Burnett required 8in. pots, but Mikado and Enchantress should be grown in 7in. pots. To prolong the flowering period, stopping at intervals was necessary, some shoots being stopped, while others were allowed to flower. September was soon enough for the first flowers, as there were plenty of other flowers earlier, and if the plants had been properly managed flowers would be provided all through the winter, and in abundance in March and April. Careful watering and abundance of fresh air, except during hard frost, was necessary, and for large, well-developed flowers it was necessary to disbud. He thought that when the preparation of the perpetual carnation for bedding purposes was properly understood it would be planted all over the country, and in time would supersede the border carnation altogether for outdoor decoration.

The president and several of the members made some remarks on the subject, and Mr. Hay received a very hearty vote of thanks.

The exhibits were: Dwarf polyantha rose Jessie and African and French marigolds from Messrs. Dobbie and Co., Edinburgh; strawberries Givon's Late and The MacMahon, tomato Gilbert's Improved Sunrise, and black currant Scarlett's Edina, from the City of Edinburgh Distress Committee's farm at Murieston, per Mr. Cairns; pyramid-trained gooseberries from Messrs. Storrie and Storrie, Glencarse, Perthshire; and Eucomis punctata, from Mr. A. Johnstone, Hay Lodge, Edinburgh.

Four new members were elected.

At the meeting on September 5, Mr. Porter, market gardener, Davidson's Mains, Midlothian, will read a paper on "Montbretias."

It was intimated during the evening that the following address of welcome had been forwarded to the Secretary for Scotland for presentation to the King on the occasion of their Majesties' first state visit to Scotland:

To the King's Most Excellent Majesty.

May it please your Majesty,

We, the office-bearers and members of the Scottish Horticultural Association, on the occasion of this the first state visit of your Majesty and Her Majesty Queen Mary to the capital of your ancient kingdom of Scotland since your accession to the throne, humbly offer to your Majesty and your Royal Consort our respectful greetings and a most cordial welcome, and we also desire to renew our assurance of loyalty to your Majesty's person and throne.

Representing as we do a large proportion of those of your Majesty's subjects who are engaged in horticulture, and recognising the ameliorating and refining influence which it has on the people generally, we rejoice to know that your Majesties take such a deep interest in everything which pertains to it, and we humbly venture to express the hope that during your sojourn in our midst your Majesties may receive a favourable impression of its prosecution in your northern kingdom. We also humbly venture to express the hope that this may be but the forerunner of many such visits to your historic palace of Holyrood.

It is our earnest wish and prayer that your Majesties may be long spared to reign over a happy and contented people, and that during your reign peace and prosperity may obtain in all the lands which own allegiance to your Crown.

Signed on behalf of the office-bearers and members of the association this fifteenth day of July, nineteen hundred and eleven,

W. H. MASSIE, President.
A. D. RICHARDSON, Secretary.

It was also intimated that a basket of Scotch-grown roses had been presented to Her Majesty the Queen by the president and Council. The roses, which were grown in their Royal nurseries at Craigmillar, were presented by Messrs. Dickson and Co., and the basket was arranged by Mr. Thomas Fortune, florist, Edinburgh. The following letter was received from Her Majesty's private secretary in acknowledgment of the flowers:

Holyrood Palace,
July 20, 1911.

Dear Sir,—I have handed to the Queen the beautiful basket of Scotch-grown roses which the president and you brought to the palace this morning.

Her Majesty is greatly pleased with the flowers, and commands me to write at once and ask you to be good enough to convey to the president and Council of the Scottish Horticultural Association her deep sense of appreciation of, and grateful thanks for, their kind and charming gift.—I am, yours faithfully,

E. W. WALLINGTON.

A. D. Richardson, Esq.

Broughty Ferry Horticultural Association.

The Sweet Pea, Rose, and Hardy Flower Conference in connection with this association was held on the 2nd inst. Taken as a whole, the quality of sweet pea flowers was not up to the standard of last year. This might be directly attributed to the long spell of drought and intense heat experienced on the east coast of Scotland, making watering by artificial means the main point in cultivation. Where anything like high-class quality was in evidence, one could trace success to the diligence and time at the disposal of the cultivator, and from the exhibits the following may be mentioned as the cream of the varieties shown: Mrs. Henry Bell, Mrs. C. W. Breadmore, Doris Burt, Mrs. Alic Ware, Helen Lewis, John Ingman, Edna Unwin, Nancy Perkin, Earl Spencer, Thomas Stevenson, Edrom Beauty, Maud Holmes, George Stark, Paradise Crimson, Tom Bolton, Othello Spencer, Florence Nightingale, Flora Norton, Mrs. Townsend, Etta Dyke, White Spencer, Picotee, Clara Curtis, Evelyn Hemus, Elsie Herbert, Mrs. Hardcastle Sykes, Asta Ohn, The Marquis, and Constance Oliver.

The principal medallists were: Messrs. Thyne and Son, Meric Muir Nurseries, Downfield; and Mr. Robert Brown, Eathiebeaton Gardens. Other prominent winners were: Messrs. George Reid, Invertay Gardens; George Masson, Aystrie Gardens; D. K. Meston, The Lodge Gardens; D. Kiellor, Seabourne Gardens; Wm. Grieve, Hazelwood Gardens; and P. Campbell, Forbescourt Gardens; all in Broughty Ferry. Some of these names could also be found amongst the winners for roses and hardy flowers, which, however, were only a poor display.

Non-competitive exhibits were a source of attraction, adding to the beauty of the show, and contributing to the general interest. The President's exhibit did credit not only to himself and the association, but to the Grange Gardens, where all-round good cultivation is always displayed. A table of dessert fruits consisted of Black Hamburgh and Foster's Seedling grapes, Barrington peaches, Pine Apple nectarines, Williams' Bon Chretien pears, Cox's Orange Pippin apples, etc., deftly arranged by Mr. Bethel with sweet peas Clara Curtis, Paradise Ivory, Nancy Perkin, and Earl Spencer.

Mr. William Grant, Fern Hall Gardens, set up a very effective table of sweet peas in about 60 varieties, which might have done him credit in competition in some of the classes. A table of sweet peas, apples in prolific abundance, still on the branches, vegetables, etc., made up a composite table from Mr. Wm. Christeson, Brackenbrae Gardens.

A large ripe melon, Sutton's Fertility, weighing 8lb., shown by Mr. George Masson, Aystrie Gardens, was a revelation to many in the matter of size. Cactus dahlias from Mr. D. Keillor, Seabourne Gardens, and two huge plants of well-flowered marguerites, growing in garden vases, from Mr. D. K. Meston, The Lodge Gardens, were a set off to the platform.

The trade was represented by Messrs. Laird and Sinclair, and Messrs. D. and W. Croll, the former exhibiting sweet peas, roses, and hardy flowers, in choice variety, well set up in artistic effect. The latter firm showed of their specialities in roses, Dorothy Perkins, Madame Ravary, The Lyon, Hiawatha, etc., making a bold background to the formal stands of handsome blooms, set out among vases of carnations, liliums, etc.

Mr. Robert Stewart, horticultural builder, had on view "Coronation" chairs, which are handsome and useful ornaments for the garden.

Prescot.

AUGUST 7.

This annual fixture was again held in Knowsley Park by kind permission of the Right Hon. Earl of Derby. A considerable falling-off in the exhibits was noticeable, leaving lengths of unfurnished tabling, which greatly detracted from the effect of the exhibition.

For a collection of plants arranged for effect, Mr. W. H. Roberts, gardener to F. Dixon Nuttall, Esq., was first with crotons, palms, carnations, caladiums, etc.; Mr. J. Barker, gardener to F. R. Dixon Nuttall, Esq., was second.

Two palms: Mr. J. George, gardener to T. Henshaw, Esq., was first, and for four stove or greenhouse plants, not less than two in flower, Mr. D. McKelvie, gardener to J. Stone, Esq., led with Clerodendron Balfouri, crotons, etc.; and Mr. W. H. Roberts was second.

For four greenhouse plants in flower Mr. W. H. Roberts proved the winner, and for one plant Mr. D. McKelvie scored with a well-flowered Gloriosa superba. For one foliage plant Mr. D. McKelvie led with a fair croton, and for one fern Mr. W. H. Roberts won with a well-grown nephrolepis. Four caladiums found Mr. C. Houghton, gardener to E. Shorrock Eccles, Esq., to the front with fine specimens; Mr. J. W. Barker second with plants of good merit. For one plant Mr. C. Houghton again led, and these two classes were the outstanding feature of the show.

For four stove or greenhouse ferns, Mr. W. H. Roberts led with fresh plants, and for four begonias Mr. E. Lambert, gardener to F. C. Hall, Esq., took the lead. Mr. J. Barker took the lead for four zonal geraniums, and for three fuchsias Mr. W. H. Roberts led with good plants.

Eighteen cut roses found Mr. J. Barker to the front, and for twelve Mr. C. Houghton led. In the class for a collection of hardy herbaceous cut flowers Mr. J. George led with good bunches, and for eight bunches of sweet peas and twelve dahlias Mr. J. George was the winner.

Four dishes of fruit brought Mr. D. McKelvie to the front with Madresfield Court grapes, Crimson Galande peaches, etc.; second, Mr. W. Oldham, gardener to J. Beecham, Esq. Mr. Oldham had both the leading black and white grapes, the latter well-coloured Buckland Sweetwater.

For a collection of vegetables, nine varieties, Mr. J. George was well ahead, having good cauliflowers, leeks, onions, etc. Mr. W. J. Roberts and Mr. J. Barker took the remaining awards.

Royal Scottish Arboricultural Society.

A general meeting of this society was held in the showyard of the Highland and Agricultural Society at Inverness, and there was a large attendance, including many gentlemen who are interested in the work of the society. Sir John Stirling Maxwell, Bart., of Pollok, president, occupied the chair.

In opening the proceedings, Sir John said he had to report what progress had been made in the steps towards sylviculture in Scotland, which the society had been pressing on the Government for years. He was glad to say that in the few months which had elapsed since the annual meeting in Edinburgh some progress had to be recorded. They had only within the last few days a report published on behalf of the Development Commissioners, in which they have laid down an outline of the policy of forestry development in Scotland, which he thought their society would be able to accept as intelligent and comprehensive in its character. That development grant was voted by Parliament, and one of the primary objects of its being voted was for the development of forestry. Therefore, the movement in which they were interested had a very early claim upon the assistance from that grant. The Development Commissioners had now happily laid down a general outline for the kind of development they considered possible, and this, he thought, their society would be able to accept without much reserve. Since their meeting in Edinburgh, the Secretary for Scotland (Lord Pentland), had already shown his interest in the movement, and had appointed a small committee to formulate a scheme which his department might lay before the Development Commissioners. That committee was composed of seven members, four of them being members of that society, and three of that four were members of the council of that society, so that their society might claim to be adequately represented.

The committee was now at work, and he hoped that before very long it would formulate a scheme for the development of forestry, which the Secretary for Scotland might lay before the Commissioners, and they might hope to see realised. Of course, their society had been working too long at that movement to mistake words for deeds, but he thought that they had never had the Government so friendly to the development of forestry. He expected the society would watch very anxiously everything that had been done in that direction, and he would add, for the benefit of any of the younger members, that the change they now saw in the attitude of the Government to their movement was not the result of this year or last year or the year before, but the result of the work the society had steadily done, and had been doing for more than a generation; and it must be a satisfaction to some of the older members for the energy they had devoted so long to the subject. He was reminded that since their last meeting Lord Lovat and Captain Stirling, of Keir, had made a survey of part of Inverness-shire, which had been published. He thought that from what he had learned on all sides, the society had no reason to regret having embarked on that enterprise.

The Secretary reported that the following had received Royal Scottish Arboricultural Society medals in connection with the essay competition: Class I.—"The raising and management of thorn hedges, and the comparative merits of various local methods": 1, silver medal, W. H. Whellens, Camlorgan Nursery, Ruthwell; 2, bronze medal, J. Ferguson, Gregynog Lodge, Newton, Montgomeryshire. "On the best method of planting at high altitudes and in exposed situations, together with the best species of trees to plant there with the object of procuring (a) shelter for stock, and (b) a profitable timber crop; with three illustrations"—2, silver medal, A. W. B. Edwards, Hollybank, Thirlmere. "The propagation in Wales of exotic conifers from seeds collected from trees grown in Wales"—bronze medal, J. Ferguson, Montgomeryshire. "The valuation of standing timber"—bronze medal, W. H. Whellens. Class II.—"A collection of notes of sylvicultural interest based on personal observation"—bronze medal, J. Brown Carmichael, Thorsby Park, Allerton.

Brodie of Brodie, who was one of the judges in connection with the forestry exhibition, gave in his report, which was exceedingly complimentary to all concerned, and he and the other judges were, on the motion of the chairman, heartily thanked by the meeting for their capital work. A hearty vote of thanks was also given to the Northern Branch of the society, who had given great assistance to the society in all the work connected with the arrangements for the show. A similar compliment was also paid the Highland and Agricultural Society of Scotland for providing prizes and giving space for their show.

With regard to the excursion for 1912, the Chairman said the council had come to the conclusion that Deeside (which embraces Aberdeenshire and Kincardineshire) would probably be a good district to visit. They thought of proposing an excursion abroad, but most people they consulted thought it would be rather too soon after their last one, and that it would be better to leave it over until the following year. The society had not visited Deeside since 1887, and it was considered that an excursion to that district now would be more interesting to those who had visited then than to those who had not visited it at all. The council would recommend that the excursion should be to Deeside, and, as usual, about the end of June or the beginning of July.

The appointment by the council of Mr. Fred Moon, Western Australia, as a correspondent of the society was confirmed. The Secretary said that a notice of motion had been given by Mr. Richardson for next meeting. Its effect would be to prevent the return of old members to the council, and to introduce new blood.

A hearty vote of thanks to Sir John for presiding was enthusiastically passed.

Bournemouth Gardeners' Association.

On August 1 the members of this association paid an evening visit to the Riverslea Nurseries, Christchurch, by kind permission of Mr. Maurice Prichard.

Every courtesy was shown to the visitors, and the most interesting features, which were many and varied, pointed out. Altogether about twenty acres of herbaceous and alpine plants are grown, and, considering the unusually dry spell of weather which we have lately experienced, the plants and flowers looked remarkably well. Altogether the outing was a very instructive and enjoyable one, and the thanks of the members were accorded Mr. Prichard and his assistants for the kindness shown them.

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers is "Dahlias and Their Cultivation," by J. B. Wroe. Price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

ANSWERS TO CORRESPONDENTS.

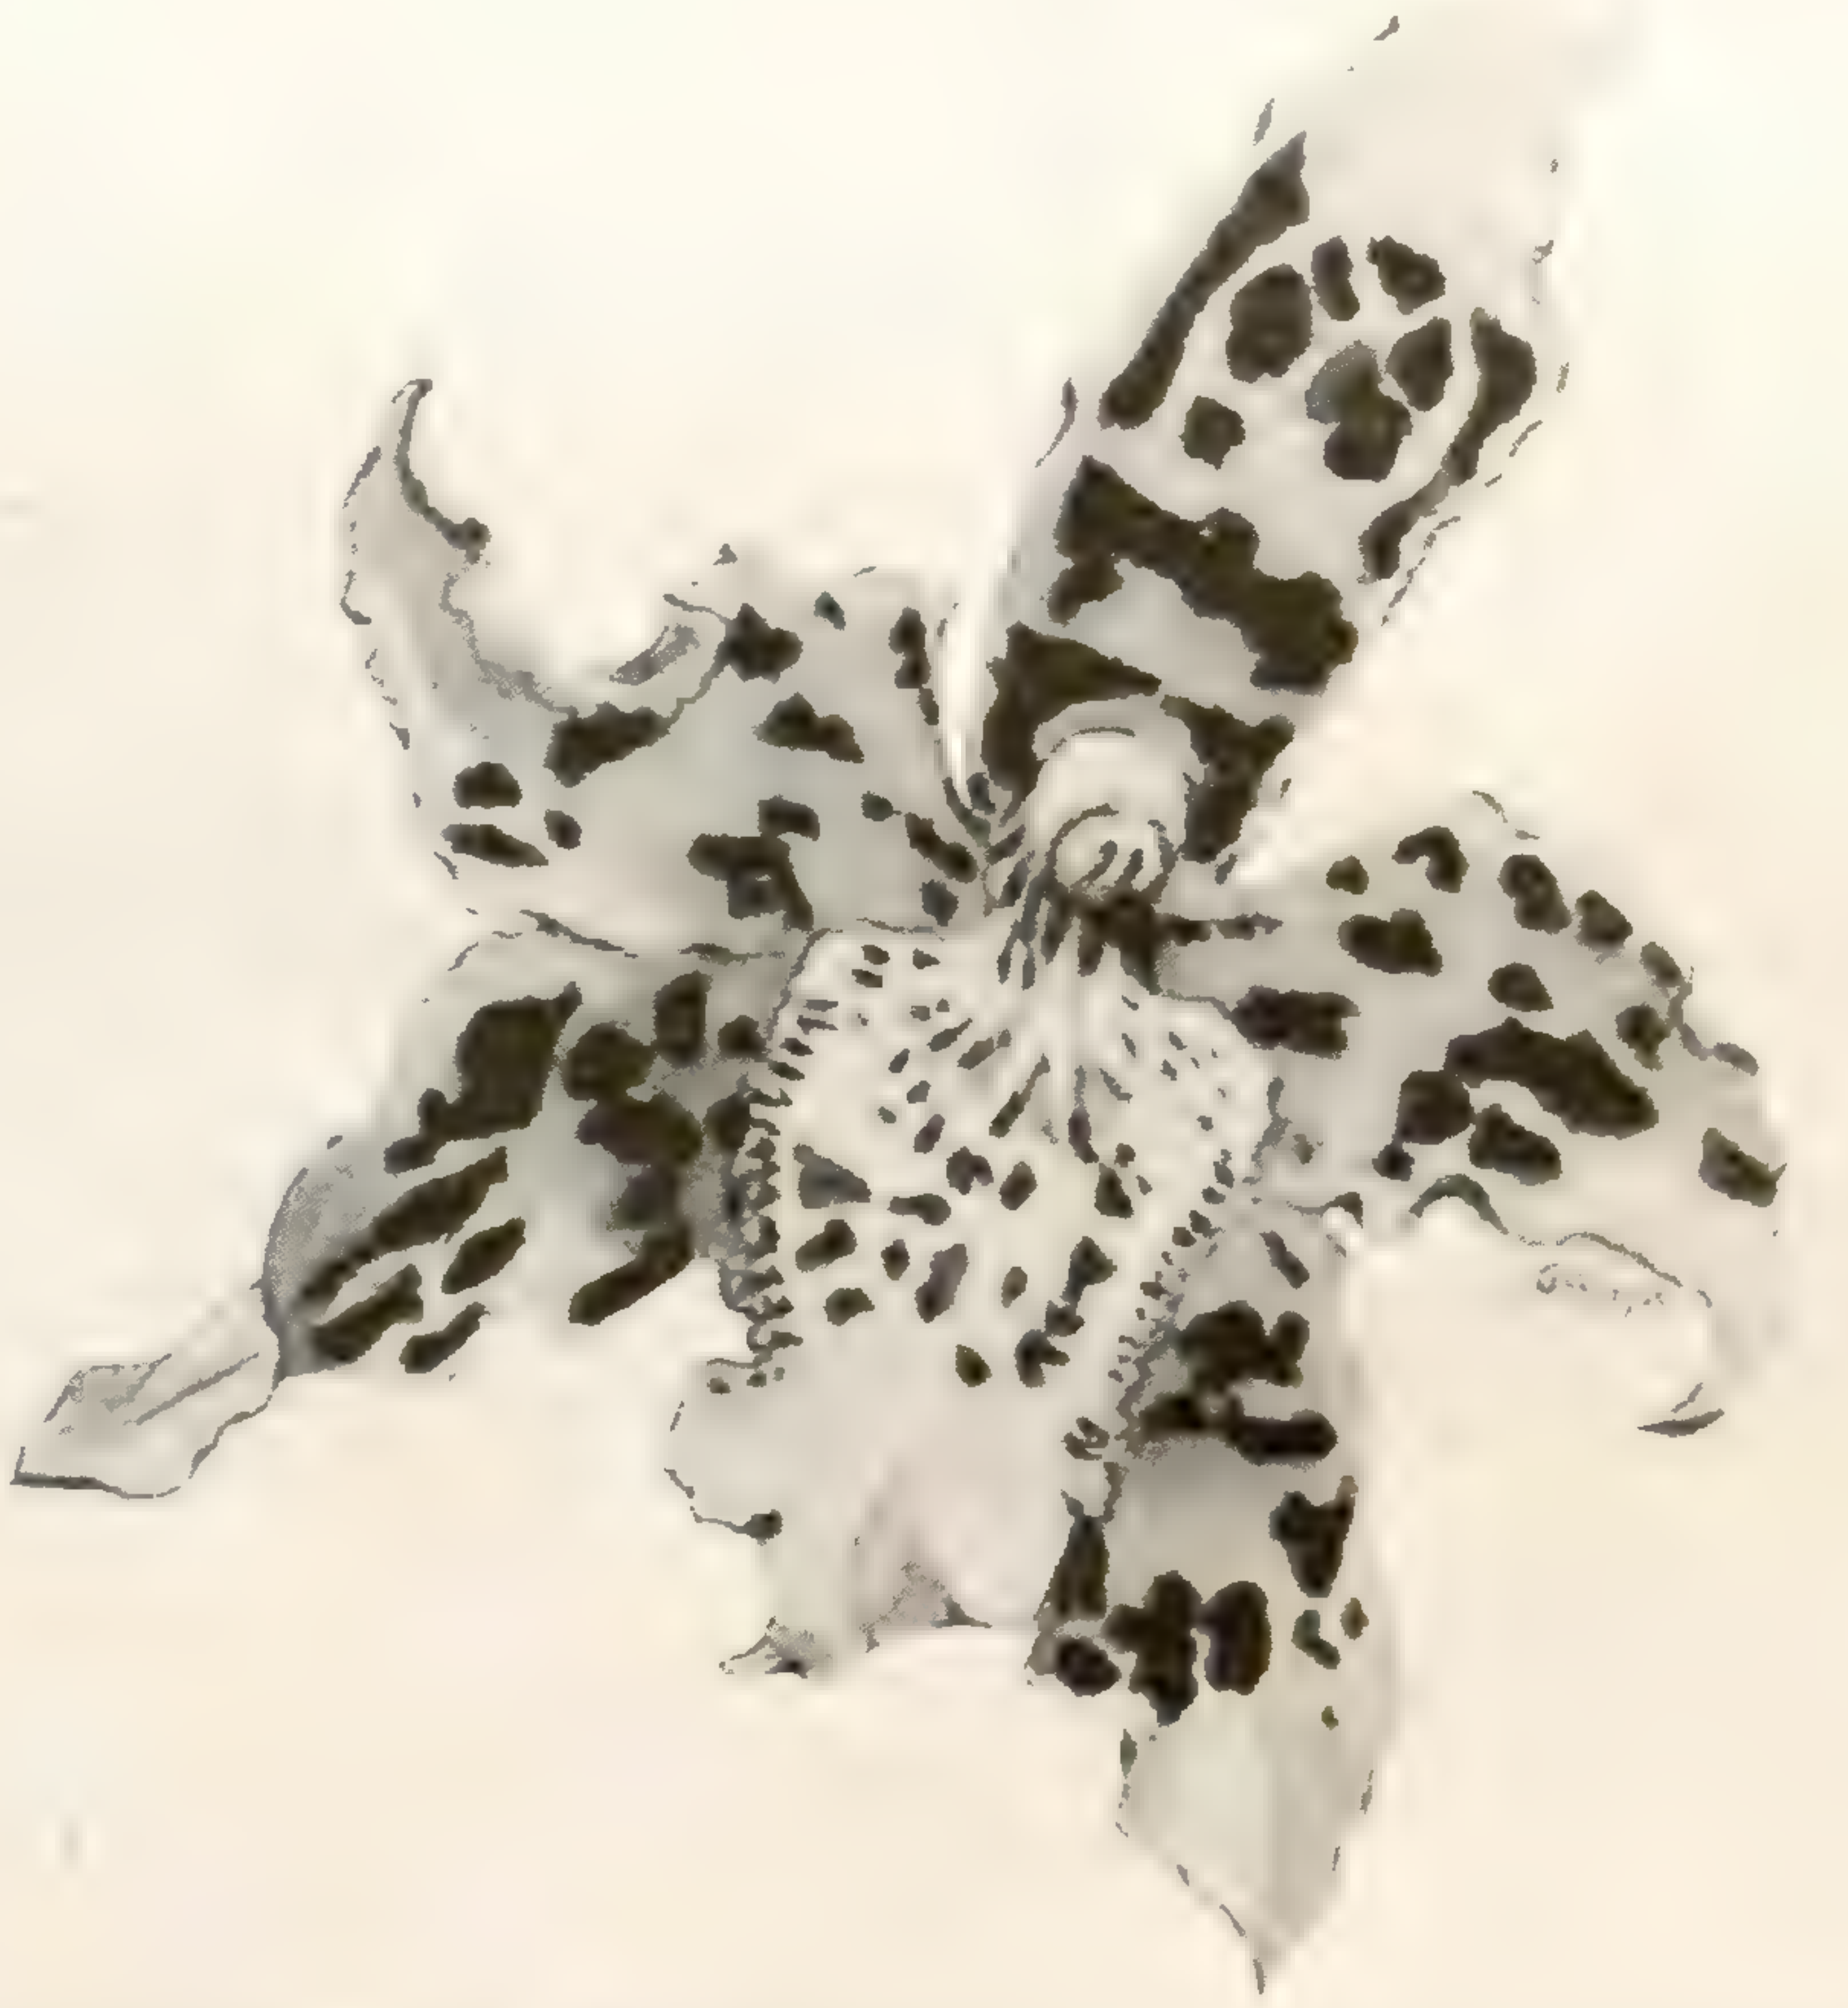
Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

SWAN RIVER DAISY.—J. T. H., Colchester: The pretty, blue-flowered Swan River Daisy is Brachycome iberidifolia, and we are not at all surprised that the few seedlings given you have excited your interest and admiration. In former years we have seen broad bands of this useful annual, surrounding shrubs or herbaceous plants, and only a few days ago we saw large breadths being cultivated for seed purposes, and noticed that very few half-hardy annuals had stood the test of open field culture so well as Brachycome iberidifolia. Sow seeds in March in gentle heat, and prick out the seedlings as soon as they can be conveniently handled. Gradually harden them and plant out during the first week in June. Another method is to sow the seeds in the open border in April, and thin the seedlings to six or eight inches apart. There is a white variety, and there is some difference in the shape of the flowers in different strains.



ODONTOGLOSSUM SPECTABILE (O. CRISPO-HARRYANUM).

CATTLEYA IRIS.—P. J. H., Vienna: This very fine hybrid was originally raised by Messrs. Charlesworth and Co., when at Heaton, Bradford, and it was obtained by crossing Cattleya bicolor with C. Dowiana. It appeared in 1901, and was figured in our pages during that year, specially fine varieties being also illustrated by us in 1902 and in 1907. In the latter year (p. 653) we figured the grand variety named His Majesty.

ODONTOGLOSSUM CRISPO-HARRYANUM.—F. E. G., Appleby: The handsome and variable hybrid between Odontoglossum Harryanum and O. crispum appeared in 1898; it was raised by M. Vuylsteke, of Ghent, and O. crispum was the seed parent. The better title for the hybrid is O. spectabile, but O. crispo-Harryanum is a name still used, just as O. Harryano-crispum is used sometimes to denote the reverse cross. O. Bræckmani is another name that has been given to the hybrid between O. crispum and O. Harryanum. Remembering how very variable O. crispum is, it is quite natural that O. spectabile should be equally variable. The accompanying illustration represents one of the older forms of the hybrid, and serves to show how well the parental characters are combined in the offspring. In this particular instance the colouring is white, yellow, and bright chocolate-red. In some of the rarer and more expensive varieties of O. spectabile the flowers are rounder and the colouring very bright. O. spectabile is a strong grower, and should be treated as suggested in the orchid notes under "Work for the Week" in the present issue.

RUST ON TOMATO LEAVES.—M. B., Rochdale: Tomato leaf rust does not appear to be so prevalent this season as in some previous years, judging from our own observation and from the letters we have received. The rusty patches on the under surface of the leaves spread rapidly, and some cause the leaf so attacked to turn brown or blackish, and die. Cut away, and at once burn, all affected leaves, and then spray the plants with a dilute solution of sulphide of potassium, repeating the application at intervals of a week or ten days until the disease is checked or the crop can be cleared. Wherever an attack of rust has occurred the young tomato plants should be sprayed with a sulphide of potassium solution next season, and spraying should be continued at intervals. This early spraying will keep the plants clean and healthy.

NAMES OF PLANTS.

J. T. H., Colchester.—Brachycome iberidifolia.

W. A. G., Stow.—1, Solanum Wendlandi; 2, Olearia Haasti.

M. E. T., Everton.—1, Herniaria incana; 2, Molucella lævis; 3, Chelone barbata; 4, Veronica spicata.

C. M., Bristol.—1, Calystegia pubescens fl. pl.; 2, Gentiana septemfida; 3, Menyanthes trifoliata.

ILLUSTRATIONS.

Portrait of Mr. Edward Keith, 583; The Rose Garden at the White City, 587; Carnation The Nizam, 588; Begonia Lucerna, 589; The Pensioners' Garden at Chelsea, Hospital, 590; The Garden Front at Chelsea Hospital, 591; Rodgersia pinnata, 592; Cornus paucinervis, 593.

Border Carnations.—If it is intended to plant the layers direct into their flowering quarters as soon as they have made sufficient roots, it is necessary to prepare the ground at once. Carnations delight in well-drained soil, and if possible this should be afforded them, selecting a piece of open ground in preference to borders under a wall. In dealing with soil which is naturally drained and of a light character, a good dressing of well decayed manure should be given, adding wood ashes and sea sand, and thoroughly incorporating these with the soil. If the soil is inclined to be heavy, old mortar rubble may be added to the above dressing, and the sea sand used in larger quantities. In many gardens autumn planting is found to be an absolute failure; therefore the layers have to be potted, and planting out deferred until spring. As soon as the layers have made enough roots to allow them to be lifted, the ground should be worked down firm and level by treading and raking, when planting may commence. Although some varieties are more vigorous than others, generally speaking, the plants may be put out eighteen inches apart each way.—E. C. P.

FORTHCOMING ENGAGEMENTS.

VOL. LIV.—No. 3,016. SATURDAY, AUGUST 19, 1911.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

The International Horticultural Exhibition, 1912.

Within the past two or three months we have received a considerable number of inquiries relating to the schedule of the great horticultural exhibition that will be held at Chelsea in May next, and the only reply we could give our correspondents was to the effect that we believed it was in an advanced stage of preparation, and that it would probably be published at no distant date. We are now in a position to state that the schedule has been published within the past few days, and that it is so comprehensive in character, and, as a whole, so eminently satisfactory, as to be well worth waiting for. It would have been a great advantage to all concerned had the issue been made six months ago, but it must not be forgotten that the preparation of a schedule of a great international horticultural exhibition is a very different matter to the preparation of a list of prizes for an ordinary flower show, with the full experience gained in previous years to fall back upon. Many months have elapsed since we received, as duly announced in these pages, the full programme of the Ghent Quinquennial, to be held in 1913, but our Belgian friends have an experience extending over upwards of a century to guide them in making preparation for the next addition to the great horticultural gatherings that have contributed in no small degree to the fame which the city has so long enjoyed in its relation to the gardening art. It is interesting to observe that notwithstanding the prominence that hardy plants of all kinds have obtained during the forty-five years that have elapsed since the International Horticultural Exhibition at South Kensington was held, stove plants have pride of place, or, to be more exact, have the first section of the first division devoted to them. In the whole of the fifteen classes the exhibitors will have a given space allotted them, this being proportionate to the importance and characteristics of the subjects, and the capacities of the several classes of cultivators who are likely to take part in the competition. In the second section the classes are provided for specified numbers of plants, stove or greenhouse, and in some of these visitors may have an opportunity of seeing large specimens in a high state of development. In the regulations of the competition in these classes it is stipulated that "all plants other than foliage plants must be in flower," which is a very loose way of stating that plants other than those with fine foliage or ornamental leafage must be in bloom. All the plants that will be admissible to the classes in question have foliage, and if it had been stipulated that the foliage be "fine," or the leafage "ornamental," the exhibitors and the members of the jury would have known exactly what was intended. Orchids will occupy a different position in the exhibition to be held next year to that assigned them in 1866. Then there were a few classes for specified numbers of plants, none of the numbers being high; but for 1912 twenty-eight classes have been provided, and in two of these, one for amateurs and one for nurserymen, each group will have 500 square feet allotted to it. This section should be immensely attractive, and possess considerable educational value, although this aspect of orchid culture has not been quite so fully developed as could have been desired. With a full recollection of the glorious effect produced by the magnificent specimens of show and fancy pelargoniums that were contributed to the exhibitions thirty or forty years ago, we are pleased to see once again classes provided for these beautiful flowers, and trust they may be filled with specimens that will remind us of the efforts of the past generation of cultivators. The popularity of the rose is reflected in the schedule by the number of classes assigned this delightful flower. There may not be seen huge specimens such as those which delighted the visitors to the previous International Exhibition, and brought unbounded praise to the exhibitors; but it may be anticipated, with the full assurance of the anticipation being realised, that there will be displays of roses that will far surpass in beauty and interest those previously seen. The roses will, so far as international flower shows are concerned, form a new feature, as, indeed, will alpine and hardy border flowers, which have sufficient provisions made for them to encourage growers of these fine groups of plants to present their favourites to public notice in the best possible manner. In like degree the Schedule Committee have been careful to afford the utmost encouragement possible to the various classes of hardy shrubs remarkable for their ornamental leafage, or for the beauty of their flowers, and a unique opportunity will be afforded for becoming acquainted with the finest of the many kinds now at the command of planters. Fruits and vegetables occupy a position in the schedule commensurate with their importance, and there can be no doubt as to growers of both classes of products doing their best to maintain the traditions of British gardens in relation thereto. The perusal of the schedule has given us much satisfaction, for it represents an endeavour on the part of the executive to obtain an adequate represen-

MR. THOMAS ALFRED H. RIVERS.

tation of present-day horticulture, and we trust this endeavour will obtain a full reward.

Mr. Thos. A. H. Rivers, of Sawbridgeworth, Herts, bears an honoured name, and one that will always be remembered with respect in horticultural circles, and particularly among pomologists. He is the eldest son of the late Mr. T. Francis Rivers, so well known as a raiser of plums and peaches; in his earlier manhood Mr. T. A. H. Rivers spent some time in Western America, so that he is fairly conversant with the fruit growing and farming industry in many parts of the great Republic. Returning home in 1894, he actively associated himself with the work at Sawbridgeworth, and since the death of his father, in 1899, he has, in partnership with his brother, Mr. A. H. Rivers, conducted the business of Thomas Rivers and Son. We need hardly remind our readers that this firm has a very high reputation as cultivators of all kinds of fruit trees, roses, and hardy trees and shrubs, and that they occupy an unique position as raisers of peaches, nectarines, plums, pears, and apples. Mr. T. A. H. Rivers is a member of the council of the National Federation of Fruit Growers, and is also one of the directors of the Royal International Horticultural Exhibition of 1912. In local affairs Mr. T. A. H. Rivers has a seat on the Sawbridgeworth Urban District Council, he is overseer and churchwarden of High Wych, and on the Management Committee of three schools.

The Heat and Drought.—As we go to press it is satisfactory to have some promise of cooler conditions than those which have been experienced over the United Kingdom for some time past, but, unhappily, there are no signs of the general rain which is so greatly needed by all classes of cultivators. On Tuesday the weather was fine, with brilliant sunshine, but owing to the heat being tempered by a cool breeze from the northward the maximum temperature was about 10 degrees lower than that of Monday, and only about three degrees above the average. In London the highest temperature was 76 degrees, but at Portsmouth the thermometer reached 80 degrees. On Sunday, the 13th inst., the temperature exceeded 85 degrees over the greater part of Great Britain, and at several stations the temperature reached 90 degrees, and at Kew, Oxford, and Seaford 91 degrees were recorded. On Wednesday, the 9th inst., a record was established, inasmuch as at Kew and Hillington, near King's Lynn, 97 degrees were recorded, and 100 degrees at the Royal Observatory, Greenwich. This latter is the highest temperature that has yet been recorded in the United Kingdom, but 97 degrees were registered at Greenwich on July 15, 1881.

Layering of Carnations.—Mr. R. Morton, one of the most successful of the many growers of carnations, and an active member of the National Carnation and Picotee Society, writes with reference to the layering of carnations as follows: "I differ entirely in my views on cutting the stems of the plants when layering from the method usually advised by writers on the cultivation of these flowers. I therefore consider it advisable to suggest a quicker and better method. Annually I put down between 4,000 and 5,000 layers, and in order to expedite the work I have long since given up the tedious and rather clumsy way of cutting upwards through the stem. I would advise the operator to insert the knife, which ought to be a thin-bladed one, with an edge on both sides, immediately above the joint, cutting downwards, and bringing the knife out a short way below the joint. I can almost guarantee that he will put down three layers for every two that he will prepare by cutting upwards, with the additional advantage of spoiling but few layers. The cut should not be a long one, from half to three-quarters of an inch being quite sufficient, it being only necessary to cut through a joint."

Festival of Empire Rose Show.—The success of the rose show held in connection with the Festival of Empire, at the Crystal Palace, at the end of June, was such as to induce the authorities to hold a second exhibition at the end of the summer. Mr. T. Geoffrey W. Henslow, the secretary of the Horticultural Department of the Festival, with his characteristic energy, at once proceeded to make the necessary arrangements, and as one result of his activities we have before us an advance copy of the schedule of the exhibition, which is fixed for September 1. The schedule contains fifty-three classes, of which nine are for arrangements of roses in which the competition will be limited to ladies; twenty-one are set apart for nurserymen; and twenty-three for amateurs. Mr. Henslow assures us that the forthcoming exhibition has the promise of surpassing the show held in June, and that the principal feature will be formed by the groups of flowers from the nurserymen and amateurs. The prizes will consist of cups and medals, and, as on the occasion of the June show, Messrs. Clay and Son have presented a gold medal, which will be presented to the best rose in the whole exhibition. Schedules may be obtained from Mr. Henslow, Horticultural Department, Festival of Empire Offices, Crystal Palace, S.E.

The National Hardy Plant Society has arranged a conference, to be held at Shrewsbury on August 24 (the second day of Shrewsbury Flower Show), when papers on "Ways and Means of Advancing the National Hardy Plant Society" and "Possible New Methods of Exhibiting Hardy Flowers" will be read and discussed. The conference will be held in the concert room of the Old George Hotel, and the chair will be taken at four p.m. All members and prospective members of the society are cordially invited to attend. Full particulars may be obtained from the hon. secretary, Mr. Frank Bouskell, Market Bosworth, Nuneaton.

Use of Hot Water in Forcing.—In the report of the botanical department of the Wye College, Mr. S. T. Parkinson describes some interesting experiments in the use of hot water for the purpose of accelerating the growth of plants placed in the forcing pit. Two years since Professor Molisch, of Prague, published a paper in which he suggested that perennial plants, while in their resting stage, should be dipped in hot water previous to their being placed in the forcing pit or house. In his paper Professor Molisch distinguishes in the resting period, between the rest that is inherent to the plant and cannot be altered, and the rest that is dependent on external conditions and can be modified. By steeping the plant in hot water at the proper time the latter rest is eliminated, and its cells at once renew their activity. By this means the treated plant obtains a start over that which is untreated, and attains its full development in a much shorter period. Mr. Parkinson has carried out a number of experiments to test the efficacy of hot water, and in the course of these he found that an exposure of about twelve hours to a temperature of 95 degrees F., or, in the case of soft plants, such as seakale, to 85 degrees F., just after the period of "deepest rest," i.e., the end of November or beginning of December, led to very rapid growth. One of the illustrations accompanying the report shows that the effect of water on some astilbes (not spiræas, as stated in the report) was very considerable. Plants that were dipped in a quite dormant state on November 25 had made considerable growth on December 13, when they were photographed, while the untreated plants showed no signs of renewed activity.

The National Trust.—A movement is on foot for the purpose of securing a tract of land on the foreshore of Ullswater, and placing it in charge of the National Trust. A proposal was made to erect buildings on the land, which occupies a position between Stybarrow Cragg and Glencoin Park, and as the result thereof a local subscription was started with a view to purchasing the property; but difficulties arose, and the National Trust took the matter in hand, and the local scheme was left in abeyance. A few evenings since a well-attended meeting was held at Patterdale, under the presidency of Mr. W. H. Marshall, of Patterdale Hall. Canon Rawnsley, of Crossthwaite, who has taken an active part in the preservation of various open spaces in the Lakeland, was among the principal speakers. It was stated in the course of the proceedings, that the land has an area of five acres, and half a mile of foreshore, and that the owner was willing to take £250. In a very short time over £100 was subscribed in the room, and a committee was appointed to carry out the scheme.

Mechanism of Mitosis.—To a recent meeting of the Royal Society a paper was contributed by Dr. A. A. Lawson on nuclear osmosis as a factor in the mechanism of mitosis. The author stated that a study of the spore mother-cells of disporum gladiolus, yucca, and hedera, and the vegetative cells in the root tip of allium,has revealed a series of stages in the development of the mitolic spindle which has hitherto been overlooked. They are regarded as important and critical stages concerning the fate of the nuclear membrane, and are to be found in the early prophase, preceding the organisation of the equatorial plate. Contrary to the generally accepted view, it has been found that the nuclear membrane does not break down during spindle formation, but behaves as a permeable plasmatic membrane should behave under varying osmotic conditions. The interpretation of these stages throws an entirely new light on the problem of the "mechanism of mitosis," and necessitates a revision of the accepted views of nuclear phenomena. It goes to prove that osmotic conditions are active factors in the formation of the acromatic spindle.

An Interesting Fossil Fern.—The structure and affinities of Metaclepsydropsis duplex (Williamson) formed the subject of an interesting paper contributed by Dr. W. T. Gordon to the Royal Society. This Carboniferous fern was first recorded by Williamson in 1874, when he was investigating the structure of fossil plants from Pettycur, Fife, numerous petioles of the fern being discovered among his specimens. The same species has since been obtained near Régmy, in France; but in all these cases only fragments of petioles and pinnæ were discovered. Recently, however, stems and roots have been found at Pettycur. In a silicified mass of material several pieces of stems were obtained in close association with innumerable fragments of petioles and pinnæ. Certain emergences from the stem were noted, and an examination of the petioles soon established a series showing a continuous variation from the normal petiole trace to a trace which was identical with these emergences. In this way it was proved that the stems and petioles belonged to one and the same species. The stem stele is very simple in structure. The axis consists of a circular cylinder in which the outer zone is composed of long stout tracheides, while the inner zone is formed by a mixture of long narrow tracheides and conjunctive parenchyma. The stem emits petiole and root-traces at long intervals, and occasionally bifurcates dichotomously. In the theory of the medullation of the zygopterid stele, this stem is of some importance, since it exhibits a stage closely similar to that shown in the stem of Ankyropteris corrugata (Williamson). Like some other members of the Zygopterideæ, A. corrugata has a biseriate arrangement of the primary pinnæ, while in M. duplex and others a quadriseriate distribution of these appendages is shown. In both the quadriseriate and biseriate divisions it is now possible to arrange the stems in a series which demonstrates the gradual medullation of the stems, and is, at the same time, compatible with the geological age of the specimens.

Nicotine makes such an excellent wash, both for fruit trees and hops, that a supply at a lower price than that now ruling has become a matter of much importance to those engaged in fruit and hop culture. Hence the experiments that have been conducted by Mr. Garrad, at Wye College, are of much practical interest. In recording the experiments on the growth of tobacco for nicotine extraction, Mr. Garrad states that he produced it at a cost of 6s. per pound, as compared with 12s. per pound, the price usually charged. If this should prove to be the cost of production on commercial lines, a profitable industry might be developed with immense advantage to cultivators generally who have to combat insect pests.

Improvement of Old Pastures.—Experiments in the amelioration of the herbage of old pastures have been conducted under the auspices of the Edinburgh and East of Scotland College of Agriculture, and the report thereon by Mr. W. Bruce is of much interest. The field selected for the trials was on the boulder-clay soil, and about 500ft. above sea level. It had been many years in grass, and was clothed with a thick covering of soft inferior herbage composed chiefly of bent, Yorkshire fog, rye grass, and moss, with a sprinkling of stunted clover plants. Half the eight-acre field was left unmanured and the other four acres received superphosphate at the rate of 6½ cwt. per acre, three-fourths of the same area being dressed with sulphate of potash and two acres with half a ton of ground lime. Sheep were grazed on the manured and unmanured portions, and the influence of the fertilisers can be gathered from the fact that the four acres top-dressed carried a third more sheep than the other four acres, and the rate of increase in weight was also greater, showing that the quality of the herbage had been influenced as well as the quantity. The financial results are of interest as showing that an expenditure of £5 18s. in fertilisers produced in three years a gain of £9 11s. 0½d., giving a net profit of £3 13s. 0½d.

Messrs. Dickson and Robinson, of Manchester, were the exhibitors of the fine collection of scabious, carnations, gladioli, etc., at the Bury Flower Show, of which a report is given in our issue of the 12th inst.

ROSES IN POTS.

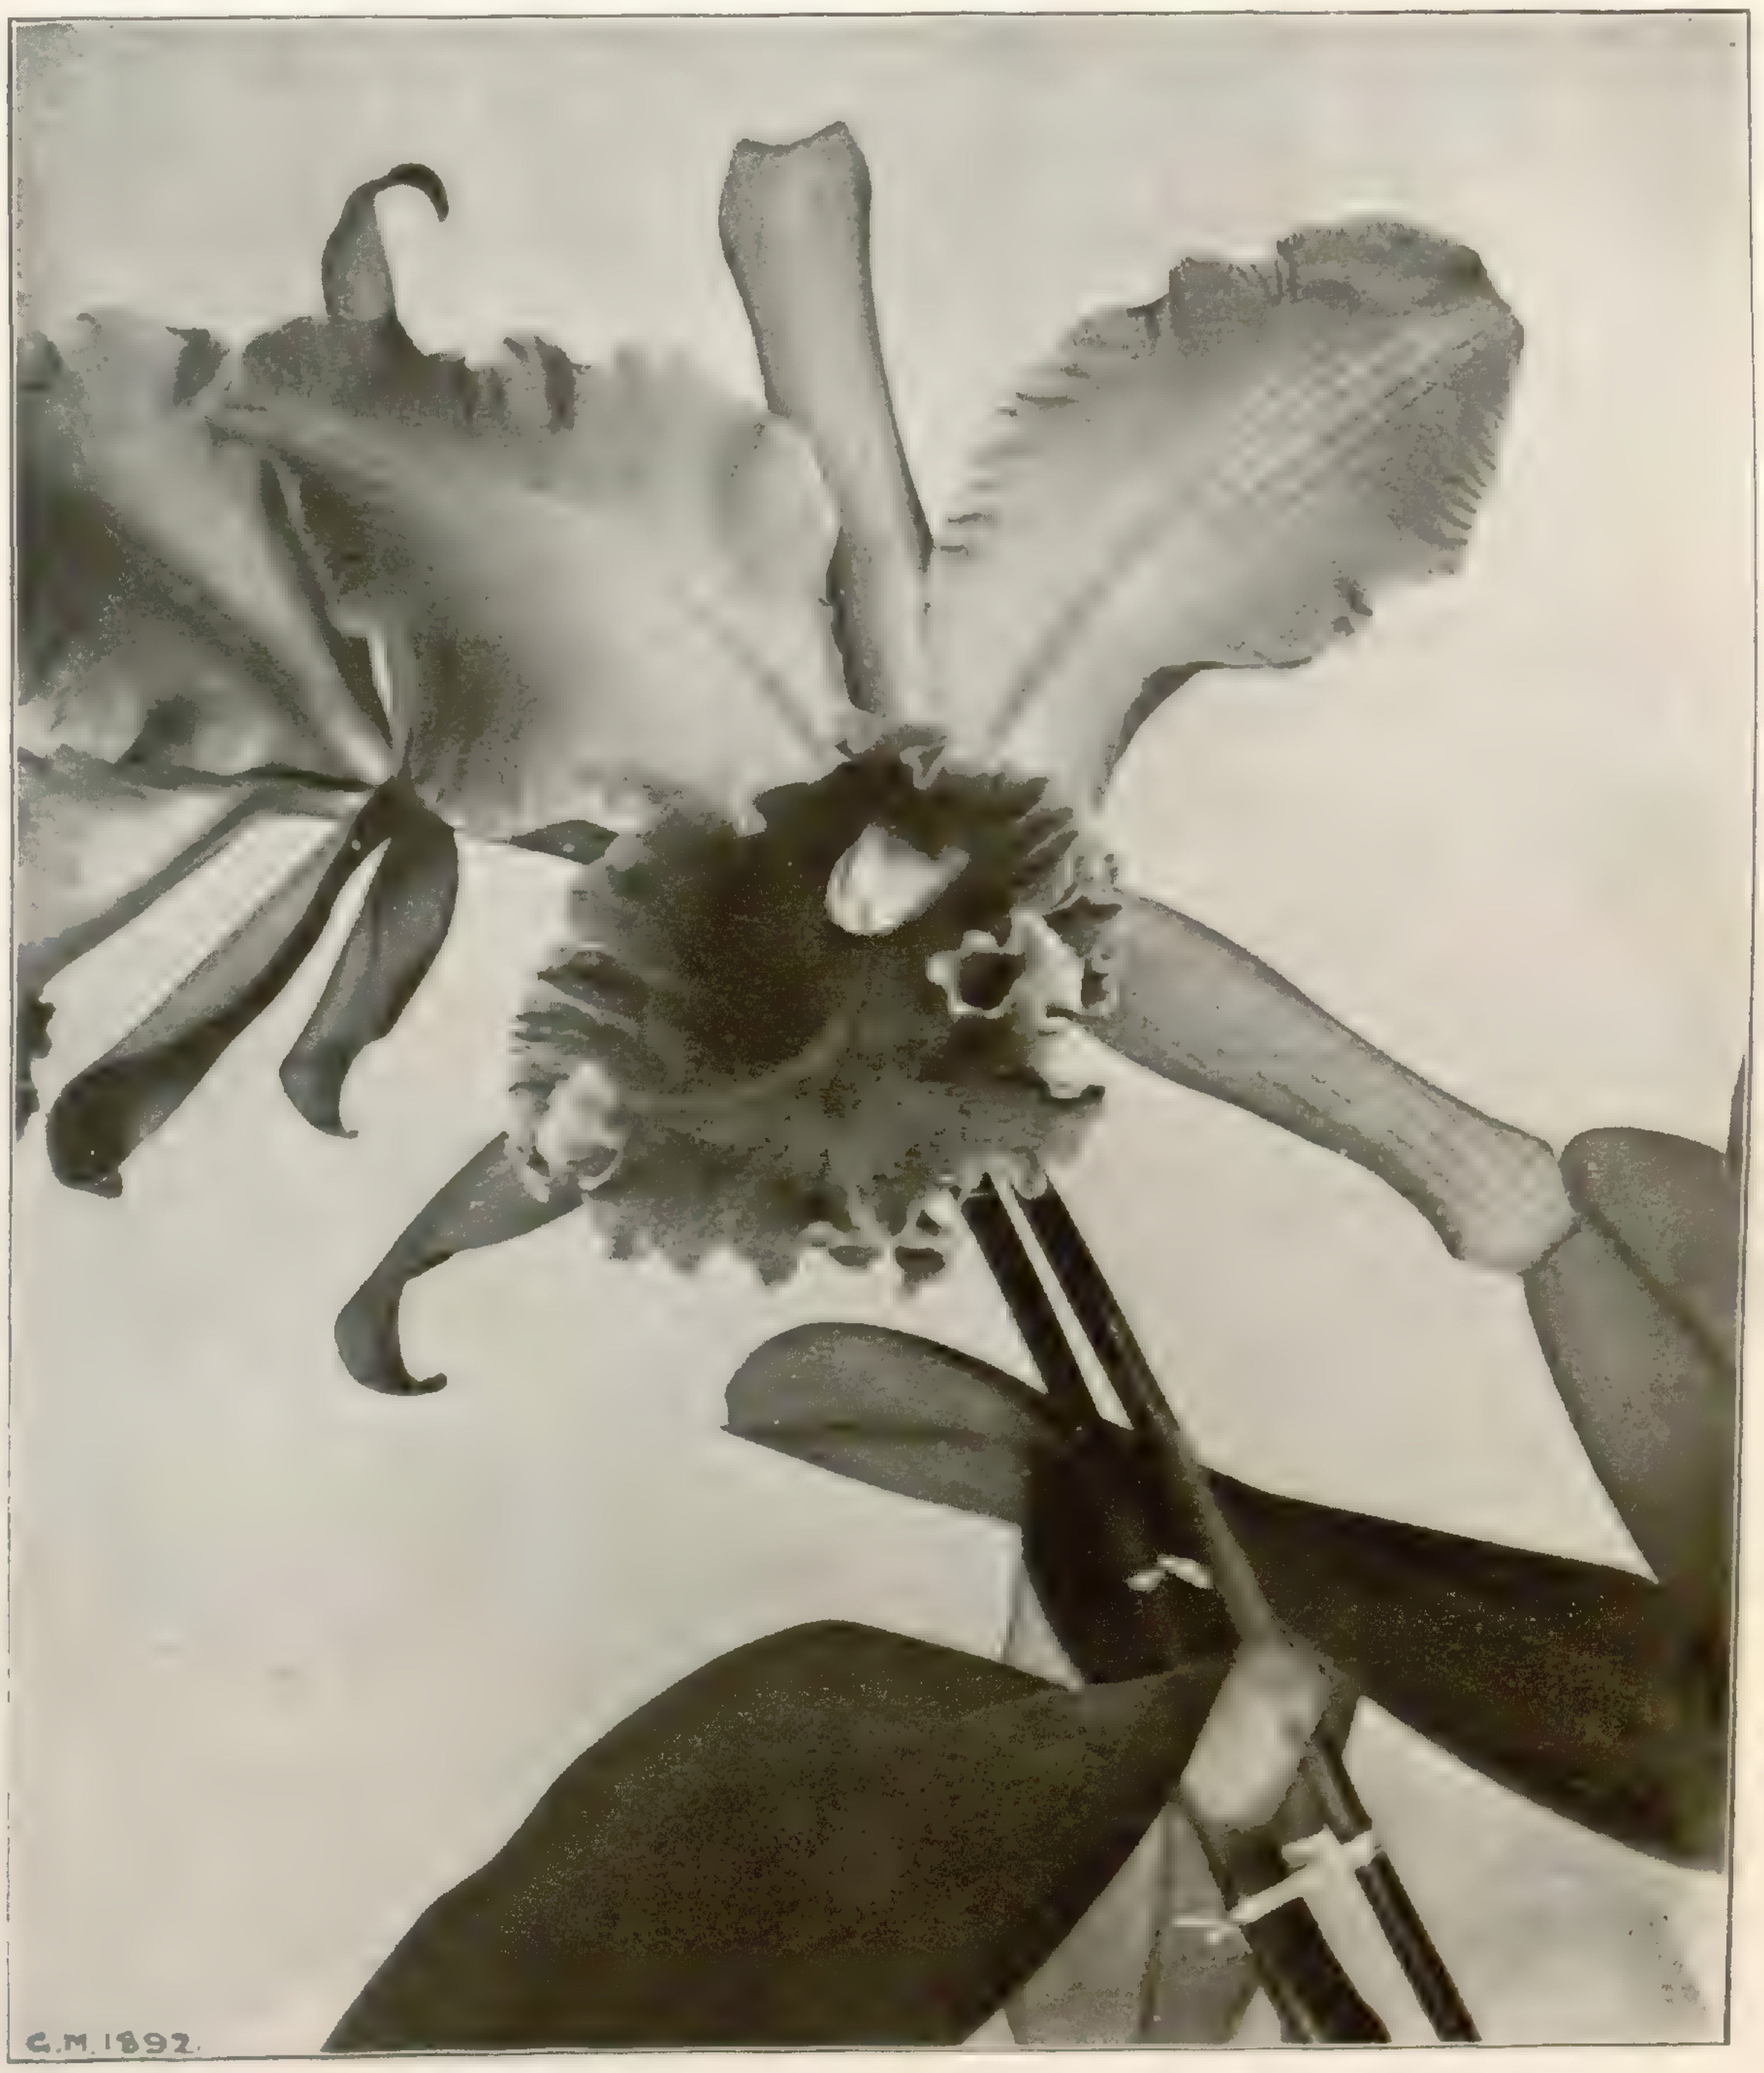
If we want a good display of cut roses during the winter months, we must look well ahead, and commence operations at once. Two plans may be adopted. We may start with ripened wood during November, or keep the plants growing steadily on the cool side of a wall or hedge until the cold nights warn us they must be housed, and so realise the last crop of blooms on teas and their hybrids. But if the same plants are wanted to give a second or third crop of bloom early in the year, I would prefer to start with plants that have had a partial rest.

When a batch of plants has once been used for forcing, they come to hand better for the same purpose a second time, as their early growth allows earlier ripening of the wood, and the consequent rest thus afforded. Plants that were growing all through winter and early spring may be stood out of doors by June, if given a sheltered position, when with careful watering the natural freedom of summer growth is somewhat checked. It is most essential to build up ripened wood for the following winter flowering. In fact, more depends upon the water supply than many apparently consider. If too dry, we injure the roots, and it is surprising how very quickly the soil in pots becomes parched during summer, much of which can be guarded against by partly plunging the pots. Less water will be needed to the soil the rose roots are in if we water the plunging material between the pots.

To stand the plants in a sunny position is favourable, but to allow sun and wind direct access to the outsides of the pots cannot fail to injure the roots upon many occasions, as a large proportion of the roots will be touching the inside of the pot. It is well to have the plants in two batches; the earliest being overhauled now, and what repotting that may be needed attended to at once. At the same time the ripest may be pruned. Keep the newly-potted plants by themselves. These will not want so much water until the fresh roots are at work, nor will they need stimulants until the fresh soil is thoroughly permeated with roots. Then there is the question of drainage, which must be complete. There is no need to turn the plants out of the pot to ascertain the condition of this, as it can generally be seen by laying the pot on one side and examining the drainage hole.

Where repotting is not considered necessary, it will be found an excellent plan to remove a little of the surface soil and mulch with a strong compost, which will not only support young roots as the plants commence to grow, but help those below by the steady feeding naturally washed down when watering. A deep pit or frame is a suitable place for the pot plants at this stage, as we can then keep off heavy rains, and also afford a little shade and shelter from wind.

A. P.



CATTLEYA RHODA ILLUMINATA.

Flowers large, the sepals and petals orange suffused with rose, the lip purple-crimson with golden throat. F.C.C., R.H.S., August 15. Messrs. Charlesworth and Co.

TAUNTON FLOWER SHOW.

Taunton was in gala dress on Thursday, August 10, its streets being gay with flags, bunting, arches, and other decorations. It was Flower Show Day, and as is always the case, the inhabitants, whether horticulturists or not, were as enthusiastic as usual.

PLANTS.

There were three pretty little groups of stove and greenhouse plants, arranged in oval form, and occupying a space of 13ft. by 10ft. Messrs. J. Cypher and Sons, Cheltenham, had a very effective arrangement of useful plants, and secured first prize. A big kentia surmounted an arch, overtopping brilliant crotons and choice liliums. The groundwork was well treated with cattleyas, small plants of Clerodendron fallax, ixoras, etc., with suitable ferns and foliage. Mr. C. J. Ellis, Weston Nurseries, Weston-super-Mare, was a good second.

In the amateurs' section, Mr. Chas. Cook, gardener to H. Cornelius, Esq., was first with a circular group arranged in pyramidal form, and containing some shapely furnishing plants, with acalyphas, etc., to add colour. Mr. Cox, gardener to Mrs. Bernard, was second, his little group being lightly set up, and very bright. Third was taken by Mr. Alfred Truman.

Twelve specimen stove and greenhouse plants in flower found Messrs. Cypher and Sons the victors. Their plants were big, well-grown specimens of Statice intermedia, Clerodendron Balfouri, Ixora Duffi, and other good subjects of similar character. Again for six specimens in bloom, Messrs. Cypher scored, showing profusely-flowered Erica Eweriana, Rondeletia speciosa major, and other choice subjects. The Cheltenham firm was also awarded the first prize for six fine foliage plants, and for four orchids, Mr. Alfred Truman coming second. Four dracænas found Mr. W. H. Bruford, gardener to Hon. H. P. Gore-Langton first, Mr. Truman again being second.

A fine lot of plants filled the centre of the amateurs' tent, the winner in the class for twelve stove and greenhouse plants being Mr. W. Cox, gardener to Mrs. Bernard, Bougainvillea Sanderiana, Alocasia metallica Rondeletia speciosa, Acalypha hispida, and some finely-coloured crotons constituting a collection of great merit. Mr. A. Truman had also good specimens, for which he received second prize. Mr. Chas. Cook, gardener to H. Cornelius, Esq., led for six plants, his specimen of Acalypha Sanderi being exceptionally fine. Some magnificent coleus were shown, Mr. P. Fawle, gardener to the Lady Abbess, Franciscan Convent, being the winner with beautifully-developed and richly-coloured plants. The three caladiums staged by Mr. Chas. Cook scored first among three entries, Mr. J. Stuckey taking second.

We are always pleased with the ferns shown by the Taunton amateurs and private gardeners, and this was a feature that was well maintained this year. Mr. W. Cox's winning half-dozen included: Adiantum Farleyense, Nephrolepis davallioides furcans, N. Whitmanni, and N. todæoides, and a grand example of Adiantum trapeziforme. Mr. W. H. Bruford was a capital second, showing a beautiful Dicksonia Balantinum ciliata, and other choice species and varieties. Mr. Bruford won first in a class for six smaller specimens with Woodwardia Orientalis Adiantum fragrantissimum, Asplenium lucidus, Nephrolepis Piersoni, etc.

CUT FLOWERS.

The collections of hardy flowers, occupying 12ft. by 3ft., were bright and showy, but would have been still more effective if staged in the centre of a tent with more head room than is available on the side tables. Mr. Fred Eames, The Nurseries, Frome, was first, his flowers being clean, fresh, and tastefully arranged. Scabiosa caucasia, gladiolus, and liliums were strong points. Messrs. Rich and Co., Bath, were well placed second, showing pentstemons, gaillardias, and other useful things; third went to Mr. Henry Corder, Bridgwater.

Dahlias are generally well shown at Taunton, but this year the blooms were small, and entries few. The best twelve shows came from Mr. J. Stuckey, gardener to B. C. Shepherd, Esq.; Mr. Geo. Humphries was awarded second, and Mr. A. P. Ironsides third. Mr. Humphries scored for twelve fancies, followed by Mr. Sidney H. Cooper and Mr. J. Stuckey. Cactus varieties were shown in triplets, Mr. Humphries being first for six varieties. C. E. Wilkins, Etruria, and Rev. J. W. Jameson were nicely shown; second went to Mr. Ironsides, Mr. Stuckey maintaining third position.

The class for twelve spikes of phloxes was disappointing owing to the heat, but Mr. Fred Eames staged a dozen capital trusses, which early in the day were very pleasing. Messrs. Rich and Co., and Mr. G. Humphries were the second and third prizewinners. Mr. Eames' twenty-four spikes of gladioli were worthily awarded first prize. Border carnations were well shown by Messrs. A. R. Brown, Lim., King's Norton; Mr. Charles Wall, Melrose Nursery, Bath; and Mr. C. J. Ellis.

Twelve bunches of cut stove and greenhouse flowers only brought two entries. Mr. W. H. Bruford, gardener to the Hon. H. P. Gore-Langton, came first, showing eucharis, anthuriums, lapagerias, Oncidium flexuosum, and other popular things; the second prize lot came from Mr. Samuel Kidley, gardener to Rev. P. B. Lloyd, containing gloriosas, orchids, stephanotis, etc. Five entries for twelve double begonia blooms on boards made a nice class. The first prize exhibit was that staged by Mr. W. Hayward, gardener to Miss Neal, his flowers being large, well-grown specimens of high quality. Mr. W. Stone, gardener to C. N. Bramfield, Esq., was second, and Mr. Bruford third. Asters were not equal to the usual run here shown, but Mr. Henry Corder's first prize dozen of Comets, and Mr. J. H. Merrett's winning stand of Victorias were good for the season. There were less than twenty stands of asters all told, whereas some years there are treble that number.

Dinner table decorations in two classes were good. The ladies' class for a table set for eight persons mustered three entries, Mrs. Woodland, Frome, leading. The scheme was worked out in delicate style, mauve orchids, pancratiums, and francoas being the material used. The fruit was not above average quality. The Misses Hill were second with a tasteful arrangement of sweet peas; Miss Mildred Lance third. In the open class Mr. J. T. Curtis, gardener to Sir W. Howell Davies, M.P., was awarded first. He had a tall rustic centrepiece furnished with oncidiums and lælias, with smaller receptacles of similar flowers at the corners. The fruit was of good quality, the whole table being attractively laid. Mr. F. J. Cole was second, his floral arrangement being on similar lines to first, but with glass centrepiece; Mr. C. F. Ellis, Weston-super-Mare, third.

FRUIT.

As might be expected, fruit was particularly rich in colour, but rather on the small side. The class for collections of eight dishes contained three entries, and Mr. G. Richardson, gardener to H. St. Maur, Esq., was the winner, his bunches of Mrs. Pince grape being well finished; Grosse Mignon peach, Superlative melon, and other dishes making a good collection. Mr. Thos. Turton, gardener to F. J. B. Wingfield Digby, Esq., was a good second. He had pretty fruits of apple Beauty of Bath, large Dymond peaches, and a big specimen of Sutton's Emerald Gem melon. Mr. T. Wilkinson, gardener to G. A. Gibbs, Esq., M.P., was third. There were five entries for four dishes, Mr. Thos. Turton leading with Muscat of Alexandria grapes, Dymond peach, Scarlet Rival melon, and Pitmaston Orange nectarine. Mr. G. Richardson came second; third went to Mr. F. Little, gardener to the Right Hon. Lord Justice Farwell. Mr. Jas. Webber showed the best three bunches of Black Hamburgh, and also the best three bunches of any other black with Madresfield Court in nice condition. The winner for three bunches Muscats was Mr. Thos. Turton, with beautiful bunches of well-coloured berries. Plums, cherries, apples, and other single dishes were staged in quantity, the names of Messrs. H. Dyer, T. Turton, F. Jenkins, Fredk. Jones, and G. Richardson appearing prominently among the winners.

VEGETABLES

are always a great feature at Taunton, but, like everything else, they could not quite equal previous records. In the collection of ten distinct kinds there were three entries, Mr. W. Cox, gardener to Mrs. Bernard, receiving first prize. The celery, leeks, and carrots were good, but the cauliflowers were poor. Mr. H. Bolton, gardener to the Right Hon. the Earl of Devon, was second, showing good tomatoes, beetroot, peas, carrots, and other dishes; Mr. Stuckey third. Mr. Stuckey was winner in the class for eight kinds provided by Messrs. Carter and Co., and Mr. Wm. Gold led in Messrs. R. Sydenham's class, Mr. Stuckey again coming to the front in Messrs. R. Veitch and Son's class, and also in Messrs. Sutton and Sons' and Messrs. Webb and Sons'.

NON-COMPETITIVE.

An exhibit of perpetual carnations was put up by Messrs. Young and Co., Hatherley, Cheltenham. This firm has a reputation for artistic staging, and on this occasion their fine flowers were set off to advantage by a background of ferns and foliage plants. Cut blooms of begonias were staged in clear glass vases by Messrs. Blackmore and Langdon, Twerton Hill Nurseries, Bath. The flowers were really fine, and the method of showing them was excellent.

Messrs. A. A. Walters and Son, Bath, were exhibitors of herbaceous flowers. Rudbeckia Golden Glow, Chelone barbata, several varieties of lobelias and pentstemons, were among the brightest subjects.

An elaborate and very interesting exhibit was staged by Messrs. R. Veitch and Son, Exeter. As usual, this firm's collection of rare rock and border plants was replete with gems of high merit. Tunica saxifraga, Origanum dictamnus, Hypericum Ægypticum, and Calandrinia umbellata were but a few of the good things. Gladioli were another fine feature, and a new rosy-coloured bedding lobelia named Prima Donna was distinct.

On Mr. Vincent Slade's stand of zonals such striking varieties as President Loubet, Kingswood, Hibernian, and Hopedene were well represented. A new ivy-leaved variety named Miss Popham, was worthy of note, its brilliant rose colour being most effective. Mr. Slade also showed a nice group of the extremely beautiful and useful hardy fern Polypodium cambricum. Zonal pelargoniums were a strong feature in Messrs. Jarman and Co.'s extensive exhibit.

The whole of one side of the non-competitive tent was occupied by a collection of gladioli from Messrs. Kelway and Son, Langport. The highest compliment we can pay the truly glorious spikes of bloom is to say we never remember seeing Messrs. Kelway stage finer flowers. Several novelties of exceptional merit were included, Queen Emprss, a faintly tinted white; Langport Blue, Flame of War, vivid scarlet; and Voluptuaire, very dark crimson, being some particularly striking varieties.

A bold and well-arranged stand of herbaceous flowers was exhibited by Mr. H. Clarke, The Nurseries, Taunton.

MEDAL AWARDS.

Gold.—Messrs. Kelway and Son, Langport; Messrs. Jarman and Co., Chard.

Silver.—Messrs. Young and Co., Hatherley; Messrs. Isaac House and Son, Westbury-on-Trym; Messrs. Clibrans, Altrincham; Mr. H. Clarke, Taunton; and Messrs. Robt. Veitch and Son, Exeter.

Bronze.—Messrs. W. E. and T. Cousins, Taunton, floral designs; and Messrs. A. A. Walters and Son, Bath.

ANTIRRHINUM ROSE DORE.

The popularity of antirrhinums grows apace, and deservedly so, because few flowers of such easy culture make such a fine display over a goodly period of the year, and few show such a wonderful range of colouring and of habit. There are tall, intermediate, and dwarf strains, and the colour ranges from pure white to deepest crimson. The self colours are now splendid, and to these have been added varieties and strains that give art shades. Antirrhinums come very true from seeds, and they also may be propagated by means of cuttings taken in the autumn. Either for beds or borders, or for groups in large herbaceous borders, they are excellent, but for pot culture they have not yet gained much popularity. This, however, is only a matter of time, especially in these days when so many amateurs possess an unheated greenhouse, and are looking out for hardy and half-hardy plants to grow therein for early flowering. Further, there is a market for early flowers of antirrhinums if the flower spikes are good and the colouring distinct. The variety Rose Doré has become fairly popular already because of the lovely rose shade of its fine blooms. It may be had in flower in May without difficulty, and then forms a useful subject for conservatory decoration. Strong cuttings or autumn-sown seedlings, wintered in frames, will provide good plants for such flowering, and at little cost of time and trouble. The spikes illustrated herewith were photographed at Messrs. T. S. Ware's nurseries at Feltham about the middle of May last.

LACHENALIAS.

Lachenalias form a small group of bulbous plants occupying a position just beyond the pale of hardiness, consequently they require the protection of glass to bring them to perfection, yet no artificial heat is necessary beyond that actually required to keep out frost. Their culture is in every respect identical with that accorded to freesias; bulbs are potted up in August, using good fibrous loam, leaf-soil, and a little sand, placing six bulbs in a six-inch pot, and standing them on a cool bed in a shady place until evidence of growth is seen. With the advent of frost place them in a cool, airy structure, in a position open to the light, and maintain a temperature of about 40 degrees.

The flowering season extends over some three months in spring, when the bright yellow and scarlet-tipped flowers impart a welcome change to the ordinary run of greenhouse plants. All the species and varieties of lachenalia are worthy of cultivation, one of the best being Nelsoni, a hybrid form that attains a height of nine inches and yields fine spikes of apricot-lemon flowers.

After flowering lachenalias are treated similarly to freesias; gradually withhold water as the foliage shows signs of ripening, and finally stand the pots in a position exposed to sun until the advent of next potting season. Lachenalias are prolific in increase, and once having acquired a variety, only neglect and mismanagement should ever necessitate a second purchase.

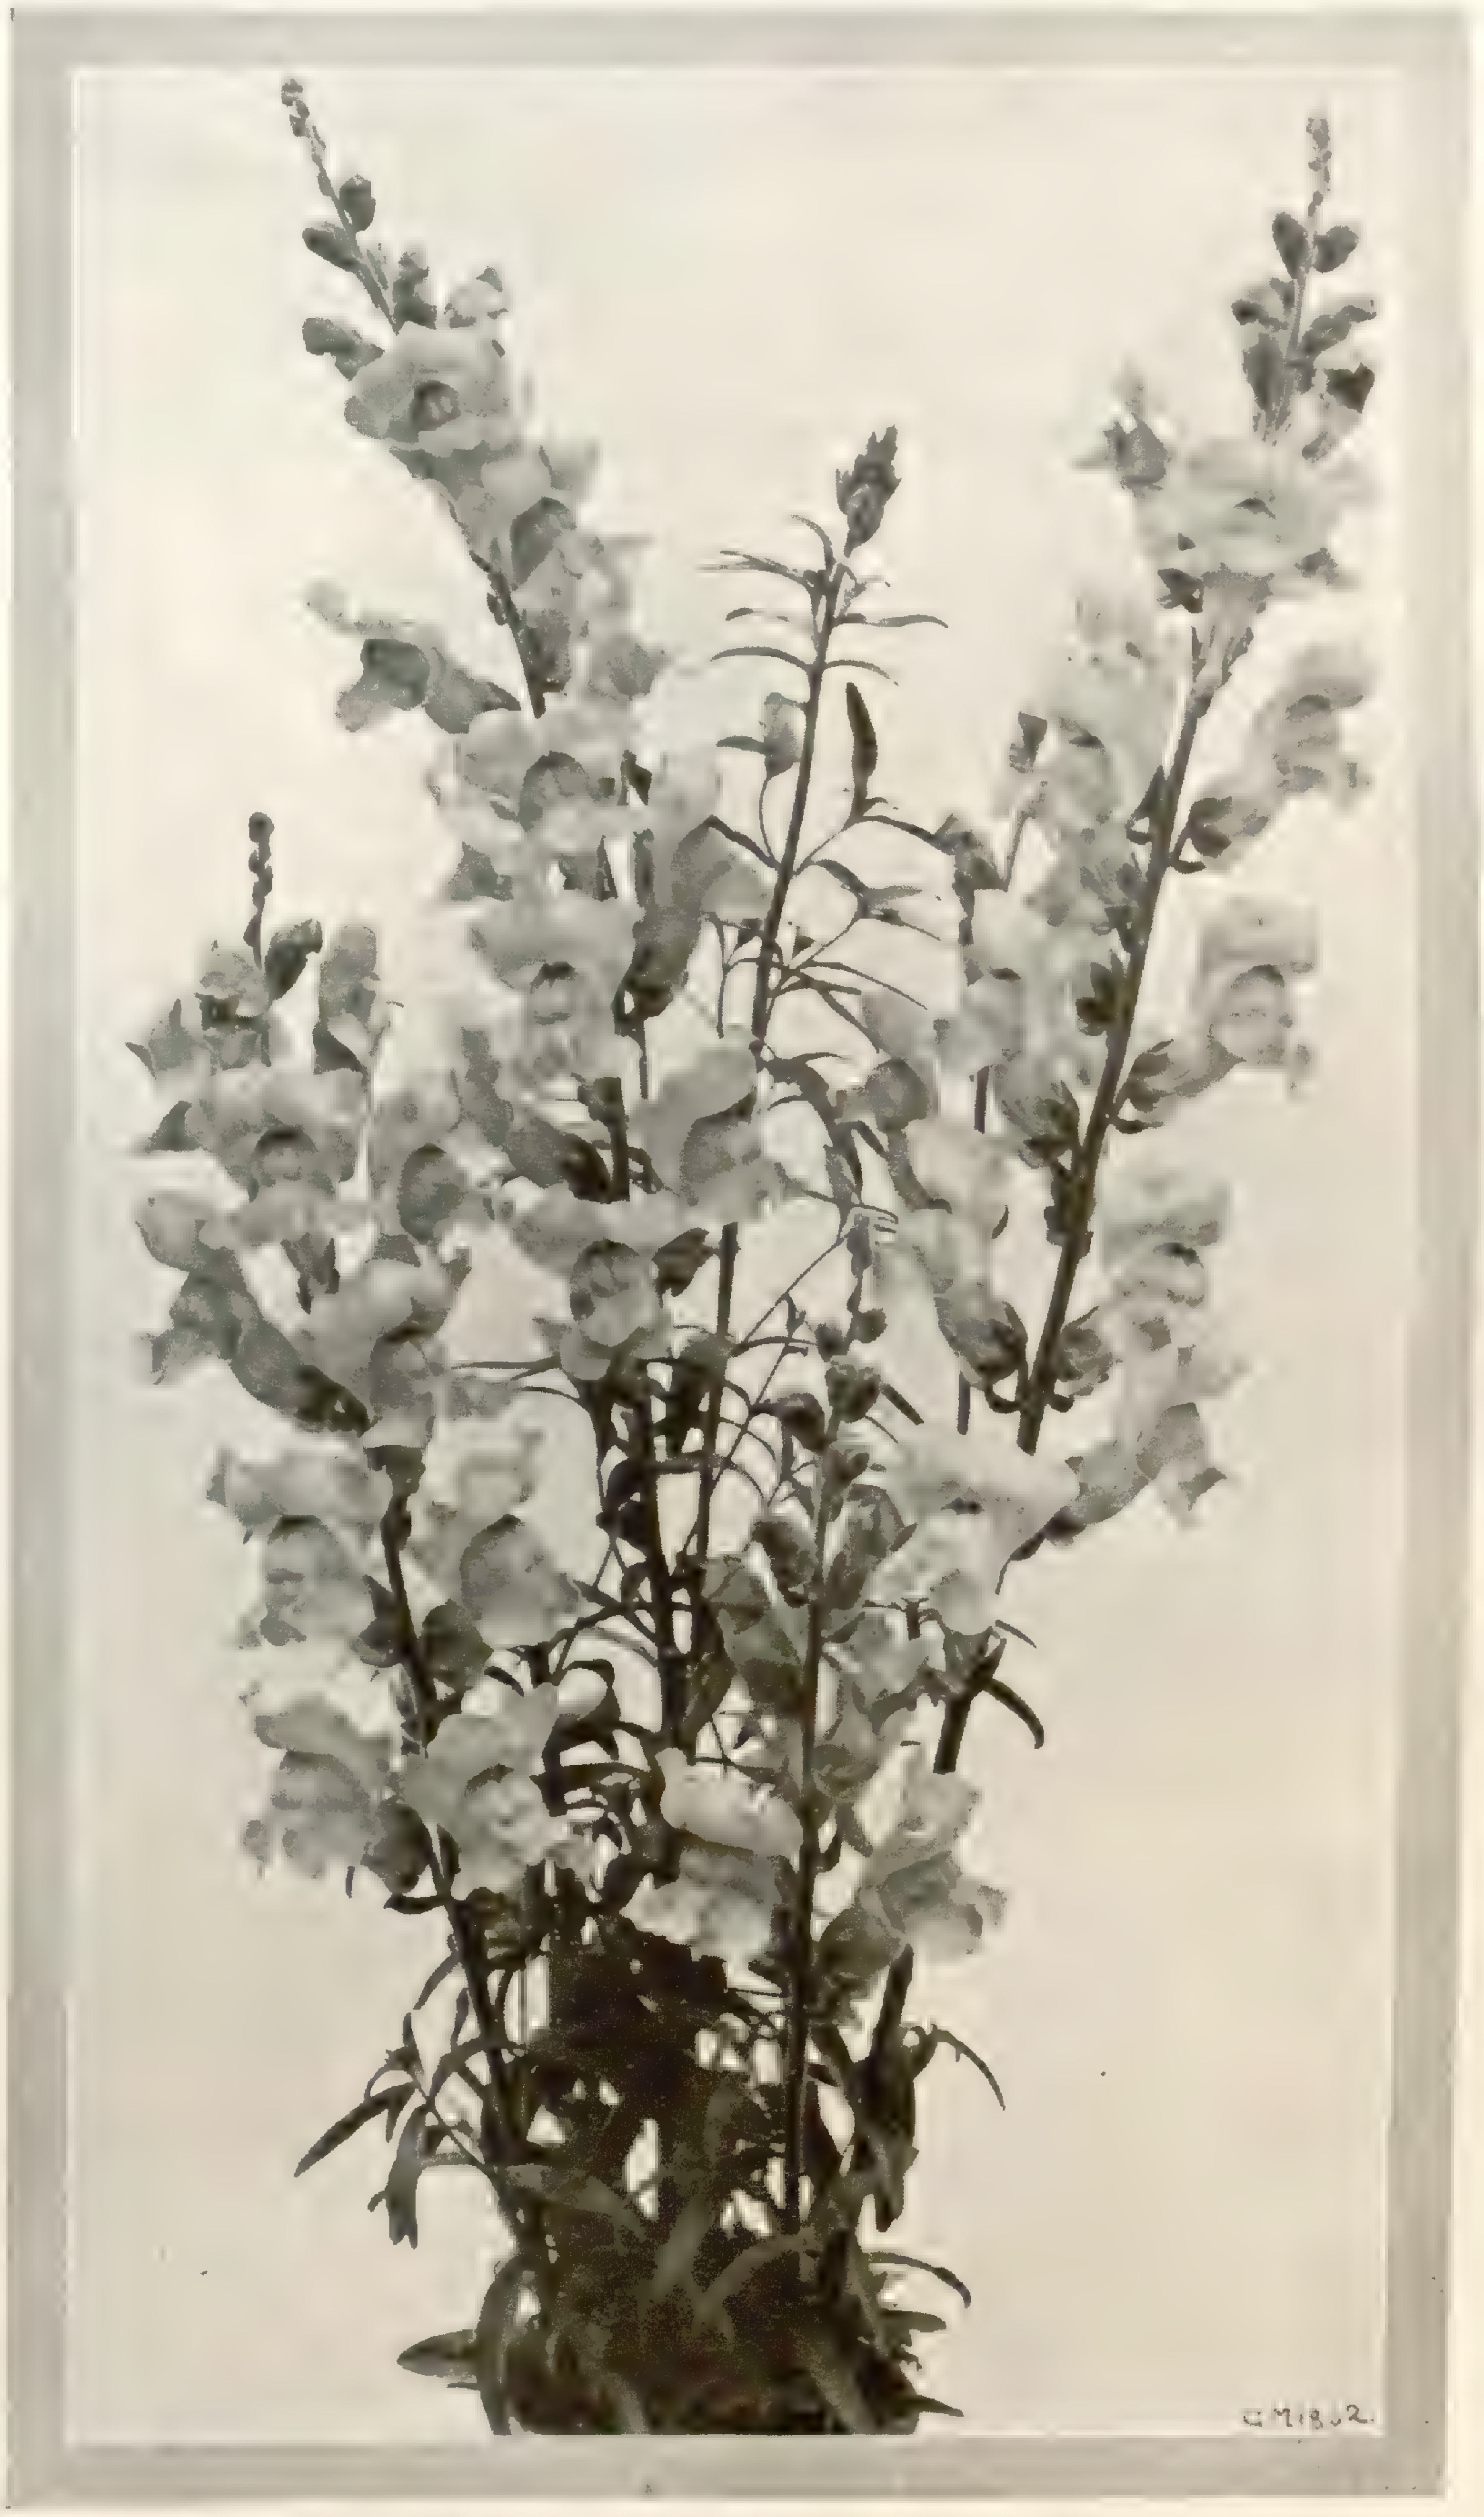
"CHRYSANTHEMUMS AND HOW TO GROW THEM FOR EXHIBITION," by J. B. Wroe.—Full details on timing and stopping for Northern, southern, and Midland growers, selections of the best varieties, illustrated instructions on taking the buds, cuttings, staging, etc. Prices 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.



ANTIRRHINUM ROSE DORE.
A beautiful free-flowering variety with fine spikes of old-rose coloured blooms.

TREES SUITABLE FOR EXPERIMENTAL FORESTRY.

(Continued from page 571.)

Black Cherry.

According to reports from American sources the wood of the Black Cherry (Prunus serotina, Ehrh.) occupies a similar position in America to that of the common cherry in England, for it is used for cabinet-making, decorative work in houses, and various fancy articles. Being of a rich reddish-brown colour and finely grained, it may be manufactured with a handsome finish, and it is capable of taking a high polish. As is the case with our native species, however, it has been used so extensively that the present supply is limited. Though there is no reason to believe that it would possess any distinct advantage over the British species, it is well worth a trial, especially as it will bear a moderate amount of shade, and thus be able to act as a partner of the ground whereon some light-demanding subject is to be grown. American foresters recommend it for mixing with white ash, silver maple, and black walnut.

Under forest conditions in America the black cherry is said to have a long, slender trunk surmounted by a comparatively small, open crown, composed of large, irregular branches. The trunk is often free from branches for a distance of 70 feet. In New England it is said to be of medium size, from 30 to 50 feet in height, with a diameter of from 15 to 24 inches. In the Middle States a height of 60 feet and a diameter of 2½ feet is attained, but the best development is said to occur on moist residual soil of the upper slopes of the southern Alleghenies where a height of 90 feet and a diameter of 4 feet are not uncommon. In this country it will probably not attain more than average growth, although trees planted in poor, sandy soil have grown to a fair size. The larger trees at Kew measure from 45 to 63 feet in height, and are up to 4 feet 4 inches in girth. These are growing in poor sandy soil.

Under natural conditions this tree is found among beech, birch, oak, hickory, black walnut, and maple. The above-mentioned circular says that "the black cherry will grow fairly well on dry situations, but it is only in the moist, well-drained, rich soils of mild climates that the maximum development is reached. The tree thrives on bottom lands, yet makes a moderate growth on sandy or rocky upland if the soil is penetrable."

At the present moment the value of English cherry wood cannot be said to hold out any recommendation to planters. As with some other kinds of timber, however, the supply for some years past has been so small and so irregular that it has ceased to be looked on as a standard wood, and it is quite probable that were a good supply to be again obtainable prices would go up, and it would be sought after.

False Acacia.

Attempts were made a century or more ago to popularise the Black Locust or False Acacia (Robinia Pseudacacia, L.) in England for commercial purposes, and again in 1823 its merits were strongly advocated. Loudon, "Arboretum et Fruticetum," i., gives a considerable amount of information on the subject, and states that about the latter period one man alone sold 1,000,000 trees for the purpose. Unfortunately, no records appear to have been kept of these plantations, and apparently all the information that can be gleaned about them has to be extracted from short notes which were published from time to time in various periodicals, 40 to 60 years ago.

The species is a native of the Eastern United States, where it grows to a height of from 60 to 80 feet, with a trunk 2½ to 3½ feet in diameter under favourable conditions, though in some places it is much smaller. Its rate of growth in Great Britain compares favourably with American records, while as regards size, it grows almost as large in England as in its native country. The yellowish coloured timber is hard and durable. In America it is used for shipbuilding, tree-nails, hubs for wheels, posts for fencing, and various other purposes. In some Continental countries the wood of young trees is in demand, both round and split, for vine props, and older wood is used for spokes, etc. "Forest Service Circular," No. 64, United States Department of Agriculture, gives the life of a post made from the heart-wood as from 15 to 25 years.

It adapts itself to a variety of soils and conditions, for it flourishes on poor, light land and also in ground of a clayey character. Good specimens are notable both on low land and on hill sides where shelter from rough winds is provided. Suckers are produced freely, and for this reason it has been recommended for planting on loose banks to help to bind the soil. The timber ought apparently to be cut when the trees are between the ages of 35 and 55 years, for older trees often show signs of decay. The scarcity of the false acacia in our woods after being planted somewhat extensively, suggests that it is not suitable for forest planting. In the absence of any definite information on the subject, however, the usefulness of the timber makes it well worth a further trial.

Black Birch.

The Black or Cherry Birch (Betula lenta, L.) is one of the several American birches which supply a large amount of timber each year both for home consumption and for export. Some idea of the importance of our imports of American birch-wood may be gathered from the statement made in J. R. Batterden's book, "Timber," p. 104, that 1,500,000 cubic feet were imported into the Mersey in 1906. This wood is received partly in the log, partly as boards, and sometimes worked ready for use. It is employed for a variety of purposes, the better qualities being used in the manufacture of furniture and for cabinet work, while bobbins, shuttles, shoe lasts and other articles are made from the remainder.

B. lenta is described in the "Silva of N. America," as forming a tree 70 to 78 feet high with a trunk 2 to 5 feet in diameter. The wood is reported to be heavy, very strong, and hard, close-grained, with a satiny surface, susceptible of receiving a beautiful polish. A dark-brown or reddish heart-wood is contrasted with yellowish sap-wood. It is used largely for furniture, and in some of the provinces on the Canadian sea-board for ship-building. Hough, "American Woods," ii., p. 35, reports very favourably on the wood, and says that it makes a good imitation of mahogany and cherry when polished.

The species is found in Canada and the N.E. United States, and is distinguished from other birches by its aromatic bark and leaves. The bark is of commercial importance in America, for it is collected during late summer and by processes of maceration and distillation furnishes an oil, known as "oil of sweet birch" and "oil of betula," it is used for flavouring purposes. It is also said that beer is made from the sap of the tree.

Planting in this country appears to have been limited, for well-grown trees are rare. Representatives are to be found at Kew, but the older trees have hardly proved so satisfactory as some other American kinds. As the birches are usually fast growing trees a plantation would soon prove its worth. It would be well to try it on somewhat richer soil than that which is usually associated with the growth of birch.

Yellow Birch.

The distinguishing features of the Yellow Birch (B. lutea, Michx.) and B. lenta are less marked than is the case with other American birches, though the sweet bark of the cherry birch is a good character. Descriptions of both trees are to be found in the "Silva of N. America," vol. ix., and their botanical characteristics are also recorded in "Trees of Great Britain and Ireland," iv. It is found in the N.E. United States and Canada, the better developed trees being up to 80 feet high and 3 feet in diameter. Hough, "American Woods," i., pp. 64-65, refers to the timber as follows: "Wood hard, close-grained, tough, heavy, and very strong, compact, taking a beautiful satiny polish; heart-wood reddish-brown, sap-wood nearly white." Its uses are numerous, for in addition to being employed by wheelwrights and cabinet-makers, it enters largely into the manufacture of chair-bottoms, friction-pulleys, and small wooden articles. Young saplings are split for hoops for casks, and burrs from old trees make good mallets and beetles. It would probably succeed best as a fairly dense, pure stand. Pine and spruce might, however, be tried with it to form a mixed wood.

Paper Birch.

The Paper or Canoe Birch (Betula papyrifera, Marsh) is another of the American birches which appears to be worth a trial in British woodlands, for it grows quite as well as the common birch, and produces a good quality timber. Hough, ii., pp. 33-34, describes it as being a favourite timber for such small articles as clothes pins, spools, pill-boxes, shoe-lasts, and pegs; he also says that it is used for wood-pulp and for furniture. Its bark was formerly an object of considerable importance to the North American Indians, for in addition to fashioning their canoes from it, it furnished them with waterproof tent covering, baskets, and various other commodities. In Museum No. 1 at Kew an interesting series of articles manufactured from the bark of this tree may be seen.

The paper birch is found further north than any other deciduous American tree, and under favourable conditions grows to a height of 80 feet with a diameter of 3 feet. It is about equal to B. alba, L. for hardiness and stands better than either B. lenta or B. lutea. It grows well at Kew in poor, sandy soil. The largest specimen is 50 feet high, with a girth of 4 feet at 5 feet from the ground. All the birches are suitable for close planting in pure stands, and they may also be mixed with spruce or pine.

River or Red Birch.

Though of less importance than the birches already referred to, the River or Red Birch (Betula nigra, L.) grows freely enough to warrant a trial under forest conditions. Hough describes it as a tree 80 feet high by 2½ feet in diameter, extending from Massachussets southwards to Florida and westwards to Iowa, Kansas, and Texas. Its wood is said to be "rather hard, strong, close-grained, compact, with fine medullary rays, yielding a smooth finish; used in turnery, woodenware, shoe-lasts, etc." Under natural conditions it is found inhabiting moist land, such as banks of streams and marshy places. That it grows fairly well on dry ground, however, is shown by several good specimens which are growing in the natural sand at Kew. One of the best, standing near the Victoria Gate, is 55 feet high and 4 feet 10 inches in girth at 5 feet from the ground. B. nigra may be distinguished amongst other birches by its rough reddish-brown bark.

Oregon Maple.

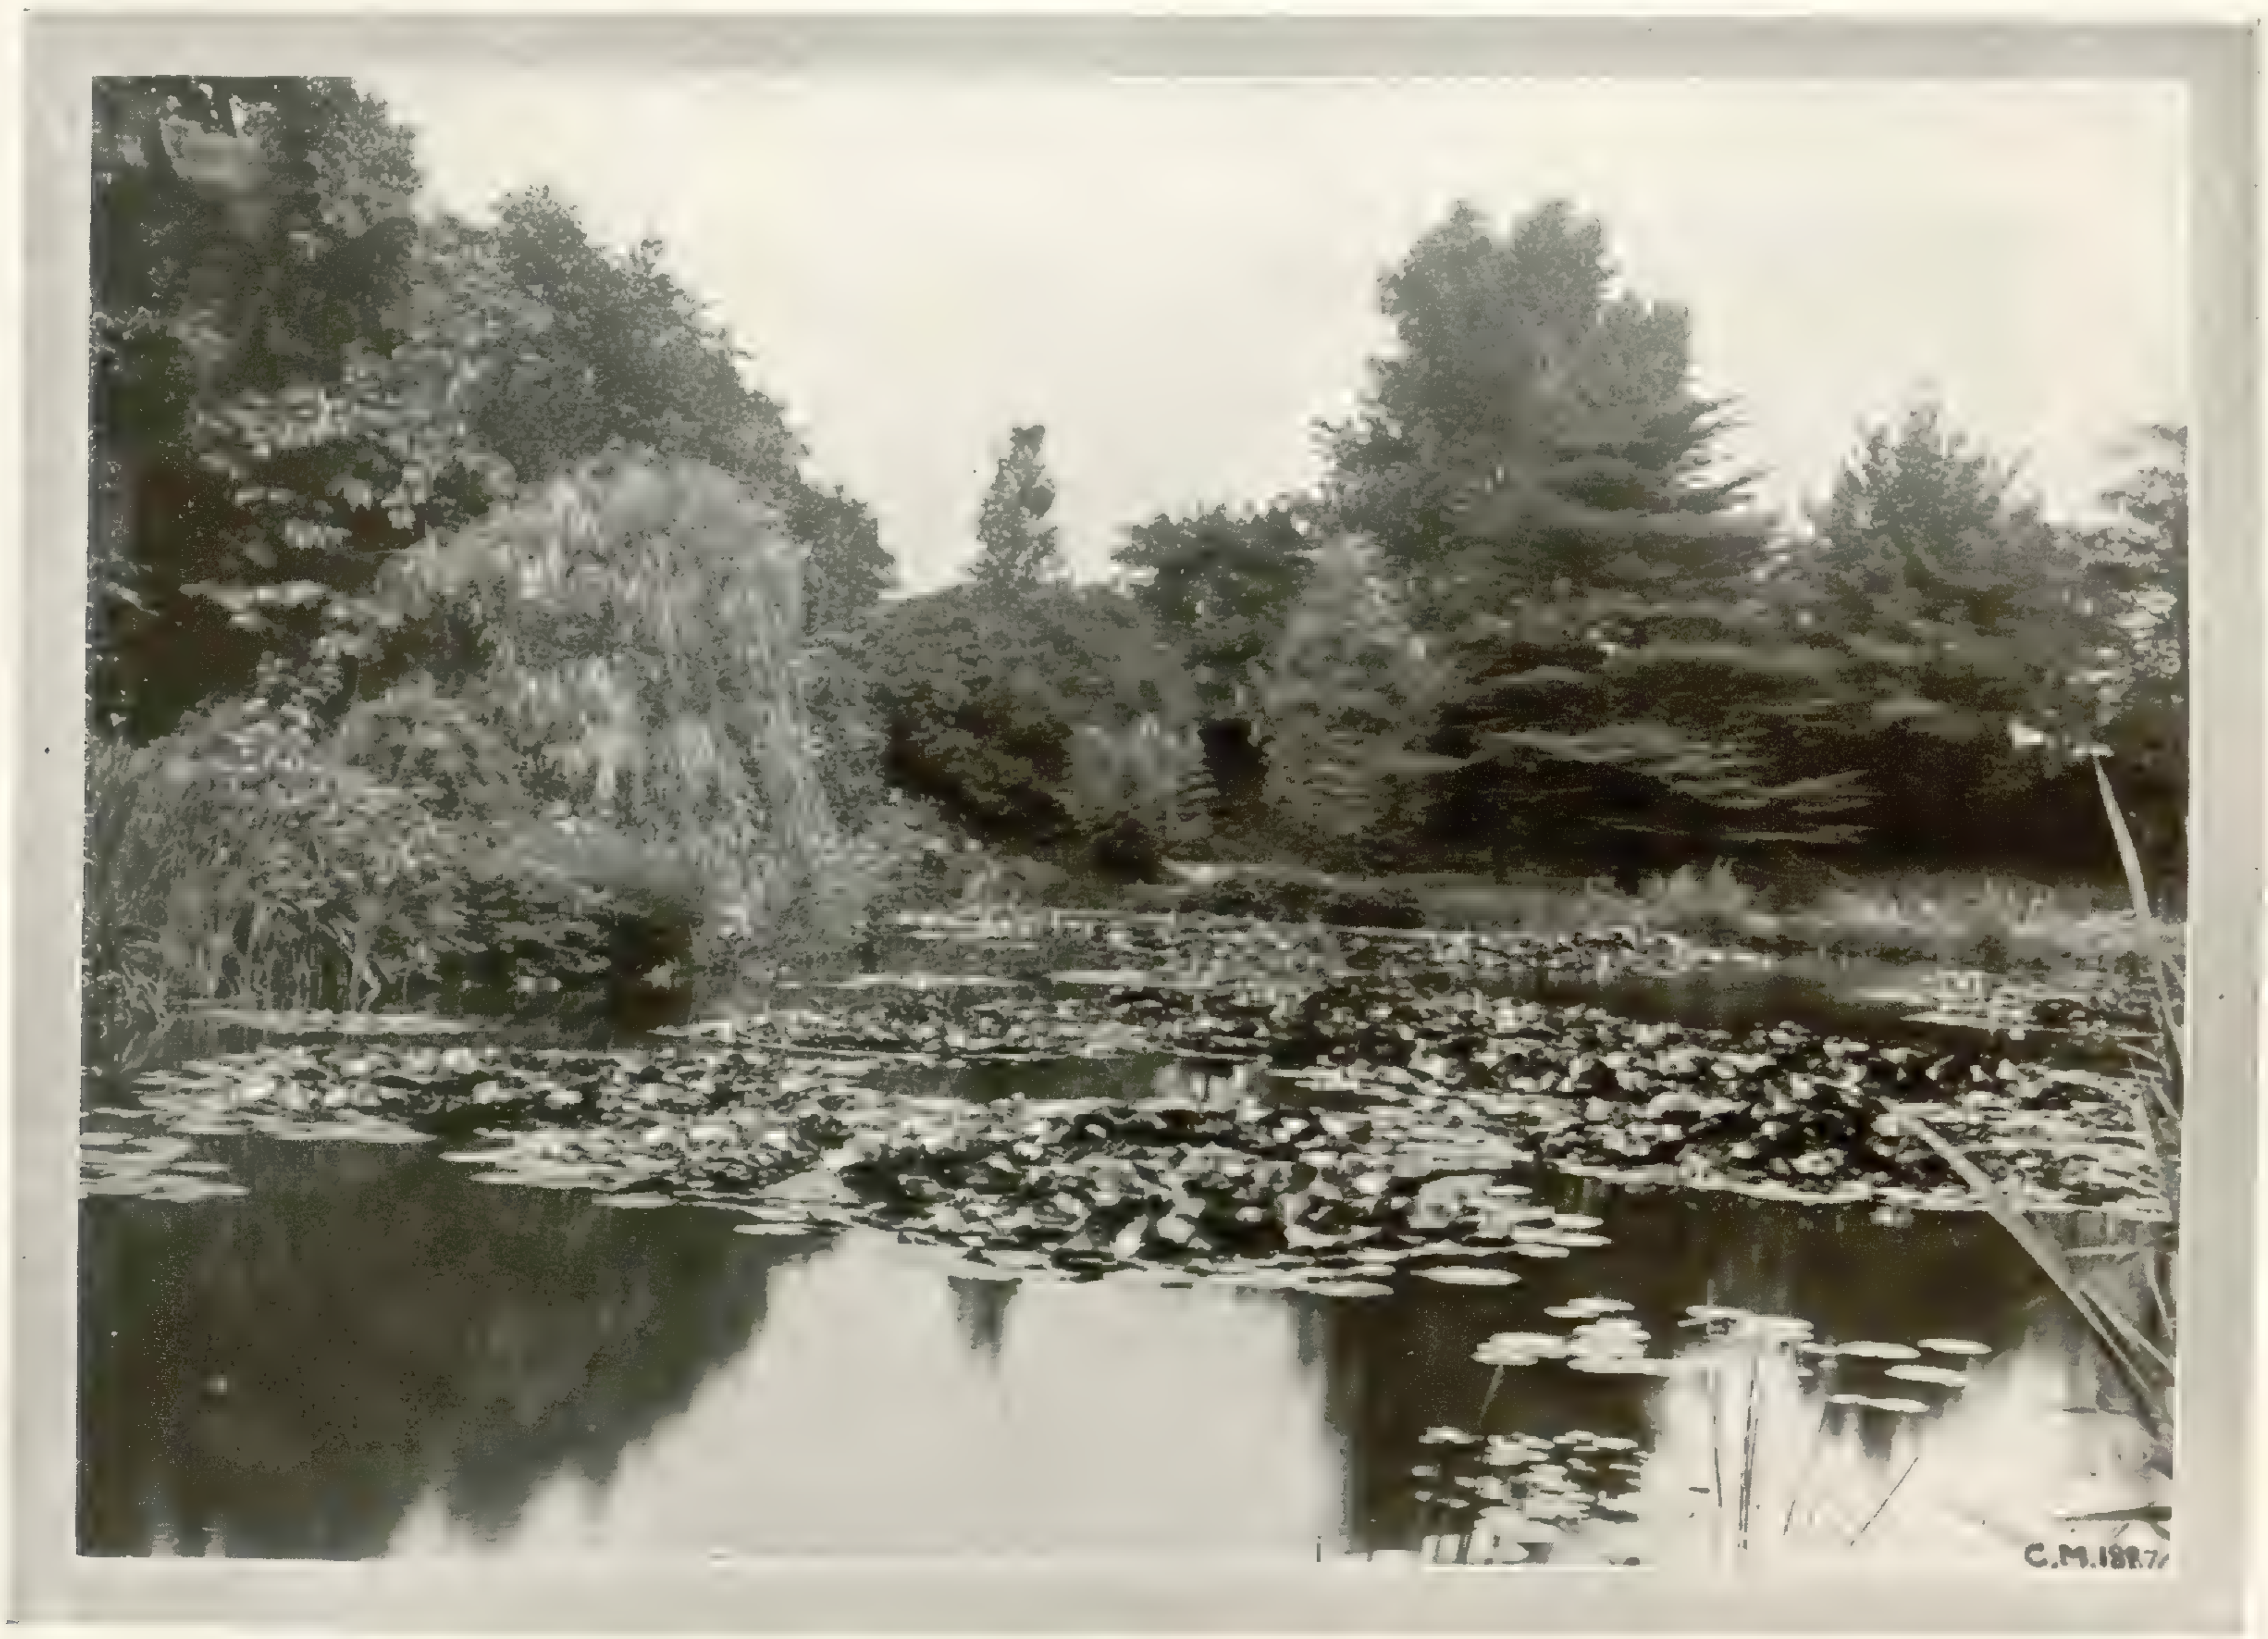
The Oregon Maple (Acer macrophyllum, Pursh.) is one of the most important of several American maples which are likely to prove useful for British woodlands, for it grows quickly, forms a large tree, and its timber is of good quality. Although introduced a century ago it is not common, but some good examples have been noticed in a few places. In the "Silva of N. America," ii., pp. 89-90, it is described as forming a tree up to 130 feet high with a girth of 15 feet. It is found along the Pacific coast, below 2,000 feet elevation from Alaska to S. California, and appears to reach its maximum dimensions in the moist climate of Vancouver Island and the adjacent mainland. The timber is said to be of good quality, light, soft, close-grained and capable of receiving a beautiful polish. The largest tree known to Mr. Elwes in this country is growing at Boynton, in Yorkshire. When measured a few years ago it was 70 feet high and 6 feet in girth, and had been planted about 60 years.

This species may be distinguished from others by means of its large sycamore-like leaves, which are sometimes 9 inches across, and by its hairy fruits. The pendulous racemes of fruits are sometimes very conspicuous, for they are from 6 to 9 inches long, and the wings are frequently red in colour. Fertile seeds are borne on trees at Kew. A. macrophyllum is likely to thrive under similar conditions to the common sycamore, and as its wood is apparently quite equal in quality, there would appear to be no reason to doubt of its proving a commercial success, providing it thrives satisfactorily under forest conditions. It could be grown as a pure wood or as a mixture with beech or silver fir for a companion. Planting might be done at 4 feet apart.

The Torenias.—Two at least of these, namely, T. Bailloni and T. Fournieri, are worthy of a place among the most select of tender annuals, and they are both very attractive in the greenhouse for a considerable period during the summer. The seeds should be sown in gentle heat in early spring, and when the young plants are large enough to conveniently handle they may be pricked off into 5in. pots. If half a dozen plants, equidistant from each other, are put into each pot pretty little specimens result therefrom. They do well in a mixture of loam, leaf-mould, and sand, and are benefited by an occasional stimulant when the pots are full of roots. T. Bailloni, also known as T. flava, has rich yellow flowers with a purple blotch, while T. Fournieri is strangely coloured in violet, white, yellow, and lilac. There is also a form of this last whose flowers are nearly white.—W. T.

WATER LILIES.

The season through which we are now passing is remarkable in many ways; and, without taking into account anything that has occurred outside the boundaries of the garden, it will long be remembered by those who take an intelligent interest in what is going on within them. The occupants of the garden are still suffering from the effects of one of the most severe, and practically one of the longest, of the droughts that have been recorded; and we have had opportunities for feeling the effects of a temperature ranging between 80 degrees and 100 degrees on so many occasions that comparatively little notice is taken of a temperature of 80 deg. Yet with these two serious drawbacks to the full development of useful crops and of ornamental plants that thrive under conditions which most generally prevail, aquatic plants have grown vigorously and bloomed profusely, and contributed more than their usual quota to the attractions of the pleasure grounds. All kinds of aquatics that have had access to a sufficient supply of water have been most satisfactory, but the water-lilies would appear to be revelling in the brilliant sunshine and the high temperature that now, as during the past six weeks, form such characteristic features of the English weather.



PART OF LAKE WITH WATER LILIES, GUNNERSBURY HOUSE.

There are but few years in which the temperature is not sufficiently high during the summer months to enable the most choice of the hardy nymphæas to produce with considerable freedom their finely-formed and exquisitely-coloured flowers; but it is in summers in which both the sunlight and heat are above the average that they attain their highest degree of development. It is certainly in hot, dry summers that the charms of the water garden are the most highly appreciated, and it would be difficult to imagine anything more delightful than to sit under the wide-spreading branches of a tree and enjoy the charms of

> “ Floating water-lilies broad and bright ”

in a neighbouring pool or wide-spreading lake. To have water-lilies in the highest degree of perfection possible, even in the most favourable seasons, good cultivation is essential. The varieties must be selected with due regard to the area of the pond or lake in which they are to be grown, and they require replanting as often as may be necessary to prevent their becoming crowded; for when overcrowded the plants push their leaves some distance above the surface of the water, and the flowers, which are produced in lessened numbers, are more or less hidden by the leaves. Moreover, where water-lilies are so crowded as to suggest a severe struggle for existence the effect is anything but pleasing. The illustration of a portion of the lake that is devoted to water-lilies in the gardens of Gunnersbury House, one of the residences of Leopold de Rothschild, Esq., will convey a much better idea than a written description of the manner in which water-lilies should be arranged to ensure the best results both in flower production and general effect. As a matter of course the several varieties are spaced according to the spread of their leaves when growing vigorously, and they are lifted and replanted at such intervals as may be found necessary to prevent overcrowding. Whether the replanting be done annually, biennially, or triennially will, of course, be determined by the characteristics of the varieties, and whether the several kinds are in a moderate or robust state of health. The accompanying illustration has been reproduced from a photograph taken a few days ago, and is therefore useful as showing the freedom with which the nymphæas are flowering in this time of heat and drought, as well as indicating the advantages of arranging the plants at the most suitable distances apart.

There is no occasion to refer at any length to the remarkable success that has been achieved by Mr. J. Hudson, V.M.H., in the cultivation of water-lilies, for he has long enjoyed a high reputation in connection with these beautiful flowers. He may, indeed, be described as one of the pioneers in the cultivation of water-lilies in this country; for within a very short period of the introduction of the earliest of the late M. Marliac's fine hybrids, the planting of the fine lake at Gunnersbury House was commenced. Since then the more noteworthy introductions have been added from time to time, and, as the result, the collection is not less remarkable for its comprehensive character than for the splendid condition of the plants that have a place in it. As evidence of the interest that has throughout been taken in the newer water-lilies by Mr. Hudson, it may be mentioned that of the awards made by the Royal Horticultural Society's Floral Committee for nymphæas, fully two-thirds have been conferred upon flowers shown by him. G.

Flowering Cannas.—It is questionable if even now these grand flowering plants are in many gardens appreciated to the extent they might be, for many of them must be regarded as simply gorgeous. They are also so continuous flowering that, apart from their value when bedded out, they are extremely valuable for the embellishment of the greenhouse or conservatory during the summer and early autumn months. Quite recently an Award of Merit was given to a distinct variety—Frau E. Kracht. In this the large flowers are of a distinct salmon-rose tint, a pretty shade, yet at the same time decidedly less showy than many of the others.—W. T.

DISA GRANDIFLORA.

No terrestrial orchid commands more attention than Disa grandiflora, the beautiful species found on Table Mountain, near Cape Town. Everyone who has seriously taken up the culture of orchids has at some time or other tried to cultivate this Disa, but, judging from the many poor specimens seen from time to time in collections, the results are very far from satisfactory, except in a few instances. The remarkable point about the culture of Disa grandiflora, however, is that where the plants do well they grow like the proverbial weeds, and under conditions that appear to be easily reproducible in other gardens. A moist atmosphere is one of the things to be provided, but too often this is accompanied by a stuffiness and high temperature that do not suit the plants. Wherever Disa grandiflora is grown the great point is to try plants in various situations until the most suitable is found, remembering always that it is a cool orchid and one that must not be severely rested, though naturally it does not require a large supply of water when not in full growth.

One plant in a pot and annual potting generally secure the best results, and this is the practice followed at Warren House, Stanmore, the residence of Mrs. Bischoffsheim, where, in a moderately cool greenhouse, this disa is a great success each year. A considerable quantity of plants are grown, and on August 1 Mr. A. Taylor, the grower, staged about a hundred examples, carrying fine spikes of orange and rose-coloured flowers. One spike is illustrated herewith.

DISA GRANDIFLORA.

A beautiful terrestrial orchid with large flowers coloured orange-scarlet and rose.

FORESTRY IN SCOTLAND.

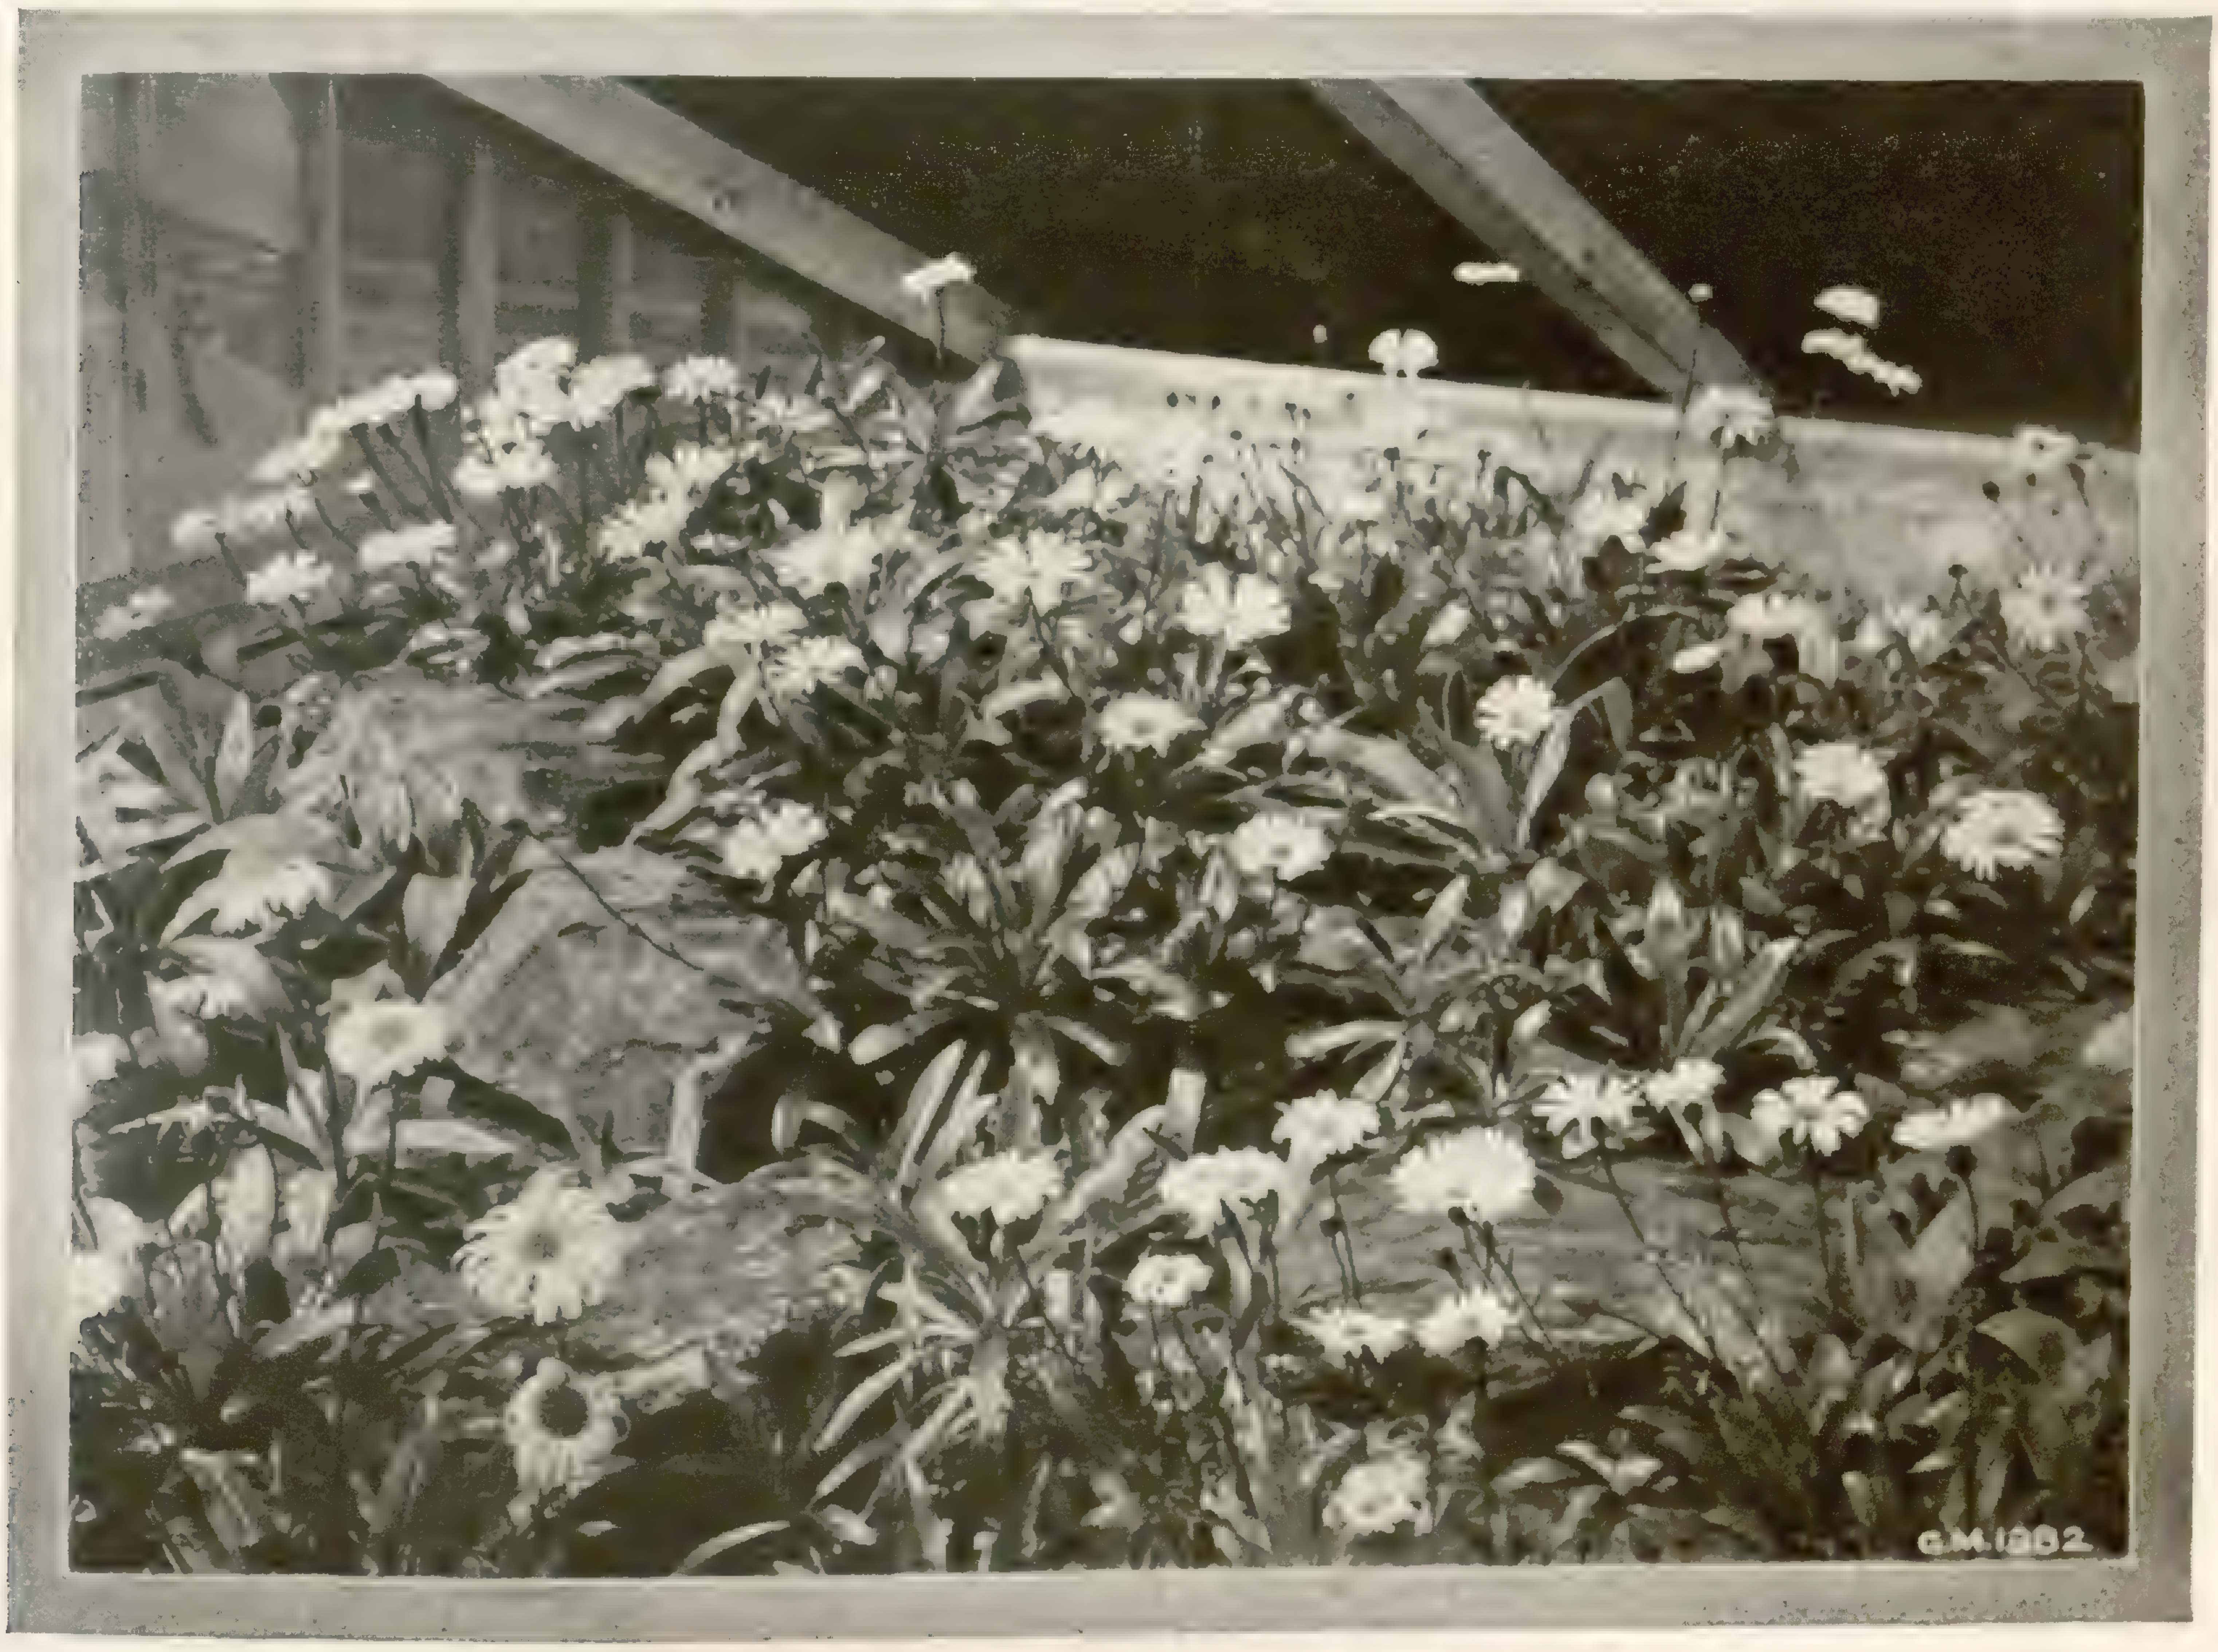
In anticipation of the meeting at Inverness, the Royal Scottish Arboricultural Society issued its summer volume of Transactions, edited by Lieutenant-Colonel F. Bailey, and containing a number of interesting papers and notes dealing with various aspects of forestry. Several of the papers submitted to the society during the year are reproduced, as, for instance, Mr. William Dawson's article on "The State and Private Woodlands," in which he describes some of the means taken by Continental countries to assist the private landowner in afforestation, and Mr. Donald Munro's paper on "The Home Timber Trade Outlook," in which, from his knowledge as a practical wood merchant, he suggests the trees that might be most profitably grown in this country. Mr. Munro urges the planting of larch, Scots fir, spruce, and Douglas fir. He believes that spruce would give better returns than any other timber he knows, and he cites a tract of it near Aberdeen which is worth £110 per acre. Mr. Dawson points out that in many Continental States newly-planted forest is exempt from taxation, a practice which he urges should be adopted in this country. With regard to State loans he points out that in Germany these are advanced less often to individuals than to communes, corporations, and local authorities. "In Hanover," he says, "where there are vast tracts of moorland, a system was introduced by which the State supplied, in the form of a premium, 40 per cent. of the cost of new plantations. The remainder, or any part of it, can be given in the form of a loan. The rate of interest charged on the loan is 2 per cent. to corporations or suitable local authorities, and 3 per cent. to private individuals, while in both cases an additional 2 per cent. is paid to a sinking fund. The work of afforestation and supervision is mostly done by the State authorities. This is really a very suggestive scheme, and is well worthy of our consideration." Replanting is compulsory in most German States, and fines are imposed where it is not carried out.

An interesting article is contributed by Mr. G. P. Gordon, describing the primeval forests or woodlands of Scotland. These are of three kinds, the birch woodlands, which are fairly common throughout the Highlands, the pine woods, which are found in such places as Ballochbuie and Glen Lui and Rothiemurchus, and of which the finest example is perhaps the Lochiel forest on Loch Arkaig, and the oak woods, which are generally found along a loch side or river side. Mr. Gordon enters in some detail into the flora or plant undergrowth which is typical of each of these classes of forest. This flora evidently persists for a considerable period after the trees have been changed. Thus at Achnacarry a larch forest from 40 to 60 years old has taken the place of a primitive oak forest. Yet the woodland flora has undergone no change, and remains typical of an oak wood. In connection with the pine forest at Loch Arkaig, it is noted that on an area felled about a hundred years ago, the few trees left are regenerating the area naturally. The same thing is mentioned in connection with Ballochbuie and Rothiemurchus. Value attaches to a paper by Mr. G. F. Scott Elliot on larch seed in view of the trouble which has arisen in recent years in Scotland through larch disease and the disappointing condition of larch woods. Some proprietors have ceased planting larch. Mr. Scott Elliot says the disease is not so much the enemy of the larch as a sign that the trees are unhealthy and wanting in natural vigour. "As a matter of personal observation," he says, "much of the injury seems to be due to careless sylviculture. I have myself seen larches planted in a perfectly flat peat moss, with a subsoil of stiff estuarine clay and in a sheltered place. They happened, in this case, to be attacked by insects rather than by Peziza, but it was obvious enough that whoever it was that planted larch in such a situation was guilty of arboricide. Mr. S. J. Gammell, of Drumtochty, also informs me that in humid, windless places, aphis and not peziza is usually the executioner selected."

Mr. Scot Elliot describes some of the researches which have been carried out by Scottish and by Continental authorities into larch seed, and he comes to the conclusion that the Scottish larch seed at present sold is inferior to European larch seed. He urges the use of Tyrolese or Japanese seed. Among the other papers is a discussion by Mr. A. D. Richardson of Mr. Augustine Henry's recent investigation of elm seedlings, a report upon the afforestation of water catchment areas by Mr. George Baxter, engineer to the Dundee Water Commissioners, who was asked to report to the Commissioners upon the planting of the Dundee catchment area, and notes by Mr. B. Ribbentrop, upon the influence of the origin of the seed of the future character of forest trees as illustrated by German researches on the subject. In the general notes, which along with reviews of recent books on forestry complete the Transactions, it is stated that the Development Commissioners have approved of the purchase of an area in Scotland to be converted into a demonstration forest, as soon as they are satisfied that a suitable tract of land can be obtained.

CELMISIAS.

In his "New Zealand Plants and their Story" Dr. L. Cockayne, of Christchurch, New Zealand, writes: "Generic names are frequently hideous, but in celmisia we have one dainty enough to take a foremost place among those feminine floral appellations now so popular. And well does a race of plants so beautiful deserve a fitting title. On every mountain side, at all seasons, it is the celmisias that give the characteristic stamp to the meadows, filling the air with aromatic fragrance, and delighting the eye with their beauty of form or abundance of flowers. With one exception all are true New Zealanders, and are probably a remnant of the long-vanished meadow plants of sunken southern lands. Two special classes occur—those with fine upright rosettes, and those which trail over a considerable area, forming round mats. Some, again, have quite small rosettes, and form dense silvery cushions, such as Celmisia sessiliflora and C. argentea. The most handsome of the celmisias is perhaps C. coriacea, a plant with large stiff silvery leaves, and flower heads several inches in diameter."



CELMISIAS AT THE ROYAL GARDENS, KEW.

This illustration represents a great cultural triumph. The species most in evidence is Celmisia holosericea.

Another authority, Mr. T. F. Cheeseman, curator of the Auckland Museum, says, in the "Manual of the New Zealand Flora," that, "The genus Celmisia, which is confined to New Zealand, with the exception of one species found in Australia and Tasmania, forms one of the chief ornaments of the montane and alpine flora of the colony, the various species usually composing a large proportion of the vegetation, especially in the South Island, where the mountain slopes and valleys are often whitened for miles from the abundance of their large daisy-like flowers." Many years before the above was written Sir Joseph D. Hooker (then Dr. Hooker) produced "The Botany of the Antarctic Voyage of H.M. Discovery Ships 'Erebus' and 'Terror.'" He was botanist to the expedition, and he described the celmisias as "Beautiful herbaceous plants, often forming dense patches on the boggy mountain tops, with spreading, radical leaves, grass-like, or oblong, covered underneath in almost every species with thick white wool; and single-flowered scapes." Dr. Hooker described ten species, and gave illustrations of C. holosericea, C. coriacea, C. spectabilis, C. hieracioides, and C. incana. This was in 1853. In 1906 Mr. Cheeseman described no fewer than forty-three species.

These references and quotations go to prove that the genus Celmisia is an important one, that many of its species are extremely beautiful, and therefore their culture in the United Kingdom is worthy of some effort. So many New Zealand plants are hardy, or nearly so, in this country, consequently such culture should not be attended with any great expense; but although this is granted, the celmisias have until recently been extremely difficult subjects to manage with any degree of success. At rare intervals specimens have been produced which served to whet the appetite of flower lovers, and set not a few to work upon an endeavour to grow the plants that, according to so many authorities, are so very beautiful and free-flowering in their native haunts.

Pot culture in cool greenhouses or cold frames, and the use of a peaty soil for rooting medium, pretty well sums up the methods generally tried with celmisias. In some favoured gardens outdoor culture on rockwork has been adopted, but with no great success, the plants succumbing to hot sunshine, on the one hand, and to the damp of winter on the other.

At Kew many variations of what may be called "half-hardy" treatment has met with varying success, and such success has never been maintained until now. A few years ago Mr. W. Watson, the curator of the Royal Gardens, Kew, resolved that if it were humanly possible celmisias should be grown so as to show what they are like in New Zealand; he fired the enthusiasm of Mr. Taylor, the skilful foreman of the Temperate House, various plans were formed, seeds were not difficult to obtain, and the work was set going that has resulted in a cultural triumph.

It may be urged that there is no need to go into ecstasies over the celmisias, as they are not likely ever to become popular, and their commercial value is very small. Just so. But remember Gerbera Jamesoni, a plant that presented many difficulties, practically all of which have been overcome, and now gerbera flowers are a marketable commodity of no mean value. There must be a beginning, and this has been made at Kew. It is now for the amateur plant lover and the traders to profit thereby.

There are two things that celmisias strongly object to in cultivation, indeed there are three. These are bright sunshine, drought at the roots, and overhead moisture in the winter. They are almost hardy, and, therefore, must not be coddled. A cool or moist rooting medium is essential, and the plants have a great dislike for frequent and abundant overhead watering. At Kew, one end of a span-roofed frame was boarded off for the celmisias, and a compost, consisting of about half good loam, and the other half leaf-soil, some peat, sand, and broken sandstone, was placed over moderate drainage, and built up in the form of a low rock garden, so as to secure a good depth of soil, and admit of the use of sandstone to keep the soil and roots cool. In this strong seedling plants were placed, and these, now three or four years old, are fine specimens, many of them forming masses of ten or a dozen growths, and in May last they were a picture of health and beauty, as the illustration will show.

The frame is heated, but it is obvious that artificial heat is not necessary. Even during the severest weather the celmisias receive ventilation, while during favourable weather the lights are thrown wide open, indeed, their chief use is to protect the plants from rain and snow. From flowering time until the early winter rains the lights are removed altogether, and a heavy shading is used over the plants. That hot sunshine is not desirable is proved by the fact that some plants on the south side have succumbed this season, whereas those on the shadier side are particularly robust. Further, that artificial heat and bright sunshine are unnecessary is also proved by the plants growing on a rockwork arrangement on the north-west side of the Temperate House, right in the angle formed by the entrance and the side of the central block of the building. Here the sun reaches the plants for a little while in the afternoon during the summer, but not at all during the winter and spring months. Of course, the position is sheltered by the Temperate House, and frame lights are placed well above the plants during winter and spring to throw off rain and snow. Here the celmisias grow practically as well as in the frame in the nursery, though they do not flower with quite so much freedom, and are, naturally, about a fortnight later in blooming.

Celmisias are slow to move in the small seedling stage, and so far plants have not been flowered until two years old. At Kew an ordinary greenhouse has been found a suitable place in which to raise seedlings, and that the seed pans, and also the pots of small seedlings, should be plunged in sphagnum, or some equally good moisture-holding material. In their earlier stages of growth the seedlings appreciate a little sphagnum in the compost. That they appreciate the sphagnum plunge bed was very evident a few days ago, when a few plants were lifted, and it was seen that the roots had passed six inches or so into the sphagnum, and laid hold of the moss in no uncertain fashion.

Very many species are now being tried at Kew, thanks to the kindness of the Dunedin authorities and to Captain Dorrien Smith. Those that have responded so well to the treatment at Kew are C. holosericea, the one most in evidence in the illustration; C. Munroi, C. coriacea, C. petiolata, C. Browni, C. Lindsayi, C. hieracifolia, and C. verbascifolia. A few others are in cultivation, but have so far scarcely passed the experimental stage, though all promise well. The following species are in cultivation:

C. Browni is a rare species from the Southern Islands, and has petiolate, leathery leaves, clothed on the underside with a greyish-white tomentum.

C. coriacea is from the North and South Islands, and ranges in altitude from 1,500 to 4,500 feet. It has large leaves, sometimes as much as two feet long, thick and leathery, silvery-green above, and white beneath. The flower heads are upwards of three inches in diameter.

C. hieracifolia is a native of the Southern Island; it is a smaller grower than many, and is apparently somewhat rare and local. The tomentum on the undersides of the leaves is buff, instead of the usual white or silvery-white. Its flowers heads are about one and a-half inches across.

C. holosericea is a handsome plant, found from sea level up to 4,000 feet, in the Southern Island of New Zealand. The leaves are from six to twelve inches long, and two inches broad, lanceolate, white beneath, and green, strongly veined above. The growths are a foot high, and the flower heads are carried about eighteen inches high, three inches across, white, with yellow disc. This species has so far shown itself the most amenable to cultivation.

C. Lindsayi is found on the cliffs of the south-east coast of the Southern Island, and forms large rounded masses of growth, evidently somewhat like C. holosericea, though its flower heads have but one series of ray florets.

C. Mackayi is found in the South Island, and is a distinct species, with long acuminate leaves that are glabrous and green on both surfaces. It has large flower-heads and long white ray florets. So far it has not, I think, flowered at Kew.

C. Munroi (or Monroi) comes from the northern half of the Middle Island of New Zealand, and was discovered by Dr. Munro on the Upton Downs, in the province of Marlborough. This species, with its large white, golden-disked flowers, has been in cultivation some time, and I remember it flowering in a greenhouse in the T-range at Kew about fifteen years ago. The stems and the undersides of the leaves are thickly clothed with a dense white silky wool that gives the plant a distinct appearance. Usually the flower-heads are two inches across, or a trifle more in some cases, and the white ray florets are about two-thirds of an inch long. We owe the introduction of this species to Messrs. James Veitch and Sons.

C. petiolata is found at an elevation of from 2,000 to 4,500ft. on the Southern Alps, from Lake Tennyson southwards to the west of Otago. It has white, yellow-disked flower-heads, and differs chiefly from other kinds in having long, slender, purplish petioles, and narrow, almost membranous, leaves.

C. spectabilis was figured in these pages as far back as July 25, 1891, shortly after its appearance at a meeting of the Royal Horticultural Society, when shown by the Chelsea firm. A First Class Certificate was awarded on June 9 of that year. It was stated at the time that "a large basket of small plants was exhibited, and at once compelled attention as being utterly unlike the usual run of things shown at the meetings. The plants were about six inches high, the leaves distinctly lanceolate, narrow, and covered on the under-surface with a down-like felt, the upper surface silvery, and in excellent contrast to the flowers. Each flower is erect, carried on a short, sturdy peduncle, and about two inches across, the ray florets numerous, pure white, the disc yellow, and making up a full, handsome, symmetrical bloom. It is very free-flowering, and the whole plant of a distinct tufted habit." Considerable success has attended the cultivation of this species in the Edinburgh Botanic Gardens, and even so far north its culture out of doors was more affected by the damp than by the cold of winter.

C. verbascifolia comes from the South Island, and is found from sea level up to 2,000ft. It has stout roots, and is a strong-growing, handsome species, with leathery leaves three inches wide, and from eight to thirteen inches long, covered on the under side with whitish down. The flower-heads are about four inches across.

C. viscosa, not yet flowered at Kew, is distinctly alpine, being found at from 4,000 to 6,500ft. elevation, in the South Island. It has short, narrow, erect, grooved, and viscid leaves, and tufted habit, and, without close inspection, suggests a primula. The flower-heads are about an inch and a half across.

C. H. Curtis.

FORCED LILY OF THE VALLEY.

The blossoms of the lily of the valley meet with favour at whatever season of the year they are produced; their rich perfume, chaste purity, and simple beauty, and the accompanying setting of pale green leaves, combine to render it one of the most graceful of all flowers, and a familiar object to almost every one. The natural flowering season of Lily of the Valley (Convallaria majalis) covers a brief period of only some three or four weeks, when it is grown in the open garden. For a supply at other seasons of the year resource is made to retarded crowns; by a special process the natural activity of the plant is arrested, but is immediately released on being taken from this sphere of influence. Consequently retarded crowns will, if desired, supply flowers every month of the year; so accurate, constant, and thoroughly reliable are the results obtained by this method that scarce any other calls for mention.

The best stock is that known as Berlin crowns. These are immediately potted up on receipt, twelve to twenty-five crowns being put in each pot, according to its size, or if in boxes then tolerably close together. A good loamy compost is necessary, which is carefully worked among the crowns, pressing the soil firmly into position, making the buds level with the top of the pot, and just clear of the soil. The pots are then plunged to the rim on a brisk bottom heat of 80 degrees to 90 degrees F. for winter and spring, each box or pot being darkened by another of the same size inverted on the top, and this is kept in position until the shoots are about two inches in length, after which light is gradually admitted, and these are dispensed with. A low temperature and insufficient moisture are the evils experience finds it essential to guard against in forcing retarded crowns. Hence the plants must be liberally supplied with water both at the roots and in the atmosphere, up till the time the flowers expand. Once the latter show colour the plants can be removed to a lower temperature and drier atmosphere, which hardens them off sufficiently to enable the spikes to retain their freshness longer when cut. The period in which lily of the valley may be had in flower under this system varies from about twenty-eight days in mid-winter to rather under twenty-one days in autumn and late spring.

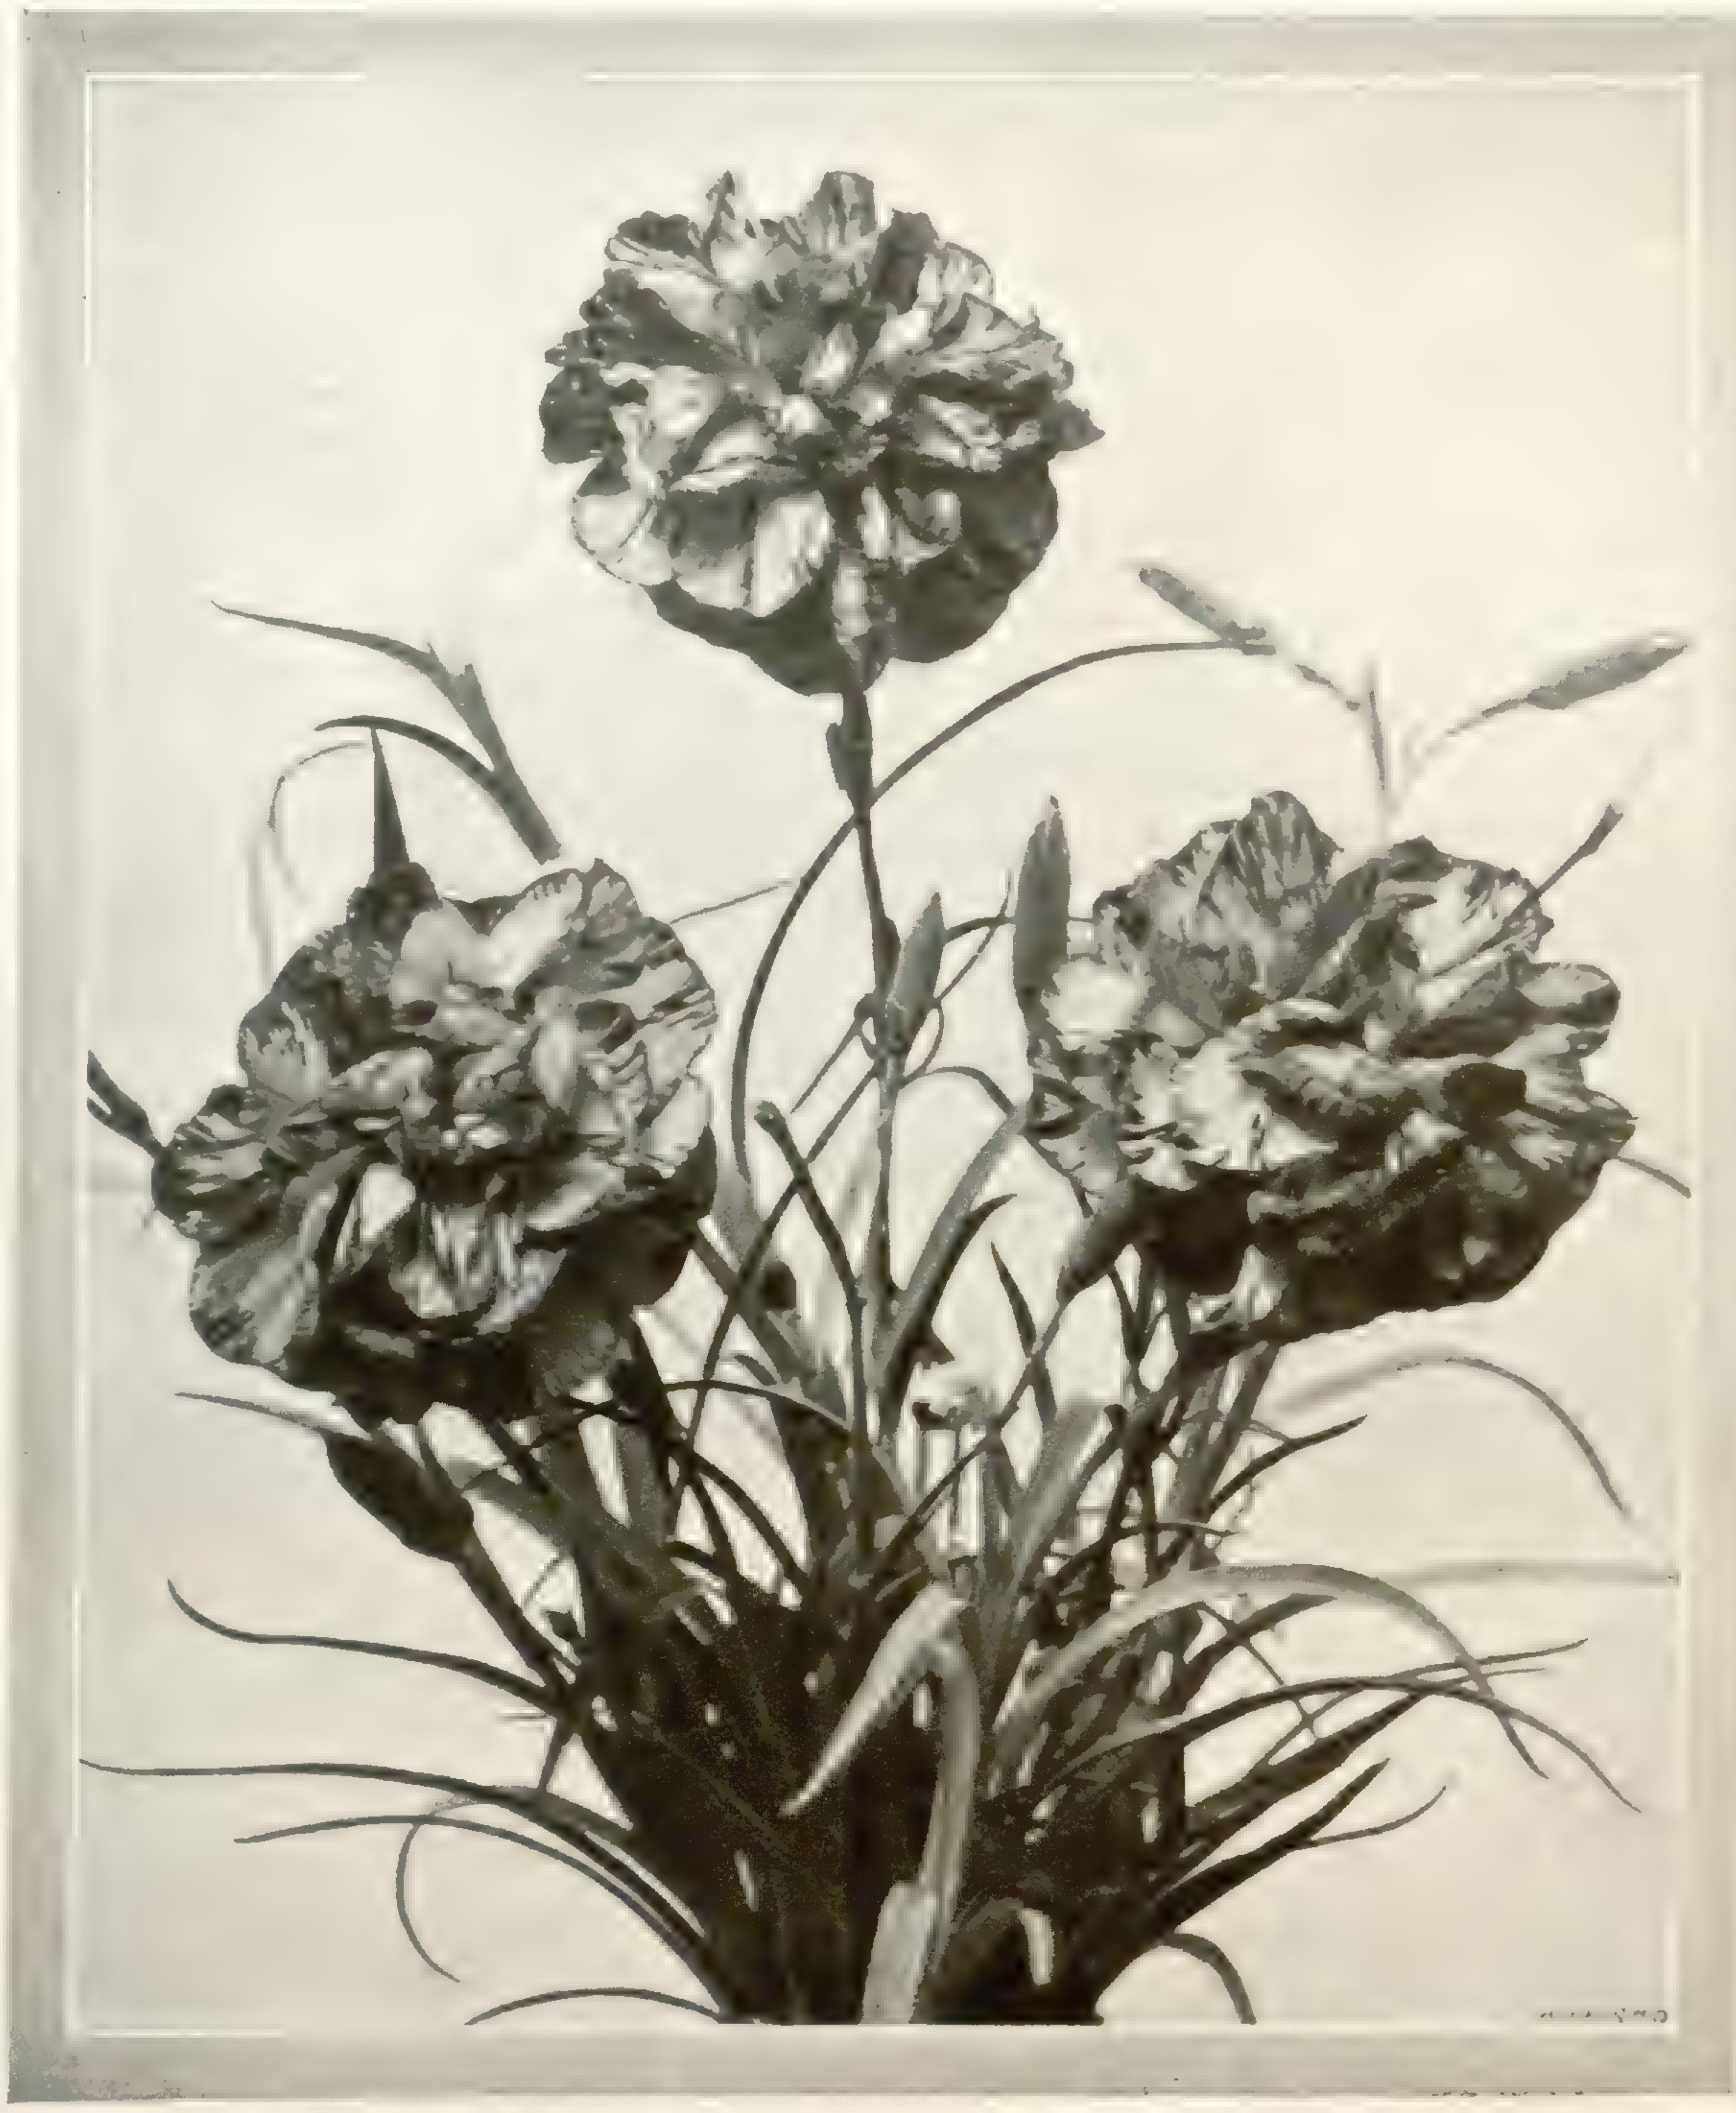
Natural prepared Berlin crowns, as also those of Fortin's Giant variety may also be forced into flower, not introducing these to heat earlier than February, otherwise the crowns are liable to go blind. A temperature of from 75 degrees to 80 degrees F. will most generally give good results at this season, treating the plants in other respects as advised for retarded crowns.

Thomas Smith.

BULBS.—A practical treatise on the cultivation of hardy, hothouse and greenhouse bulbous and tuberous rooted plants is "Bulbs and their Cultivation," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

CARNATION LORD STEYNE.

In our issue of August 5 we gave an account of fancy carnations, and a list of the finest varieties. At the same time we gave an illustration of the splendid yellow ground fancy variety Pasquin, an illustration that has been greatly admired and pleasingly commented upon by our readers. Another variety of the same class, and one which is well deserving of culture, both by those who grow carnations for exhibition and those who grow them for garden decoration, is Lord Steyne. This is a strong grower, and produces a large flower of striking colouring. The ground colour is soft yellow, and this is margined and freely marked with crimson and purple maroon. Lord Steyne is one of the many fine varieties raised by the late Mr. Martin R. Smith, and it is deserving of every attention from prospective carnation cultivators. The flowers here represented are those that won the first prize for Mr. C. A. Linzee, Alresford, at the exhibition of the National Carnation and Picotee Society on July 25.



CARNATION LORD STEYNE.

A yellow-ground fancy, marked with crimson and purple-maroon. Mr. C. A. Linzee's first prize blooms at the National Carnation and Picotee Society's Exhibition.

THE LING.

We are so accustomed to seeing wide expanses of country clothed with this plant in a state of Nature that we are apt to forget that many thousands are disposed of annually for garden decoration, and that their raising and disposal form an important part of the business done by several nurserymen. A visit to the nursery of Messrs. Smith, of Darley Dale, would, however, convince one of the prominent position occupied by the ling, for many acres are devoted to its culture and to that of its varieties. For, looking over a collection such as one finds in a well-stocked nursery, one is struck by the great range of variation shown by the species, not only in colour of flowers, but also in habit. As regards colour, one finds many shades of red and pink, whilst white-flowered kinds are also prominent. In habit, one finds forms which at maturity are almost three feet in height, whilst others are tiny plants scarce a couple of inches high, looking more like moss than ling. Some of these varieties are more floriferous than others, and in the white-flowered varieties, those which when cut might look all alike, are abundantly distinct when growing side by side. Differences are also to be seen in the colour of the leaves, for in some cases the foliage differs from that of the type by being golden, copper, or silver hued.

The origin of these varieties is, in many cases, doubtful, though some of the best have originated as chance seedlings, and have been perpetuated by propagation. Others, which were originally wild forms, have improved under cultivation. Now and then a distinct form is found amongst the type on a common or hillside, and this is carefully tended, and a stock produced from it. Some positions are prolific in variations from the type, and half a dozen forms may be collected in a limited area. The writer once collected a form half an inch high growing in an exposed position in sandy ground in the Scilly Islands, whilst on the Cheshire hills, and also on Surrey commons, it is possible to cut ling branches between two and three feet in length. Owing to sentimental reasons white forms of ling are most eagerly sought after in a wild state, and they have become very scarce in places visited by large numbers of people. Tourists have, however, no reason to complain of a shortage of white ling, for a brisk trade has developed within the last few years in supplying cut branches of this to florists who cater for the wants of tourists and others during the months of August and September. In some nurseries wide areas are grown specially for the supply of cut flowers.

When making plantations of ling—or Calluna vulgaris, as it is rightly named—the taste of the planter will decide as to the arrangement of the plants. As a rule an irregular-shaped mass in the wilder parts of the garden finds most favour, though it is sometimes used in formal-shaped beds, or as masses near the front of shrubberies, which are filled for the greater part with peat-loving shrubs. The planting of distinct kinds in large masses is attended with good results, for then one obtains simple, but effective displays. Others may, however, favour a combination of the various colours. In such a case the inclusion of a number of varieties planted indiscriminately may be tried.

The original planting of ling need offer no serious difficulties, providing the ground is fairly free from lime, for if ordinary loamy or sandy soil is dug over the plants may be inserted straight away; any time will do for the work between October and the end of March. When preparing the ground the inclusion of a little peat or decayed leaves is attended with good results, though it is not absolutely necessary. Propagation of ling may be carried on in several ways. By sowing seeds from the various kinds a large stock of plants may be raised. If, however, the varieties are to be kept true to name, layers, or cuttings, must be resorted to. The former are branches weighted down into loose soil by means of pieces of stone in spring. They are left about two years before being severed from the parent plant. Cuttings are taken during July and August, and they are inserted in sandy peat in a cold frame or under a handlight out of doors. Roots are usually formed during winter. By placing the cuttings in pots and standing them in a slightly warm propagating case in July or August, roots may be expected in about six weeks' time. Plants raised from cuttings are, as a rule, superior to those produced from layers, therefore cuttings should be used whenever possible.

As regards varieties, the following may be taken as a good selection: Alba, alba pilosa, alba rigida, alba Serlei, and Hammondi, white; Alporti, flore pleno, rosea, rubra, and tenuis, red; alba minor, Foxi, hypnoides, and pygmæa, dwarf; and argentea, aurea, and cuprea, coloured foliaged kinds.

A certain amount of common ling is used for thatch for sheds, fruit rooms, and summer houses, and for the purpose it is excellent, whilst the branches are also used in some places for brooms. W.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

STANHOPEAS.—The highly-perfumed and richly-coloured stanhopeas are not so largely grown in orchid collections at the present time as was the case some few years ago, and why they fail to receive a full share of attention from the owners of collections is not probably difficult of explanation. The flowers of the stanhopeas are singular in form and rich in colour, but, unfortunately, they are of short duration, and they are quite unsuited to any of the various forms of floral decoration that find favour at the present time. On the other hand, there are immense numbers of orchids that bloom freely and produce flowers that are highly attractive, and have the merit of retaining their freshness and beauty for a very considerable period, and these are undoubtedly formidable rivals to the stanhopeas. In gardens where orchids are not extensively cultivated, we frequently find numbers of stanhopeas growing under varied conditions, but generally in the ordinary plant stove. They are best grown in baskets, and the drainage used must be so fixed as to permit the pendulous flower scapes obtaining egress through the bottoms of the baskets. This is practically the only special attention that is necessary. The plants are best repotted when the new roots are being produced. See that the potting compost used is of a durable nature, as it is not desirable to disturb the plants for repotting purposes more frequently than is absolutely necessary; unless they have outgrown their baskets or the compost has become sour, they need not be disturbed. We find that a mixture of good fibrous peat, osmunda fibre, and chopped sphagnum moss in about equal portions suitable. This should be made moderately firm. The compost should be well watered when the repotting has been completed. The conditions of an ordinary plant stove suits them well, but when grown in the orchid houses, the warm end of the cattleya or intermediate house will be the most suitable position. The baskets should be suspended within reasonable distance of the roof glass, the only protection necessary is to see that the foliage does not become injured by an excess of bright light during the growing season. An abundance of root moisture is required, and there should be a liberal degree of humidity in the atmosphere. The plants should be syringed overhead to keep down red spider and other insect pests on all favourable occasions. During the resting season only sufficient moisture is required to keep the foliage and pseudo-bulbs in a normally plump state, and cooler conditions should also be afforded.

ACINETAS.—A. Barkeri and A. Humboldti are the two species of this genus that are found most general in cultivation. These also produce their flower racemes from the base of the pseudo-bulbs, and push through the rooting medium in the same manner as the stanhopeas. Hence they require an outlet at the bottom of the receptacle in which the plants are growing. Baskets are the most suitable, especially as the plants when growing in them may be suspended from the roof. They do well under the same conditions as the winter-flowering cypripediums. The foliage being broader and of less texture than the stanhopeas they will not bear without injury so much strong light. The time of potting and the material used is the same as that given for stanhopeas.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

LUCULIA GRATISSIMA.—This is an excellent autumn-flowering subject, and as one considers its good qualities, combined with its comparatively easy culture, it most certainly appears to deserve more attention. Luculia gratissima may be successfully wintered in an intermediate plant stove, or even a warm greenhouse where the temperature does not fall below 50 deg. As the plants complete their season of blooming, the old flowering shoots may be somewhat shortened back, and by gradually reducing the supply of water, with a free circulation of air, the plants may be brought to rest. During this process excessive dryness of the roots must be avoided. Should mealy bug, red spider, or any other insect pest be found troublesome, it would be advisable to thoroughly syringe with an insecticide before storing the plants away for the winter's rest.

BEGONIA GLOIRE DE LORRAINE and its sports are now growing rapidly, and any batch of late plants may still be shifted into larger sizes, which must, of course, be their final stage. A central stake must be provided to each plant, and all the lateral growths looped carefully up with green raffia. Plants which have been previously treated as advised will now be filling their flowering-pots with abundance of roots, and will be greatly assisted by liberal applications of clear soot water and weak farmyard liquid manure given in alternate weeks. The stages and paths may also be damped down occasionally with farmyard liquid. During the growing season of this type of begonias abundance of heat and moisture are essential, with a good shade from the hot sunshine.

MARANTAS.—These ornamental fine foliage plants always command a fair share of attention, the distinct markings of their foliage being most interesting; they will continue to develop their foliage rather slowly for another month or so, after which the roots may be given less moisture so as to prepare them for their resting season a little later on. As time and opportunities present themselves the foliage may be sponged with soapy water which will greatly benefit the plants.

GENERAL REMARKS.—As the season advances the temperatures of the plant stoves may be gradually reduced in proportion to the shortening of the days, so that the occupants may be brought under the influence of a brief season of rest when the days are the shortest. The present season is also an excellent time for overhauling the plant stoves, and a tasteful rearrangement will provide an interesting change to the general appearance; this work when effectively carried out, after a thorough cleansing of plants and their surroundings, cannot fail to command appreciation.—John Donoghue, Bardon Hill Gardens.

THE FLOWER GARDEN.

SUMMER-FLOWERING CHRYSANTHEMUMS will now require attention with regard to staking, etc. One stake to each plant is quite sufficient, and should be placed in the centre and the growths looped to it. Some varieties will be improved by slightly disbudding where the buds are very thick. Liberal doses of liquid manure should be afforded the plants occasionally, which will prove of great assistance.

SPRING BEDDING plants must be given every encouragement to provide a good stock of healthy, sturdy plants for putting out later on. The success of the next spring display depends, in a great measure, on the way the various subjects are grown the previous summer. It is essential that hard, stocky plants should be provided to stand the wet and frosts of the winter. Cuttings of alyssum, arabis, and aubrietias, which were propagated as advised earlier in the season, will now be sufficiently rooted to plant out into nursery beds. Seedling plants of silene, myosotis, violas, pansies, etc., which are yet in boxes, must be planted out without delay.

ANTIRRHINUMS AND PENTSTEMONS.—Although these may both be successfully grown as annuals, yet it is sometimes desirable to raise a batch from cuttings. This operation should now receive attention, and plenty of shoots will be found at the base of old plants which will provide suitable material for the purpose. These should be prepared, and inserted in sand in a cold frame, where they will quickly root if kept moist and shaded.

PINKS, which were propagated as advised earlier, will be ready now for lifting from the frame and planted out in the nursery beds. Pinks are partial to a soil which contains lime, and should there be a deficiency of this, old mortar rubble may be added with advantage.

HARDY ANNUALS.—By making a sowing of this useful class of flowers towards the end of the month, an early supply of bloom can be obtained. The seeds should be sown thinly in beds where the plants are to remain, and the young plants thinned out as soon as they are large enough to handle. The following are useful, as they will provide an excellent supply of cut flowers: Cornflowers, annual chrysanthemums, coreopsis, gaillardias, larkspurs, lupins, scabious, poppies, sweet sultans, and linarias.

ANEMONES CORONARIA AND FULGENS should be planted in beds to provide a supply of cut flowers. St. Brigid is one of the finest varieties to grow, and a good strain has a remarkable effect when in bloom. They are extremely useful for decorative purposes, lasting for some time in a cut state. The intense scarlet of fulgens makes it very desirable and highly appreciated, coming into bloom as it does so early in the year. When preparing the soil for the roots, it will prove beneficial if well-decayed leaf soil and sand are incorporated with it. Ranunculus should also be treated in the same manner, —E. C. Pooley, Gnaton Gardens.

FRUITS UNDER GLASS.

POT VINES. — Where these have been brought along with the object of forcing for early fruit next season, the first consideration should be good growth; secondly, ripe wood; and with the hot, baking sun we have been subjected to this season, their ought not to be much difficulty about either. Give the vines now more air; in fact, as the growths are pretty well complete the ventilators should be kept open top and bottom, and after a fortnight of this treatment the plants may be taken outside and tied up to wires, where the ripening process will be carried on under quite easy conditions. The pots should, however, be plunged in coal ashes up to the rims, and in hot, bright weather the vines must receive a good syringing every afternoon. Be quite sure the roots receive enough moisture.

VINES.—The wasps are exceedingly numerous, and means have to be taken to prevent their ingress to the houses; and this is best done by fixing wasp-proof netting over the ventilators, by keeping the doors shut, and by destroying all the nests one can find. We have destroyed considerably over a hundred nests already.

CUCUMBERS.—Plants of Everyday or Improved Telegraph should now be raised for a winter supply. Sow singly in small pots, and grow along gently and sturdily, and as soon as the roots have reached the outside of the soil give another shift, so that there will be nice strong plants to put out in September. A thoroughly clean house should be made ready for their reception. Choose a house with a south aspect, and one which can command a temperature of 70 deg.

TOMATOES. — Keep the side growths pinched out as often as required, in order that no unnecessary strain be put upon the plants which are bearing fruits. Shift into fruiting pots as soon as ready those that are being prepared for winter use. Make the soil quite firm so as to encourage short-jointed growth. On the approach of damp nights shift the plants into a cool house, and allow them to remain there for as long a period as possible.

LATE MELONS.—Keep these well stopped and neatly tied up to the wires, and set the fruits as soon as a crop can be obtained, as they will need all the sunshine we can get during the next six weeks. Close the house earlier as the days shorten.—W. A. Cook, Leonardslee Gardens.

SANDY, BEDFORDSHIRE.

43rd ANNUAL SHOW, AUGUST 31st, 1911.
PLANTS, FLOWERS, FRUIT, VEGETABLES, etc.;
DOGS, POULTRY, PIGEONS, RABBITS, CATS, etc.
PRIZES VALUE £1,000, including
£70 for Groups of Plants, £9 for Roses.

Entries close August 24th.

Schedules and particulars of
W. GREEN, Sec., Sandy, Beds.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

North of England Horticultural Society.

This society continues to progress under the vigorous secretaryship of the Rev. J. Bernard Hall and its large committee. Its latest venture in the beautiful and fashionable town of Harrogate, in conjunction with the Harrogate Agricultural Society, on August 15, was a success horticulturally, and, we hope, financially as well. A large marquee was set apart for the accommodation of the numerous exhibits, and during the afternoon there was a good stream of visitors.

The exhibition was visited by a deputation from the Royal Horticultural Society, consisting of Sir Albert Rollit, Mr. H. B. May, V.M.H., Mr. James Hudson, V.M.H., Mr. G. Bunyard, V.M.H., Mr. E. A. Bowles, M.A., the Rev. F. Page Roberts, with Mr. A. Gaskell as secretary. There was also a deputation from the National Hardy Plant Society, which included Messrs. J. S. Brunton, Merryweather, Artindale, Gibson, and Harkness.

The exhibits were of varied interest, but hardy flowers were the prevailing feature.

An extensive exhibit from Messrs. William Artindale and Son, Sheffield, proved a great attraction by reason of its varied character. At one end perpetual carnations were effectively grouped in tall stands, with low vases, nephrolepis and gypsophila between. At the other end hardy border flowers were boldly grouped; the background consisted of large bunches of Lilium speciosum and L. s. rubrum, with great sheaves of deep rose, yellow, and white double hollyhocks. Below these were fine bunches of Pentstemon Torreyi, Lupinus roseus, the deep scarlet Montbretia germanica, Cimicifuga dahurica, Crinum Powelli, and an assortment of phloxes. Along the front the best things on view were Pentstemon Huntingdon Scarlet, the white P. Spitzberg, P. White Newbury Gem, and P. Southgate Gem, with some fine Gandavensis gladioli and Crinum Powelli album. Between these two groups was another composed of alpine plants, very well arranged on a low rockery.

In a particularly elegant fashion, entirely avoiding the evils of overcrowding, Messrs. Gibson and Son, Bedale, presented a collection of hardy flowers

Ferns in great variety and beauty were contributed by Messrs. H. B. May and Sons, Edmonton, who presented a large group composed chiefly of smaller plants than they usually show. Their central set of the lovely Nephrolepis Marshalli compacta was greatly admired for its mossy elegance.

Mr. C. F. Waters, Balcombe, Sussex, brought up a pleasing group of perpetual carnations, and arranged the flowers in his usual elegant style; among the good things forward he showed Mrs. H. Burnett, Enchantress, Edith Waters, Mikado, Winsor, the white and much-fringed Georgia, Marmion, the yellow ground fancy Aurora, and the new A. E. Manders.

A large and bright exhibit, arranged by Messrs. Dobbie and Co., Edinburgh, attracted attention by reason of its bright colouring. Roses were plentifully shown, notably such varieties as Countess of Derby, Madame C. Soupert, Hugh Dickson, Walter Speed, Edu Meyer, Prince de Bulgarie, and Le Progres; these and other beautiful varieties being disposed in small vases in front of good bunches of such useful early chrysanthemums as Leslie, Diana, Carrie, Connie, Polly, Abercorn Beauty, and Frankie.

Large masses of Lilium speciosum rubrum, L. s. album, L. longiflorum, Gloriosa superba, tuberoses, and Hydrangea paniculata grandiflora were grouped effectively with the newer plumose nephrolepis by Messrs. E. J. Batchelor and Sons, Harrogate.

Cut roses and hardy flowers from Messrs. Mack and Son, Darlington, made up a bright contribution; many of the roses were capital blooms for the time of year.

Messrs. Young and Co., Hatherley, once again demonstrated the decorative value of perpetual carnations by showing good flowers in well-filled vases. The firm had excellent representations of Queen, buff; Enchantress, Lady Audley Nield, Rose Doré, Mikado, Mrs. H. Burnett, Winsor, and Britannia.

Big masses of phloxes the Baron, Elizabeth Campbell, Aurore, Rosenberg, the vivid Firefly, the White Mdme. G. Marie, Selma, and G. A. Strohlein were set up in blocks by Messrs. Dickson and Robinson, Cathedral Street, Manchester; these were associated with a selection of scabiouses.

GOLD MEDAL ARRANGEMENT OF HARDY HERBACEOUS PLANTS.
Exhibited by Messrs. Gibson and Co. at the North of England Horticultural Society's Show on the 15th inst.

Mr. Wm. Bonsall, Roseville Nursery, Harrogate, showed Adiantum Glory of Noordwyk, plumose nephrolepises, perpetual carnations, etc., and edged the group with Campanula Mayi.

Mr. S. Bailey, Tentergate Gardens, Knaresborough, had a quite good group of sweet peas.

Orchids were not extensively shown on this occasion, only a few groups being presented. Messrs. Charlesworth and Co., Haywards Heath, Sussex, had, in their exhibit of about three dozen plants some good specimens of Vanda cærulea, V. Kimballiana, Lælio-cattleya callistoglossa, L.-c. Colmaniana, Cattleya Vesta, C. Rhoda, Brasso-cattleya Maroniæ, Odontoglossum armainvilliersense Xanthotes, Oncidium Lanceanum, and the graceful Odontioda Lairessæ.

Messrs. Mansell and Hatcher, Rawdon, Leeds, had a goodly exhibit of orchids, and made up an attractive display, consisting of Cattleya Atalanta superba, Vanda cærulea, the beautiful Brasso-cattleya Pocahontas, Dendrobium Phalænopsis, the quaint little Cypripedium concolor, Oncidium Lanceanum in good form, Miltonia vexillaria Queen Alexandra, Odontoglossum crispo-Harryanum, Vanda Kimballiana, the showy Cattleya Jean, and Odontioda Thwaitesi.

A few orchids shown by Messrs. A. J. Keeling and Sons, Westgate Hill, Bradford, included Cattleya Harrisonæ, Cypripedium Penelope, Cattleya Wavriniana, C. Masseanium, and Odontoglossum Harryanum.

Cattleya Gaskelliana alba, Brasso-cattleya Maronæ, Cypripedium Maudiæ, C. Wm. Lloyd, C. Lawrenceanum Ball's var., Cattleya Pittiana, and C. Iris excelsa with grand crimson lip, were the pick of the orchids shown by Mr. Edward V. Low, Vale Bridge, Haywards Heath.

A marginal rock garden, well filled with dainty subjects, fronted the display of hardy border flowers submitted by Messrs. James Backhouse and Son, Lim., York. Phloxes were prominent among the latter, and such varieties as Etna and G. A. Strohlein were especially bright for so dry a season. Rudbeckia purpurea, R. laciniata fl. pl., Chelone barbata coccinea, Lilium tigrinum, Helenium cupreum, and Acanthus mollis, were much in evidence, while in the little rockery arrangement the leading things were Helianthemum venustum, Campanula pusilla, C. turbinata, C. White Star, Erica McNabiana, Acæna microphylla, Viola cornuta, Mimulus cupreus, Menziesia polifolia, Ramondia pyrenaica, and numerous sedums.

A choice group of hardy plants was arranged to form a little rock garden by Messrs. William Conway and Sons, Lim., Halifax.

Messrs. Mawson Bros., of Windermere, contributed a collection of phloxes, and put up excellent bunches of Iris, Le Mahdi, F. Hornung, Selma, Tapis Blanc, Gen. Von. Hentsz, and the lovely white Frau von Lassberg. Fine bunches of Lilium tigrinum, L. t. plena, and L. t. splendens, and L. auratum lent a special grace and dignity to the display.

Facing the tent entrance was a very pretty exhibit of carnations, from Mr. William Lawrenson, Yarm-on-Tees, Newcastle.

A small collection of crotons, submitted by Messrs. Ker and Sons, Aigburth Nursery, Liverpool, was very interesting, as these handsome plants are not often shown otherwise than in groups. Some of the best were C. Thompsoni, C. Sinitzianum, C. superbum, C. Aigburthensis, C. Prince of Wales, C. Reidi, with its splendid broad bright leaves, C. aneitemense, and the useful C. Hawkeri. In another group the Aigburth firm showed the splendid Bignonia grandiflora, Phœnix Roebelini, and the variegated Hydrangea nivalis.

A large and bright contribution of hardy flowers from Messrs. Harkness and Sons, Bedale, gave ample evidence of cooler weather than the southern counties have of late experienced.

Mr. F. J. Bell, Crescent Nurseries, Whitley Bay, made up a pretty exhibit of sweet peas, pansies, and violas, etc.

Lord Faber's Silver Cup for the best amateur collection of fruits, etc., was won by Mr. Hathaway, gardener to J. Brennand, Esq., Baldersby Park, Thirsk, who contributed a high-class display, and one that was well arranged. The chief subjects shown were Lady Hutt, Muscat of Alexandria, Madresfield Court, and Barbarossa grapes; grand Souv. de Congres, Louise Bonne of Jersey, Doyenne Boussoch, Marguerite Marillat pears; Lord Suffield, Emperor Alexander, Lady Sudeley, Loddington, and Worcester Pearmain pears; Dymond, Golden Eagle, Royal George, and Noblesse peaches; Pitmaston Orange, Humboldt, and Pineapple nectarines; Bryanston, Green, and Oullin's Gage plums; and a number of melons, peas, carrots, tomatoes, onions, marrows, potatoes, celery, cucumbers, leeks, and cauliflowers were the vegetables submitted; while carnations, gypsophila, and francoa sprays provided the floral embellishment.

Mr. Haynes, gardener to W. D. Cliffe, Esq., staged excellent dishes of Rival apples, Marguerite Marillat, Souv. de Congres, and Mdme. Treyve pears, and Jefferson, Washington, Pond's Seedling, and other plums.

Messrs. Kelway and Son, Langport, filled a small tent with about 300 spikes of stately gladioli, displaying three spikes of a variety; a few of outstanding merit were Golden Measure, Lady Roberts, Kelway's Blue, Princess Victoria, King Edward, Miss M. Duncan, and Richard Martin.

Messrs. Wood and Son, Wood Green, were present with an attractive stand of horticultural sundries in great variety.

HARDY PLANT GROUPS.

A competition was arranged by the National Hardy Plant Society on this occasion, and it was for a circular group from 6ft. to 8ft. in diameter, so set up as to show the value of hardy herbaceous plants for bedding purposes. Four groups were staged out in the open, and the premier award, the Gardeners' Magazine Gold Medal and £3 was won by Messrs. Gibson and Co., Leeming, who used the graceful Hyacinthus candicans over dwarf plants of Phlox Le Siécle, and edged the whole with Nepeta Mussoni. The second prize, a silver-gilt Coronation medal and £2 fell to Messrs. Artindale and Son, Sheffield, who had a centre of the new Bidens dahliaoides, surrounded with Asclepias tuberosa, and a broad margin of Silene laciniata Purpusi; the third prize fell to Messrs. Dickson and Robinson, Manchester, whose subjects were scarlet gladioli, phloxes Mdme. G. Marie, The Baron, and E. G. Campbell, and Helenium pumilum magnificum, and H. cupreum.

The Hardy Plant Society awarded a silver-gilt Coronation medal to Messrs. W. Artindale and Son, Sheffield, for their collection of alpines.

ROYAL HORTICULTURAL SOCIETY'S AWARDS.

Silver Cups.—To Messrs. Harkness and Sons, Bedale, for gladioli and herbaceous plants; to Messrs. Artindale and Son, Sheffield, for hardy flowers and rock gardens; Messrs. Batchelor and Son, Harrogate, for ferns and hardy flowers.

Silver-gilt Flora Medal. — To Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. H. B. May and Sons, for ferns.

Silver-gilt Banksian Medal.—To Messrs. Mansell and Hatcher, Rawdon, for orchids; to Messrs. Gibson and Co., for hardy flowers; to Messrs. Dobbie and Co., Edinburgh, for roses and gladioli; to Messrs. Jas. Backhouse and Son, Lim., York, for hardy flowers and apples; and to Messrs. Kelway and Son, Langport, Somerset, for gladioli.

Silver Hogg Medal.—To Mr. Hathaway, gardener to J. Brennand, Esq., Baldersby Park, Thirsk, for fruit and vegetables.

Silver Knightian Medal.—To W. D. Cliffe, Esq., for fruit.

Silver Flora Medal.—To Mr. E. V. Low, Haywards Heath, for orchids; to Mr. W. Lawrenson, Yarm-on-Tees, for carnations and phloxes; to Mr. C. F. Waters, Balcombe, for carnations; to Messrs. Ker and Son, Liverpool, for stove and greenhouse plants; to Mr. F. J. Bell, Whitley Bay, for sweet peas and violas; to Messrs. W. and J. Brown, Peterborough, for roses.

Silver Banksian Medal.—To Mr. S. Bailey, Knaresborough, for sweet peas; to Messrs. Young and Co., Hatherley, for carnations; to Messrs. Conway and Sons, for hardy flowers; to Messrs. Mack and Miln, Darlington, for roses and hardy flowers; to Mr. A. J. Hall, Harrogate, for coleus and fuchsias; and to Messrs. Mawson Brothers, Windermere, for phloxes, etc.

Bronze Flora Medal.—To Messrs. Keeling and Son, Bradford, for orchids; to Messrs. Dickson and Robinson, Manchester, for phloxes, etc.; to Mr. A. H. Rigg, Baildon, for roses; to Mr. W. Bonsall, Harrogate, for carnations and greenhouse plants.

Bronze Banksian Medal.—To Mr. W. J. Jarman, Ripon, for sweet peas and dahlias.

Cultural Commendation.—To Mr. W. S. Hannan, for peaches.

Certificate of Appreciation.—To the British Botanical Association, York, for an educational exhibit.

MEDALS.

The North of England Horticultural Society's awards were as follows:

Gold.—To Messrs. W. Artindale and Son, Sheffield.

Silver-gilt.—To Messrs. J. Kelway and Son[illegible]Langport; and to Messrs. H. B. May and Sons, Edmonton.

Large Silver. — To Messrs. W. and J. Brown, Peterborough.

Silver. — To Messrs. Harkness and Son, Bedale; to Mr. A. H. Rigg, Baildon; Messrs. Young and Co., Hatherley; Mr. C. F. Waters, Balcombe; and Mr. F. J. Bell, Whitley Bay.

Large Bronze.—To Messrs. Batchelor and Sons, Harrogate; to Mr. W. Lawrenson, Yarm-on-Tees; to Messrs. J. Backhouse and Son, Lim., York; to Messrs. Mawson Brothers Windermere; and to Mr. W. Bonsall, Harrogate.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, AUGUST 1.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair), Messrs. E. M. Holmes, W. Cuthbertson, J. W. Odell, W. Hales, J. T. Bennett-Poë, J. Fraser, and F. J. Chittenden (hon. secretary).

UNCOMMON ORCHIDS.—Mr. J. O'Brien drew attention to two uncommon orchids shown by Sir Trevor Lawrence—Catasetum apterum, which he regarded as nearly related to C. splendens, several varieties of which had been described, and Eria mysorensis, bearing pretty small flowers, with a curious and rather unpleasant scent.

ANTIRRHINUM, ETC., MALFORMED.—Mr. Fraser showed a flower of Antirrhinum majus, with the petals separated nearly to the base, and therefore almost free. The flowers below it in the inflorescence were of normal structure. Two plants showed the peculiarity, but seed did not appear to be formed freely. He also showed gloxinia flowers having petaloid outgrowths from near the base of the corolla, on its outer side, similar to those previously exhibited by Mr. Odell in gloxinia and streptocarpus, and which Mr. Odell had found in the former plant to be produced regularly every year.

ACONITUM ROSTRATUM.—Canon Ellacombe sent a fasciated branch of this rare white-flowered aconitum.

CUCUMBER WITH PERSISTENT FLOWER.—Dr. G. Walker, of Wimbledon, exhibited fruits of cucumber, having the flower green, and persisting even when the fruit was fully grown. This is not a very uncommon occurrence in fruits of this family, but the plants sent showed it in a marked degree.

SWEET PEA WITH SUPERNUMERARY CARPELS.—Mr. W. Cuthbertson mentioned the occurrence in the garden of E. H. Christy, Esq., of Margaretting, of sweet peas, having three pods produced from every flower in the variety Mrs. Hugh Dickson. The flowers appeared to be otherwise normal, but every flower had produced three carpels on the plant, which had been noticed by Mr. A. Ireland when examining Mr. Christy's collection.

MEETING OF COMMITTEES, AUGUST 15.

Owing to the closing of the Horticultural Hall for the purpose of redecoration there was no exhibition on this occasion. The Floral, Fruit, and Orchid Committees met in the committee rooms upstairs for the purpose of dealing with novelties. The Orchid Committee had several meritorious novelties submitted to them; but the duties of the Floral and Fruit Committees were very light. The contributions to the Floral Committee were limited to a few seedling scented-leaf pelargoniums, but they were not considered sufficiently distinct from varieties already in cultivation to obtain recognition. Several tomatoes were shown, but no awards were made.

The most noteworthy of the novelties submitted to the Orchid Committee were Trichopilia Lehmanni, a beautiful white-flowered species exhibited by Sir Trevor Lawrence, Bart. (A.M.); Cattleya rhoda illuminata, a handsome form, exhibited by Messrs. Charlesworth and Co., Haywards Heath, the flowers large, with broad petals and sepals orange suffused rose, and the lip rich purple-crimson with orange throat. (F.C.C.) Sophro-cattleya Goodsoni, a distinct hybrid, exhibited by Mr. H. S. Goodson, Fairlawn, Putney; the flowers are of medium size, with crimson lip. (A.M.) Gongora leucochila, a distinct species from Messrs. Charlesworth and Co., with pendant racemes of white and purple flowers. (A.M.) Several new orchids were exhibited by Messrs. Stuart Low and Co., Bush Hill Park Nurseries; Messrs. Sander and Sons, St. Albans; Mr. J. Gurney Fowler, Glebelands. Messrs. Charlesworth and Co. and Mr. H. S. Goodson exhibited several novelties in addition to those which gained awards.

Basingstoke, AUGUST 7.

In Goldings Park the annual show was held on the 7th inst., and was a distinct improvement upon recent years. The entries were much more numerous, while the quality of the various exhibits left little to be desired. The hon. secretary, Mr. L. T. E. Llewelyn, and other members of the executive may be congratulated on the manner in which they performed their duties.

In the class for a group of miscellaneous subjects arranged for effect in a semicircle, there were three exhibitors, the first award going to Mr. W. Green, gardener to S. E. Bates, Esq., Manydown Park, Basingstoke, for a bright, tasteful arrangement of orchids, crotons, palms, ferns, and gloxinias; Mr. E. Wassel, gardener to Mr. W. H. McConnel, Baughurst, Basingstoke, second for a good arrangement, except that a white form of Phlox Drummodi, although singularly beautiful, was too plentifully employed. Mr. J. Keen, gardener to H. Welch Thornton, Esq., Beaurepaire Park, third. For nine specimens, in or out of bloom, three competed, and Mr. J. Keen was first. In his collection was a remarkably fine specimen of Cycas revoluta, good Stephanotis floribunda, and Allamanda Hendersoni. Mr. Wassel was second with good palms.

Tuberous begonias were a distinct feature, being numerous and good. Mr. F. Sweet, gardener to J. G. Holt, Esq., Kingsclere, was first for eight with large, finely-flowered specimens. Mr. Dean, gardener to L. de L. Simonds, Esq., Audley's Wood, Basingstoke, second with capital specimens. Pyramidal-trained coleus were very fine, Mr. W. Green winning for four with remarkable plants in size and colour. The plants were fully 6ft. high, and richly coloured. With an extremely fine specimen of Ixora Duffi, Mr. Learmouth, gardener to J. Liddell, Esq., Sherfield Manor, Basingstoke, won for a specimen flowering plant. Mr. Dean secured a similar honour for foliage plant with a good specimen of Latania borbonica; Mr. Wassel coming next with a richly-coloured specimen of Dracæna Lord Wolseley. Exotic ferns were admirably displayed by Mr. Keen in his first prize collection of six, Nephrolepis elegantissimum, Adiantum elegans, and a good Dicksonia were the leading kinds. Mr. Keen was also the only exhibitor of caladiums, and was awarded first for six specimens. Mr. Learmouth won for twelve table plants in a strong competition, and also for four pots liliums.

Roses were moderately shown, Mr. Dean winning for twelve, and also for twelve kinds of hardy flowers with popular varieties well staged. For a collection of flowers grown out of doors to fill a space of 6ft. run of tabling, five competed, making an interesting display; quality of flower and the general decorative effect were to be the leading features. Mr. Dean won with such subjects as phloxes, liliums, roses, carnations, and zinnias, all effectively displayed. Mr. G. Petty, gardener to Wilfred Buckley, Esq., Moundsmere, Basingstoke, was a good second. For twelve bunches, any distinct kinds, five entered, the best coming from Mr. Learmouth. Ixora Duffi, Gloriosa superba, hibiscus, cannas, liliums, etc., made a handsome display; Mr. Keen second. Sweet peas were fairly well shown. Mr. A. Child, gardener to the Hon. Mrs. Baring, Preston, Candover, won for six varieties (Messrs. J. Carter and Co.'s prize). Cactus dahlias were finely displayed, Mr. Child winning with a good set, as also he did with show varieties. Mr. Learmouth had the best carnations, thirty-six blooms in twelve varieties.

Fruit was finely shown, as it usually is here. For a collection of six dishes, pines excluded there were three contestants. Mr. Learmouth was first with Madresfield Court and Alexandrian Muscat grapes, Dymond peaches, Spencer nectarines, Brown Turkey figs, and Hemskirk apricots. Mr. J. Gardner, gardener to Colonel H. Walpole, Keckfield Place, Winchfield, was a close second. Muscat of Alexandria and Cooper's Black grapes, with Sutton's Scarlet melon were the most important dishes. Mr. F. West, gardener to Lord Curzon, Hackwood Park, Basingstoke, third. Eight entered for two bunches Black Hamburgh grapes. Mr. G. Wassel was first with large shapely bunches and berries, well coloured; Mr. Dean second with larger bunches, but less shapely. For two bunches, any other black, Mr. Green had the best of nine sets with Madresfield Court, Mr. Learmouth coming next with the same variety. In the class for two bunches, any Muscat, Mr. Gardner won with superb examples of Madresfield Court; Mr. Learmouth second with Alexandria. Melons were numerous and good. Mr. Green was first with Sutton's Superlative for scarlet flesh; Mr. Dean for green flesh. Mr. Keen, with handsome examples of Noblesse peaches, secured the award for a single dish, Mr. Learmouth occupying a like place with nectarines. Mr. Gardner was first for three dishes dessert apples; Mr. Learmouth for culinary; while Mr. West won for pears and plums.

AN EFFECTIVELY ARRANGED COLLECTION OF FRUITS, VEGETABLES, ETC.,
For which Mr. Hathaway was awarded Lord Faber's Silver Cup at the North of England Horticultural Society's Show on the 15th inst.

Harborne Gooseberry Show.

The exhibition of the Harborne Gooseberry Society's Show, which was founded ninety-seven years ago, was, as usual, held at the Green Man Inn, Harborne, on the 12th inst., and two following days. There were about one hundred plates of fruit awaiting the arduous trial of weighing, and considering the recent arid weather, many excellent examples were staged. A large proportion of the berries bore evidence of over-ripeness, and had to be tenderly handled in the gathering and weighing operations.

As for several years past, the champion, Mr. Emanuel Withers, was once again victorious in a keen contest. The premier berry, Bobby, 26dwt. 6gr., was contributed by Mr. E. Withers. In the class for twin berries, Mr. W. Smith led with Bobby, 25dwt. 21gr.; Mr. J. Davis second for King of Trumps, 24dwt. 17gr.; Mr. H. Eardley third for Fascinator, 22dwt. 17gr.

For a single red berry.—Mr. E. Withers scored with Bobby, 20dwt. 5gr.; Mr. W. Timmins second with Lord Derby, 17dwt. 4gr.; Mr. G. Nicholls third with Blucher, 14dwt. 12gr.; Mr. R. Sheppy fourth with Blucher, 14dwt. 12gr.; Mr. W. Smith fifth with Jumbo, 14dwt. 4gr.; Mr. J. Davis sixth with Jolly Potter, 13dwt. 5gr.

For one yellow berry.—Mr. W. Timmins first with Leveller, 18dwt. 4gr.; Mr. E. Withers second with Ringer, 17dwt. 22gr.; Mr. G. Nicholls third with Thatcher, 15dwt. 18gr.; Mr. W. Priest fourth with Goldfinder, 14dwt. 13gr.; Mr. R. Dix fifth with High Sheriff, 12dwt. 12gr.; Mr. R. Sheppy sixth with Lady Popham, 12dwt.

For one green berry.—Mr. G. Nicholls first with Shiner, 16dwt. 5gr.; Mr. E. Withers second with Surprise, 16dwt. 3gr.; Mr. W. Timmins third with Telegraph, 14dwt. 17gr.; Mr. W. Smith fourth with Stockwell, 14dwt.; Mr. C. Corbet fifth with British Oak, 13dwt. 22gr.

For one white berry.—Mr. G. Nicholls first with Fascinator, 17dwt. 12gr.; Mr. W. Smith second with Transparent, 16dwt. 6gr.; Mr. E. Withers third with Faithful, 14dwt. 6gr.; Mr. H. Eardley fourth with Careless, 13dwt 6gr.; Mr. J. Davis fifth with King of Trumps, 12dwt. 16gr.; Mr. C. Corbet sixth with Alice, 12dwt. 9gr.

For four colours berries.—Mr. E. Withers first with Bobby, Transparent, Leveller, 68dwt. 4gr.; Mr. G. Nicholls second with Bobby, Surprise, Leveller, 64dwt. 21gr.; and Mr. W. Timmins third with Stockwell, Fascinator, Bobby, and Leveller, 64dwt. 6gr.

For six red berries.—Mr. E. Withers first with Bobby, 108dwt.; Mr. W. Timmins second with Bobby, 100dwt. 12gr.; Mr. J. Davis third with Bobby, 90dwt. 12gr.

For six yellow berries.—Mr. E. Withers first with Ringer, 101dwt. 6gr.; Mr. J. Davis second with two Ringer and four Levellers, 87dwt. 16gr.; Mr. W. Timmins third with six Levellers, 86dwt. 21gr.; Mr. W. Priest fourth with six Levellers, 80dwt.

For six green berries.—Mr. E. Withers

first with British Oak, Matchless, and Surprise, 85dwt. 5gr.; Mr. G. Nicholls second with Volunteer, Telegraph, and Surprise, 80dwt.; Mr. W. Timmins third with three Stockwell and three Telegraph; Mr. H. Eardley fourth with British Oak, Shiner, and Telegraph, 76dwt. 18gr.

For six white berries.—Mr. W. Smith first with Transparent, 93dwt. 12gr.; Mr. E. Withers second with Transparent, 91dwt. 18gr.; Mr. J. Davis third with five Transparent and one Fascinator, 65dwt. 20gr.; Mr. G. Nicholls fourth with Fascinator, 65dwt. 4gr.

Atherstone, Warwickshire.

The annual exhibition of the Atherstone Horticultural Society was held on the 7th and 8th inst. in Meredale Park.

There were 212 classes, and close upon 2,000 entries, the products being staged in six large marquees picturesquely disposed about the show ground.

The chief feature of the show was formed by the four groups of plants arranged for effect. The pride of place was easily obtained by that well-known Midland exhibitor, Mr. J. Victor Macdonald, gardener to Sir Geo. H. Kenrick, Whetstone, Edgbaston. Conspicuous in the artistically-arranged group were the richly-coloured crotons; the second prize was awarded to Mr. W. R. Manning, nurseryman, Dudley; and third to Mr. William Vause, Leamington, both having highly meritorious arrangements. Stove and greenhouse plants were very well shown by Messrs. W. Vause, W. R. Manning, and Mr. Alfred Sale, Atherstone. In the class for single specimens in bloom, Messrs. W. Vause, W. R. Manning, and Mr. W. Hanson, Sale, were the respective prize-takers. For a single greenhouse plant Messrs. W. Vause, W. L. Ireland (Atherstone), and W. R. Manning won in the order named. Exotic ferns were largely and excellently shown by Mr. W. R. Manning, Mr. A. Sale, Colonel Hemming (of Mancetter), and Mr. W. L. Neland. Fuchsias were very creditably staged by Messrs. W. L. Ireland, Colonel Hemming, A. Sale, W. Pemberton, W. R. Manning, and T. Dolman. Single-flowering tuberous-rooted begonias were fairly well represented, Messrs. W. L. Ireland, Alfred Sale, and W. E. Oatley, Cliffe Castle, being the more successful exhibitors. For four double flowering begonias Mr. W. E. Oatley was first. Gloxinias were capitally staged by Messrs. W. S. Ireland, Alfred Sale, and Lady Agnes Peel, Mancetter.

There was a large display of herbaceous and annual flowers. Carnations and picotees formed an interesting feature, but these were staged on cards, there being no class for blooms as grown. For twelve yellow-ground carnations the respective winners were Messrs. Arthur R. Brown, Lim., Mr. C. J. White (Walsall), and Messrs. Wm. Pemberton and Sons, Bloxwich. For six selfs Mr. C. J. White led. Messrs. A. R. Brown, Lim., second; and Messrs. W. Pemberton and Son third. For six flakes or bizarres Messrs. A. R. Brown, Lim., and Messrs. W. Pemberton and Son, and Mr. C. J. White were the winners. For six picotees, yellow-grounds, the previous order of winners was repeated. For six white-ground picotees a similar repeat occurred. Sweet peas were not a very strong feature, otherwise, considering the adverse character of the season, the leading exhibits were fairly good. In the class for twelve varieties, arranged in a space 5ft. by 3ft., the winners were Mr. W. F. S. Dugdale and Lady Agnes Peel, of Mancetter. For a box of cut flowers of stove and greenhouse plants Mr. W. F. S. Dugdale, Mr. W. E. Oakley (Cliff House, Atherstone), and Mr. W. L. Ireland were the prizetakers in the order named.

For a collection of six kinds of flowers other than those named, own foliage only allowed, Mr. W. L. Ireland, Mr. W. F. S. Dugdale, and Mr. W. S. Allen (gardener, Mr. Joseph Green), were the winners with meritorious exhibits. In the class for a collection of twelve kinds of hardy herbaceous and perennial flowers, staged in vases (the trade excluded), the successful exhibitors were Sir Geo. Chetwynd, Lady Agnes Peel, and Mr. W. H. Sale.

There was a goodly display of grapes, and for two bunches of black varieties Mr. Wm. Turner, Atherstone (gardener, Mr. J. Black), was awarded the premier prize for large clusters of Black Hamburgh; Mr. W. F. S. Dugdale second, with fine bunches and berries; Sir Geo. Chetwynd, with smaller but well-coloured berries, third. For a single bunch of Black Hamburgh, Mr. Dugdale, Mr. G. H. Fowler, Hale End Hall, Tamworth (gardener, Mr. M. A. Sleath), and Sir Geo. Chetwynd were the winners. For two bunches of Muscat of Alexandria, Mr. G. H. Fowler, Mr. Dugdale, and Sir Geo. Chetwynd won in the order named with very good examples. For a single bunch of Muscat of Alexandria grapes, Mr. G. H. Fowler, Sir Geo. Chetwynd, and the Earl of Huntingdon obtained the awards with very good examples. Melons were excellently shown. Mr. Stanes Chamberlayne, Witherley Hall, Atherstone; Mr. W. F. S. Dugdale, and Mr. S. Allen, Rose Hill, Atherstone, were the successful contestants. Peaches were very fine, both in size and colour. There were six exhibits, and the Rev. Bramber Hall, Weddington Rectory, Nuneaton, was first, and Mr. Stanes Chamberlayne second.

Aberdeen Sweet Pea Exhibition.

AUGUST 11 and 12.

Under the auspices of the Aberdeen and Northern Counties Sweet Pea Society a fine exhibition of these beautiful flowers was held in the Music Hall Buildings, on the above dates, and the success which it attained must have proved exceedingly pleasing to the promoters. Not a little of the credit is due to Mr. M. H. Sinclair, who acted as secretary.

There were over 200 entries, comprising something like 500 separate exhibits. In the class for twelve varieties, with waved standards, the leading prize—a very handsome silver rose bowl—went to Mrs. Dunbar Dunbar, of Seapark, Forres, N.B. (gardener, Mr. John A. Grigor). Of the twelve, the best were Charles Foster, Edrom Beauty, Etta Dyke, Masterpiece, Earl Spencer, Unique, and Shrimp. Second honours went to Sir Thomas Burnett, Bart., of Leys, Crathes Castle (gardener, Mr. John Petrie), for a very fine group. Mrs. Davidson, of Dess, Dess House, Aberdeenshire (gardener, Mr. J. Ingram), took third place. For the best six vases of varieties with waved standards Mrs. Dunbar Dunbar, of Seapark, again won splendidly; Mr. A. M. Williamson, Monboddo House, Fordoun, N.B. (gardener, Mr. James Tullo), made a capital second. In the class for three vases with waved standards Mr. A. M. Williamson carried off first and second honours, his entries including some very fine specimens. In the competition for best three bunches, novelties of 1910 and 1911, Mrs. Dunbar Dunbar, of Seapark, scored; Mr. Alex. Grigor, Duff House, Banffshire, was second; and Mr. A. M. Williamson third. For the best bunch of lavender sweet peas leading place again fell to Mrs. Dunbar Dunbar, but she was closely run by Mr. A. M. Gordon, Newton House, Insch, Aberdeenshire (gardener, Mr. William Cameron), and Sir Victor Mackenzie, Bart., Brackley House, Ballater, Aberdeenshire (gardener, Mr. R. Gibson). For one bunch sweet peas Mrs. Davidson, of Dess, Mr. A. M. Williamson, and Sir Thomas Burnett, Bart., divided the honours. Mr. Williamson, Mrs. Dunbar Dunbar, and Sir Victor Mackenzie were the most successful for picotee-edged sweet peas.

A very good show was also put up by the amateurs, no little credit being due to Mr. R. M. Williamson, Rubislaw Den, Aberdeen; Mrs. Edwards, Beech Hill House, Aberdeen; Mr. James Mitchell, 3, Arbeadie Terrace, Banchory; Mr. G. Rhind, 42, Gordon Street, Huntly; Mrs. Mitchell, Sluivannachie, Ballater; Mr. W. Cormack, Dyce, Aberdeenshire; and Mr. Wood, 64, Hilton Place, Aberdeen, for the fine displays they made.

Some exceedingly fine work was shown in the section for floral decorations, which demonstrated how well the sweet pea lends itself to decorative effect. For the best dinner-table decoration of sweet peas Mrs. Porter, Monaltrie, Ballater, had a very fine win. Mrs. Milne, 357, Hardgate, Aberdeen, made a good second. The bowls of sweet peas proved a very fine item, and were greatly admired. Mrs. Edwards, Restalrig, Cults, Aberdeenshire, won first and second honours here with capital entries, and Mrs. Edwards, Beech Hill House, Aberdeen, was third. This last-named lady also carried off the first prize for the best vase of sweet peas, any two varieties. Baskets were few, but what there were were good. Mrs. Milne, 357, Hardgate, Aberdeen, had a very fine win here, and her exquisite taste was much admired. Mrs. Porter, Monaltrie, made a good second.

Lockerbie Sweet Pea Society.

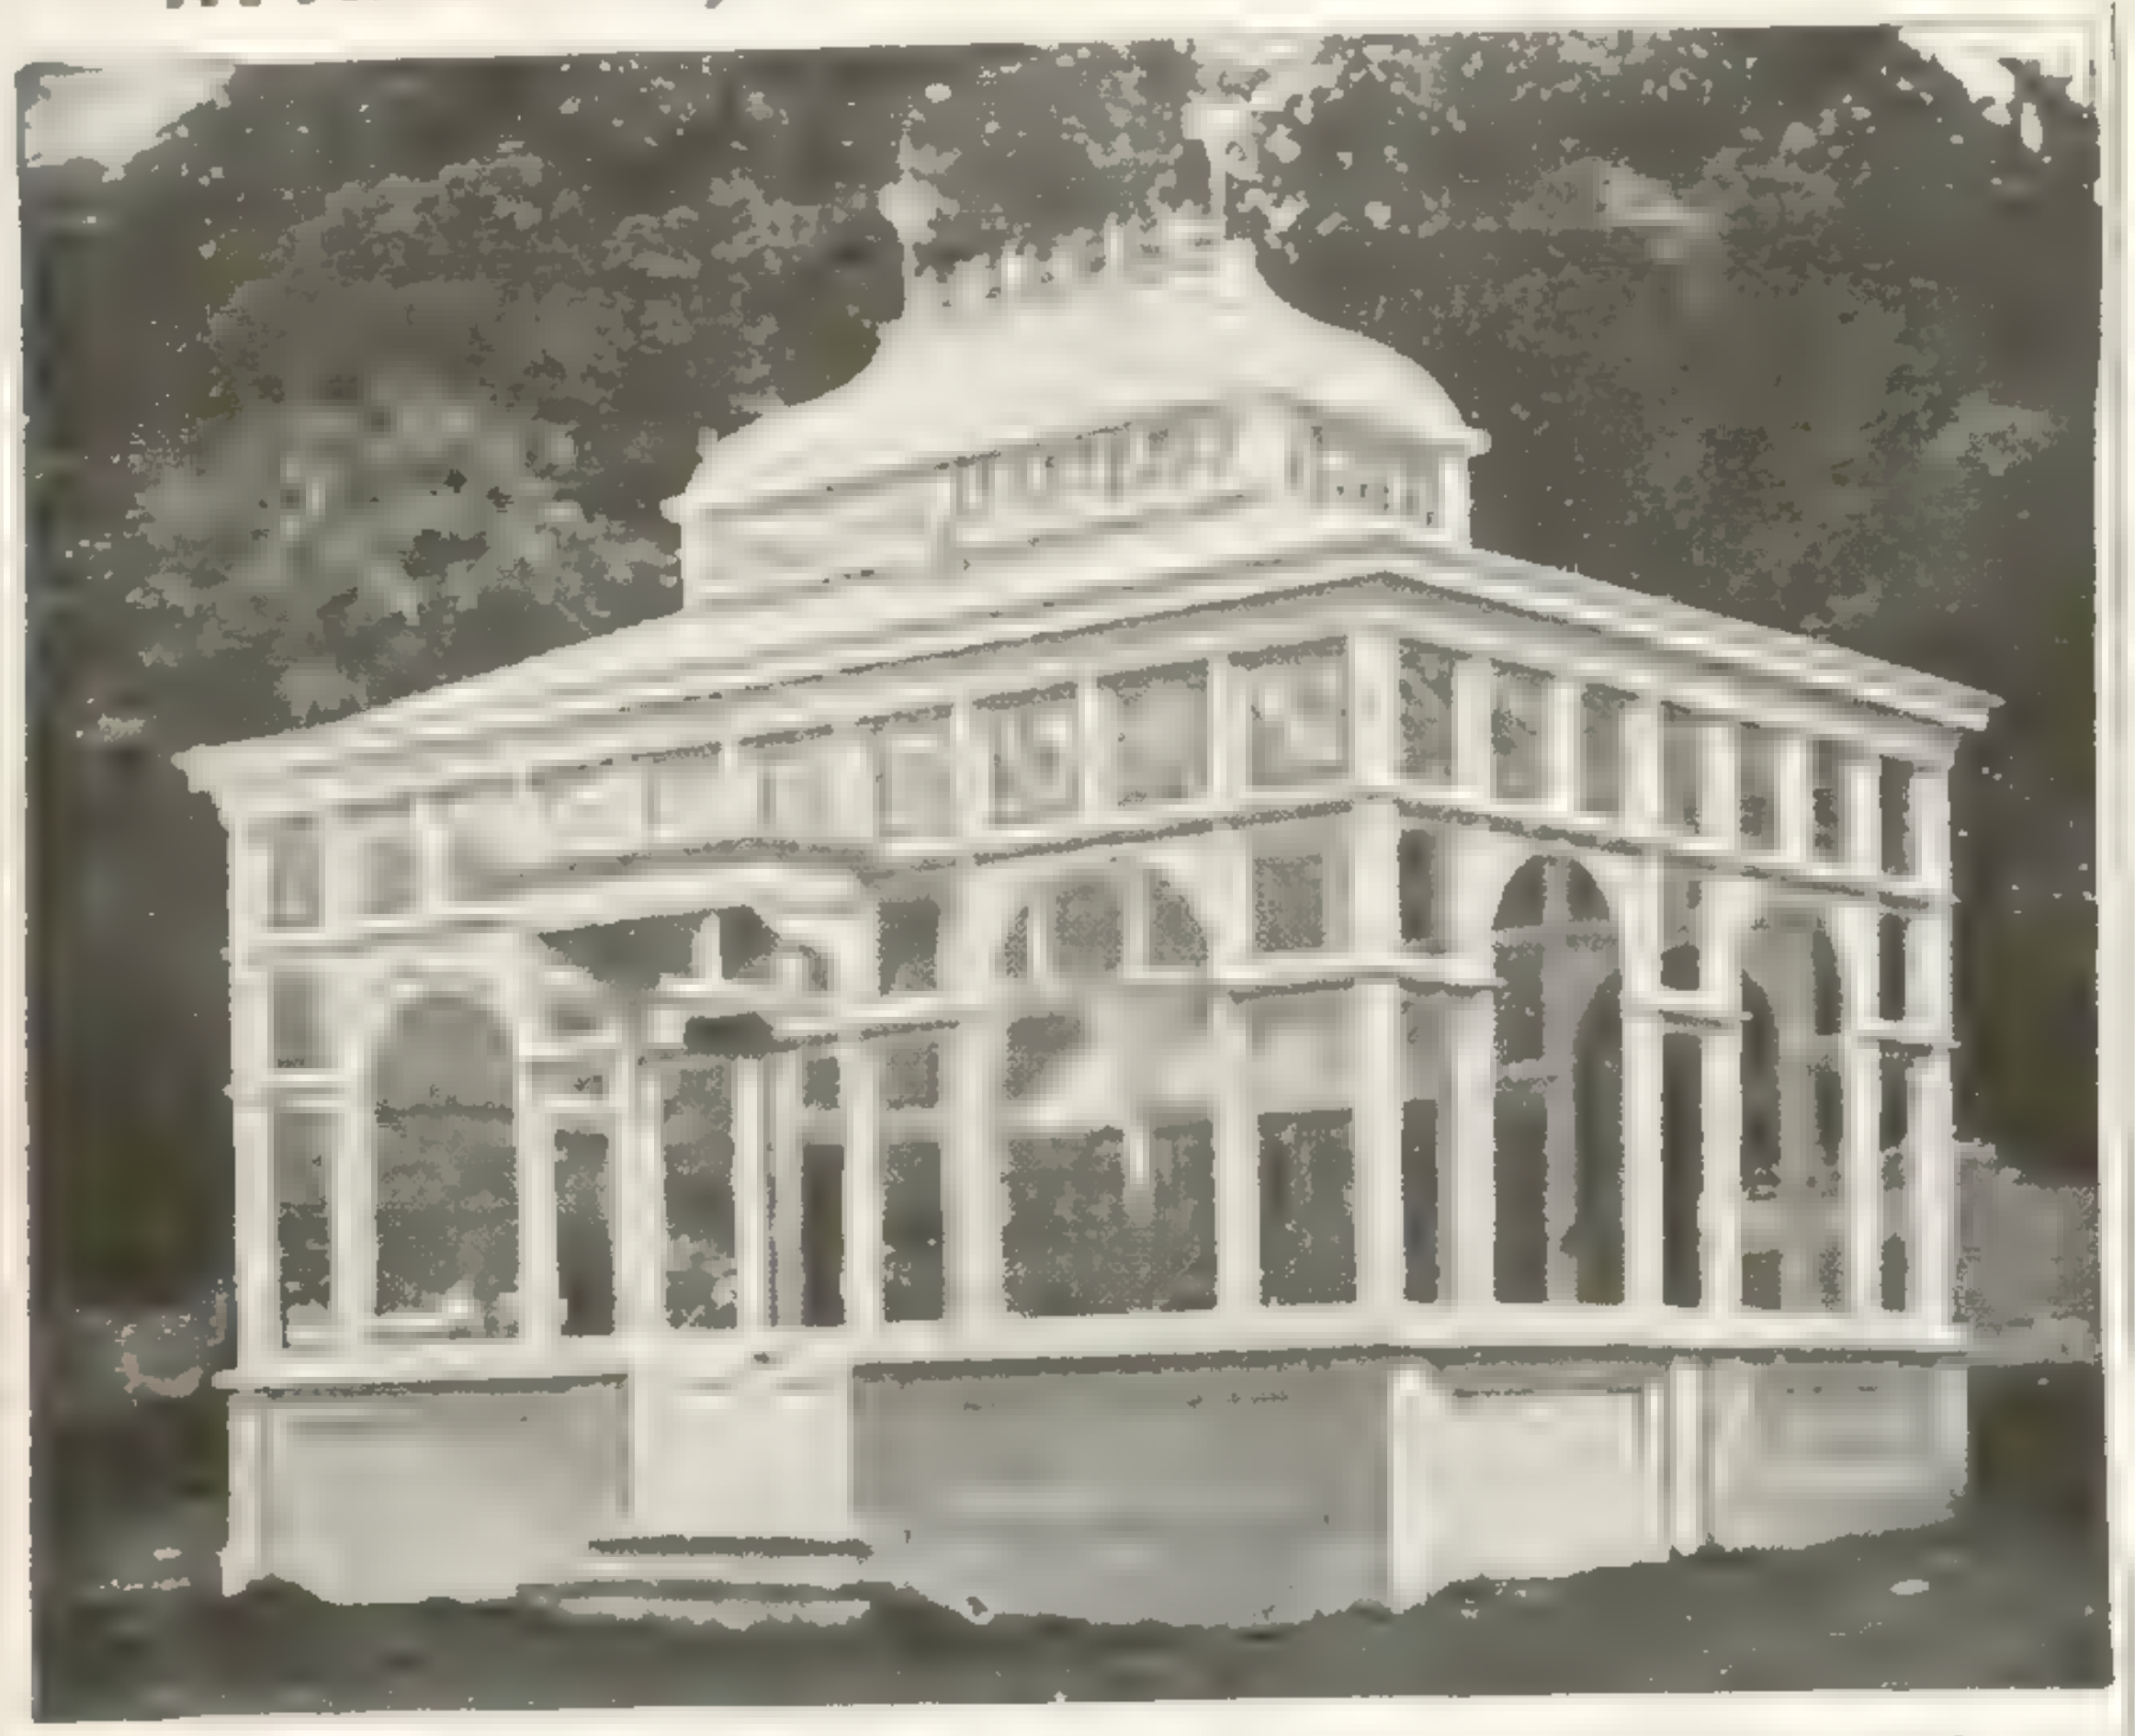
This society, which has been recently formed, inaugurated its career by holding its first show in the Town Hall, Lockerbie, on August 5. The exhibition was an excellent one, the flowers, as a whole, being fresh, clean, large, and showing every appearance of high cultivation; while a considerable number of the newest varieties showed that the exhibitors were in touch with the development of the sweet pea. The arrangements of the show were good, and reflected credit on the committee, of which Mr. A. Watt is chairman, and Mr. G. L. Moffat secretary. The prize for twelve vases of sweet peas, in twelve varieties, went to Mr. G. L. Moffat, who staged excellent flowers in good varieties. For nine vases Mr. Moffat was also first. The best six vases, distinct, came from Mr. Thos. Stoddart; and the best three were staged by Mr. Jas. K. Johnstone. Mr. W. Howie had the best vase of white, as well as that of crimson, carmine, or scarlet, and of one of lavender or blue. Mr. G. Wilson, Bridge Street, was first for a vase of picotee-edged. Mr. J. H. Tweedie won for a vase of pink or blush and for one of bronze or maroon; also for a lady's spray. Mr. J. K. Johnstone won for a vase of mixed sweet peas. The dinner-table competition was a good one, and Mrs. Mair, Ardyne, was first with remarkably pretty sweet pea decorations; Miss A. Halliday and Miss Murray being respectively second and third.

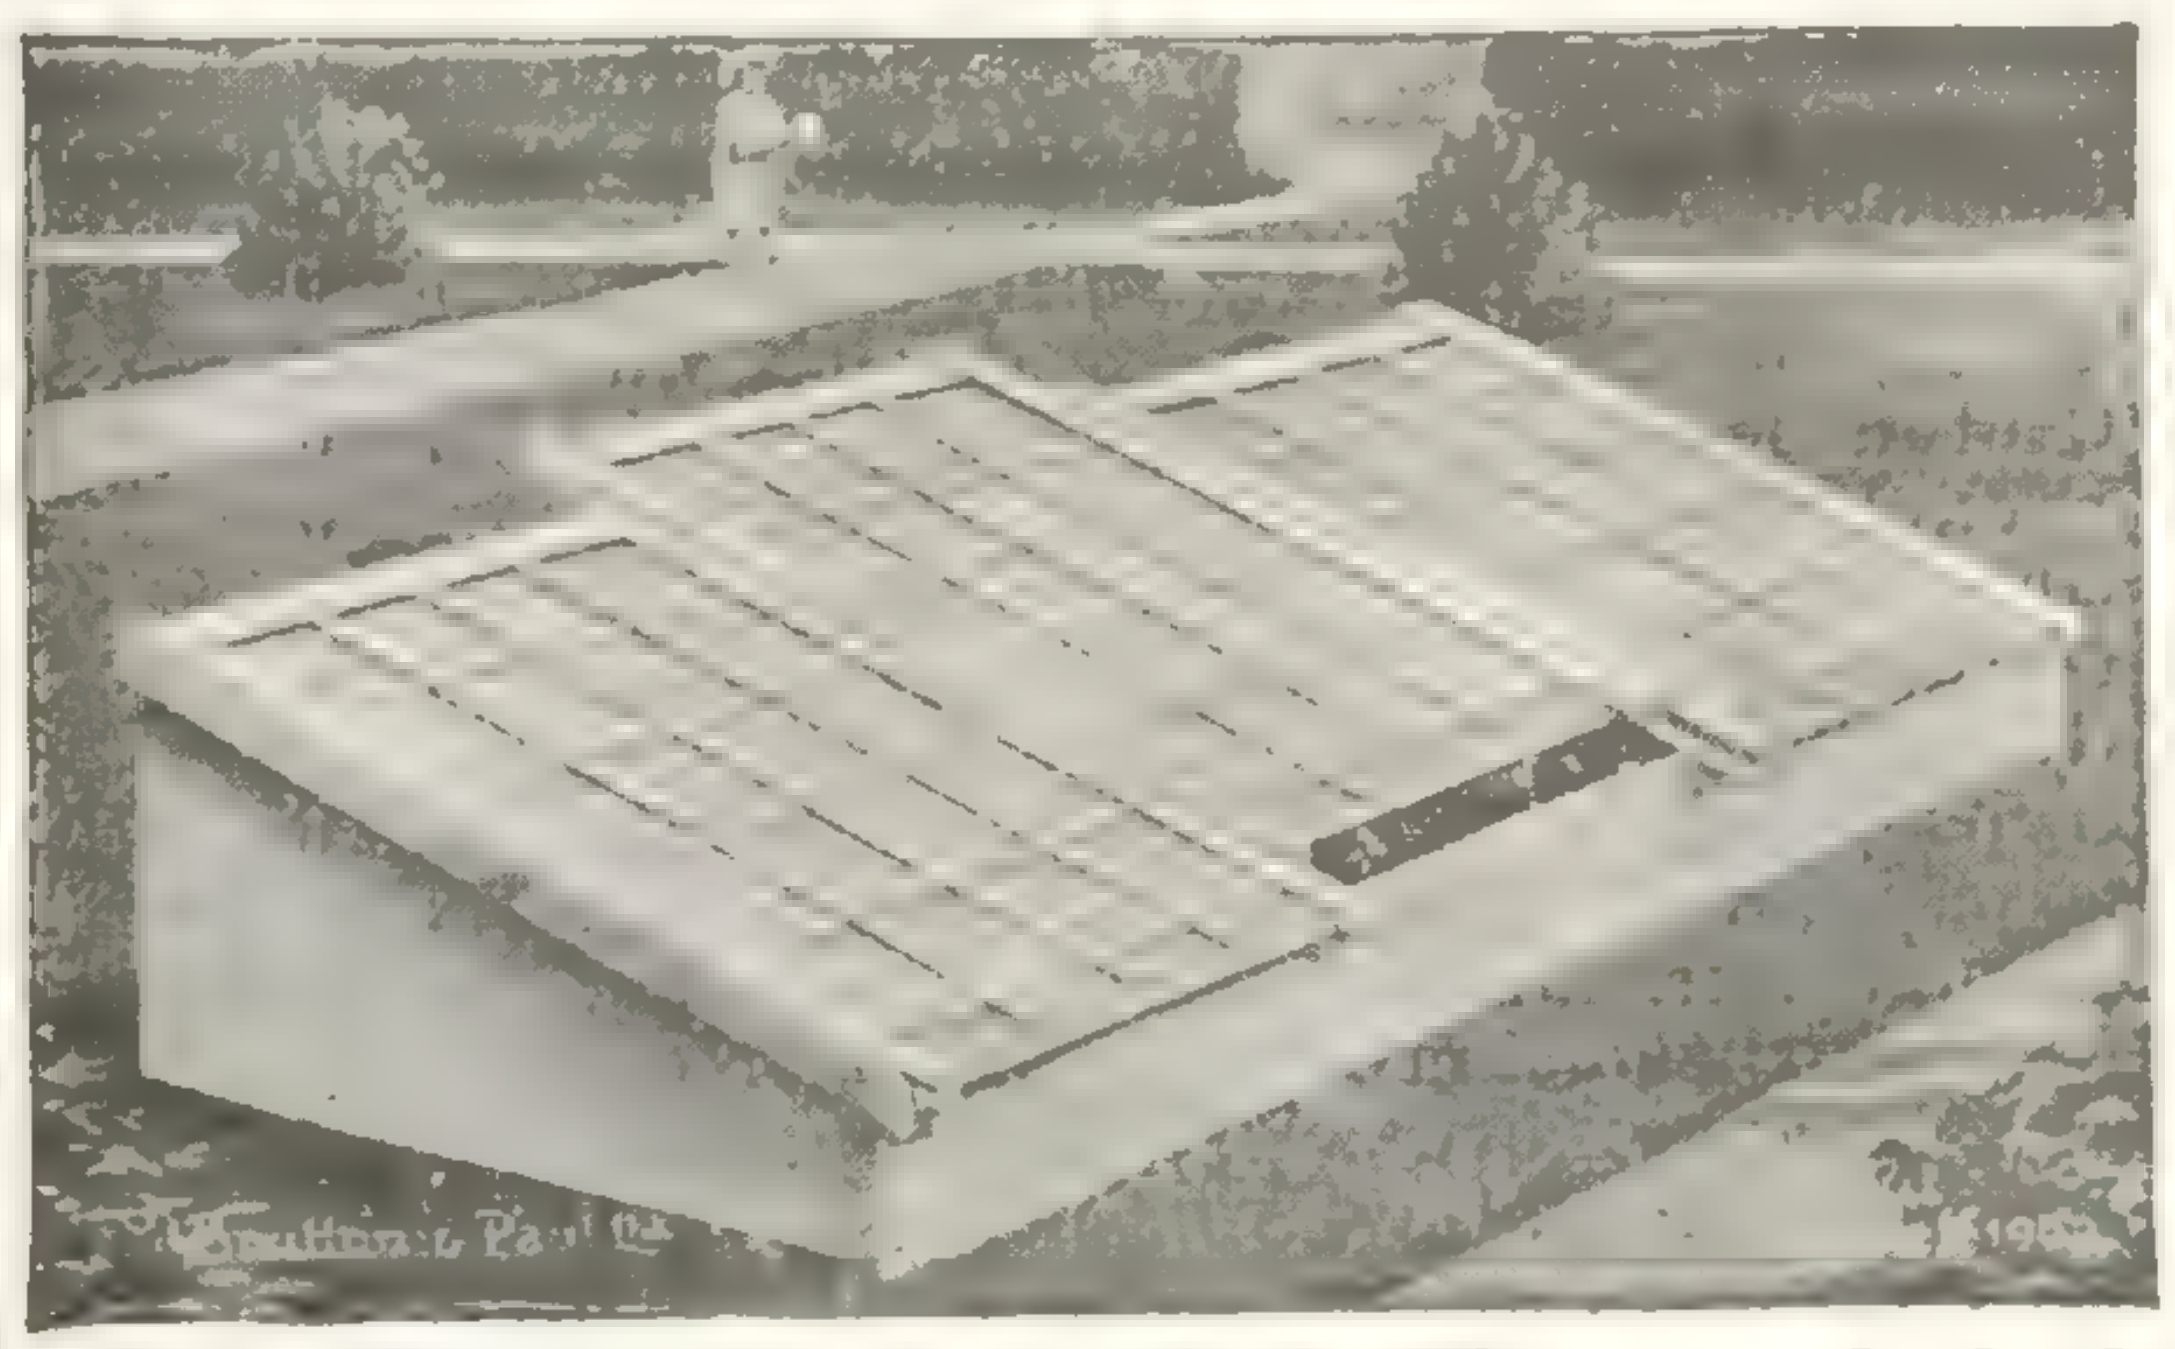
Solihull Horticultural Society.

AUGUST 7 and 8.

The seventh annual exhibition provided an opportunity for the cultivators in this district to produce an excellent display, and the executive had good reason to be well satisfied with the results of their labours. As usual the show and fête were held in the picturesque park of Malvern Hall. Non-competitive exhibits were not numerous, but lack in numbers was amply compensated for by the more than ordinary beautiful floral contributions of Messrs. Gunn and Sons, Olton, and Messrs. Hewitt and Co., Solihull. Messrs. Gunns' artistic arrangement comprised a lily pond bordered by rockery and furnished with suitable plants. To the right and left of the pond were disposed large groups of phloxes in good condition. On the extreme right were also bold sheaves of various coloured statices (sea lavender), and on the left-hand side were Japanese lilies in variety. A large gold medal was awarded this firm, and a similar award was made to Messrs. Hewitt and Co. for a splendid arrangement of liliums, begonias, carnations, ferns, etc. A silver-gilt medal was awarded Mr. H. N. Ellison, West Bromwich, for a really artistic arrangement of finely-grown exotic and other ferns.

A class was provided for groups of plants arranged for effect, 18ft. by 12ft., and in this there were three exhibitors. The premier position was occupied by Messrs. J. Cypher and Son, Cheltenham, with a surprisingly beautiful arrangement, in which richly-hued crotons played a conspicuous part; the second prize was awarded to Mr. W. Vause.





BOULTON & PAUL, LTD., HORTICULTURAL BUILDERS, Norwich

ATTRACTIVE, PRACTICAL GLASSHOUSES.

Ladies and Gentlemen waited upon by appointment.

All parts are numbered ready for easy re-erection by any handy man.

Leamington, for a very meritorious exhibit; Mr. W. Saunders, gardener to Mr. J. Earle, King's Norton, being a close third. In the class for six stove or greenhouse plants Messrs. Cypher were the winners with medium sized specimens; Mr. W. Vause second, and Mr. W. Saunders third.

In the amateurs' class for a group of plants arranged for effect, the first prize and a silver challenge cup was awarded to Mr. H. F. Foster, gardener to Mr. F. E. Muntz, Umberslade Hall, with a most tasteful arrangement of well-grown plants; Mr. D. Bagg, gardener to Mr. W. E. Perks, Solihull, second; and Mr. T. Warner, gardener to Mrs. M. Davis, Solihull, third. For six foliage and flowering plants. Mr. F. E. Muntz was placed first; second, Mr. J. Warner, gardener to Mrs. C. T. Wade, Sandal House, Solihull. Ferns were well shown, and the first prize was annexed by Mrs. F. Yardley, Prospect House, Solihull (gardener, Mr. G. Mills). For three coleus, distinct, Mrs. M. Davis was first. Begonias were well staged by Mr. W. Hulse, Mrs. M. Davis, and Mr. Hugh Mitchell (gardener, Mr. T. Batchelor). Zonal pelargoniums were creditably shown by Mrs. M. Davis. Gloxinias were fairly good, the first prize being annexed by Mr. J. Warner, gardener to Mrs. C. T. Wade, Sandal House, Solihull; second, Mr. J. Taylor, gardener to Mr. Ed. Allday, Solihull. Fuchsias comprised well-grown specimens of large size, the first prize being won by Mr. F. Warner, gardener to Mr. M. Davis, Berry Hall, Solihull; and the second by Mr. J. Warner, gardener to Mrs. C. Wade, Sandal House.

Sweet peas were not very abundant. For twelve vases, distinct, Mr. Wm. Hulse, The Dingles, was first with fairly good blooms; second, Mr. E. Gladstone, Hampton-in-Arden (gardener, Mr. G. Thompson); and Mr. E. A. Grove third. A silver medal was awarded to Mr. G. F. Spittal, Glengariff, Solihull, for a collection of carnations arranged in vases, of exceptional merit.

Vegetables were strongly represented, and mainly of fine quality, and the special prizes offered by Messrs. Sutton and Sons, Reading, and Messrs. A. Webb and Sons, Wordsley, were keenly competed for.

FORTHCOMING ENGAGEMENTS.

TUESDAY, August 22.—Royal Horticultural Society of Ireland.

WEDNESDAY, August 23.—Shrewsbury Floral Fête; two days.

Battle Horticultural Society

THURSDAY, August 24.—Peebles Horticultural Society.

National Hardy Plant Society.—Conference at Old George Hotel, Shrewsbury, commencing 4 p.m.

SATURDAY, August 26.—Glassford Horticultural Society.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

PEACHES ON WALLS.—W. G., Derby: You cannot do better than well syringe the trees early in the evening after each hot day, expose the fruits to sunshine by adjusting leaves and growths, and keep the roots of the trees comfortably moist. A little nitrate of soda well watered in would help the fruits to swell up, but this must be carefully given, or it will excite growth too much, and thus possibly result in some amount of unripened wood should cool moist weather follow.

DISQUALIFICATION.—L. C. L., Wolverton: Competitors are not notified that they have won a prize until the prize is paid, nor is a competitor told he has been disqualified; he is expected to find out these things for himself. With reference to the other points raised, it is quite impossible for us to deal with them in the absence of the schedule, but we may state that distinct varieties and distinct kinds are two very different matters.

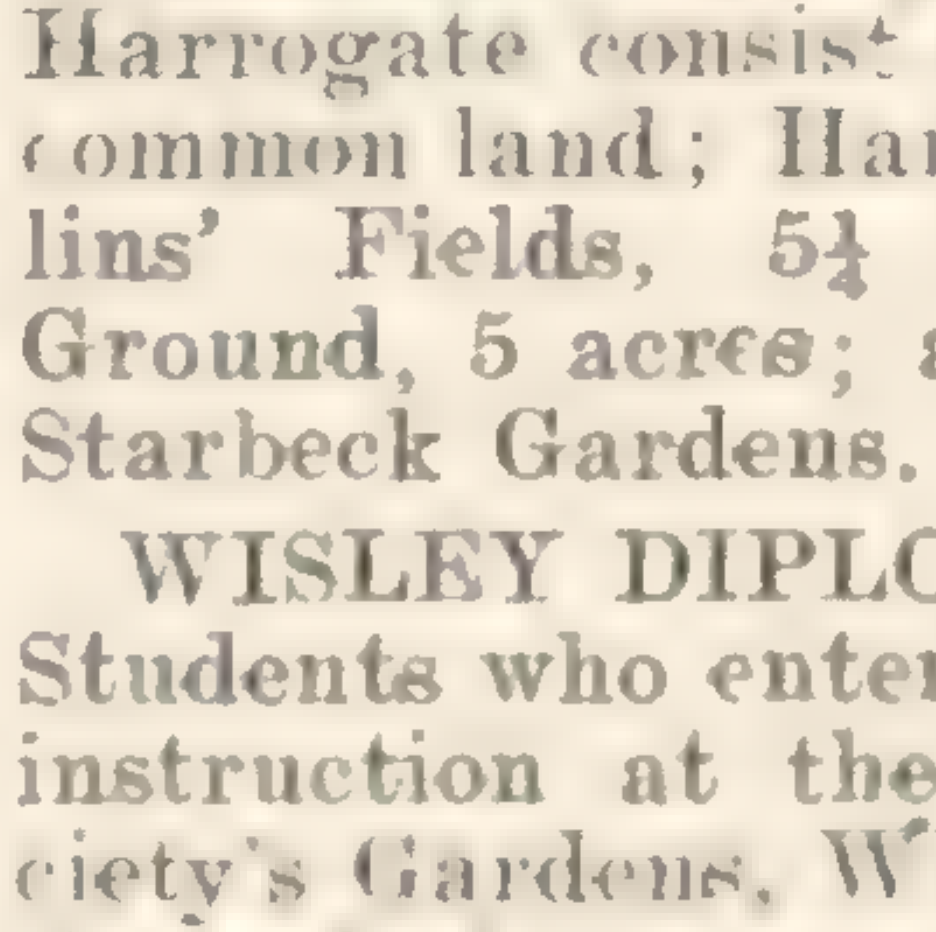
BLACK ROT IN TOMATOES. — B. N., Wantage: The specimens sent showed strong evidence of the presence of Macrosporium Tomato, a fungus pest known as Black Rot. Remove and burn all affected fruits, and spray the plants at intervals with a solution of potassium sulphide. Keep the house well ventilated, and maintain a dry buoyant atmosphere in the structure.

SAVING TOMATO SEEDS. — F. P. B., Nottingham: When the fruits are ripe enough for general use they are sufficiently ripe for the extraction of seeds. Cut the tomatoes through the middle, laterally, so as to expose all the interior divisions; then, with the handle end of a spoon, or with a knife point scoop out the seeds and pulp. Place the seeds in a finely-meshed wire sieve, and hold under a tap of water, at the same time working the pulp about with the fingers until it is parted from the seeds and passes through the sieve. It is practically impossible to wash out all the pulp, as this is very adhesive, but as soon as the seeds are well washed turn them out on a sheet of glass, spreading them thinly. Place the glass in the sunshine (with an inverted sieve over them, if out of doors, to keep birds away), until dry, when they should be removed, placed in dry, fine silver sand, and be well rubbed through so as to remove all bits of dry pulp. The sand can be easily sifted away from the seeds, leaving the latter quite clean and dry, ready for storing in a cool dry cupboard.

INEXPENSIVE HARDY FERNS.—E. R. K., Rotherham: The following varieties of hardy ferns come within your specification, as they are all of free growth, elegant, and inexpensive: Athyrium filix-fœmina (Lady fern) corymbiferum, A. f.-f. cristatum, A. f.-f. Elworthii, A. f.-f. grandiceps, A. f.-f. percristatum, A. f.-f.-plumosum Axminster variety, A. f.-f. ramo-cristatum, Lastrea filix-mas (Male fern) cristata, L. f.-m. cristata angustata, L. f.-m. grandiceps, L. f.-m. polydactala, L. f.-m. ramo-cristata, L. f.-m. sub-cristata, Lastrea dilatata (Broad Buckler fern) foliosa cristata, L. d. grandiceps, L. d. polydactala, Polystichum angulare (Soft Shield fern) acutilobum, P. a. cristatum, P. a divisilobum, P. a. grandiceps, P. a. latipes, P. a. pulcherrimum, P. a. tripinnatum, Scolopendrium vulgare (Hartstongue fern) capitatum, S. v. crispum, S. v. c. fimbriatum, S. v. c. grande, S. v. Edwardsi, S. v. grandiceps, S. v. ramo-cristata, S. v. ramo-marginatum, S. v. undulatum rigidum.

HARROGATE'S OPEN SPACES.—U. N., Holmfirth: The parks and open spaces at Harrogate consist of The Stray, 200 acres of common land; Harlow Moor, 52½ acres; Collins' Fields, 5¼ acres; Valley Pleasure Ground, 5 acres; and the Prospect Hill and Starbeck Gardens.

WISLEY DIPLOMA.—M. E. J., Rawdon: Students who enter for a two years' course of instruction at the Royal Horticultural Society's Gardens, Wisley, receive a diploma at the end of the course provided, in addition to conforming to the rules and regulations of the gardens, he (1) Pass written and practical examinations in the principles and operations of horticulture upon the syllabus laid down for study. (2) Present an essay



SCOTT'S WASP DESTROYER

has stood many years' test as the only effectual protection for Fruit Trees, &c., from Wasps and Flies.

written by himself upon some approved horticultural or scientific subject. (3) Submit a collection of at least 200 properly dried, named and localised plant specimens collected outside the Wisley Gardens; and (4) submit a collection of insects either injurious or helpful to horticultural plant life. One or two student demonstratorships, or travelling scholarships, will be awarded by the Council, at their discretion, after considering the reports of the director, superintendent, and examiners, to enable the student to acquire special knowledge of some particular branch of horticulture. Students to whom these awards are made will receive a small remuneration and will be required to assist in demonstrating to the junior students. The following prizes are annually awarded: (1) The "Sutton" prizes to the value of £3 10s. divided between the most successful candidates at the diploma examination. (2) The "Nicholson" prize of the value of £2 2s. awarded to the student who shows greatest diligence in observation.

BRICK MEASUREMENTS.—L. S. A., Sutton Coldfield: Stock bricks should measure 8¾ inches by 4½ by 2¾ inches; Welsh fire bricks, 9 by 4½ by 2¾ inches, and paving bricks 9 by 4½ by 1¾ inches. An ordinary stock brick weighs about 7lb.

MELON AND MARROW SEEDS.—G. A., Shildon: If the seeds are kept dry and away from frost, they should retain their germinating power for several years; indeed, many growers prefer melon seeds that are two seasons old when sown, believing that a sturdier and more fruitful growth results than from quite new seeds.

FRENCH GARDENING.—F. L. C., Ludlow: It has been estimated that the equipment of a French garden of two acres, which is considered the best area when the produce has to be marketed, involves an expenditure of about £1,000, but the purchase of sufficient frames and cloches for a private garden is a small matter. As a proof of this, it may be mentioned that a three-light frame, 12ft. by 4ft., costs about £1 10s., and 100 cloches about £6. Consequently six frames, giving a run of 72 feet, and 100 cloches would cost about £15, and be sufficient for the majority of gardens. Commencing with the month of October, hotbeds are in use for about five months, and the collection of stable manure has to be commenced in September and be continued until February or March. In accordance with the practice that at present obtains in English gardens, the manure is turned over three or four times with a fork, and each time well shaken up in the process. The beds should be 5ft. 6in. wide, and run from east to west, and vary from 10in. to 20in. in depth, according to the season, and the crop, 10in., for example, being sufficient for the cabbage lettuces. The beds on which to place the cloches are made up in a similar manner to those for the frames. The manure is trodden firmly, as the beds are made up, and when they have been completed they are covered with soil, the layer ranging from 5in. to 8in. in thickness, according to the crop. The French practice is to mix with the soil an equal quantity of old manure, and this practice should be adopted in English gardens.

NAMES OF PLANTS.

D. D., Ashton.—Cattleya Rex.

L. L. J., Yarmouth.—1, Statice latifolia; 2, Sedum carneum; 3, Morisia hypogæa.

D. R. S., Leominster. — 1, Helenium autumnale; 2, Chironia ixifera; 3, Funkia Sieboldi.

W. R., Congleton. — 1, Selaginella Mertensi; 2, S. Kraussiana aurea; 3, Phyllanthus glaucescens; 4, Costus igneus.

S. K., Minehead. — 1, Escallonia macrantha; 2, Leycesteria formosa; 3, Colutea arborea; 4, Phormium tenax; 5, Piper ornatum.

C. E. M., Lincs.—1, Selaginella cæsia; 2, Eupatorium ageratoides; 3, Epilobium angustifolium; 4, Linaria alpina; 5, Dactylis glomerata variegata; 6, Diplopappus chrysophyllus.

Geum Mrs. Bradshaw.—This has not been long before the public, but it has already become a general favourite, for its large, semi-double orange-red blossoms are particularly showy, while, provided the old flowers are cut off when their beauty is past, a succession is kept up for a long time. Taken altogether, the geums are certainly a very showy class of herbaceous plants. Even the old Geum coccineum will in the herbaceous border hold its own with many more expensive subjects.—W. T.

Strong plants of the above, 2s. per doz.; seed, 9d. per pkt.
CHAS. CUNDY,
Nurseryman and Seedsman, Sudbury, Suffolk.

SLUGS, SLUGS, SLUGS. — "SANITAS POWDER" will rid your garden of slugs. Mr. Walter P. Wright, of the "Garden Week by Week," says:—"The particular hint that I was going to offer about slugs was to scatter 'Sanitas Powder' on the soil amongst the plants—slugs simply loathe it." Mr. E. Poulter, of Mayfield, Sussex, writes:—"I have found 'Sanitas Powder' most efficacious in keeping off slugs." "SANITAS POWDER," 6d. and 1s. tins, and 12s. 6d. per cwt.

THE SANITAS CO., Ltd., Limehouse, London, E.

GRAPE VINES. — Stout Young Green Canes for present planting. FRUITING FIGS IN POTS. List on application. WILL TAYLER, Hampton, Middlesex.

WINTER-BLOOMING SWEET PEAS.— The "Télemly" Sweet Peas gained the Gold Medal (1907) of the Hort. Soc. of Algeria, and the
LARGE NEW WAVED VARIETIES
the Gold Medal of 1911. If sown in August or September will flower from December till May in Southern Europe, N. Africa, Madeira, etc. In England must be sown in pots and protected from frost till the end of February, and will flower in April in the open, or at Christmas in a sunny greenhouse. 12 seeds each of 4 plain and 3 waved varieties will be sent on receipt of 4s. by the Rev. E. ARKWRIGHT, 36, Seymour Street, W.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Surplus Sunbeams.

That it is possible to have too much even of a good thing is being exemplified by the abundance of sunshine experienced, coupled, naturally, with such an absence of rain that most vegetation is suffering terribly from the drain upon the foliage by the ever-thirsty sunbeams and the lack of moisture in the soil to enable the thirsty roots to find any equivalent supply of humidity as a counterpoise. Without going into meteorological data and records it may safely be stated that for very many years there has been no such long-continued spell of practically cloudless skies as have prevailed this summer. The old saying that an English summer consisted of three bright days and a thunderstorm has been signally contradicted, so far as this summer is concerned. Almost unprecedented thermometrical records on the one hand, and an almost unappreciable rainfall on the other, are stamping the season as a really phenomenal one. Pasture and grass lands generally, which usually manage to retain some verdure even in ordinary droughts, are as brown and burnt up as one would expect in the driest tropical regions, while the poor trees and shrubs in many places are miserably parched and shrivelled, and the very bark seems imperilled by the abnormal shrinkage involved in the impoverished supply of sap. The foliage of many kinds of trees is commencing to fall as rapidly as it should in October, while where irrigation or artificial watering is impracticable the very fruits are ripening ere fully developed, or falling in showers at every breeze. The garden lover is at his wits' end to preserve his plants, for of what use is a watering can, or even a hose, when the soil is so baked as to be full of deep fissures, which carry off the would-be refreshing flood as fast as it falls into the recesses of the subsoil, and leaves the surface with but a glistening skin-deep film of water, which simply does more harm than good by attracting the superficial roots to the surface only to be scorched and destroyed by the next day's sun. Meanwhile, the weather prophets are assiduously studying the cyclones and anticyclones of the world around us in the hope that some advancing depression may bring the much-needed rain in its train; but all in vain, each one recorded hopefully as trending this way is deflected in its course or mysteriously disappears. The accumulated heat of the soil itself is probably a factor in the continuance of these conditions, since ordinarily rainfall is induced by the warm vapour-laden ocean breezes becoming cooled on reaching the land, and, consequently depositing the bulk of their watery burden owing to the lowering of their temperature. Obviously, if the land be abnormally warm, this cannot happen, clouds are not induced to form, and, not only is no rain shed, but the sunheat is increased by the absence of shade, and so it goes on. The only happy plants, so to speak, are the xerophytic, or drought-loving ones, whose natural habitats are sunburnt rocky or desert places. These are truly in their element, but in a normally humid climate like ours they form the minority of outdoor cultivated plants, the large majority of which are of the opposite nature, and demand a fairly liberal rainfall as a condition of healthy existence. In agricultural districts the harvest of cereals has been abnormally early, and, of course, the bright weather has been in favour of the harvester; but when we turn to the crops of succulent roots, such as turnips, or of foliaceous market vegetables, there is quite another tale to tell; and as for pasture lands, as we have already said, they are, in most parts of the country, only so in name, and the stock farmer is sorely put to it to find provender for his beasts. Unhappily, too, there is some reason to believe that the persistently tropical conditions have affected humanity in other ways by inducing a truly southern frame of mind, coupled with an unreflecting impulsiveness and irrationality, more fitted for a Republic in some semi-tropical region than for the usually more sober Britain. The surplus sunbeams, in short, would seem to have had an unfortunate effect on the temperament of mankind with which we could well dispense, as well as the strain upon most vegetative life, under which the gardener and farmer are at present suffering so severely. It is highly gratifying to be able to state that within the past week the conditions all round have been immensely improved, although neither gardener nor farmer is able to feel satisfied with the amount of rain that has fallen.

MR. JOHN HIGHGATE.

Mr. John Highgate, whose portrait we have the pleasure of giving in this issue, has for some years occupied a prominent position among the many distinguished gardeners resident within a comparatively short distance of Edinburgh, and has throughout been not less highly esteemed for his personal qualities than for the evidence he gave at Yester House of his remarkable abilities in all that relates to garden management. Probably no better proof of the high estimation in which Mr. Highgate has been held could be given than his appointment in succession to Mr. T. Hay, now superintendent of Greenwich Park, as chief of the famous gardens of Hopetoun House, Linlithgowshire, the palatial seat of the Marchioness of Linlithgow, and the satisfaction his appointment gave to his many friends. We are not quite certain as to the number of years Mr. Highgate was head gardener at Yester House, Haddington, the fine seat of the Marquis of Tweeddale, but we know that he had charge of them for a considerable period, and also that by his splendid work in various directions he contributed in no small degree to the fame that they now, as for a long time past, so deservedly enjoy. While all departments of the Yester House gardens received a full share of attention, Mr. Highgate specially distinguished himself as a cultivator of fruits, and obtained many honours for them at the Edinburgh exhibitions. In the interest of the great gardens of which he has now charge, and of himself, we trust that Mr. Highgate may long occupy his present position.

The Break in the Weather which occurred on Monday has been disappointing to those who were hoping that the rainfall would be sufficient to moisten the soil to an appreciable depth, and render substantial assistance to all forms of vegetation in the garden and on the farm. The rainfall in the metropolis on Monday was comparatively light, except in the southern and south-western suburbs. There was a very light fall in London on Tuesday, which was remarkable as being the first day for nearly two months in which no bright sunshine has been recorded at South Kensington. In the North-East and South of England, and in Scotland, a considerable amount of rain was registered on the day last named. The atmospheric conditions that obtain at the time of going to press suggest that the break in the weather is not likely to be of long continuance.

Tree Pruning in London Parks.—The report of Professor I. Bayley Balfour, F.R.S., on tree pruning in the Royal Parks and Gardens has been issued as a White Paper. Dealing with the trees in the Mall, he says he has been impressed by the evidence of the application of sound practical knowledge, combined with scientific principles in the pruning of the trees in relation to their environmental conditions. "That four unbroken lines of shapely, symmetric, healthy trees of the size they have now attained have been established in the Mall," he states, "is a tribute to the skill with which they have been handled." He also observes, "I say without qualification that the trees in the Mall are a picture of the correct art of pruning in relation to environment." Professor Balfour directs attention to the fact that, in the case of these trees, the excess of lateral branches has been properly diminished, and the head of the tree has, therefore, been adequately lightened in relation to wind currents, so that risk of upset of the whole tree and of breaking of branches have been lessened. The branches which remain have been selected with judgment so as to form a right framework for the future extension of the crown of the tree and their lateral extension has been checked judiciously, so that they have been stimulated to produce quantities of well-placed leafy shoots. So well has the natural development of the growth-form of the tree, in Professor Balfour's opinion, been encouraged, that he expresses the hope that photographs of the trees with and without foliage be taken and copies be transmitted to every local body to which the care of trees in thoroughfares is entrusted as an example of what should be aimed at. In contrast with the trees in the Mall and Parks he directs attention to the young plane trees in Piccadilly opposite Hamilton Place, which show mutilation by unscientific pruning. This type, he considers, is too commonly found in thoroughfares, and is the cause of the frequent condemnation of the use of the pruning knife. In conclusion, Professor Bayley Balfour states that he makes no suggestion of alteration in the procedure in the treatment of the trees. The staff which has brought the trees so successfully through their first juvenile stages may be safely trusted to apply sound scientific principles in the treatment of the trees through their later years of adolescence, and to modify, practise, and adjust it to the immediate and prospective requirements of the trees

The National Vegetable Society will hold its second annual exhibition at the Royal Horticultural Hall, Vincent Square, Westminster, on Wednesday next. We understand that notwithstanding the very dry weather that has been experienced over the whole of the United Kingdom, an excellent display is anticipated. In any case the exhibition will be of interest as evidence of the possibilities of high-class vegetable culture in a dry season

The Pageant of Empire Rose Show.—In our issue of the 19th inst. we called attention to the schedule of prizes offered for competition at the exhibition of roses that had been arranged for August 31 and September 1. We have since received a letter from Mr. T. Geoffrey Henslow, secretary of the Horticultural Department of the Festival of Empire, stating that owing to the continuance of the drought, which has so greatly checked the growth of roses, it had been decided to defer the holding of the exhibition until the end of September. We were pleased to receive this intimation, because had the original date been adhered to the show must have been more or less a failure. At present there are, as the result of the prolonged drought, but few roses, but with the aid of the moister conditions that now obtain in many parts of the country, and the exceptionally high temperature of the soil, the plants may be expected to at once commence to make new growth, and produce an abundance of good blooms towards the end of September. Much will, of course, depend upon the weather that will be experienced during the next month, and whether the rainfall during the next few days is sufficient to reach the lower roots. It is proposed, Mr. Henslow informs us, to increase the number of classes for displays of roses.

The National Dahlia Society will hold its annual exhibition at the Crystal Palace, on September 7 and 8, and the blooms will be arranged in the central transept of the Palace.

Fruit Packing in British Columbia.—Those of our readers who have seen the large displays of well-packed apples that have been made by the Government of British Columbia will be interested in knowing that special efforts are made by the authorities to impart to those engaged in the fruit industry a sound knowledge of the art of packing. They fully recognise the fact that it is not less necessary in commercial fruit culture to pack well than to produce good crops. Consequent thereon the Department of Agriculture for the Province conducted last season thirty fruit packing schools in convenient centres. The schools were attended by four hundred pupils of various ages, and diplomas were given to those who showed the greatest proficiency. It is satisfactory to know that in distant parts of our Empire the necessity of grading fruit properly and packing it in the best possible manner is being recognised, but it would have given us more satisfaction had fruit growers in this country given many years ago proper attention to this important aspect of the fruit industry. It would certainly have added appreciably to their profits, and rendered the fruit more valuable to the general body of consumers. Their failure to do this has not been because of any want of advice from those having sufficient breadth of view to give due consideration to each of the many points on which success depends.

The Nursery Industry in America.—Mr. J. W. Hill, in acknowledging the welcome accorded by the Mayor of St. Louis to the American Association of Nurserymen, on the occasion of the St. Louis Convention, took occasion to emphasise the importance of the nursery interests of the country by citing that there were over 2,300 nurseries in the United States, aggregating a capital of 30,000,000 dollars (about £6,000,000), turning out an annual produce valued at, at least 15,000,000 dollars (about £3,000,000), and employing labour to the amount of three or four million dollars (or about £700,000) per annum. He closed with a strong statement of the place of the nurserymen in the economy of the country, as affecting its material, esthetic, and moral welfare.

Importation of Potatoes into Australia.—We learn from the "Journal" of the Board of Agriculture that by a proclamation dated March 17, 1911, the importation of potatoes from any country into the Commonwealth of Australia is prohibited unless they are accompanied by an official certificate, dated and signed by a responsible officer of a Government Department of the country of origin, identifying the potatoes, specifying the quantity, and certifying: (a) That at the date of the issue of the certificate they were free from the disease caused by Phytophthora infestans (known as Irish blight), and from the disease Chrysophlyctis endobiotica (known as potato canker, black scab, warty disease, and cauliflower disease in potatoes); (b) that they were grown in the country named; (c) that they were grown at least twenty miles from any place known, after due investigation, to be or to have been within five years infected with either of the said diseases; (d) that they were packed in the country of origin in clean, new packages. The bags, crates, or other packages containing the potatoes must be marked on the outside with the name of the country of origin and with other distinguishing mark or marks. The above restrictions are relaxed in respect of potatoes imported for food.

Advice to Property Owners.—Provisional valuations are now being served in considerable numbers throughout the country. The values shown are intended to be the basis for levying all the new duties on land and property introduced by the Budget of 1909. Under these circumstances, the secretary of the Land Union strongly advises property owners to scrutinise carefully the valuations served upon them, as, after the expiration of sixty days, unless an objection is lodged, the values will be fixed against them for all time. Owners in doubt should communicate with their professional advisers, with the hon. secretary of any local branch of the Land Union, or with the secretary of that organisation in London, at St. Stephen's House, Westminster, S.W.

SHREWSBURY FLORAL FETE.

On Saturday, August 19, the possibility of the Shrewsbury Floral Fête of 1911 in any degree approaching the extent and importance of its predecessors seemed very remote, owing to the great railway strike. We deeply sympathise with the genial and capable secretaries of this great show, Messrs. Adnitt and Naunton, who must have had an extremely anxious time of it at the end of last and the beginning of the present week. Telegrams and letters poured in upon them on Friday and Saturday, all containing expressions of regret and inability to exhibit because of traffic troubles. But on Sunday things brightened up, and on Monday, August 21, telegrams and letters came thick and fast, all expressing a hope that the senders would be able to come themselves and bring their exhibits. Messrs. Adnitt and Naunton worked like Trojans on the Sunday as soon as they heard the strike was over, and their entreaties to competing and non-competing exhibitors met with a response as hearty as it was pleasing. Midday on Monday many exhibitors could not tell whether they would be able to reach Shrewsbury, but by Wednesday morning there were few absentees.

The exhibition was a splendid one, especially when we remember the difficulties of the season and the railway troubles. Groups were excellent, and the plant classes were well filled. Cut flowers showed a little falling off owing to the drought, and roses were quite poor, though sweet peas were delightful. Fruits were shown in grand style, and the competitions were especially keen; grapes were, perhaps, just a little below the Shrewsbury high-water mark.

There is one point we venture to direct attention to, and it is the impossibility of having the judging finished by the early hour 11.30 a.m., at which visitors are admitted to the show. Judging begins at 9.45, which really means 10 o'clock, and the hour and a-half is not sufficient time for the completion of the judges' duties in certain sections. It seems desirable to commence judging earlier, or delay the opening for half an hour.

FIRST PRIZE GROUP OF HARDY BORDER FLOWERS, AND ROCK AND WATER GARDENING AT SHREWSBURY FLORAL FETE, EXHIBITED BY MESSRS. GUNN AND SONS, OLTON, WARWICKSHIRE.

CHAMPION DECORATED FRUIT TABLE.

The great attraction in the fruit classes at Shrewsbury nowadays is the one for a decorated table of thirty dishes of ripe fruit, in not less than ten distinct kinds, staged on a space 10ft. by 4ft. 3in. The chief award is the twenty-five guinea silver challenge cup and £20. There were five competitors, and the successful one was Mr. N. F. Barnes, gardener to the Duke of Westminster, Eaton Hall, Chester, who, having won the cup in 1908 and in 1910, now holds it for good. We congratulate Mr. Barnes upon this splendid achievement and upon the magnificent fruit he staged. He secured a total of 278½ points. He showed: Muscat of Alexandria, 8½, 9, 9, 9½; Madresfield Court, 8, 8, 9, 8½; Appley Towers, 8½, 8, 7½, 8½; and Chasselas Napoleon grapes, 5½, 7; Cox's Orange Pippin, 6½ and 6½; Gascoigne's Scarlet, 6; and Emperor Alexander apples, 6; Transparent Gage plums, 5; Dymond, 7; Royal George, 7 and 7½; and Belle Bance peaches, 7; Humboldt, 7½ and 7½; and Pineapple nectarines, 7½ and 7½; Marguerite Marillat, 7 and 6½; Triomphe de Vienne, 7; and Doyenne du Comice pears, 7; Brown Turkey figs, 6; cherries, 4; melons, 6, 7, 7, and 6; beauty of flowers and foliage, 6; general arrangement for effect, 5½; total, 278½ points.

Mr. J. H. Goodacre, gardener to the Earl of Harrington, came a good second with a total of 258½ points; he had fine examples of Black Hamburgh grapes, Ribston Pippin, Washington, and Peasgood's Nonsuch apples, Souv. de Congres and Williams' Bon Chretien pears, Barrington and Thomas Rivers peaches, and Transparent Gage plums. Mr. Parker, gardener to J. H. Drakes, Esq., Market Rasen, third, with 238½ points. Mr. G. Mullins, gardener to Lady Henry Somerset, Ledbury, fourth, with 221½ points.

CHAMPION GRAPE CLASS.

There were no fewer than ten entries in the champion class for a dozen bunches of grapes, florally decorated, and arranged on a space 6ft. by 4ft. 6in. The premier award of £20 was made in favour of Mr. S. Barker, gardener to the Duke of Newcastle, Worksop, for an excellent collection, but one that scarcely came up to the best we have seen at Shrewsbury in previous years. His bunches were as follows:

Variety.	Maximum Points.	Points Awar'd.
(1) Muscat Hamburgh ...	10 ...	7
(2) Muscat of Alexandria ...	11 ...	8½
(3) Madresfield Court ...	10 ...	9
(4) Black Hamburgh	10 ...	9
(5) Muscat of Alexandria ...	11 ...	8½
(6) Muscat Hamburgh ...	10 ...	8
(7) Muscat Hamburgh ...	10 ...	8
(8) Muscat of Alexandria ...	11 ...	9
(9) Madresfield Court	10 ...	8½
(10) Madresfield Court	10 ...	8½
(11) Muscat of Alexandria ...	11 ...	8½
(12) Madresfield Court	10 ...	8½
	124	101

The second prize of £16 fell to Mr. J. Dixon, gardener to Lord Rowallan, Kilmaurs, Ayr, who had quite heavy bunches, but some of these were not shapely, and colour was distinctly lacking in several instances. Taking the bunches in their order they came as follows: Muscat Hamburgh (possible 10), 6½; Muscat of Alexandria (11), 8; Black Hamburgh (10), 8; Madresfield Court (10), 8½; Muscat of Alexandria (11), 7½; Muscat Hamburgh (10), 8½; Madresfield Court (10), 8½; Black Hamburgh (10), 9; Black Hamburgh (10), 8½; Muscat of Alexandria (11), 8½; Madresfield Court (10), 9; Muscat Hamburgh (10), 10; total, 100½. The third prize fell to Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby; fourth, Mr. W. Parker, gardener to J. H. Drakes, Esq., Market Rasen; fifth, Mr. T. Ireland, gardener to Miss Webb, Newstead Abbey; sixth, Mr. W. H. Cooke, gardener to

Lord Belper, Derby. Mr. Barker was also first for floral decorations, and Mr. T. Ireland second.

COLLECTION OF FRUIT.

The best collection of nine dishes of dessert fruit, florally decorated, was the one submitted by Mr. J. Mills, gardener to Captain Heywood Lonsdale, Shavington Hall, who presented fine specimens of Madresfield Court and Muscat of Alexandria grapes; Allington Pippin apples, a seedling melon, Bellegarde peaches, Pitmaston Orange and Stanwick Elruge nectarines, and Souv. de Congres pears. Mr. W. Catt was placed third, and Mr. C. Roberts, Halston Hall, second; Mr. Catt led for floral decorations in this class.

Four competitors came forward in the important class for a collection of a dozen dishes of dessert fruit, not less than nine kinds, and all distinct varieties, and the £10 prize fell to Mr. S. Barker, gardener to the Duke of Newcastle, Worksop, who scored with Madresfield Court, Black Hamburgh, and Muscat of Alexandria grapes, neat, well-coloured clusters; Humboldt nectarines, Transparent Gage plums; Dymond peaches, Triomphe de Vienne and Souv. de Congres pears, Ribston Pippin apples, Brown Turkey figs, Sutton's Scarlet and a seedling melons. Second prize fell to Mr. Cotton, gardener to Lord Biddulph, Ledbury Park, who had fine Duke of Buccleuch grapes, and Souv. de Congres and Marguerite Marillat pears; Mr. J. Jones, gardener to Mrs. F. Need, Great Malvern, third; and Mr. A. H. Cooke, Derby, fourth. The prizes for decoration fell in order to Mr. Cotton, who used Lilium speciosum, francoa sprays, and pink carnations; Mr. S. Barker second with white Lilium speciosum, white carnations and sprays of francoa and Chelone barbata; Mr. W. Parker, Market Rasen, third.

GRAPES.

Premier award for four bunches of grapes was won by Mr. T. Lambert, gardener to Lord Harlech, Brogyntyn, for large clusters of Madresfield Court and Muscat of Alexandria; Mr. W. Wilkins, gardener to C. Tangye, Esq., Knowle, came second with broader bunches of the same varieties; and Mr. W. Dawes, gardener to Lord Trevor, Brynkinalt, Chirk, third, also with the same varieties.

Mr. S. Barker, gardener to the Duke of Newcastle, Worksop, led for two bunches of Black Hamburgh grapes with heavy, large-berried bunches, well coloured; Mr. J. H. Goodacre, second, and Mr. A. H. Hall, gardener to Colonel France Hayhurst, Middlewick, third. Mr. W. Parker, gardener to J. Drakes, Esq., Market Rasen, led for one bunch of Black Hamburgh, and was followed by Mr. Goodacre and Mr. T. Lambert; ten entries.

Mr. A. H. Hall annexed the leading prize for two bunches of black Muscat grapes with Madresfield Court in good style; Mr. W. Parker second, and Mr. S. Barker third. Mr. Hall was also first for a pair of clusters of Madresfield Court, and scored with grand bunches, well filled and coloured; Mr. S. Barker second, and Mr. W. H. Faulkner, West Kirby, third; nine entries. The best pair of bunches of Alicante grapes came from Mr. A. H. Hall, who again showed finely, and he was followed in order by Mr. W. Parker and Mr. S. Barker. For two bunches of white Muscats, Mr. Barnes, gardener to the Duke of Westminster, Eaton Hall, scored with Muscat of Alexandra, finely coloured; Mr. W. Parker second, and Mr. J. H. Goodacres third; ten entries. Mr. Barnes had also the finest single bunch of a white Muscat, Mr. W. Parker coming second, and Mr. G. Richardson, gardener to H. St. Maur, Esq., Newton Abbott, third. For "any other white grapes," two bunches, Mr. W. Oldham, gardener to J. Beecham, Esq., Huyton, led with the showy Buckland Sweetwater; Mr. T. Wilkinson, gardener to A. Gibbs, Esq., Tyntesfield, Flaxbourton, second, and Mr. T. Ireland, gardener to Miss Webb, Newstead Abbey, third. Mr. S. Barker led for the heaviest bunch of grapes with a 7lb. cluster of Gros Guillaume; Mr. A. H. Hall second with Alicante, 5¼lb., and Mr. G. Richardson third, with Mrs. Pince.

MISCELLANEOUS FRUITS.

Mr. W. H. Cooke, gardener to Lord Belper, Derby, had the best white-fleshed melon—Eminence; for a scarlet-fleshed variety Mr. H. Forder, gardener to Col. Cornwallis West, Ruthin, was second, and for a green-fleshed melon Mr. J. Stalker, gardener to W. J. Legge, Esq., Madeley, led; there were splendid entries in each case. Major A. H. Lloyd, Shrewsbury, scored for apricots. There were eleven entries of a dish of nectarines, and here Mr. N. F. Barnes scored with Pineapple in grand condition; Mr. G. Mullins, gardener to Lady Somerset, Ledbury, second, and Mr. W. Catt, gardener to A. H. Heber Percy, Esq., Hodnet, third. There were a dozen dishes of peaches, and numbers of splendid fruits were staged. Mr. H. Weaver, gardener to Sir C. A. Smith, Bart., Bangor, was first with an unnamed variety, Bellegarde probably; Mr. N. F. Barnes second with Barrington, splendid fruits; Mr. S. Barker, Clumber, third with Dymond. Mr. G. Davies, gardener to Mr. F. Alderson, Oswestry, led for a collection of hardy fruits, six dishes; Mr. Mills coming second, and Mr. W. Catt third.

GROUPS.

In the principal group class for an arrangement for effect upon a space of 250 square feet, there were four competitors, and here Messrs. J. Cypher and Sons, Cheltenham, secured the premier award, and in doing so presented a delightful display. An arched background was clothed with small crotons, palms, and liliums, with a towering central Kentia. Below this were some gorgeous examples of Croton Thomsoni, while tall spiral-leaved crotons of the Warreni type occupied the chief points throughout the big group. Lilium speciosum and its white variety, and Lilium longiflorum, were freely used in the foreground, with cattleyas, lælio-cattleyas, Vanda cœrulea; Oncidium flexuosum, and other bright and graceful orchids. Alocasias, caladiums, and marantas were also freely and advantageously used to complete the groundwork. Mr. J. F. Macdonald, gardener to Sir G. H. Kenrick, Whetstone, Edgbaston, Birmingham, gained second place, and his beautifully coloured crotons were a great feature, as also was Oncidium flexuosum. Mr. W. R. Manning, Dudley, came third, and Mr. W. Vause, Leamington, secured an extra prize.

The class for a group of hardy herbaceous and perennial plants and flowers, with a background of decorative plants, bamboos, etc., and a rockery, pool of water, water plants, etc., all arranged for natural effect, brought out but two competitors, and the chief award of £25 was awarded to Messrs. Gunn and Sons, Olton, Warwickshire, for a display that admirably fitted the class specification. A thin background of bamboos lent a veiling of green to a mass of Lilium speciosum and L. auratum, in front of which were splendid groups of helianthuses, rudbeckias, pink astilbes, bright montbretias, phloxes, and a base of hardy ferns just as the rockwork surrounding the pool was reached. In the pool were exquisite white and flesh-coloured water lilies, and surrounding the pool a low rockwork filled with heaths, saxifragas, sedums, and other dainty alpines. Mr. Swann, Halston Hall, was placed second, but he seemed to have exceeded the specification, as he had crotons, alocasias, palms, etc., with his hardy flowers.

PLANTS.

Fifteen stove and greenhouse plants, especially large specimens, make a feature, and on this occasion there were three competitors. Messrs. J. Cypher and Son led, and showed, among their best examples, Croton angustifolium, C. Countess, Ixora Duffi, Rondeletia speciosa, Allamanda nobilis, Statice profusa, and Stephanotis floribunda, with giant kentias. Mr. W. Vause, Leamington, second; and Mr. Manning third. Messrs. J. Cypher and Sons were first, and Mr. Vause second for thirty stove and greenhouse plants in 10in. pots, and they exhibited a great variety of useful subjects, all in fine condition, ixoras figuring largely.

For six stove and greenhouse plants Messrs. J. Cypher and Sons scored with grand examples of Rondeletia speciosa major, Ixora Duffi (2), Allamanda nobilis, Clerodendron Thompsonæ, and Statice intermedia, all splendidly in flower; Mr. Wm. Vause, Leamington, came second, and Mr. W. R. Manning, Radford Villas, Dudley, third. Mr. T. Lambert, Brogyntyn, scored for a dozen stove and greenhouse plants with a set of very useful stuff; Mr. W. R. Manning second.

Messrs. Blackmore and Langdon, Bath, had an easy task in the class for a group of begonias, as they presented wondrously fine flowers on finely-grown plants, and overhead they had baskets of drooping varieties; for size and colour this was a tip-top exhibit.

The best miniature rock garden was one well filled with dwarf campanulas, saxifragas, heaths, etc., by Mr. T. R. Hayes, Keswick; Messrs. Caldwell and Sons, Knutsford, were second.

DAHLIAS AND SWEET PEAS.

The principal prize for a collection of cactus and other dahlias, arranged for effect on a space having a frontage of 8ft. 6in., was won by Mr. John Walker, Thame, who had particularly fine flowers of Mrs. A. Dyer, Phineas, White Lady, H. F. Robertson, and other cactus varieties, set up in tall stands with grasses and asparagus sprays; it was a splendid arrangement of fine blooms; Messrs. Keynes Williams and Co., Salisbury, came second; and Mr. John E. Knight, Wolverhampton, third. Five entries.

Mr. J. Walker, Thame, had the best two dozen show and fancy dahlias, and staged remarkably fine examples of T. J. Saltmarsh, Mrs. Saunders, Mabel, J. Bennett, Golden Fleece, etc.; Messrs. H. Clark and Sons, Rodley, second, and Messrs. Bottomley and Burton, Elland, third. Messrs. Bottomley and Burton led for a dozen bunches of cactus dahlias with bright clean flowers of Advance, Iolanthe, Snowdon, Red Admiral, W. Marshall, Stormer, F. M. Quade, Dreadnought, etc.; Mr. G. Bowness, Busby, second, and Messrs. M. Campbell and Son, High Blantyre, third.

Mr. H. Berman, Nantwich, had the best dozen cactus dahlias on boards, and Mr. J. C. White, Bramley, came second. Messrs. Henry Clark and Sons, Rodley, were easily first for two dozen cactus dahlias on boards, and they scored with a beautiful set of clean, fresh, and bright flowers; Messrs. Bottomley and Burton second.

Mr. H. Peerman, Nantwich, was to the front for eighteen cactus dahlias, single blooms of the same number of varieties; Mr. J. E. White, Bramley, second.

Mr. G. L. Moffat, Lockerbie, led for a dozen bunches of sweet peas, with some fine bunches of Chas. Foster, Edrom Beauty, Mrs. W. J. Unwin, Maud Holmes, Clara Curtis, etc.; Dr. Rambaut, Bicton, second. Mr. Moffat also led for six bunches with Romani Rauni, and Etta Dyke in grand form; Mr. A. Brydon second; Mr. D. Williams, Aberdare, third.

Eighteen bunches of sweet peas was a fine class, and there was a splendid competition. The leading prize of £5 was awarded to Mr. H. Forder, gardener to Col. Cornwallis West, Ruthin Castle, for Mrs. H. Bell, Mrs. C. W. Breadmore, Marjorie Willis, Asta Ohn, Mrs. H. Dickson, Mrs. W. J. Unwin, etc. Mr. G. Bamfield, Kington, second, and Mr. H. Weaver, gardener to Sir C. A. Smith, Bart., Bangor, third.

CUT FLOWERS.

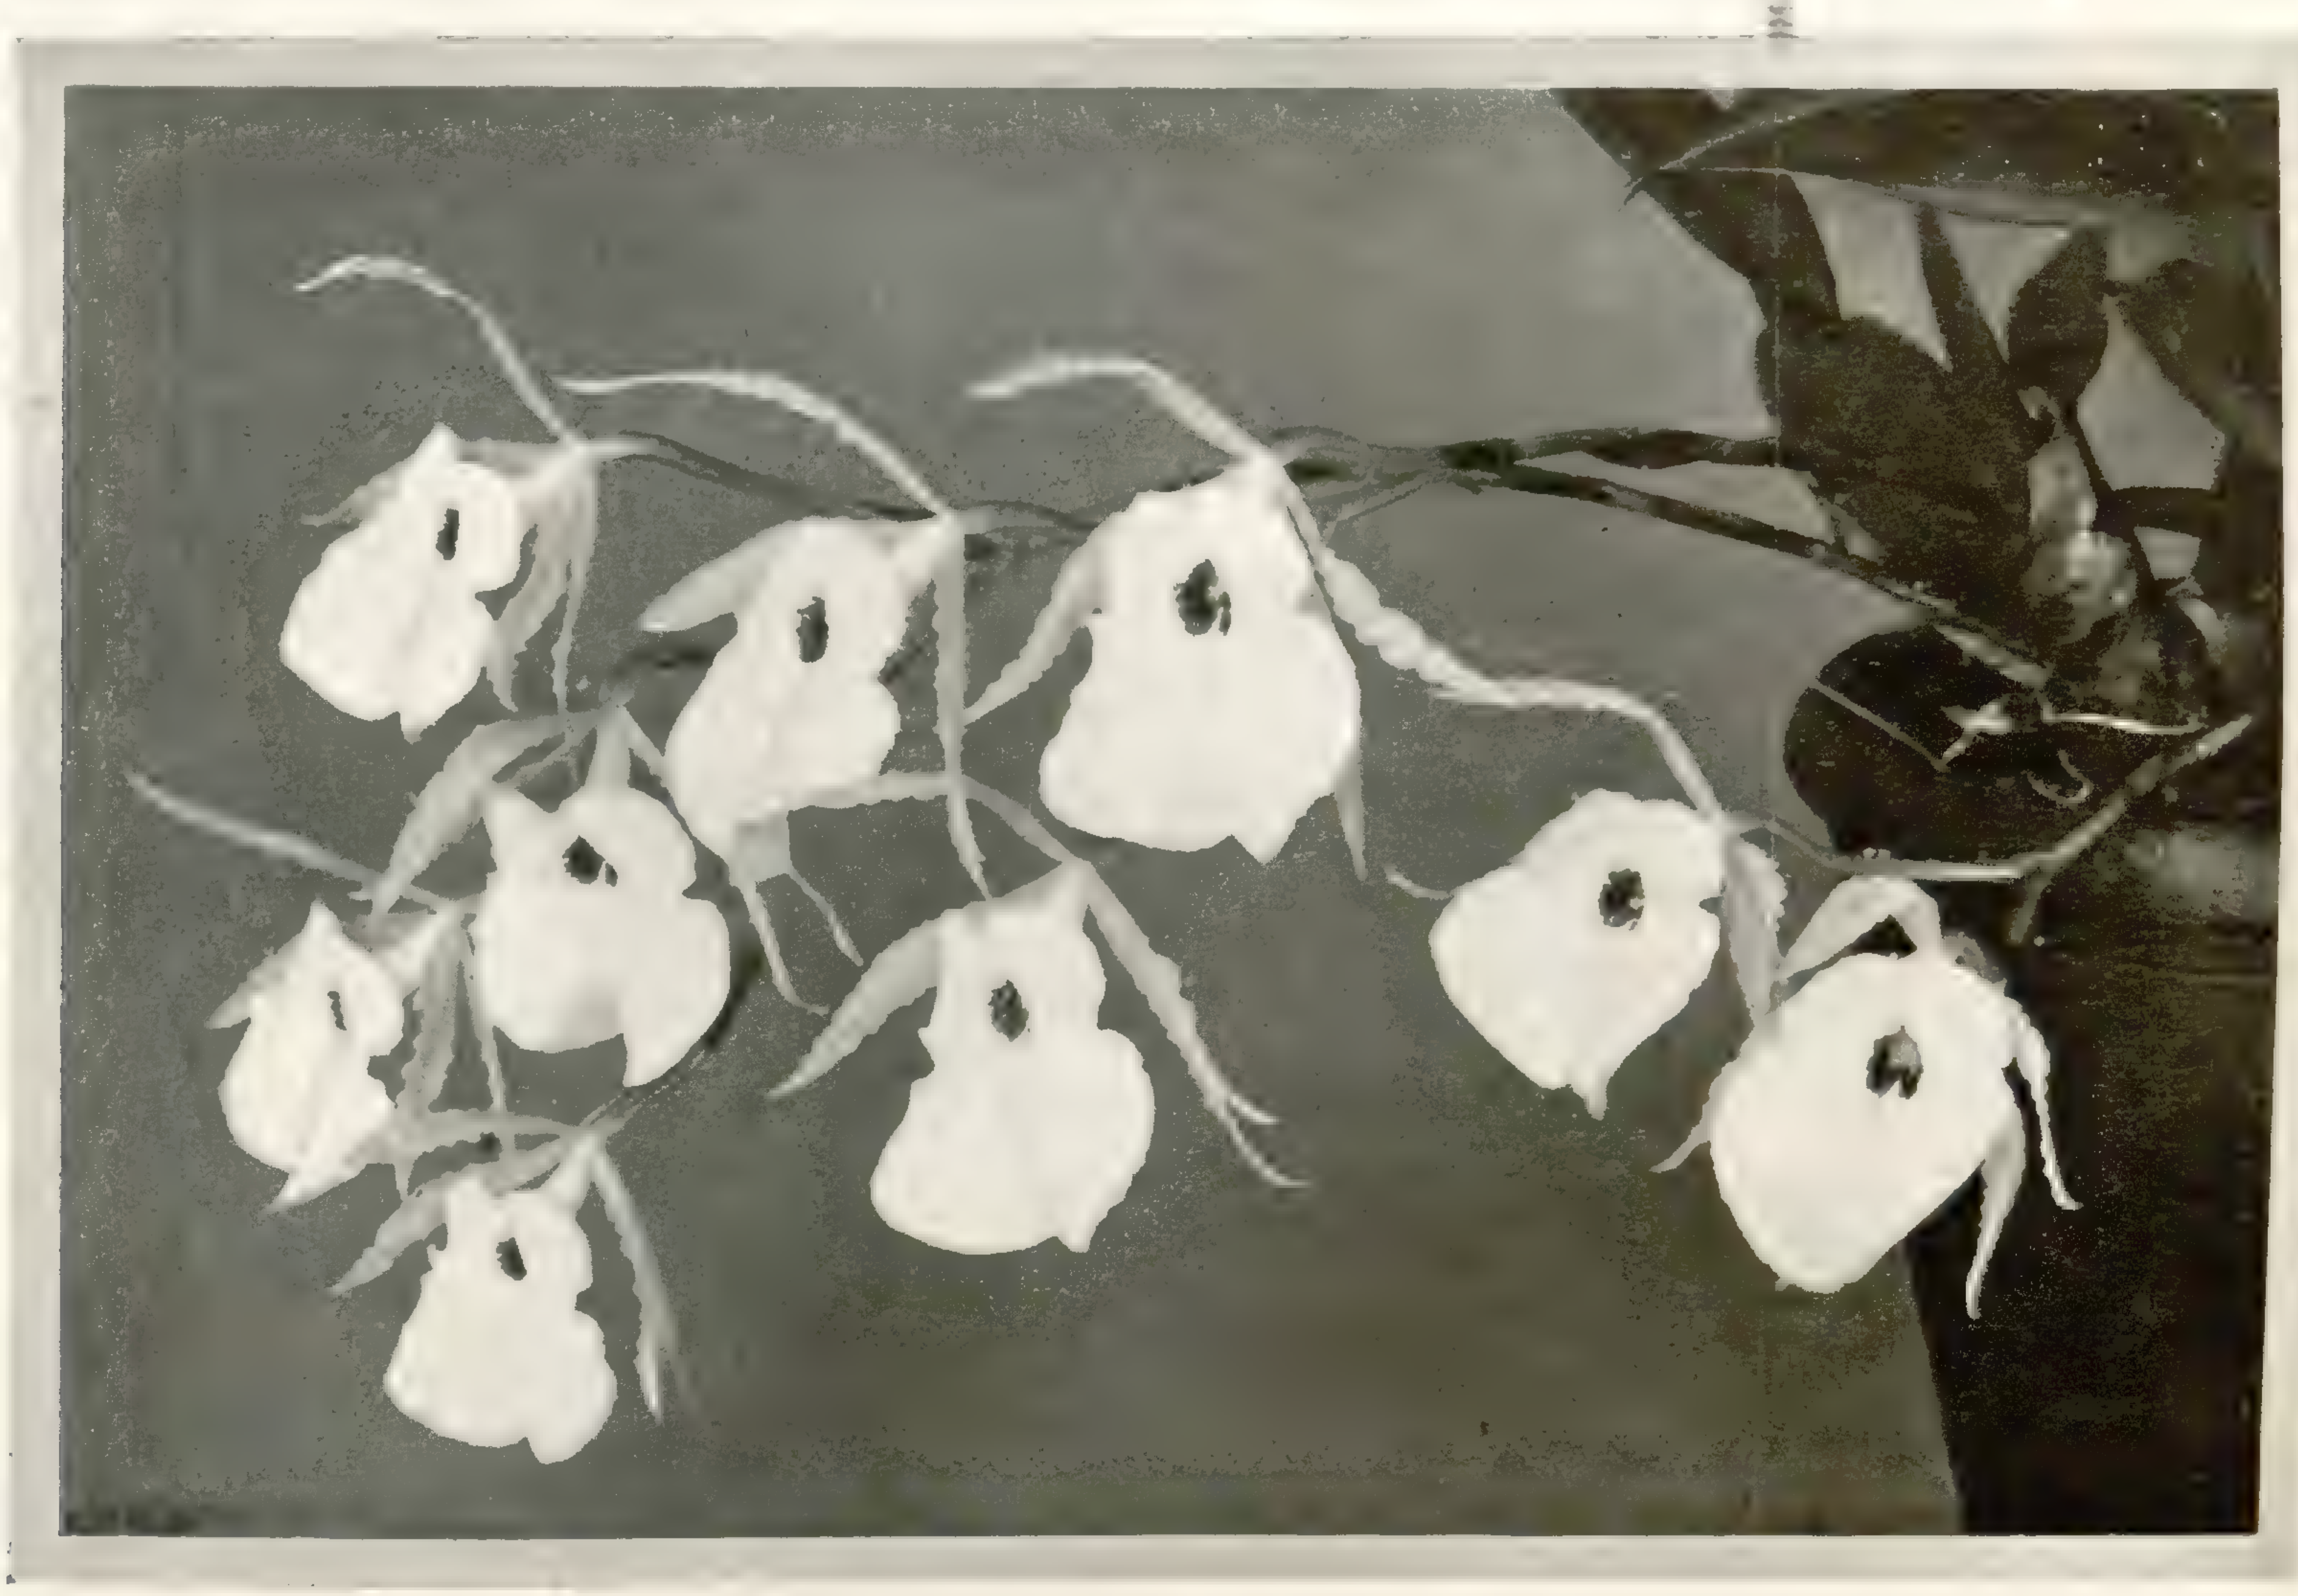
Messrs. Harkness and Son, Bedale, led for gaillardias, followed by Messrs. G. Gibson and Co. and Dr. D. F. Rambaut, Bicton. Mr. A. Brydon, Inverleithen, N.B., had the finest dozen spikes of gladioli; and Messrs. George Mair and Sons, Prestwick, N.B., had a superb set of twenty-four spikes, wherewith they won first prize in that class; in one

(Continued on page 631.)

NEW PLANTS, ETC.

TRICHOPILIA LEHMANNI.

A beautiful species belonging to the Pilumna section of the genus. The flowers are produced from three to four on a spike, and the sepals and petals are narrow, slightly undulate, and of a pale fawn colour; the large lip is pure white with orange-coloured blotch at the base. A.M., R.H.S., August 15. Sir Trevor Lawrence, Bart., Burford Lodge, Dorking (grower, Mr. W. H. White).



TRICHOPILIA LEHMANNI.
Flowers pure white and pale buff. A.M., R.H.S., August 15. Sir Trevor Lawrence, Bart.

DEINANTHE CÆRULEA.

An interesting and attractive species introduced from China by Mr. E. H. Wilson, who re-discovered it at Nant'o in Hupeh, where it grows in wet places on the cliffs. From some of the seeds then obtained plants were raised in the gardens of Colesborne, the residence of Mr. E. J. Elwes, V.M.H., where it first flowered in 1909. At Colesborne the plant makes the most satisfactory growth in a moist position on the north side of a wall. The leaves are ovate or elliptic, bifid at the tip, and the flowers, which have from six to eight petals, are bright blue. "Bot. Mag.," t 8,373.

CATTLEYA RHODA ILLUMINATA.

A remarkably handsome hybrid obtained from a cross effected between C. Hardyana and C. Iris. The flowers are of large size, the sepals and petals broad and of a rich orange suffused with rose, the lip is purple-crimson, with orange-coloured tube. F.C.C., R.H.S., August 15. Messrs. Charlesworth and Co., Haywards Heath.

RHODODENDRON LACTEUM.

A handsome species raised in the Jardin des Plantes from seeds sent from Western China to Paris by the late Abbé Delavay. It first flowered in Europe in the garden of Mr. P. L. de Vilmorin at Verrières-le-Buisson in 1908, and last year it bloomed in the gardens of South Lodge, Horsham, the residence of F. D. Godman, Esq. The flowers are campanulate, white with a large crimson blotch in the upper portion of the tube, and borne in large corymbs. It is regarded as about equal in hardiness to R. Falconeri, and R. grande. "Bot Mag.," t. 8,372.

GONGORA LEUCOCHILA.

A distinct and beautiful species producing its relatively large flowers in pendulous racemes; the sepals and petals are white and purple, and the lip white with chocolate-coloured blotch on each side. A.M., R.H.S., August 15. Messrs. Charlesworth and Co.

SOPHRO-LÆLIO-CATTLEYA GOODSONI.

A distinct hybrid with Sophro-Lælia Heatonensis and Lælio-Cattleya luminosa as its parents. The flowers are of medium size, the sepals rich rose-purple, and the lip crimson-purple. A.M., R.H.S., August 15. Mr. H. S. Goodson, Fairlawn, Putney (gardener, Mr. J. Day).

DROUGHT-RESISTING GARDEN PLANTS.

That a number of plants possess remarkable powers of endurance under adverse or exceptionally hot and dry conditions has been very clearly demonstrated this summer. Over the greater part of the country no rain worth speaking about has fallen since early in June, while the sun has shone brilliantly, and done his best to bring things to maturity at the earliest possible moment.

With reference to plants that have been subjected to identical conditions, and have received a very fair amount of artificial watering, we find that no inconsiderable number have suffered severely, and present a woebegone appearance, while others appear perfectly happy. In a fairly moist and cool season tuberous begonias are seen at their best, and geraniums are then obliged to take second place, but their behaviour this summer clearly demonstrates their inferiority under tropical conditions and long-continued drought. The improved scabious have led us to expect an uninterrupted display extending over two or three months, but their season of beauty has been a very short one, and, on the other hand, zinnias have grown and developed in luxuriant fashion, and appear just as happy as at the beginning of the drought.

And what a glorious display tropæolums have made, and, further, colonies in exposed situations, that have received no attention in the matter of watering, are in the zenith of their beauty and vigour. The same applies to verbenas, and with regard to fibrous begonias it is very clear that they are capable of coming through a severe drought unscathed. Under the most careful management violas have suffered severely, while fuchsias, that are now so extensively employed for garden decoration, are a partial success only. It is well worthy of note that Ballet Girl, Marinka, and Madame Corneilson have been a failure in town gardens, and the kinds that have given, and are still giving, a fairly good display are Lye's Own, Mrs. Marshall, Charming (this being certainly the best of all the brightly-coloured varieties), and Lord Beaconsfield.

The French marigolds are indifferent to drought and great heat, but the roasting has been too severe and prolonged for petunias, and, except where they have been deluged with water from time to time, both flowers and leaves have become very small. The perennial phloxes and spiræas are well known to be impatient of drought, and they have experienced a very trying time, more especially where the soil is of a light nature. Sweet peas were driven into flower prematurely, and I hardly think we shall hear of many ten and twelve feet high colonies this season.

Among shrubs rhododendrons and lilacs are the greatest sufferers, and in exposed situations, with little or no attention to artificial watering, they present a pitiable appearance.

Walter H. Aggett.

COTTAGE GARDENS AND VILLAGE SHOWS.

All gardeners have been hard hit by the drought this summer, and none more so than the cottagers and allotment holders who contribute to the hundred and one shows that are held in as many villages in the month of August. Evidence of the effects of the drought may be seen in certain bare spaces on the tables in the show tent, and the secretary's book containing a smaller number of entries than usual; and, considering the conditions, the wonder is that many local societies have been able to hold their annual show at all. But has any single village society failed to keep its annual engagement through lack of produce? I have never heard of a case, but more than once I have heard competent gardeners acting as judges marvel at the produce set out on the tables, and wonder where it has come from. The cottagers and allotment holders could answer the question, but it would take them a long time if they recounted the hours they have spent early in the morning and late in the evening, watering, tending, and watching, scheming and manipulating, in order to get a few things for the show.

They will admit that it has been a long, weary task fighting the drought, and it is a usual thing in the village during a season like this to anticipate the failure of the show. If you had called on any one of the little circle of exhibitors a few weeks before the event, they would one and all have told you that So and So would have it all his own way this year, as they would not have anything good enough to put in. But when a cottage gardener talks like that, you must not take him too seriously, because it is part of his nature to keep something up his sleeve, and on the show morning he turns up as usual, and if his vegetables are not quite up to the usual standard, they are good enough to do him credit, and to prove his capability for getting over difficulties.

With a Mark Tapley-like spirit, our enthusiastic cottager feels that there is some credit in showing in the usual classes in a season like this, and a short time ago a member of the labouring fraternity was bemoaning his unlucky fate because the peas which he had sown and timed to come in on show-day had reached maturity a week before the event. He hoped to save a few, however, and began scratching with his hands in the loose soil near to the pea row. As he moved the soil he brought to light, first a little bundle of pea haulm, then a slate covering a receptacle buried in the ground, and finally a pail containing a number of green, well-filled pods of peas. They were for the show. Did I think they would remain fresh? In other years he had kept them for a fortnight in the same way, and the only thing he feared was that they would get overheated. Evidently they did not, for I noticed on the day of the show that the name of our friend appeared as winner of first prize for green peas. Some of his neighbours were uncharitable enough to say that the man hadn't grown these peas, because his rows in common with the rest had dried out; but he preferred to let them think so rather than give away his method of keeping peas.

The village flower show is one of those homely institutions which never seems to change much, and yet it comes round every year with renewed freshness and interest. Anywhere else but in an English village it would probably have died out years ago; but here it is a tradition, something that belongs to the place and the people, and to let it go would reflect discredit on the fraternity. Morning and evening, from the early days of the spring, the keen spirits of the district are busy in their gardens preparing for that eventful day in August, and it is a relief to their wives when it is over, because the latter can then take their toll of the produce in the garden without fear or question.

Steadily the men go on, peeping at quiet moments over hedges and walls to view each other's operations, but not in a general way paying mutual visits; and if one man happens to get a good exhibition variety of any vegetable, he does not publish the name from the house-tops, but has a convenient way of forgetting it if any of his neighbours should ask him what it is. Without any commotion the white tent appears one day in the usual show field, a noisy traction engine announces the approach of the roundabouts and swing boats—for where would the amusement come in without the travelling showman who provides this side of the entertainment. On the morning of the event men and women hurry too and fro, some carrying, others wheeling the cleanly washed potatoes, etc., and the fresh-cut flowers upon which so much care has been bestowed. Unless the secretary happens to be a very orderly individual there is generally some confusion over the staging, but matters have a way of righting themselves, and the judges can generally begin their duties somewhere within an hour of the appointed time. We can pass over this part of the proceeding, and the next time you see the enthusiastic cottage exhibitor he is dressed in the suit he was married in, which is only worn, by the way, on high days and holidays, and with a thumbed schedule and half-inch stump of lead pencil, he is marking off his winnings as he works round the tables, stopping now and then to make a closer inspection when he doesn't quite see eye-to-eye with the judges.

This in a few words is the story of the village show, and as you look round the tables you must give the cottager credit for being a master hand at growing vegetables. He has improved considerably in recent years, for judges and lecturers have taught him that it is not the biggest but the best vegetables that are favoured at shows, and fortunately there are not so many judges nowadays who make it a point of duty to drop the prize cards on the biggest and coarsest vegetables if they happen to be in the cottagers' class. Speaking of this type of judge, it is curious how inconsistent they are, and I heard of one the other day who made a little mistake in the schedule, and gave first prizes to all the smallest potatoes in the cottagers' class, and to the largest in the division set apart for gentlemen's gardeners, which was, of course, quite opposite to his principles, and as he was judging alone, he couldn't put the blame on to his colleague. Needless to say, he hasn't heard the last of that little error yet.

One thing that annoys you at the village show is the way flowers are staged, and show committees should bring pressure to bear on cottage exhibitors to mend their ways here. The ugly show board is still an orthodox institution, year after year you see such things as twelve little carnations or zinnias dotted on the face of a board that was made for a dozen huge chrysanthemums, and even after all these years of showing, exhibitors stick to their old idea that such things as asters and carnations look all the better if they are exhibited with paper collars round their necks. It is time the advent of the sweet pea as an exhibition flower has done something to improve method of arrangement, and so far as I know, no one has ever yet insulted sweet peas by exhibiting them on an ugly show board. The example of the sweet pea, however, should be followed by other flowers; less crowding and cramming is desired, and if some enterprising local society would pass a resolution that all show boards should be chopped up, the appearance of the annual show would gain by the destruction.

Village shows in late years have been improved in interest and value by the introduction of industrial exhibits of an educational character. One sees collections of vegetables, grown by the boys in the garden at the village school, which is a step in the right direction, considering that we want these lads to be the adult exhibitors of the future; there are also useful articles in woodwork turned out from the school workshop, needlework and specimens of cookery shown by the girls, nature drawings, essays, and collections of specimens, all of which go to show parents and others that honest attempts are being made to give rural education that rural bias which has been wanting for so long. In many shows you see exhibits of wild flowers from the children, not the besom-like bundles of flowers as they used to be, but arranged with some taste, and in some instances you will find the common names of the flowers attached to the exhibits. This is as it should be, and in this way the flower show is made more and more an institution for the education of the rural community.

Inseparably associated with the show are the gardens and allotments where the produce is grown, and in not a few cases prizes are offered for the best kept plots. One gets a bit of humour sometimes in connection with these garden competitions, and one hot day in July, after I had inspected half a dozen plots in a hamlet which possesses only one water supply, and that not a very reliable one in dry weather, I was asked by an old woman who sat at the cottage door whether I was the "gentleman who was judging the gardens." On replying in the affirmative, she observed. "Thank the Lord for that; we shall p'raps get a drop o' water now. Bless you, they've bin sittin' up at nights takin' the drop o' water for their precious gardens, and in the mornin' there's bin none to boil the kettle with." These are the little incidents which crop up in connection with garden competitions; but when you look round plots in the pink of condition, profitably cropped, tidy, and in good order, where no weed is allowed to make its unwelcome appearance, you admit that every penny distributed in prize money in the best kept garden class is spent to good purpose.

H.

CLARKIAS AS POT PLANTS.

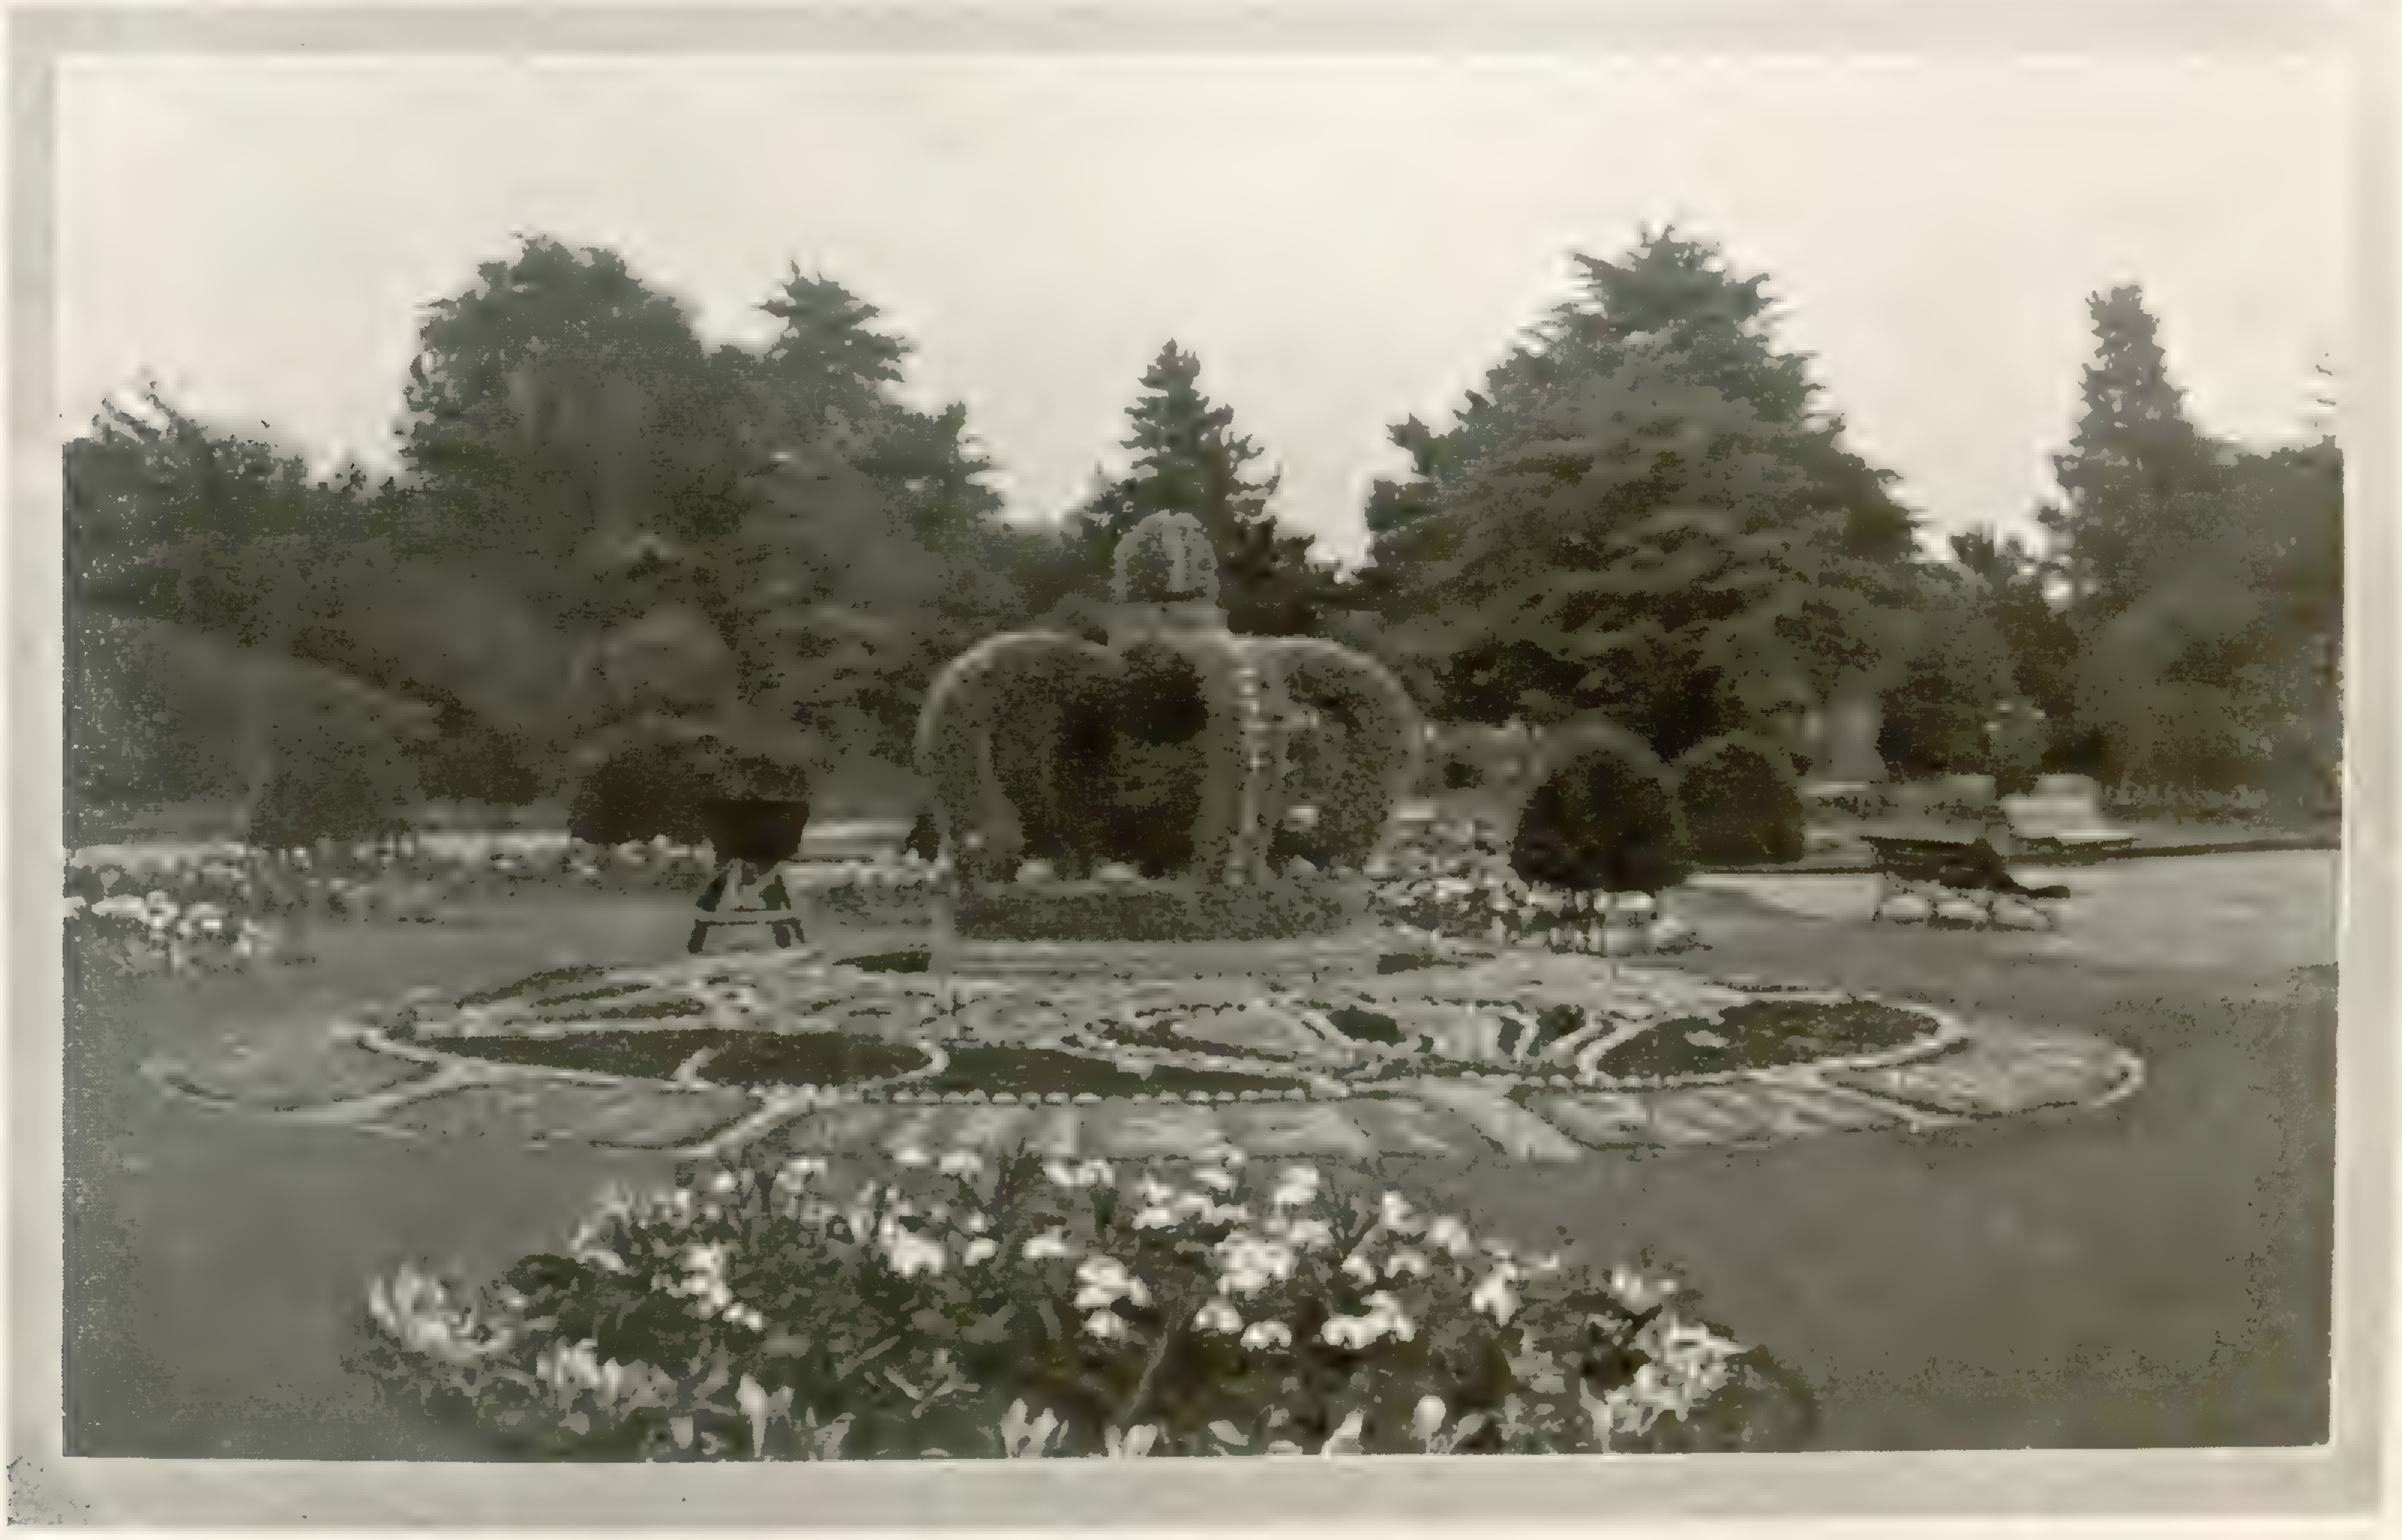
The clarkias are among our most charming hardy annuals, and when grown as pot plants for greenhouse decoration they are especially lovely. C. elegans Firefly is one of the best for this mode of culture, and from seeds sown at the present time well-furnished plants a yard high may be had in bloom during April and May. Sow in a shallow box or pan, and place in a cold frame to germinate, and when the seedlings are large enough prick them out separately into three-inch pots. They should be pinched when about three inches high, and again later, to form bushy plants. Pot them into 48's, in which size they will flower, using a light rich compost. Grow them on in a cool house during the winter months, and stake and tie as required. As the flowers develop weak doses of liquid manure will be beneficial. For conservatory decoration clarkias are found very useful, and used in a cut state for dinner-table decoration they look especially lovely.

J. Gardner.

THE CROWN FLOWER BED AT WOLVERHAMPTON.

One of the most important of the open spaces belonging to the Corporation of Wolverhampton is that known as West Park, wherein is held the great floral fêtes that have brought much fame to the town. This park has many attractions, and not the least important of these is the beautiful display of summer flowers that is annually produced for the enjoyment of visitors. This year this fine open space has been made additionally attractive by the creation of a flower bed expressive of the loyalty of the people of Wolverhampton. This bed, which is usually spoken of as the "Crown" bed, is so admirable in design and execution that there is no occasion for surprise that it should be regarded with much interest by visitors, or that it should have brought Mr. Water Felstead, the superintendent, much praise.

As will be readily seen from the accompanying illustration, this bed is circular in form, and of large size, and in the centre is an admirably executed crown standing six and a-half feet high. The skeleton was formed with iron bars and stout wire netting, but long since this has been hidden by the plants used. The principal lines of the crown are marked out with the well-known Mesembryanthemum cordifolium variegatum. This is dotted at intervals with Echeveria secunda glauca, which is intended to represent the pearls in the crown. The cushion is formed with the crimson-leaved Iresine Lindeni. The base of the crown is formed with the above-mentioned echeveria. Surrounding the central object is an elaborate and highly effective design in what is popularly known as carpet bedding, in which the Royal monogram, "G. R." is worked. The colours used in the design are blue, red, and yellow, and the plants chiefly employed are alternantheras, blue lobelia, and Golden Feather. Enclosing the design is a green band, in which is the legend, "God Bless Our King and Queen."



THE CROWN FLOWER BED IN THE WEST PARK, WOLVERHAMPTON.

MODERN STRAWBERRY CULTURE.

(Concluded from page 386.)

Rich loamy soils, or those commonly described as "fatty," are generally considered best for strawberries, but in the Hampshire strawberry growing districts one rarely comes across such soil conditions. There, the soil is very gravelly, and may consist of a sandy peat mixed with flints of various sizes. The greater portion of the subsoil is sand and gravel, but in some districts the gravel does not extend downwards to any appreciable depth. In contrast to such sandy soils, there are black, peaty, and waterlogged soils that have been quite easily adapted to strawberry growing. Considerable tracts of land in this district are covered with gorse, furze, and heather, and the greater portion of it is unsuitable for farming. The extension of the strawberry growing industry, however, has embraced many acres of these heath lands, and where the ground has been cleaned and broken up, and plantations made, there appears to be every sign of strong and healthy growth. Indeed, it is a somewhat remarkable fact that the gravelly soil around Southampton is fit for very little else except strawberry growing. That the value of the land round about is steadily increasing is not surprising, for farmers, small holders, market gardeners, and other prospective strawberry growers are making great inroads upon these unreclaimed heath lands. There is little doubt that where such light land lies in a fairly warm aspect it is almost ideal strawberry soil. The usual practice is to trench it two or three feet deep, and in this way splendid crops are produced for five or six years from the same plants. Of course, the deep cultivation assists this long fertility, for when the ground is prepared by the plough, or one spade deep, the ordinary useful life of the plant is only about three years. One drawback on light land is the unretentiveness of the soil, and deep cultivation is solely to be depended upon to remedy this drawback. Some people assert that heavy soil is more economical than light soil for strawberries, when one takes into consideration the durability of the plant and yield of fruit. There seems to be no objection to a clayey soil, provided the situation is warm, for such soil retains moisture, and never requires so much manure as land that quickly "dries out."

Strawberries display an immense amount of vigour on stiff soils, if provided with a limited quantity of dung, and little harm comes to them in such situations during a dry season. Before planting the usual practice is to give sometimes as much as 20 to 30 tons of London dung per acre, but frequently the plants are over-stimulated, with the result that the foliage develops at the expense of the fruit. Three or four tons of lime per acre, and 7½cwt. of superphosphate (where 30 tons of manure have been used), the latter applied in February, will invariably prove beneficial. Whether or not the softness of flesh and coarseness of flavour which are so characteristic of some crops are due to over-manuring, is a question to be solved by the grower himself. Naturally there is every inducement to provide the plant with as much nourishment as possible during the first three or four years, for it is particularly difficult to maintain the fertility of the strawberry bed by subsequent manuring. An alternate practice is, of course, to reduce the amount of London dung, supplementing it with a dressing of suitable "artificials." Nitrogen will be supplied in abundant proportions by the dung, and nitrate of soda or sulphate of ammonia will be simply wasted on the crop. Phosphates and potash, however, are particularly necessary, and valuable in the form of superphosphate or sulphate of potash. Strawy manure is sometimes used as bedding for the plants, and is placed on the ground in early spring so as to allow the rains to wash the straw before the fruits appear. It is not advisable, however, to adopt this method of bedding in a moist season, for the growth of weeds and oats which result from the seeds in the manure will ruin the crop. The best material for bedding strawberries is clean, baled barley straw; oat straw is sometimes used in cases of need, but it is liable to stain the fruit badly in a wet season

Strawberry crops are assailed by numerous different species of insect and fungoid diseases. Wireworm plays havoc amongst the plants on freshly-cleared ground, and the dreaded eelworm has also to be reckoned with. The ground beetles make nocturnal ravages amongst the strawberries, and both the fruit and the leaves are a prey to slugs and snails. The green rose chafer, both in the grub and beetle stage, is also particularly destructive. Of fungoid diseases the worst that has been experienced during recent years is Botrytis cinerea. This is a very dangerous disease, and every care should be taken to check it early, as the results are likely to be disastrous. It has been surmised that the fungus spores come through the medium of badly-prepared manure. The latter must be worked up into a good compost in order to avoid trouble of this kind. Another injurious fungus attacking strawberry plants is Sphærella fragariæ, known in this country as strawberry leaf spot. This fungus attacks the leaves, and forms small reddish-brown spots which often encroach on each other and form irregular patches. Later in the season these patches become bright red, which has caused it to be known as "bird's-eye spot" in some parts of the country. The variety Royal Sovereign is particularly susceptible to this disease, and the crop may be seriously reduced and the plants weakened for the following season. Some growers combat the fungus by mowing the beds soon after the fruit has been gathered, and burning some straw or dry litter over them. Others recommend spraying with potassium sulphide one ounce to three gallons of water, when the leaves are quite young. This should be continued at intervals until the flowers commence to open. The "cauliflower" disease of strawberries is caused by a species of eelworm, Aphelenchus fragariæ. Plants so affected should be removed immediately and burnt so as to prevent the spread of the disease, and an effective preventive is said to be one cwt. of sulphate of potash per acre.

J. C. N.

AMONG THE ALPINE FLOWERS.

Some day perhaps a poet will arise who will do for the alpine flowers what so many have done for the lily and the rose, and for the other favourite flowers of long ago and of the present. A few have depicted the beauties of a small number of our favourites, but the great poets have left them "unhonoured and unsung." And thus it is left for the poor scribes who love these flowers, but who cannot put into fitting language an impression of their beauties, to speak of them in their own halting way.

PELARGONIUM BLANDFORDIANUM.
Greyish-green leaves and pink flowers.

Thus do we think, as we wander among our flowers in these August days. True, they are not so bright and happy as they are wont to be. We generally have reason to grumble that Jupiter Pluvius has too much dominion over us in dear old Britain, but this season Phæton would seem to have seized the car of his father Helios, and to be threatening the garden with fire. We have been more fortunate than many in the way of rain, but as this is written it has passed away, and the flowers are again suffering from the intense heat and the absence of moisture. A considerable number we are wont to have at this time have vanished for the season, and others are evidently unable, or unwilling, to open their blossoms. We are thus without some of our usual flowers; while plants which are wont to be mounds of verdure seem unhappy, and unfit to please our eyes with their wonted greenery.

Yet we are not without something to cheer us, and to grant us compensation for the absence of many treasures.

Potentilla Tonguei.

Among the plants which are not now too plentiful is the pretty alpine potentilla called P. Tonguei. Some may possibly cavil at us calling it an "alpine potentilla," seeing that it is not a natural wilding, but that it is the product of the hybridiser's skill. Yet it is alpine in its genius, and is as much entitled to the term as are any of those garden varieties of well-known flowers of the high mountains. So far as regards its aspect it is a true alpine, as we use the word in our gardens. As we see it in the rock garden, with its neat leaves and its rather trailing stems, yielding freely the pretty apricot - coloured or coppery - coloured flowers, we recognise its beauty, and wonder why it seems going out of cultivation. It is growing on a low flat terrace of one of my rockeries, and for a long time has given, and will continue to afford us its pretty flowers. There can be no doubt of its hardiness, and it is not difficult to cultivate. At the same time I think it is a little unhappy in this unusually dry season, and that it would welcome a place where it would obtain more moisture at the roots than it usually receives. I have so far been content to follow the practice of an old grower of alpines, in whose garden I met it for the first time—how many years ago I am somewhat afraid to tell, seeing that it would make one think sadly of the lapse of time, and its serious lessons. But the experience of this season leads one to think that Potentilla Tonguei would relish a little more moisture in an average season.

Oxalis rosea.

Undeniably happy, however, in this torrid time, is the little Oxalis rosea, one of the few really hardy wood sorrels from South America, and it is a pleasure to see it daily opening its deep rose flowers, with perhaps a tinge of magenta about the hue, to the ardent approaches of the luminary it loves so well. It is a poor wet or dull-weather plant, just as it is of little value as a bloomer after the sun leaves it for the day. But even then it is interesting to study the wonderful "packing" of the petals, and the manner in which they are disposed for the time, to await the sun's return once more. We are surprised at the marvellous way in which many of our flowers are packed in the buds, but it is, I think, more wonderful still, to see this shown in the case of a flower which closes at least once a day, and may open and shut several times, as the sun becomes obscured and a passing shower falls on the blooms, and to observe how these open again without apparent loss of energy. There is no doubt that this oxalis revels in sun and heat, and it is a pleasure to see it happy and flourishing as it opens to our eyes daily.

Oxalis corniculata.

The dark-leaved wood sorrel, known as Oxalis corniculata rubra, is another dry weather plant, and it has become somewhat of a weed in many places, although it is useful as a summer carpeter of some of the smaller bulbs. Curiously enough, however, the green-leaved form, O. corniculata, itself, is not much seen, yet it is, I think, prettier than the other. It is understood to be an annual, but I find that it often survives the winter in dry places, and makes nice masses of considerable beauty, the fresh green, small, prettily shaped leaves looking always well even without the dainty little stars of gold which spangle this verdant carpet. I have been trying it between the stones of the little rough steps leading through one part of my rock garden, and there it looks very pretty indeed.

Erodium trichomanefolium.

The trichomanes-leaved heron's bill is a very lovely plant for the rock garden, and one also which seems to delight in a dry season—a sign that it is suitable for a part of the rock garden where moisture is generally at a premium. At the present time it would be difficult to find any moisture about the roots of a specimen growing here among sandstone rubbish, grit, and poor loam, yet it is flourishing, and still flowering, although its zenith time of bloom is over now. It has flowered from June onwards, and through all the drought it has thriven and looked as if it were enjoying it. Not a drop of water has been supplied artificially, and it is even now bearing a good number of its pretty flesh-coloured flowers, with darker lines, above its charmingly cut and finely divided foliage. It is a native of Mount Lebanon, I understand, and, like a goodly number of plants which hail from there, it seems to take a pleasure in a dry and sunny summer.

Other Flowers.

Other flowers there are, such as different species of erodiums, with some of the allied geraniums; a few other hardy oxalises, including, by the way, the annual self-sowing Oxalis valdiviana; and a sprinkling of other things, such as helianthemums, violas, the first of the meadow saffrons, a few campanulas, comprising, among others, C. excisa, a dainty thing indeed. There is a second bloom on Saponaria ocymoides. The autumn heaths are delightful as ever, and give us a perennial delight. Silene Schaftæ is bright, as of yore. The blue flowers of Linum alpinum look cool and refreshing on their dainty foliage. Then some gypsophilas yet trail over the stones, a few veronicas afford us pretty flowers, the quaint Origanum hybridum is revelling in the dry and bright weather, golden St. John's worts, or hypericums, give their gay flowers, and the blue spikes of Horminium pyrenaicum help the supply of bloom, although they do not claim to be among the élite of our alpine flowers.

Geums, potentillas, Iceland and alpine poppies, a few dwarf late alliums, and some other plants, show us that, late as has become the season for alpine flowers, and trying as has been the time for many, there are yet some which defy the elements to give us pleasure. S. Arnott.

DAFFODILS IN THE GRASS.

When once established daffodils do remarkably well in grass land, both in dry and moist positions. For a number of years I had considerable experience of these bulbs in such quarters, watching those already established, and planting and treating others. In low-lying places, where there is much natural moisture in winter time, it is advisable to put in the bulbs as early as possible, so that they may make some roots before the surrounding soil becomes very moist. I have found that bulbs so treated generally bear extra large flowers and leaves, and if the position is at all shaded the flowering period is rather late, thus prolonging the season when there are bulbs growing also in drier and more exposed borders. It is very important, however, that the bulbs be given a good start as regards soil. If the latter is naturally poor some fresh must be added to it. Organic manure is not required, but sweet fibrous loam and leaf-soil. Mix the ingredients some time before they are required for use, and then allot to each clump of bulbs a good spadeful at planting time. This assistance to the bulbs will be well repaid. G. B.

CAPE AND SCENTED PELARGONIUMS.

Though these plants are by no means of recent introduction, they have during the past few years become popular, and, in my opinion, deservedly so. The large majority of them are very interesting, varying very much in habit, perfume, and foliage. They may be successfully cultivated even by the most humble of our populace, many thriving splendidly in a cottage window, thus they are equally valuable to the amateur, who possesses only a small greenhouse, or to the more wealthy owner of a large amount of glass.

PELARGONIUM CORDATUM.

A variable species, with heart-shaped leaves, and, usually, pink flowers. Also known as P. betulæfolium.

Grown as large specimen plants for the embellishment of the flower garden and terrace in summer, as has been so amply demonstrated by the magnificent specimens often brought before the public by that capable gardener, Mr. J. Hudson, V.M.H., of Gunnersbury House, Acton, they are splendid. Numbers of these grand specimens are many years old, and they probably constitute the finest in the country.

A collection of smaller plants, when a house can be devoted to them, always attract much attention, and are exceedingly beautiful. For bedding purposes they are equally well suited, and unless I am much mistaken, they will in the near future be more largely employed for this purpose than hitherto. For cutting and association with cut flowers, many of them are invaluable at all seasons of the year. Though several only produce quite insignificant flowers, others have flowers that are extremely beautiful, both in the arrangement in the truss, and in the colour.

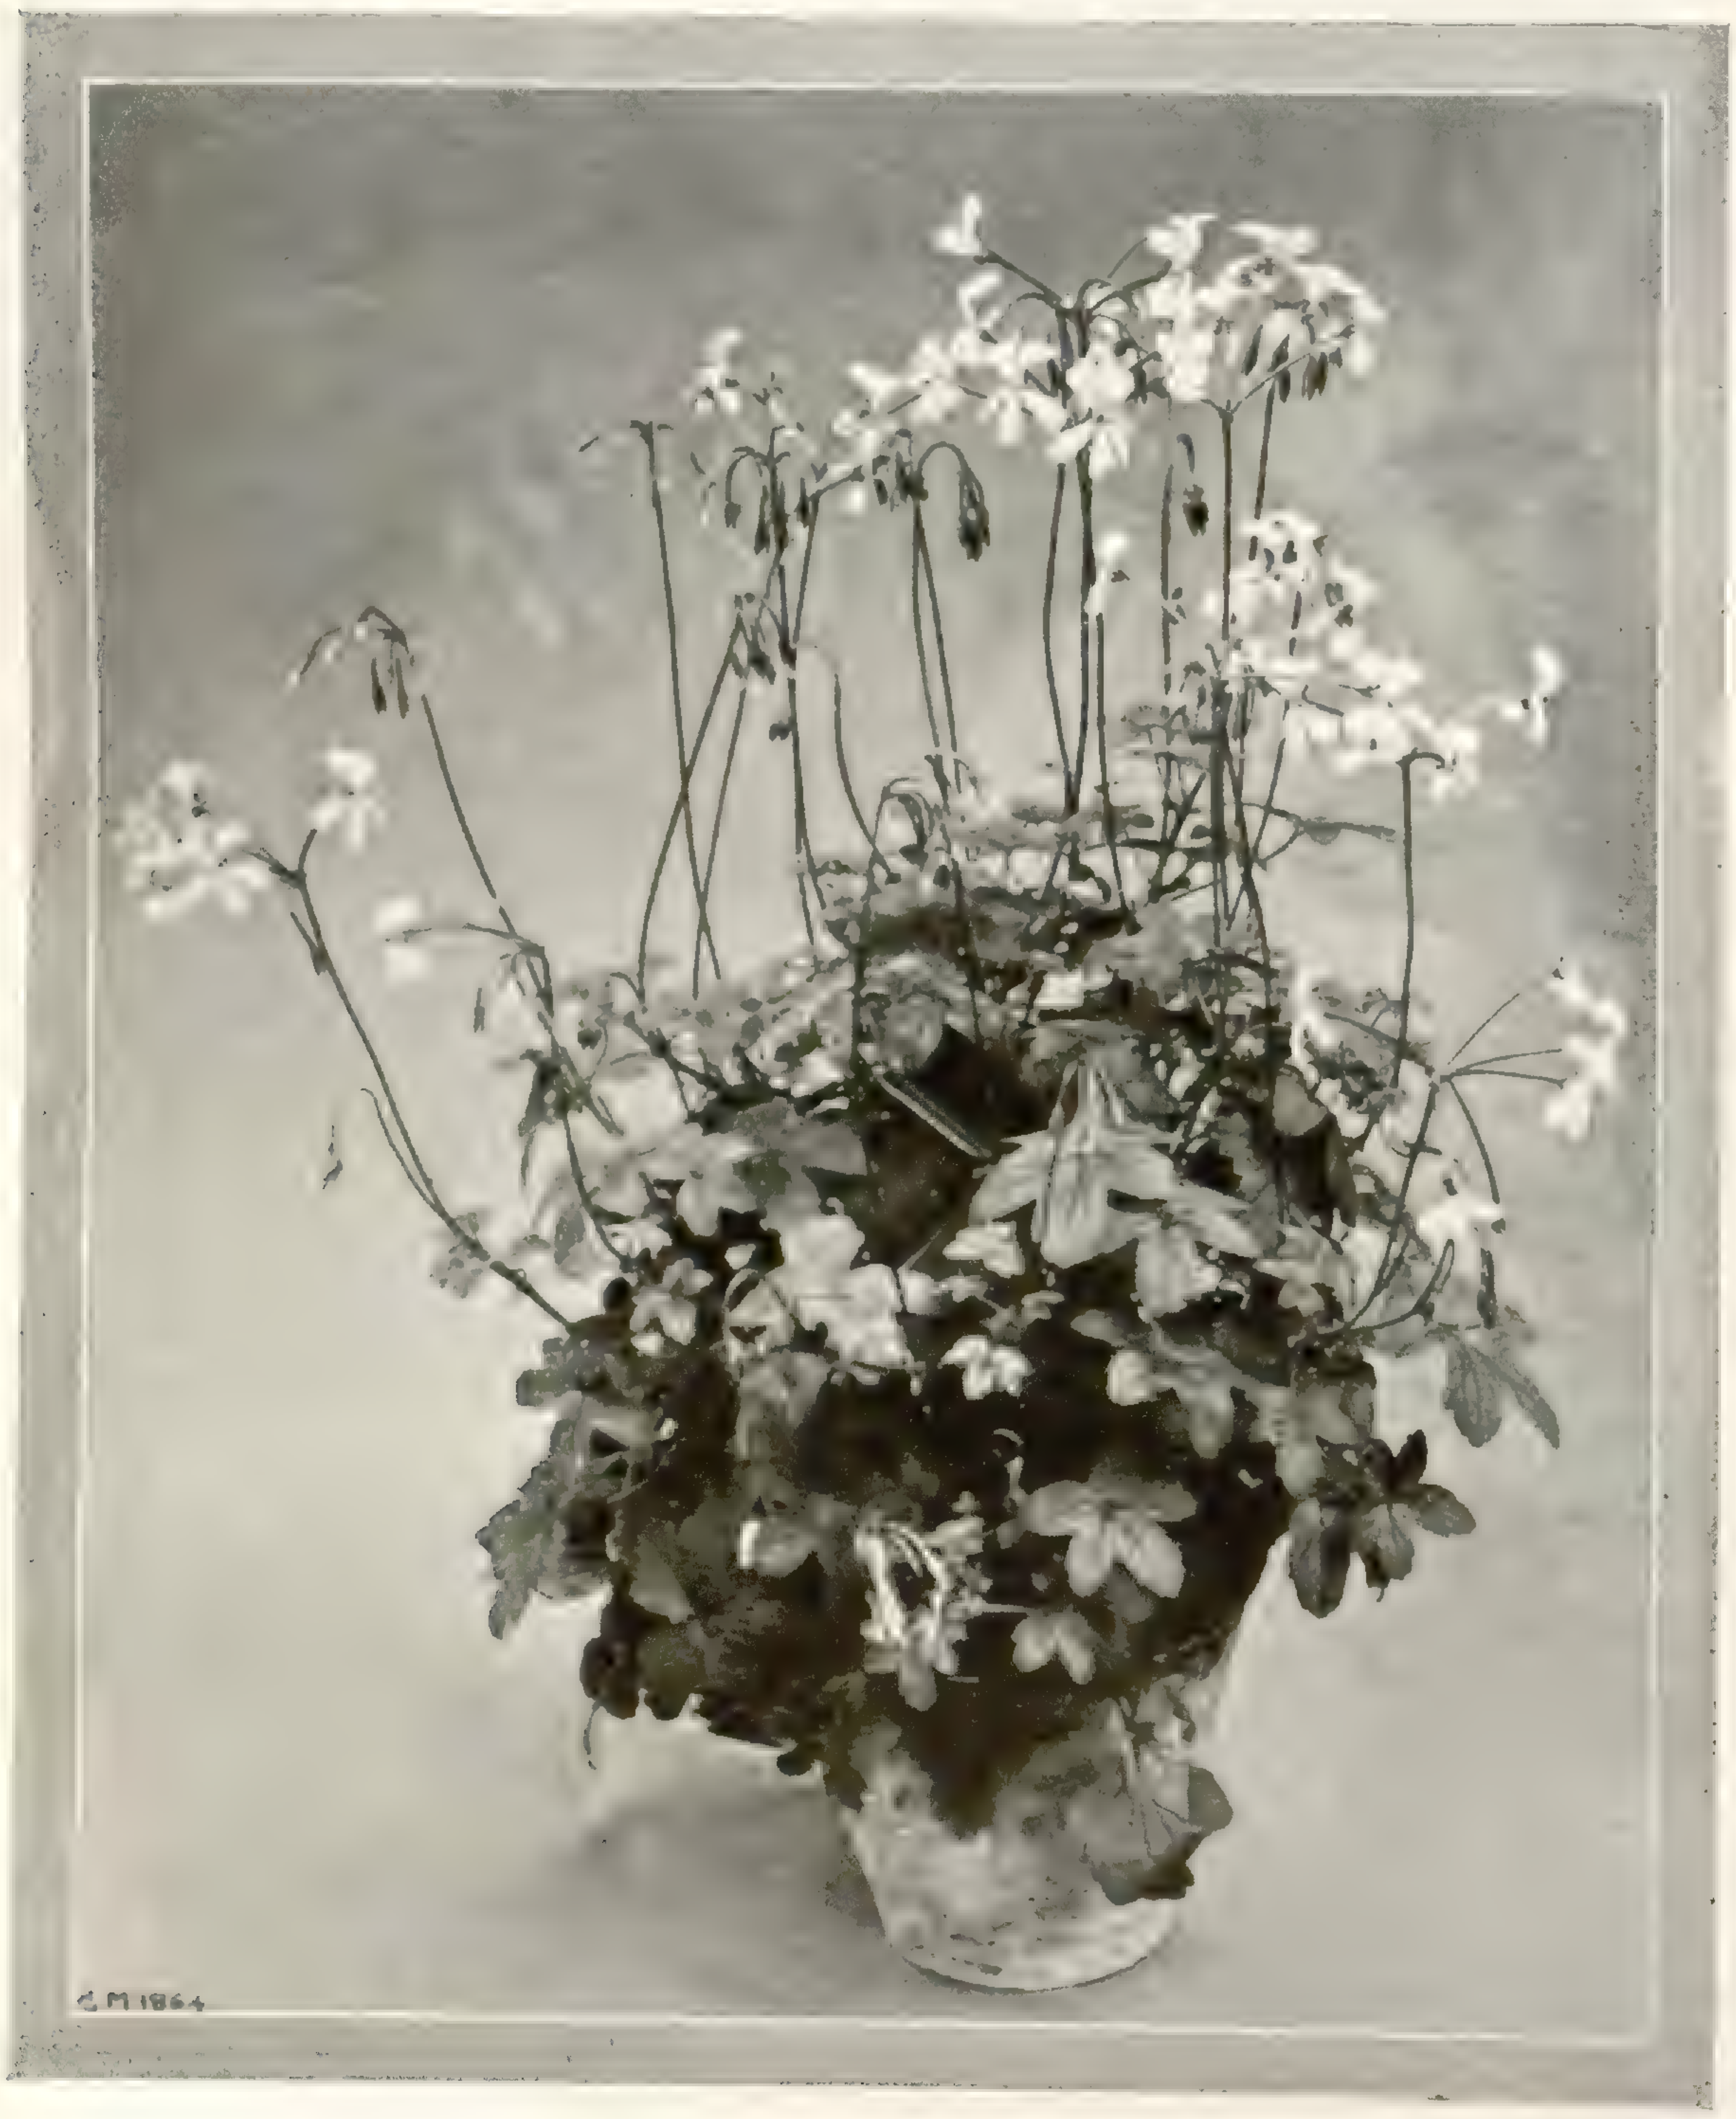
About four years since we commenced to form a collection here, and I am deeply indebted to many kind friends who have been good enough to assist me in getting together about ninety species and varieties.

The culture of Cape pelargoniums is generally most simple, but a few of the most beautiful have not a very robust constitution, consequently more care has to be bestowed on these in the way of drainage, potting, and watering. The latter carelessly done, frequently means the death of the plants. Perhaps the most important point to observe is the cleanliness of the foliage, the most troublesome pest being green aphis, but this is easily combated by frequent fumigation.

Since we exhibited our collection at the Royal Horticultural Society's meeting on July 18, I have received many congratulations, and I have also had numerous enquiries as to culture and the names of some of the more beautiful. For the benefit of those who intend taking up Cape pelargoniums I will deal briefly with what I consider to be their right mode of culture, and give a list of those I think the more beautiful sorts to the readers of the Gardeners' Magazine. Unfortunately many species and varieties bear several titles, which are practically synonymous, and I have taken a great deal of pains to ascertain as far as possible the correctness of those I use.

Now is a splendid time to make a beginning. Cuttings should be inserted in a good sandy compost, in small pots, well drained. These should be put in firmly, thoroughly watered, and rooted in the open, or, better still, in a cold shallow frame, where the light can be placed over them in case of heavy rains, removing them to a quite cool greenhouse about the end of September. They must be potted in the spring, and grown in a light position in a greenhouse temperature, and potted as required, when, by July or August, they will have developed into interesting plants.

Unless very large specimens are required, the plants should be cut back annually during the autumn, water being withheld somewhat—though the soil must not be allowed to become dust-dry—and syringe twice daily. After the plants have nicely broken they should be turned out, have the old soil shaken away, the roots trimmed back, and be then repotted into the smallest pots possible. Always make sure the pots are well drained. A suitable compost consists of three parts good fibrous loam, and one part each of well-decayed leaf-mould and cow manure, with a liberal supply of coarse silver sand



PELARGONIUM MULTIBRACTA.

Handsome dark-marked foliage, and white flowers carried on tall stems.

During the spring, after active growth has commenced, the plants should be shifted into larger pots; and after these become well filled with roots liquid manure may be liberally given, nothing being more suitable than that made from horse and cow droppings with a little soot added, and properly diluted. At all seasons of the year allow a free circulation of air, and place the plants as near to the light as possible. As previously stated, frequent fumigations must be given, or the growths will be severely disfigured and much of their beauty lost.

P. tetragonum is perhaps the most distinct, and its growth suggests that of a succulent plant, the stems being almost devoid of leaves, upright, and quadrangular. The flowers are of medium size. P. saxifragoides is a miniature-leaved species, well named, and the plant naturally assumes a trailing habit. P. tomentosum is an old favourite, both leaves and stalks being densely tomentose; its very strong scent resembles peppermint.

P. cordatum, as the name implies, has medium sized foliage, distinctly heart-shaped; also known as P. betulæfolium. P. Blandfordianum is a good grower, with very distinct leaves of a greyish colour, and small pink flowers. P. terebentha is a free grower, and one of the earliest to flower; it has small foliage, dense growth, and a peculiarly distinct aroma. P. radula has elegant foliage, and the var. minor has finely cut fern-like foliage. P. diadematum has very pretty flowers, rosy-pink, delicately suffused.

P. echinatum has very distinct thorny stems, and elegant trusses of flower, prettily marked, and borne on long stems. P. artemisioides resembles the well-known artemisia in foliage and scent. P. grossularioides variegata makes a pretty plant, being compact and bushy. P. Lady Plymouth is one that ought to be included in every collection, as it has finely variegated foliage and pleasant perfume. P. crispum maximum has erect growth and small foliage. P. Attar of Roses we consider the finest scented pelargonium we have. P. Stagshorn has large leaves, often nine inches across, deeply palmate. P. Clorinda is wonderfully free flowering, and a conspicuous plant.

Other kinds include P. Prince of Orange, and the variegated form (quite one of the best); P. ardens, and P. ardens major, P. capitatum, and P. cuculeatum (good in flower); P. pinnatum, P. Miss White, P. Endsleigh, P. Fair Rosamond, P. Major Clarke, free in growth, and with flowers of medium size; P. Lothario, P. Purple Unique, vigorous habit and fine in flower; P. Rollisson's Unique, with bright scarlet flowers; P. Moore's Victor, with scarlet flowers, not very large, but effective; P. Lady Mary, very pretty in flower, and of good bushy growth; P. Mrs. Kingsbury, with distinct dark foliage, and flowers that are very conspicuous; P. multibracta, a distinct plant, both in flower and foliage; P. Shrubland Pet, P. mollis, P. Kimberley, P. Little Gem, P. Clyne Seedling, P. Mrs. Jenkins, P. loundifolium, P. Pretty Polly, P. Fair Ellen, P. Paddy, P. aspera, and P. jatrophæfolium.

E. Beckett.

MARGUERITE CARNATIONS.

A nice batch of Marguerite carnations is very quickly raised from seeds, and where cut flowers are in great demand the cultivator cannot do better than secure one batch in the open border and another in pots. When I first commenced to grow Marguerite carnations seeds were procured from several reliable firms, but the percentage of double flowers was very low; the single ones, however, amply repaid me for my trouble. Of late years the strains have been much improved, and at the present time one can easily obtain a high percentage of double flowers.

A large nurseryman in the North of England once showed me a grand lot of pot plants placed in a house in September. They were beginning to flower freely, and were expected to do so during the early part of winter. He favoured pot culture throughout in the case of plants required for flowering under glass in the autumn. I followed the system, and also preferred it to the lifting of the plants from the borders. Specimens for this purpose need not be raised as early in the year as those required for blossoming in the open borders.

A friend of mine in Lancashire annually raised a large stock for supplying cut flowers from September to Christmas. He cultivated his plants in beds in frames, which he could deepen as required; boards were fixed on the top of the frames after the end of September, the lights put on when necessary, and the frosts and cold winds excluded. I never saw as much blossom produced in a similar space before, nor since. It was a wonderfully successful plan. If he had had hot-water pipes in the frame he could have made certain of flowers until February.

In cool, sunless summers I have found it a good plan to plunge plants in pots in flower beds instead of turning them out of the pots. They commence to bloom earlier, and all the best buds have developed before the end of the summer bedding season.

Several distinct colours may be obtained and devoted to separate beds, but the mixed colours are the most interesting and useful, where they are being grown for a supply of cut flowers. Geo. Garner.

FRUIT BOTTLING FOR SMALL HOLDERS.

The following instructions for the preservation of fruit by the process known as bottling have been issued by the Board of Agriculture for the guidance of small holders; but as they will be equally useful to all who are desirous of bottling fruit for use when ripe fruit is not available, we reproduce them with the hope that they will prove useful to many of our readers:

Among the industries to which the small holder should direct his attention fruit bottling is worthy of wider consideration than it at present receives. This method of preserving fruit is quite distinct from jam-making, and is more simply carried out.

It enables the grower to make the utmost use of all fruit which reaches maturity, for in a year of abundant crops all surplus fruit, and in any year fruit which cannot be sold at a fair price or consumed, can be preserved for future home requirements or for sale during the months when fresh fruit is unobtainable. Bottled fruit, properly preserved, is a wholesome and valuable food, which finds a ready and profitable sale.

There are probably two reasons why fruit bottling is not yet so common as it deserves to be:—(1) the process is considered to be difficult; and (2) there is a general impression that a special and costly sterilising apparatus is absolutely necessary.

With regard to the first point it is only necessary to say that few tasks could be more simple or easy to perform than fruit bottling, which requires only the care and attention of an ordinarily intelligent person. As to the second point, a patent steriliser is not necessary where only small lots of fruit are to be bottled, a large saucepan, boiler, fish-kettle, or similar vessel for heating water alone being requisite. When, however, the small holder finds that he can profitably dispose of a fairly considerable quantity of bottled fruit, a larger type of boiler holding one or two dozen bottles, or a small sterilising outfit, may usefully be employed. A few shillings will purchase a suitable flat-bottomed iron pot to hold several bottles, while a small steriliser holding about a dozen bottles for use with an oil or gas stove or a kitchen fire may cost £1 5s. to £3 3s. If it be desired to preserve several hundred bottles of fruit in one season it may be worth while to invest in a steam steriliser holding three or four dozen bottles, or even more.

THE OBJECT OF STERILISING OR "PRESERVING."

When it is desired to keep fruit until the fresh article is not available, some means is necessary which will arrest the ordinary processes of decay or "rotting" induced by a variety of low forms of life—bacteria, yeasts, fungi, and possibly even minute larvæ of insects. The most convenient plan is to employ heat to destroy such agents of decay as are present, and prevent the subsequent access of others to the fruit by enclosing it in hermetically sealed or perfectly air-tight vessels. This accomplished, practically in one operation, fruit will remain sound and good for a considerable period, even several years. The desired result is usually attained by placing the fruit in glass bottles having air-tight caps, subjecting the whole for a certain time to a given temperature by means of water or steam, and closing the bottles while still surrounded by steam.

BOTTLES.

Wide-mouthed bottles specially made for the purpose may be obtained through almost any ironmonger at from 3s. to 6s. 6d. per dozen complete, the price varying with the size and quality of the bottles. Many persons have a decided preference for bottles with glass tops instead of metal tops, and some like the "screw" tops; whilst others prefer the bottles whose tops, covers, or discs are held in position by "spring" clips. When counting the cost of the process of bottling it is well to remember that the same bottles, when once obtained, may be used repeatedly until broken; the chief renewals required are rubber rings, which are used with bottles for rendering them air-tight.

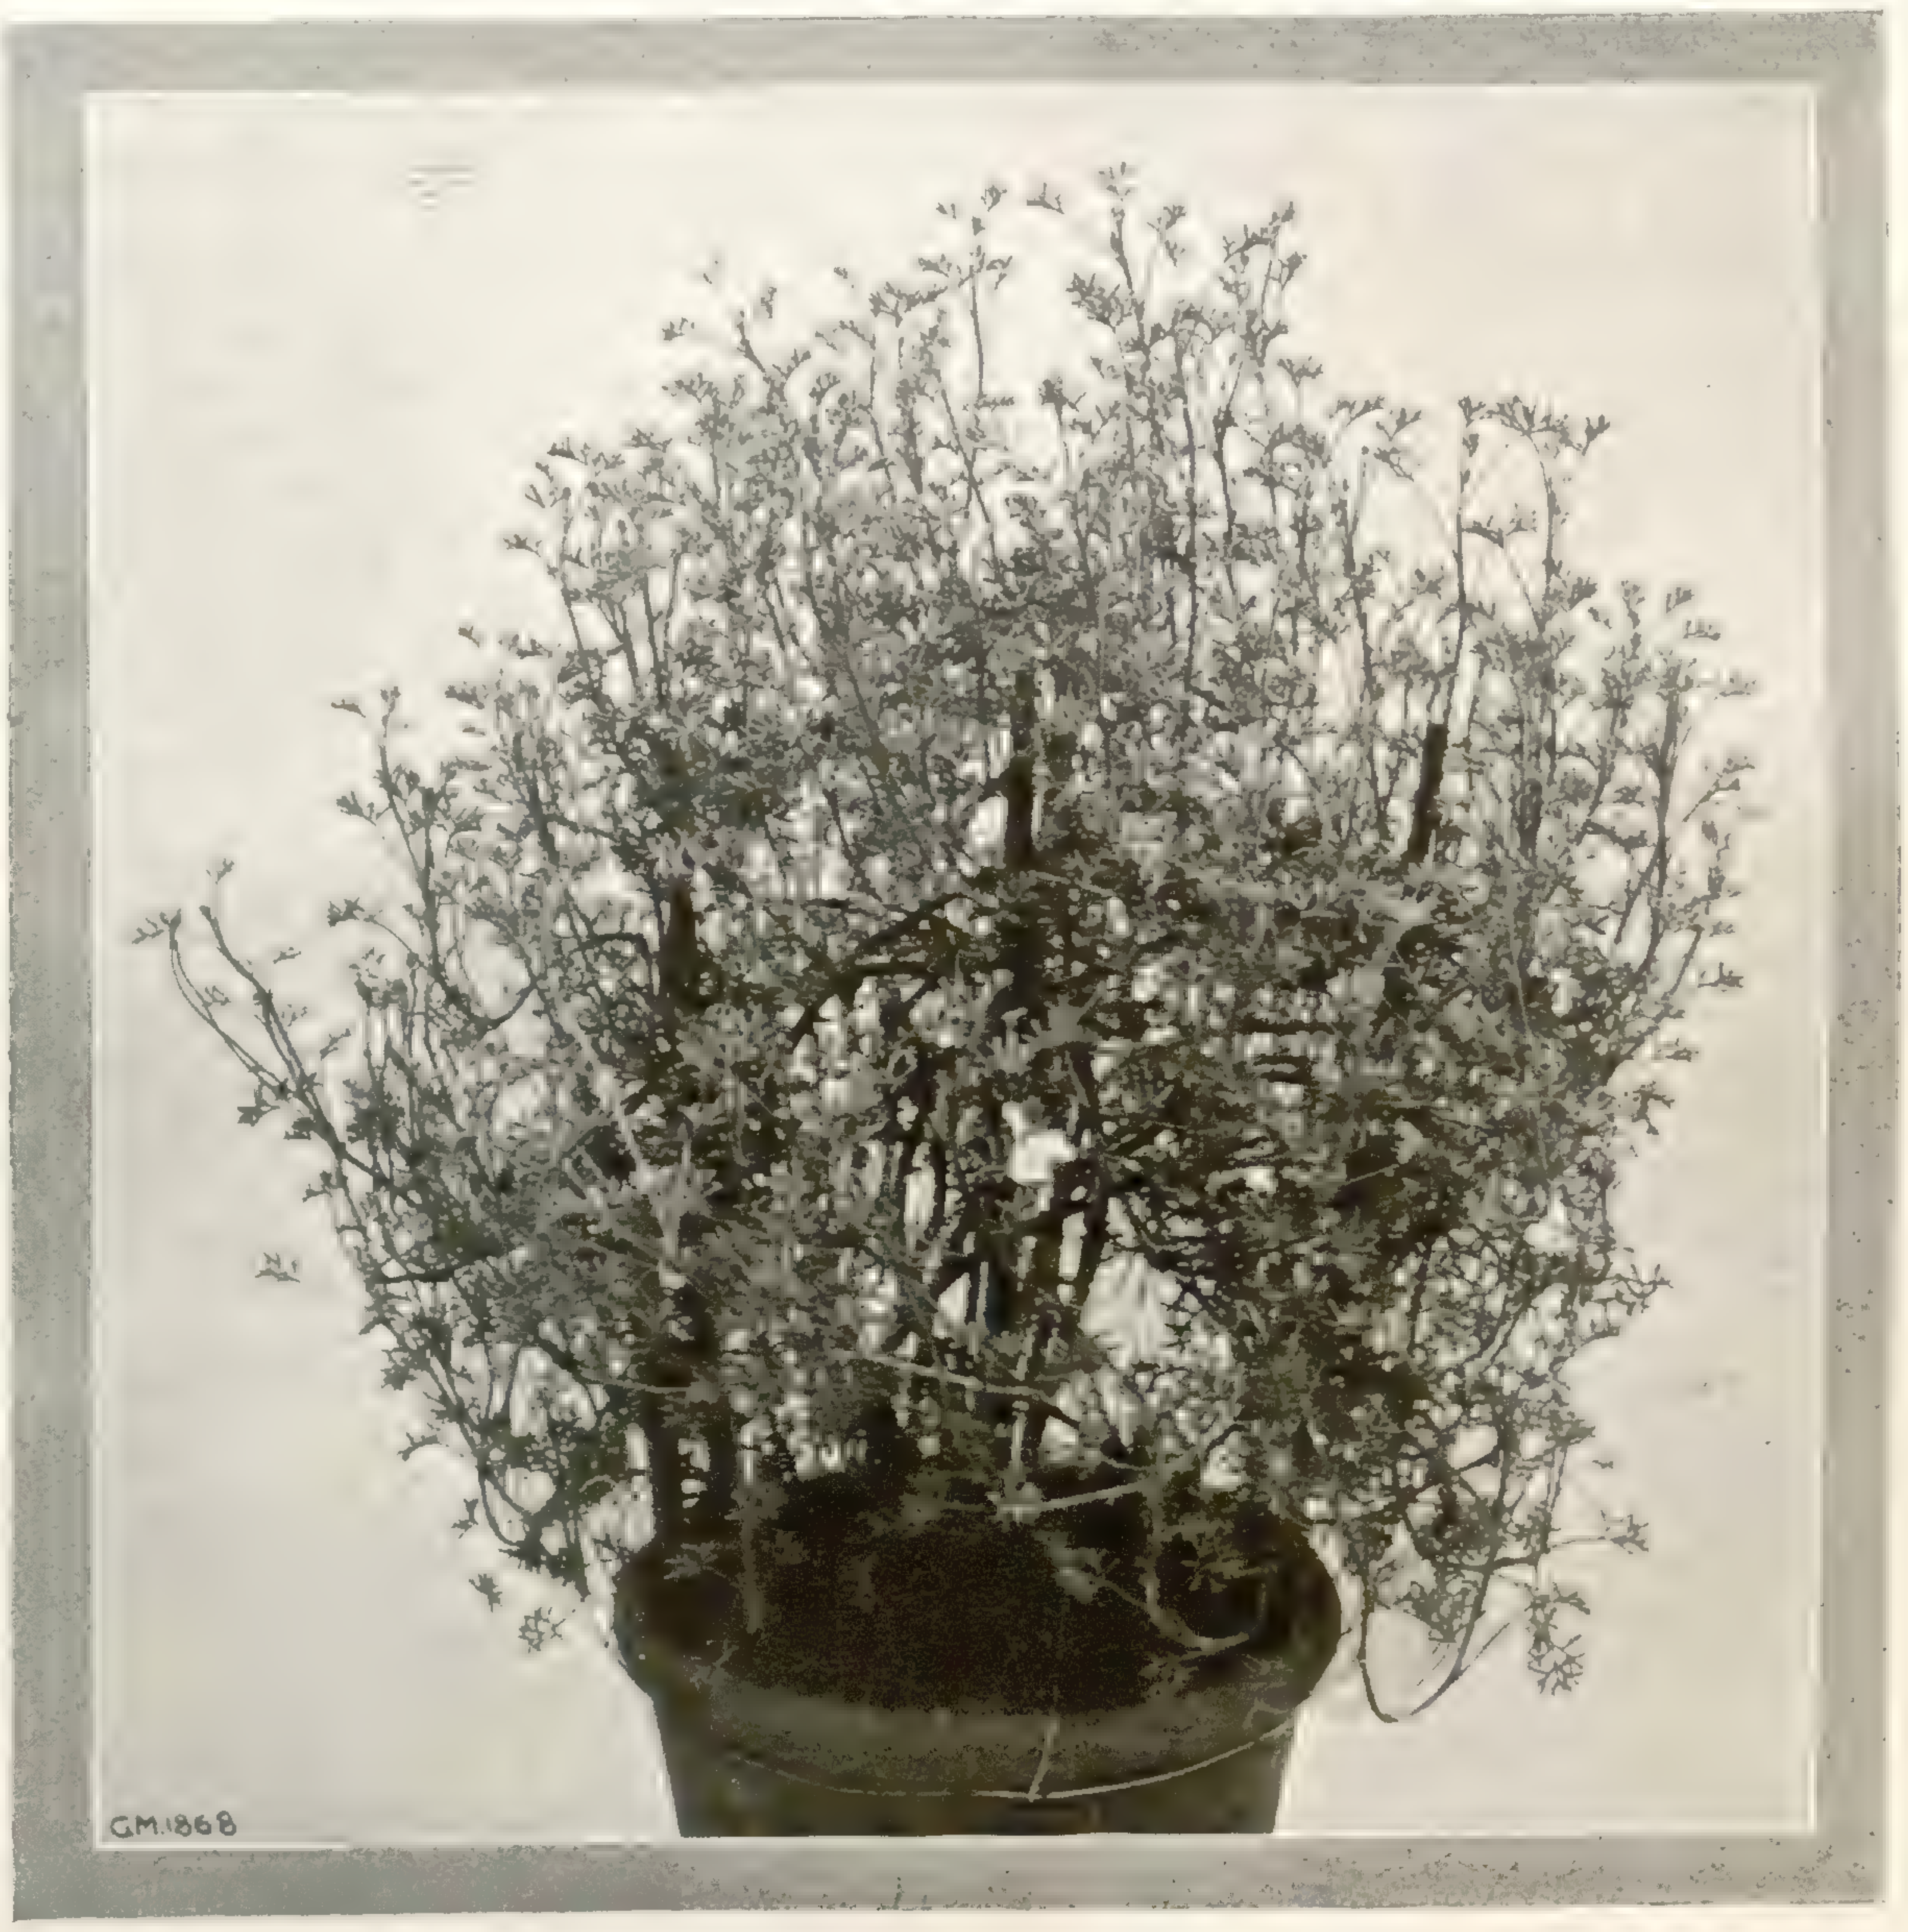
It is absolutely essential that the bottles should be air-tight. An imperfectly-fitting rubber ring or cover may be sufficient to cause failure after perfect sterilisation; the rings and covers must, therefore, fit perfectly. As this cannot always be guaranteed, there will be an occasional bottle which will not be successful. This should be used at once, or the contents may be emptied into a new bottle and re-sterilised.

THE BOILER OR STERILISER.

As stated above, in the case of small lots an ordinary saucepan, boiler, or fish-kettle may be employed to hold the bottles. While such a vessel is over the fire the bottles should be raised somewhat above the bottom of the vessel, or some of them may crack; this may be arranged by placing in the vessel a false wire bottom or a board ¾-inch thick, and standing the bottles on this. The bottles should then be "shoulder-deep" in the water. The temperature should be slowly raised to the desired point, and the caps should be fastened tightly before the vessel is removed from the fire. For fruit-bottling on a somewhat larger scale, a boiler or steriliser may be constructed to hold a dozen or fourteen bottles. Different types of these have been placed on the market.

Where large quantities of fruit are to be bottled, a steam boiler may usefully be employed in conjunction with a steriliser, which may be described as a galvanised iron vessel about four feet long, two feet wide, and two feet high, raised somewhat from the ground on four legs. The lid consists of a galvanised iron plate fitting over a number of bolts on the rim of the steriliser, and screwed down by means of winged screws; two handles serve to remove it or place it in position; a perforation allows the insertion of a thermometer; and a perforated brass or copper vent in the centre allows the escape of steam. The steam is admitted at the bottom by means of a pipe from the boiler, and is equally distributed round the steriliser by a perforated pipe running round near the bottom. Cold water can also be admitted at the bottom by a tap and pipe connected with the usual water supply. An overflow is provided at one end for the water, and a tap for the purpose of emptying the steriliser at the bottom. Bottles when filled are placed in rows in the steriliser on a perforated galvanised iron sheet or false bottom raised about four inches above the bottom of the steriliser on a ledge; they should not be fastened down, but caps should be as nearly as possible in position. The lid is screwed on and the thermometer inserted (the bulb standing in a jar of water inside the steriliser), and steam is then gradually admitted in increasing amount to raise the temperature slowly to the desired point. After maintaining such temperature for the requisite time steam is partly shut off, the lid is removed, and the bottles quickly closed down by means of the gloved hands while the live steam is still playing round the bottles. Steam and cold water are now admitted together, the water being gradually increased and the steam decreased in order to reduce the temperature quite slowly and avoid breakage of bottles. Finally, when the cold water reaches the shoulder of the bottles, these may be removed to finish cooling while another batch is treated. Such a steriliser will hold from six to eight or nine dozen bottles according to their size, and may cost about £20 to £24.

(To be Continued.)



PELARGONIUM ARTEMISIOIDES.

A slender-growing, fine-leaved species, with white flowers.

Roses may be grown to perfection by following the instructions given in Roses and their Cultivation, by T. W. Sanders. A selection is given, with description of all the best varieties, and full details for culture outdoor and under glass. Price 2s. 6d. net. by post in box 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

CONSERVATORY AND GREENHOUSE.

MALMAISON CARNATIONS.—As soon as the layers have become sufficiently rooted they should be severed from the parent plant. After the lapse of a week potting may be commenced. The best compost for the purpose is one consisting of good fibrous loam, a small quantity of leaf-soil, some finely broken charcoal, and a good supply of clean, sharp silver sand. The loam should be pulled to pieces by hand and carefully examined for the detection of wireworms, which are a great enemy to all carnations. Select only those layers which are absolutely free from disease, and pot moderately firm using 60-sized pots. After potting stand the plants in a cold frame, and shade for a few days. Do not keep them too close, and when growth has re-commenced, admit an abundance of air on all favourable occasions. Watering must be carefully attended to at this period of growth.

CYCLAMEN.—Young plants in frames will derive benefit from an application of liquid manure. Keep all flower buds picked off as they appear, and syringe frequently to keep down red spider. Those grown from seeds every year are far preferable to old plants grown on; for this purpose a sowing should be made about the present time. Sow thinly in well-drained pans filled with light sandy soil, and place in a temperature of 60 degrees. Cover each pan with a piece of glass over which a sheet of paper should be laid until germination has taken place, when the paper may be removed and the glass tilted to admit air.

FUCHSIAS.—Those who require large plants for next year's flowering should make provision now by inserting a batch of cuttings. Select those shoots which are free from flower buds, and not hard. If placed in a propagating pit they will soon root, when they may be potted off singly, and kept growing all through the winter in a warm, moist atmosphere. Heliotropes may be treated in the same manner.

ZONAL PELARGONIUMS.—The young plants at present standing outside should now be allowed to flower. As soon as they show colour take them inside. Cuttings taken from plants which have been flowering all the summer should be put in to provide plants for the same purpose next year.

CAMELLIAS.—These will now require manurial assistance to build up their flower buds. The trees must be kept well watered as drought at the roots generally causes the buds to fall. Disbudding is advisable on trees which have set an extra heavy crop. Camellias are subject to attack from mealy bug and scale, and this must be prevented by occasional sponging.—A. Grubb, Porters' Park Gardens.

HARDY FRUITS.

THE DROUGHT.—The long-continued drought is now telling on all kinds of fruit trees, particularly where they have been recently removed, or the soil is light. If carrying crops of fruit some additional mulching, not necessarily stimulating, will be of great benefit, and water should be given as often as the supply will admit. Red spider being very prevalent on apples, a check of some description will be necessary to keep them under. If a good supply of water is laid on, a good drenching may be applied to the foliage late in the evening. A flexible hose, if at command, will be of great service, as the under side of the foliage can be more easily reached, providing, of course, a reasonable force can be obtained.

PEACHES AND NECTARINES.—The fruits of peaches and nectarines are best gathered slightly under ripe, when they are less susceptible to bruising; use shallow trays for the convenience of handling, which should have just sufficient wood wool or other packing material to keep the fruits from coming into contact with the wood. These, if placed in a cool fruit room and handled as little as possible, will in a few days be ready for use. All trees as they are cleared of fruit should be carefully examined and have all growth cut away that has borne fruit, as well as other useless growth. The late varieties will need exposing as much as possible; pick off a few leaves immediately overhanging the fruits. Trees that have carried a very light crop are inclined to throw much more lateral growth than usual, but all lateral and sub-lateral growth must be kept regularly pinched, and notes may be taken of trees that will benefit by being root-pruned a little later in the season, and preparations made accordingly. Keep all trees well watered, and the foliage free from spider, so that the wood may be well ripened and set with buds.

YOUNG ORCHARD TREES.—Frequent attention should be given to ties of fruit trees, and especially is this necessary in the case of young standards, or the stems may be much damaged by the ties becoming too tight, or giving way through strain during such heavy winds as may reasonably be expected at this time of year. Water any trees that are showing signs of distress through drought.

LOGANBERRIES, ETC.—Now that the fruiting season is over loganberries, wineberries, and blackberries in their turn should have all the old canes cut away close to the ground, and treated with the same consideration and attention as is generally given to the raspberries, the cultural requirements of all being exactly the same. Blackberries deserve to be cultivated to a much greater extent than is generally the case, especially Rubus laciniatus, or the parsley-leaved variety, for if given good cultivation fine luscious fruits are obtained, and these are much appreciated because they come in at a time when soft fruits are scarce.—J. Whittle, Cheveney Gardens.

THE KITCHEN GARDEN.

CAULIFLOWERS.—The late-planted cauliflowers will need special attention to keep them growing satisfactorily, or they will turn in too soon as a consequence of the continued drought. Give them a good soaking of water at least once a week until rain in sufficient quantity falls; also frequently stir the surface soil to retain the moisture. If a sowing is made now of an early kind, such as First Crop, Early Snowball, or Early London, and the plants as they arrive at a suitable size are pricked out into frames in the autumn, they probably will be found very useful in forming valuable plants for spring planting. In a cold spring they usually surpass those reared under glass in the new year.

WINTER CUCUMBERS.—Preparations should be complete for planting so as to have the plants firmly established before the short days set in. A low, sunny house should be selected where possible for this crop. Pests of every kind are very numerous this year, which makes it necessary that every particle of the structure should be thoroughly cleaned, by washing the glass and wood with hot water, with petroleum added in such quantity as to kill them. Whiten the walls with fresh lime. Where wireworm is prevalent in the soil it may be well to burn it before making it into beds for planting. Do not subject the plants to too high a temperature, but encourage a slow, sturdy growth during the next two months, and crop very lightly.

MUSHROOMS.—The mushroom house should be cleared of all rubbish, the walls lime-washed, and everywhere made clean and sweet for commencing another season. Collect manure in sufficient quantity for the fresh bed, which should be turned frequently until it is certain that all impurities have escaped, and it is sweetened, to make up in the house. Owing sometimes to the weather, manure at this time of year is liable to become too dry, and where this is so, give a watering to the layers as they are formed into beds. Avoid spawning at too high a temperature, and secure new spawn from a reliable source, as failure is often very inconvenient and troublesome.

TURNIPS.—The sowing of Orange Jelly turnip made early in the north will have produced plants ready for thinning out at about six inches apart. Afterwards give them a good dusting of soot, and ply the Dutch hoe between the rows at intervals of a few days. If through any reason growth is slow, apply a dressing or two of nitrate of soda. The earlier sown turnips, if of good usable size, should be lifted and stored in sand in a cool place for present use.

PARSLEY.—Plants raised for winter stock will be of a suitable size for replanting either into frames or other positions to stand the winter under protection of some kind. Parsley is somewhat slow in growth until established. Lift with plenty of roots, and give attention to watering, etc., until they become active in the new soil. Part of the old bed may be cut down and the young leaves allowed to shoot up and grow sturdy before frost arrives.

GENERAL WORK.—Old crops, such as peas, beans, cabbage, etc., should be cleared from the quarters and burnt at once. Apply sulphur to the foliage of late supplies of peas, and water them freely. Remove all weeds from the ground while they are young.—Charles Flack, Cholmondely Castle Gardens.

NATIONAL VEGETABLE SOCIETY'S TRIAL OF GLOBE BEETROOTS.

Included with a much larger one of long-rooted beets, which will be dealt with later in the season, were some seventeen stocks of Globe or round-rooted varieties, kindly sent for trial by sixteen diverse seedsmen. Trials of the entire stock were conducted simultaneously on sand at "The Times" Experimental Station, Sutton Green, Surrey, under the control of Mr. Harry Foster, and on loam at Marsh Farm, Twickenham, under the control of Mr. William Poupart. At Sutton Green the rows were 22 feet long and sown in duplicate. At Marsh Farm the rows were single and rather shorter. In both cases germination was excellent, the plants later being moderately thinned, as no effort was made to secure large roots by excessive thinning. That the unusually long spell of drought and heat experienced during the growing season materially checked the growth there can be no doubt, but under the circumstances the roots were excellent. In few cases were there very uneven stocks among the round-rooted section. The sowing was made in both cases early in the month of May. The primary tests were of the roots in form, and of the flesh in colour and in fineness of grain, as these features, and especially the latter, are of special importance. Consequently, of each stock several roots were pulled and cut to make the tests complete. After the most careful scrutiny of the roots of both trials, three marks or very highly commended were given to The Sutton Globe, from Messrs. Sutton and Sons, Reading; Crimson Globe, from Messrs. Dickson and Robinson, Manchester; Early Globe, from Messrs. Yates, of Evesham; Early Red Globe, from Messrs. Barr and Sons, Covent Garden; and Blood Red, from Messrs. Hurst and Co., Houndsditch. Two marks or highly commended were given to Globe Witham Fireball, from Messrs. R. Veitch and Sons, Exeter; Selected Globe, from Messrs. Dobbie and Co., Edinburgh; Deep Blood Red, from Messrs. Alex. Dickson and Sons, Newtownards, County Down; and Crimson Globe, from Messrs. Toogood and Sons, Southampton. With respect to these latter four it is but fair to say that on other soils their flesh may equal in colour those of the first group; but it was obvious the results of the two trials named could only be adopted in this case. Several stocks showed the root flesh to be far too white or coarse to merit cultivation. The firms contributing seeds have the society's warmest thanks.

SHREWSBURY FLORAL FETE.

(Continued [illegible] page 622.)

case there were nineteen expanded flowers on a spike; Mr. A. Brydon was second, and Messrs. Harkness and Son third.

The best dozen bunches of hardy flowers were from Mr. A. Brydon, who presented Lobelia Firefly, Lilium tigrinum, etc., in grand condition; Mr. Butler, gardener to C. H. H. Shorting, Esq., Broseley, second. The class for two dozen bunches of hardy flowers found Mr. A. Brydon again to the front, and here he had Eucomis regia, Lilium tigrinum, Heuchera sanguinea, Rudbeckia laciniata plena, Montbretia Germania, etc., in splendid form. There were numerous competitors, and second prize fell to Mr. F. Eames, Frome, who had gladioli, Crinum Powelli and gaillardias in good form; Messrs. G. Gibson and Co., Bedale, third.

Twelve bunches of choice cut flowers was a good class, and first prize fell to Mr. A. R. Searle, gardener to the Marquis of Northampton, Castle Ashby, for carnations (three bunches), Cassia corymbosa, Anthurium atrosanguineum, Lilium auratum, L. speciosum, Begonia corallina, Stephanotis floribunda, Hedychium coronarium, hydrangeas, and Bougainvillea speciosa; Mr. J. W. Barker, gardener to J. R. Dixon Nuttall, Esq., Prescot, second. For six bunches of choice cut flowers Mr. T. Lambert, and Mr. W. Taylor, gardener to F. Bibby, Esq., Hardwicke Grange, Salop, were first and second respectively.

MESSRS. DICKSON AND ROBINSON'S GOLD MEDAL EXHIBIT OF LILIUMS, CARNATIONS, MELONS, ETC., AT SHREWSBURY FLORAL FETE.

Annuals, in twelve bunches, proved an attractive class, and Mr. Oakley, gardener to A. E. Humphrey Owen, Esq., Berriew, was a capital first with African marigolds, sweet sultans, Phlox Drummondi, asters, coreopsis, salpiglossis, cosmos, zinnias, lavateras, Cacalia coccinea, and Rudbeckia amplexicaule; Mr. G. Bamfield, gardener to W. H. Banks, Esq., Kington, second; and Mr. Forder, gardener to Colonel Cornwallis West, Ruthin Castle, third. We want more classes for annuals at summer shows.

Messrs. M. Campbell and Son, High Blantyre, scored for a collection of carnations, and proved that cooler weather has prevailed of late in Scotland than in the South; Messrs. A. R. Brown, Lim., second. Mr. C. F. Waters, Balcombe, led for a collection of perpetual carnations with a goodly set of popular varieties, well staged; Mr. W. Angus, Penicuik, second. Messrs. M. Campbell and Son, High Blantyre, scored for a dozen vases of carnations and picotees, with a bright set, and was closely followed by Messrs. Arthur R. Brown, Lim., King's Norton.

Messrs. Gunn and Sons, Olton, led for a collection of roses arranged for effect, and they confined their attention almost entirely to hybrid tea roses, making therewith a pretty and fragrant exhibit. In the other rose classes the flowers were poor; Messrs. A. Dickson and Sons, Newtownards; Messrs. G. Gibson and Co., Leeming Bar; Messrs. J. Cocker and Sons, Aberdeen; and Mr. G. Speight, Market Harborough, were the most successful competitors.

FLORAL DESIGNS.

Floral designs were once more finely shown. Mr. W. H. Garner, Altrincham, scored for a floral harp, with a beautiful contribution that had a foundation of white asters, with a base of cattleyas, cypripediums, and liliums; Messrs. Gunn and Sons, Olton, second with a foundation of stocks, and a base of small cattleyas; Mr. W. H. Banks, Kington (gardener, Mr. Bamfield), third.

The class for one bride's bouquet and two bridesmaid's bouquets is always an attractive one, and on this occasion there were three competitors. Miss E. E. Todd, Musselburgh, N.B., scored with one bouquet of Odontoglossum crispum, and Dendrobium formosum giganteum, and two of pink carnations; Mr. W. H. Garner, Altrincham, came second with very similar material, and Mr. J. E. Knight, Wolverhampton, was third. Mr. A. Adshead, Gatley, Chester, scored for one bride's bouquet, with a design in white orchids, carnations, and pancratiums: Mr. W. J. Garner second; and Miss E. E. Todd, Musselburgh, third.

Mr. Adshead also led for a bouquet of flowers with a graceful and gorgeous design of golden oncidiums and purple cattleyas; Mr. W. J. Garner second with somewhat similar flowers, but scarcely so bright. In the bouquet class, orchids excluded, Mr. Garner led with a light bouquet of Gloriosa superba and asparagus; Mr. Adshead second with bright pink carnations; and Mr. Broadway, gardener to Mrs. H. Greaves, Warmington, third with gloriosas.

The best dahlia bouquet was a charming one of a yellow, pink-tipped variety, arranged in a most elegant fashion by Mr. W. Treseder, Cardiff; Mr. A. Adshead second.

Mr. W. J. Garner won first for a basket of flowers with a delightful exhibit of Cattleya Trianæ, cypripediums, odontoglossums, and croton and caladium leaves, the whole producing a grand effect. Mr. Garner was again first in the class for a basket of flowers, orchids excluded, with Gloriosa superba and croton and caladium leaves; Mr. Adshead second; and Mrs. H. Greaves third.

For a table decoration premier honours fell to Mrs. Garner, Altrincham, who used Gloriosa flowers and yellow carnations, with small asparagus and caladium foliage; Mrs. H. Greaves, Warmington, second, with Gloriosa superba flowers, montbretias, and sweet sultans; Miss Jenks, Codsall, third. There were many entries, these filling one side of a tent.

VEGETABLES.

In the open section there were vegetables worthy of highest praise, for nothing has been more difficult this season than to get real quality and nice finish into vegetables, but the winning exhibits at Shrewsbury proved that some growers, at any rate, can master a trying and difficult season.

In the open class for a collection of vegetables, twelve distinct kinds, Mr. J. Gibson, gardener to the Duke of Portland, Welbeck Abbey, scored a good first. His Ailsa Craig onions, Gladstone peas, Sutton's Black beet, and Student parsnips were models of what such things should be, and the other dishes were also first-rate. Mr. J. Hudson, Leicester, was second with another nice lot of stuff; and Mr. J. R. Tooley, gardener to H. Andrews, Esq., Toddington Manse, third. In the collection of nine kinds Mr. J. Mills, gardener to Captain Heywood Lonsdale, Shavington Hall, was first, and Mr. W. Dawes, gardener to Lord Trevor, Brynkinalt, second; and Mr. Ed. Jones, gardener to the Misses Howell, Berriew, coming in third.

Numerous classes were provided by seedsmen, and the competition was well sustained, the winners in every class putting up really excellent stuff. Mr. R. H. Smith, gardener to Mrs. Arbuthnot, Newtown Hall, scored first in Messrs. Dickson and Robinson's class for nine kinds; Mr. J. W. Barker, gardener to J. R. Dixon Nuttall, Esq., Prescot, won first in Messrs. Clibran's class for twelve kinds; and Mr. G. W. Robinson, Burton-on-Trent, led in Messrs. Carter's class for six kinds.

Messrs. Webb's class for nine kinds brought four entries, among which that put up by Mr. J. Hudson, Leicester, was accorded highest honours. Mr. T. H. Pugh, Newtown, took the lead in the class provided by Messrs. Robert Sydenham, Limited, the leeks, celery, and tomatoes in this exhibit being of outstanding merit. Messrs. Sutton and Sons' class was especially good, and Mr. J. Gibson's winning collection was a masterpiece, both for quality of produce and skilful staging. There were six good entries in this class.

NON-COMPETITIVE.

The traders turned up in great force, and very materially assisted in making the show the success it was, and, as usual, they staged good material in excellent style.

Very bright and gay was the stand of vegetables, fruit, and flowers set up by Messrs. E. Webb and Sons, Wordsley. Mammoth Red onions, Scarlet and Golden capsicums, rich red tomatoes, and purple beet carried almost as much colour as the sweet peas, liliums, and spiræas that were tastefully arranged in mounds and on arches throughout the exhibit. Mr. Edwin Murrell, Shrewsbury, filled their usual bay in the big tent with a good display of roses, gladioli, and herbaceous flowers. Prince de Bulgarie rose showed up remarkably well on a tall stand in the centre of the group. Miss S. S. Thompson, Alfred Road, Handsworth, put up a stand of choice and well-grown cacti. There were some exceptionally good specimens of Echinopsis gemmata, and quite a number of uncommon things on the stand.

King's Acre Nurseries, Ltd., Hereford, brought an extensive collection of fruit trees in pots. Beurre Bosc, Marie Benoist, and Doyenne du Comice pears were carrying good crops, as also were The Queen and other apples, and several good plums. About the best exhibit of antirrhinums we remember having seen was staged by Messrs. Bakers, Wolverhampton. There were fair-sized batches of plants in separate varieties, about thirty in number, each beautiful and distinct. Particularly striking were Glow, Codsall Rose, and Dazzler. Messrs. Bakers also showed a big collection of asters, which were of fine habit and colours.

Mr. H. N. Ellison, West Bromwich, staged ferns in his customary good style, the various plumose nephrolepis being as usual a leading feature.

Hardy flowers were well shown by Messrs. Dicksons Lim., Chester, who, in spite of drought and drawbacks, had Lilium auratum and its varieties, Helianthus multiflorus maximus, sidalceas, and other popular subjects in excellent form. This firm also had a display of floral designs, which were well executed. Mr. Albert Myers, Sutton Lane Nurseries, Shrewsbury, showed zonal pelargoniums in great variety. Messrs. Jones and Son, Lim., Shrewsbury, had a nice display of sweet peas, and also choice American carnations and gladioli. On the opposite side of the table there were nephrolepis and the beautiful Polypodium crispum in capital form. A small but choice group of orchids came from Mr. E. V. Low, Vale Bridge, Haywards Heath. Cattleya Iris, C. Adula, Brasso-cattleya Mdme. C. Maron, and other fine things. were included in the exhibit.

The elaborate exhibit staged by Messrs. Sutton and Sons, Reading, was remarkably well arranged. Mounds of gloxinias at either end, and begonias in the centre, were supported by fine melons and a series of dishes of vegetables of high quality. Messrs. Hobbies, Lim., Dereham, filled one of the bays in the big tent with roses. Tall weeping standards overtopped a bed of dwarfs, which comprised such well-known things as Ulrich Brunner, Frau Karl Druschki, Juliet, Irish Elegance, and many others. Messrs. Hobbies also had on the centre tabling of the same tent a distinctly good exhibit of pæony-flowered, decorative, and cactus dahlias. The flowers were clean and fresh, and the manner in which they were staged reflected great credit upon the firm's staff. Messrs. Dobbie and Co., Edinburgh, had not so large a display of sweet peas as they generally show here, but what they did stage were excellent. They had in addition a big and very effective bank of dahlias, among which collarette and pæony-flowered varieties were well represented.

One of the most effective displays in the show was made by Messrs. Dickson and Robinson, Manchester. Tall stands of Lilium longiflorum and speciosum occupied the background, with vases of perpetual carnations in front, the colours being beautifully blended, and set off to greatest advantage by the use of smilax and small ferns. About a dozen fruits of "The Manchester" melon were put up in the centre of the stand, and were, without doubt, fine examples of a really good variety. The silvered rustic ware associated with the firm of Robert Sydenham, Lim., Birmingham, was on this occasion filled with carnations. The flowers stood well, and demonstrated the fact that the receptacles are equally as well adapted to receive carnations as sweet peas. Roses were the chief feature of the exhibit put up by Messrs. W. and J. Brown, Stamford. The Lyon, Mdme. Melanie Soupert, M. Constant Soupert, and His Majesty were in good form. Liliums, gaillardias, and other perennials were used in the background.

Messrs. Aldersey and Marsden Jones, Tilston, Malpas, staged hardy flowers, the arrangement being rather thin and flat. There were, however, some good phloxes, chelones, and statice, as well as a good variety of hardy annuals. A very creditable display of sweet peas was made by Messrs. W. H. Simpson and Sons, Birmingham, who have evidently been among the favoured few who have been able to obtain a continuous supply of flowers this season. Messrs. Jarman and Co., Chard, showed their well-known centaureas and representative collections of cactus dahlias and zonal pelargoniums. There were also good apples on the stand, Lady Sudeley being brightly coloured. Messrs. Young and Co., Hatherley, Cheltenham, staged perpetual carnations, among which Mikado, Britannia, and Mrs. H. Burnett were very well shown.

A big batch of gladioli came from Messrs. Kelway and Son, Langport. The delicate shades of some, and the intense, dazzling hues of others were delightful, but, of course, the size of bloom was not so fine as in a kinder season. Messrs. Alex. Dickson and Sons, Newtownards, brought over a good collection of garden roses, among which Duchess of Wellington, Alex. Hill Gray, and Arthur R. Goodwin were prominent. Sweet peas were staged in considerable quantity by Messrs. Herd Bros., Penrith. Mrs. Chas. Foster. Miriam Beaver, and other light-coloured varieties were good. Messrs. Isaac House and Son, Westbury-on-Trym, had a couple of new tomatoes on view, which showed remarkable cropping qualities. Devonia, a smooth round of moderate size, carried about a dozen fruits per truss. Fonthill, grown outdoors, was very heavily fruited. Messrs. H. B. May and Sons, Dysons Lane Nurseries, Edmonton, showed ferns, among which various platyceriums were very well represented. Adiantum Farleyense gloriosum and Nephrolepis Neuberti were other choice things on the stand.

Mr. T. R. Hayes, Keswick, the well-known heather specialist, had a capital exhibit of his speciality, which was worthy of more than a passing glance. In addition to the pink and white forms of E. vulgaris, there were E. vulgaris alba gracilis,, E. v. Alporti, Menzesia alba globosa, etc. Mr. Hayes also had a very fine lot of phloxes. Messrs. Clibrans, Altrincham, put up one of their very elaborate displays of vegetables, which worthily attracted a great deal of attention. The style adopted was almost as light and fanciful as could be used for a dessert table.

Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, arranged an exhibit of vegetables that included perfect examples of Webb's Purple Kidney, Provider, and other potatoes, beautiful peas, Ailsa Craig onions, and Royal Favour cucumber. In fact, everything one could wish for appeared to be included on the stand, which was, needless to say, arranged in tip-top style. Messrs. Isaac House and Son, Westbury-on-Trym, had a stand of phloxes, gaillardias, heleniums, and other border flowers in good varieties, and also a table of sweet peas, which included Mrs. James C. House, a new heliotrope variety of considerable merit. Messrs. John Forbes, Lim., Hawick, N.B., showed phloxes in big bold bunches, such varieties as Mrs. Oliver, Paul Fliche, Aurora, and Lady Menzies being grand. The pentstemons and carnations on this stand were also good.

An exhibit of more than ordinary merit was the group of fine foliage and choice flowering plants, arranged in a recess of the group tent by Messrs. Jas. Veitch and Sons, Lim., Chelsea. Anthurium Veitchi, Alocasia Thibautiana, crotons in many varieties, and graceful aralias were tastefully dispersed over a groundwork of smaller ferns, etc. In the centre of the group a batch of cattleyas, oncidiums, and other orchids made a bright bit of colour, and some plants of Thalictrum dipterocarpum claimed the attention of all. Among the host of phloxes shown in baskets by Messrs. Gunn and Sons, Olton, Warwickshire, there were some very striking things. Countess of Ilchester, Matador, Coquelicot, and King Edward VII. were all aglow with brilliant tints.

Messrs. Pritchard and Sons, Shrewsbury, showed some nice plants of the plumose nephrolepis, and a number of alpine plants in pots and pans. Some of the choicer encrusted saxifragas, sempervivums, and sedums were well done. One end of a tent was occupied by a fine exhibit from Mr. Amos Perry, Enfield. Delphiniums, grand for so late in the season, and water-lilies in a shallow tank were the chief features, the water being surrounded by osmundas, crested scolopendriums, and other hardy ferns. Violas were shown by Mr. W. L. Pattisson. Cherry Orchard, Shrewsbury, and Messrs. Harkness and Sons, Bedale, showed about twenty-five varieties of gaillardia, some of which were exceptionally fine and distinct. A big bold group of herbaceous flowers was put up by Mr. Fred Eames, Frome, the gladioli, Scabiosa caucasica, aconitums, and phloxes, all showing up well among a number of smaller but equally interesting subjects.

MEDALS.

Large Gold.—Messrs. Clibrans, Altrincham; Messrs. Sutton and Sons, Reading; King's Acre Nursery Company, Hereford; Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree; Messrs. Jas. Veitch and Sons. Chelsea; Messrs. E. Webb and Sons, Stourbridge.

Gold.—Messrs. H. B. May and Sons, Edmonton; Messrs. Dickson and Robinson, Manchester; Messrs. Dicksons, Chester.

Silver-Gilt.—Messrs. Isaac House and Son, Westbury-on-Trym; Messrs. Herd Brothers, Penrith; Mr. T. R. Hayes, Keswick; Messrs. Bakers, Codsall; Messrs. Caldwell and Sons, Knutsford; Messrs. Hobbies, Lim., Dereham; Messrs. Gunn and Sons, Olton; Mr. Amos Perry, Enfield; Messrs. Alex Dickson and Sons, Newtownards; Messrs. J. Forbes, Lim., Hawick; Messrs. Dobbie and Co., Edinburgh; Mr. H. N. Ellison, West Bromwich; Messrs. Pritchard and Sons, Shrewsbury; Messrs. H. Jones and Son, Lim., Shrewsbury; Messrs. W. and J. Brown, Stamford; Messrs. A. Young and Co., Hatherley; Messrs. Kelway and Son, Langport.

Silver.—Messrs. Simpson and Sons, Birmingham; Mr. E. Murrell, Shrewsbury; Mr. A. Myers, Shrewsbury; Messrs. Jarman and Co., Chard.

Bronze.—Mr. E. Low, Hayward's Heath; Messrs. G. Mair and Son, Prestwick, N.B.; Mr. F. Eames, Frome; Messrs. G. Gibson and Co., Leeming Bar; Mr. F. W. Johnston, Manchester; Mr. W. Pattisson, Shrewsbury; Robert Sydenham, Lim., Birmingham.

THE
NATIONAL VEGETABLE SOCIETY.
will hold their
SECOND ANNUAL SHOW
at the ROYAL HORTICULTURAL HALL, Vincent
Square, Westminster, on
WEDNESDAY, AUGUST 30th, 1911.

Open One o'clock.

Hon. Sec., E. G. QUICK, "Kelmscott," Harrow View,
Wealdstone, Harrow.

SANDY, BEDFORDSHIRE.

43rd ANNUAL SHOW, AUGUST 31st, 1911.
PLANTS, FLOWERS, FRUIT, VEGETABLES, etc.;
DOGS, POULTRY, PIGEONS, RABBITS, CATS, etc.
PRIZES VALUE £1,000, including
£70 for Groups of Plants, £9 for Roses.

Entries close August 24th.

Schedules and particulars of
W. GREEN, Sec., Sandy, Beds.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Perthshire Sweet Pea Society.

The second exhibition of this society in the City Hall, Perth, was formally opened by Lady Dewar, who was introduced by the President, Rev. Harold Mayall. The entries, considering the exceptionally dry season, were fairly large, the number being 229, which was an increase of nearly 30, compared with last year. The quality of the flowers was very high throughout.

Messrs. Thynne and Son, Dundee, were awarded a gold medal for a very fine exhibit of sweet peas, and the second prize, a silver-gilt medal, went to Messrs. Young and Sons, Elgin, for a capital display. A gold medal was also awarded to Messrs. Dobbie and Co., Edinburgh, for an exhibit of sweet peas, which included all the newest and best of the novelties, including Mrs. Cuthbertson, a useful pea for decorations, a clear rose pink standard, white wings flushed pale rose; Lady Knox, a charming variety for decorations; Melba, a fine pale Earl Spencer, raised by Mr. Malcolm; Mr. Heslingter, a beautiful lavender; and Red Star, which has good colour and substance. Messrs. Cocker, Aberdeen, were also awarded a gold medal for a first-class display of roses. This firm put up nearly 300 blooms, including a lovely box of The Lyon and pillars of Caroline Testout, Hugh Dickson, and Gloire de C. Guinoisseau, etc. A silver medal was awarded to Messrs. R. Hadeson and Sons, Perth, for a fine display of carnations and sweet peas.

The blue ribbon of the show, in the shape of the society's cup, was won by Mr. John A. Grigor, Forres, with a beautifully staged collection, arranged in the following order: Mrs. Hugh Dickson, Dobbie's Sunproof Crimson, Nubian, Elsie Herbert, Masterpiece, Mrs. W. J. Unwin, Etta Dyke, Countess Spencer, Isobêl Malcolm, Edrom Beauty, John Ingman, and Earl Spencer, all perfect flowers; the two outstanding vases were those of Countess Spencer and Earl Spencer, the former was an ideal vase, and the latter was absolutely perfect. The second prize was awarded to Mr. Young, Falkland Palace, who showed in capital form Nubian, Dobbie's Sunproof Crimson, Elsie Herbert, Marjorie Willis, Geo. Herbert, Mrs. H. Dickson, Edrom Beauty, Isobel Malcolm, Paradise Apple Blossom, Mrs. Breadmore, and Thos. Stevenson. The third prize collection was also remarkable for high quality, and was staged by Dr. Temple, Comrie.

In the class for six vases Mr. J. Grigor again led the way with another perfect lot, including Constance Oliver, Moneymaker, Asta Ohn, John Ingman, Princess Victoria, and Clara Curtis. Mr. J. F. Adams, Brechin, was second, staging a collection of exceptional merit; Mr. Wm. Young, Falkland Palace, was third. In the competition for the prizes for three varieties, Mr. J. Grigor, Forres, ran in first with King Edward Spencer, Arthur Unwin, and Edrom Beauty; Dr. Temple, Comrie, was second. In the class for six bunches of novelties, 1910 and 1911, Mr. J. Grigor was again first with Isobel Malcolm, Dobbie's Sunproof Crimson, Elfrida Pearson, Edrom Beauty, Anglian Pink, and Chas. Foster. Mr. Thos. Kirkwood, Cultoquhay, followed for second place with beautiful flowers of Maori Belle, Sunproof Crimson, Mrs. H. Dickson, Earl Spencer, Edrom Beauty, and Freda; Mr. Geo. Reid, Downfield, third.

In the small growers' class for six bunches, Mr. G. Milne, Dunnauld, Montrose, showed a remarkable lot of perfect flowers in Dobbie's Sunproof Crimson, Etta Dyke, Evelyn Hemus, Mrs. H. Dickson, Tennant Spencer, and Edrom Beauty; Mr. Fulton, Crieff, second, with a nice clean set; and Mr. J. Duthie, Claverhouse, Dundee, third. For three bunches, Mr. G. Milne was first with grand vases of Mrs. H. Sykes, Isobel Malcolm, and John Ingman; Mr. J. Duthie second; Mr. J. H. Crosby, Comrie, third. For one bunch of a lavender variety, Mr. J. Duthie, Dundee, first; Mr. J. H. Crosby, second; and Mr. J. Robertson, Meiklour, third. The premier award for a bunch of a pink variety was easily won by Mr. G. Milne, Montrose, with a glorious bunch of Stark's Hercules; Mr. J. Duthie, second; and Mr. J. Robertson, third. In the class for a bunch of picotee-edge or cream pink, Mr. G. Milne was first with Elsie Herbert in grand form; Mr. J. Duthie second, and Mr. J. H. Crosby third. In the class for six bunches, open to Perthshire growers only, Mr. Thomson, Bridgend, was first; Mr. G. L. Morrison, Craigie, second; and Mr. J. Bissett, Hillyland, third. For three vases for decorative effect, the prizetakers were: Mr. W. Robertson, Perth; Mr. A. M. Mechie, and Mr. W. Thomson. The prizes for six vases for decoration, open to Perthshire growers only, were keenly contested, and at the head of the several competitors was the Rev. H. Mayall, Comrie; Mr. A. Glass, Birnam, second; and Mr. J. Dempster, Dalguise, third. For one vase for decorative effect, the Rev. H. Mayall was again first, and Mr. J. Dempster and Mr. J. Kirkwood were second and third.

The post of honour in the class for a decorative display of sweet peas, occupying 4ft. 6in. by 3ft. of staging, was occupied by the Rev. H. Mayall; and Messrs. Alfred Young and Co., Elgin, and Mr. Geo. Reid, Downfield, were second and third.

A class was provided for school children for three vases to be arranged for decoration on the morning of the show. This was a most satisfactory class, there being thirteen competitors, who showed great taste in arrangement, and set up their flowers in a way that might well be copied by many older exhibitors.

Manchester and North of England Orchid Society.

At the meeting held on Thursday, August 10, the members of committee present were: Rev. J. Crombleholme (in the chair), R. Ashworth, C. Parker, Z. A. Ward, J. Evans, W. Holmes, A. J. Keeling, F. K. Sander, and H. Arthur (secretary).

Colonel J. Rutherford, M.P., Blackburn (gardener, Mr. Lupton), staged a very nice group, to which a silver medal was awarded; several plants of Cattleya Gaskelliana alba, and a well-flowered specimen of the type, a good form of Brasso-cattleya Maronæ, Cattleya gigas, L.-c. Calistoglossa, Cypripedium Maudæ, and several others.

Z. A. Ward, Esq., Northenden (gardener, Mr. Weatherby), was also awarded a silver medal for an excellent group of cattleyas and cypripediums, including two good plants of Cattleya Atalanta, one a good dark form, L.-c. Calistoglossa, a plant of Hardyana x Harrisonæ, bearing two well-formed bright flowers, several plants of Cattleya Harrisonæ, Cypripedium "Lord Derby," Rothschildianum, Burtoni, Tixalleuse, and others.

R. Ashworth, Esq., Newchurch (gardener, Mr. Gilden), staged an excellent group, to which a silver medal was awarded, miltonias being a feature; the cypripediums were also good, C. Rothschildianum and several hybrids from same, including a nice plant of C.

Transvaal, Odontoglossum crispum Xanthotes, a very nice form, O. Harryanum, and others; Lælio-cattleya Bletchleyensis and the Ashlands var. of C. Gaskelliana alba. (A.M.), Bollea Lalindei var. Cœlestis (A.M.), and Cypripedium Godefroyæ leucochilum var. Perfection (A.M.).

W. R Lee, Esq., Heywood (gardener, Mr. Woodhouse), staged Odontoglossum crispum Perfection and O. vexillarium superbum.

Messrs. Charlesworth and Co., Haywards Heath, staged nice plants of Odontoglossum Aireworth (Lambeauianum x crispum), O. crispum, with an exceptionally large flat lip, Sophro-cattleya Marathon, and Cattleya Smilax, of the Charlesworthi type.

Messrs. Keeling and Sons. Bradford. staged an excellent form of Cattleya Harrisonæ, named Grand Duke, a good dark colour, and Cattleya Vulcan.

Mr. J. Birchenall, Alderley Edge, staged several interesting plants, Stanhopea Rodigasiana, Bollea Lalindei, Anguloa Clowesi, and a good form of Cypripedium Bellatulum.

AWARD OF MERIT.

Cattleya Gaskelliana alba, Ashlands var., from R. Ashworth, Esq., Newchurch (gardener, Mr. Gilden), a fine flower of the variety; Bollea Lalindei, var. Cœlestis, a flower of deep colour with bands of intense purple; Cypripedium Godefroyæ leucochilum, var. Perfection, with ground colour of deep cream, regular markings, the petals and dorsal being very broad, forming a good round flower. All these were from the same exhibitor.

The next meeting will be held in the Coal Exchange, Manchester, on Thursday, September 14, 1911.

Llanishen.—AUGUST 7.

The annual show was again held by the kind permission of the Rev. R. L. Rhys, in the Vicar's Field, and though, owing to the weather lately experienced, the sweet peas and some other cut flowers were not equal to their usual high standard of quality, the exhibits were generally, nevertheless, of much merit.

In the class for a group of miscellaneous plants, fifty square feet, there were four entries, all of circular form, arranged along the centre of a tent, the leading one coming from Mr. W. H. Cullen, Llanishen, in which were employed with good taste, as chief subjects, palms, ferns, crotons, Francoa ramosa, celosias, gloxinias, etc.; Mr. J. E. Turner, Lisoane, was placed second with a similar arrangement, in which caladiums were somewhat too freely used. Mr. W. H. Cullen again scored in a class for six specimen ornamental plants and ferns, his ferns being his strong point; Mr. J. E. Turner was again a close second. Twelve tuberous-rooted begonias, as is invariably the case at Llanishen, made a strong class; four splendid sets were staged, and Mr. W. H. Cullen, with large plants, carrying plenty of blossoms of first-rate quality, was again deservedly placed first, and was followed by Mr. G. Robertson, Llanishen, and Mr. H. F. Ensor. For four zonal pelargoniums, there were three good lots staged, Mr. A. F. Hill securing chief honours with well-blossomed unnamed double varieties; Mr. J. A. Hossington second with smaller plants of single varieties.

Six gloxinias were best shown by the Right Rev. Bishop Hedley, and Mr. W. H. Cullen; three ferns, by Mr. T. C. Kirk, who had fine plants of Adiantum cuneatum, A. formosum, and Davallia fijiensis; and three begonias by Mr. W. J. Gunstone. For six greenhouse plants, Mr. T. C. Kirk led with nice examples of Plumbago capensis, a tuberous begonia, gloxinia, fuchsia, adiantum, and a palm.

Cut flowers were not so numerous as is usually the case. Six carnations were staged in fairly good condition by Mr. W. H. Cullen, who was the only exhibitor. There were three exhibitors of twelve cactus dahlias, Mr. H. Watkins being placed first, with Mr. W. Boulton a close second. Twelve blooms of pansies or violas were best staged by Mr. J. H. Ferry, who staged a good set of violas, Mr. R. Scoble being second with good blooms of pansies. Asters made a rather poor class, Mr. G. Robertson leading amongst four entrants; Mr. W. Boulton second. Mr. E. H. Page and the Rev. R. L. Rhys had the best and second best twelve vases of stocks, and Mr. R. Morgan took the lead for twelve bunches of perennials or annuals, the Rev. R. L. Rhys second. The best nine vases of sweet peas were staged by Mr. J. E. Turner, Mr. W. H. Cullen second. There were no entries for twelve roses, but Mr. G. Robertson led for six blooms.

Only seventeen classes were devoted to fruit, and these in all cases were not well filled. Mr. W. H. Cullen was first, and Mr. J. E. Turner second for grapes, each staging fairly good Black Hamburgh. Mr. G. E. Downing led amongst four exhibitors, followed by Mr. H. F. Ensor, with scarlet-flesh melons; and Mr. N. Lewis scored for a white-fleshed. Mr. J. H. Mullens was placed first for a dish of peaches, and had Crimson Galande in good condition; Mr. J. E. Turner coming second with Barrington. For dessert apples, Mr. G. E. Downing and Mr. W. E. Nicholls won in the order named, each staging splendid dishes of Beauty of Bath; while for a dish of culinary, Mr. W. B. Fabian was first.

Vegetables formed one of the most satisfactory divisions of the show. For a collection of six kinds, Mr. J. E. Turner staged creditable dishes of onions, potatoes, cauliflowers, beans, peas, and tomatoes; Mr. A. F. Hill second. Mr. W. Boulton scored with both kidney and round potatoes, and also with carrots, leeks, and broad beans. Mr. W. H. Cullen led with cucumbers, runner beans, and parsnips. Mr. H. A. Gerhold led with spring-sown, and Mr. H. W. Davey with autumn-sown onions.

Mr. G. Wells, The Nursery, Llanishen, was awarded a gold medal for a large and meritorious group of miscellaneous plants; and Messrs. W. and H. Evans, nurserymen, Llanishen, secured a similar award for a bank of hardy cut flowers.

Scottish Horticultural Association.

On August 19 about seventy members of this association, including the president, Mr. Massie, and several of the other office-bearers, paid a visit to Manderston, the Berwickshire seat of the Hon. Lady Miller. On the way from Duns Station, where they arrived at midday, the party made a halt at Mr. Malcolm's garden in order to see his fine collection of sweet peas which he had kindly invited them to inspect, and amongst which some interesting novelties, including a very fine flesh-coloured flower named Lady Miller, were seen. Passing through Duns Public Park they made their way to Manderston, where, on arrival, they were kindly entertained to lunch by Lady Miller, and thereafter, under the guidance of Mr. Marshall, the head gardener, and Mr. Moir, they made an inspection of the gardens, dairy, etc. Lady Miller accompanied the party through the flower garden, in which she takes a great interest, and pointed out its leading features, including, besides the plant collections, the fine wrought-iron gateway at the entrance, the pergola, some fine Roman statuary, etc. On the motion of the president a very hearty vote of thanks was accorded to Lady Miller for her kindness and hospitality.

FORTHCOMING ENGAGEMENTS.

TUESDAY, August 29.—Royal Horticultural Society; committees meet at 12 o'clock; lecture at 3 p.m. on "Insect Pests" by Mr. Frederick Enock, F.L.S., F.E.S.; Scientific Committee at 4 o'clock.

WEDNESDAY, August 30.—National Vegetable Society' Show at the Horticultural Hall.

Irish Gardeners' Association.

Horticultural Exhibition in connection with the Cheshire Agricultural Society.

THURSDAY, August 31.—Dundee Horticultural Society; three days.

Sandy Horticultural Society.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

THRUM EYE AND PIN EYE.—A. W., Knaresborough: The terms "thrum eye" and "pin eye" are used in connection with the flowers of the primula family, and chiefly in connection with auriculas. A "pin-eyed" flower is one in which the pistil is elongated so as to carry the pin-headed stigma up into the mouth or eye of the bloom, whereas a thrum-eyed flower is one in which the pistil is short, and the stamens are placed so high in the flower tube that they fill up the eye or tube mouth. In the case of a thrum-eyed flower the stamens are placed about half-way down the tube. These two methods of producing stamens and stigma are for the purpose of securing cross-fertilisation; a bee or other insect with a long proboscis carries the pollen from the thrum-eyed flower to the stigma of a pin-eyed flower, on its head; and, on its proboscis it carries the pollen from the pin-eyed flower and deposits it on the short stigma of a thrum-eyed flower, when searching for nectar.

GRUBS IN ROSE LEAVES. — C. P., Wetherby: The leaves sent show plainly the work of the grubs of the Rose-leaf Miner Nepticula anomalella. The moth is a very tiny one, and appears in May; it deposits an egg on the underside of a leaf, and from this the grub quickly hatches, and enters the leaf; here it eats its way, serpentine fashion, over the leaf, and when fully grown it comes out through the upper epidermis, spins a cocoon on the leaf stock, and pupates. Two or three weeks later the moth appears, and it lays eggs that give rise to a second brood, but the latter remain in pupa form all through the winter, either in the ground or in cocoons attached to the rose trees. The removal and burning of leaves containing grubs, or crushing the grubs in the leaves between thumb and finger are methods to be adopted; removal of surface soil in winter should be carried out where there has been a severe attack. Spraying with arsenate of lead early in May should act as a preventive, and it would act as a deterrent to caterpillars.

FUNGUS ON ELDER STEM.—D. S. C., Montgomery: We cannot be certain what the fungus is from the description sent, but believe it must be Hirneola auricula-judæ, the Jew's Ear fungus. This is a wound parasite, fairly common in Britain on live branches of the elder. Cut the infected stems back to perfectly clean, healthy wood, and tar the cut surface at once; remove the diseased portions carefully, and at once burn them.

GANDAVENSIS GLADIOLUS HYBRIDS.—M. E. B., West Runton: It is on record that Gladiolus gandavensis was raised in 1837 by M. Beddinghaus, gardener to the Duke of Aremberg, at Enghien, by crossing G. psittacinus with G. cardinalis. The race of hybrids, however, now distinguished as gandavensis, has no doubt resulted from the introduction of other species, as well as those named, and from the careful selection and re-selection of crossbred seedlings. Souchet of Fontainebleau, Standard of Ascot, and Kelway of Langport, have all assisted in the development of these useful and showy garden flowers.

VARIETIES OF BRITISH FERNS.—S. M. W., Portsmouth: A very large number of people are now taking up the culture of hardy ferns, especially British kinds, and we are glad to know that they are giving more and more attention to the very beautiful varieties to which we have so repeatedly drawn attention in the pages of the Gardeners' Magazine. The difficulty that

others in common with yourself have experienced is that of distinguishing between the really beautiful varieties and those that are merely curious and interesting, from the names as set forth in a catalogue or book. That titles have been given in unsparing fashion to the different variants from the wild type is obvious to anyone who has taken the smallest interest in hardy ferns. For instance, Blechnum spicant is the only member of its genus found in this country, and its fertile and also unfertile fronds are familiar to all who know anything of the West Country or the Lake District. We do not pretend to give a complete list, but the following names have been given to forms of B. spicant: Aitkinianum, anomalum, anomalum multifidum, bellum, biceps, bifidum, caudatum, concinnum, concinnum Druery, confertum, confluens, congestum, contractum, contracto-ramosum, crenato-congestum, crispato-imbricatum, crispissimum, crispum, cristata-gracile, cristatum, cristatum Barrandæ, cristatum Huddart, conciato-plumosum, elegans, flabellatum, furcans, giganteum, glomeratum, heterophyllum, imbricato-erectum, imbricatum, lancifolium, lineare, Monkmanni, multifurcatum Barnes, multifurcatum Symons, Padleyense, parviceps, paradoxum, plumosum Airey, ramo-cristatum, ramo-cristatum Kinahan, ramo-cristatum Sinclair, ramosum, ramosum Clifti, rotundatum, serratum, serratum Airey, serrulatum, strictum, subserratum, trinervium, and trinervium Hodgsonæ. But even this variation and naming is as nothing compared with a catalogue of varietal forms of that most variable of ferns, the Hart's-tongue. You should obtain "British Ferns and Their Varieties," by C. T. Druery. (Routledge and Sons.)

EARLY FIG TREES IN POTS.—W. S. R., Didcot: Figs in pots, used for early forcing should by this time have become sufficiently hardened off to stand open air treatment. Select for them a sunny sheltered position, and, having made sure the drainage is in every case satisfactory, plunge the pots up to their rims in ashes. Abundance of water will be necessary, but liquid manures and stimulants of all kinds must not be given. Any repotting necessary may be done now, and with rare exceptions the plants treated may have the ball of soil and roots so reduced that pots of similar size to those previously occupied may be used. Keep the potted plants separate from the rest, water carefully, spray overhead twice a day in suitable weather, and give a little shade during the brightest hours of very hot days.

RED SPIDER ON RUNNER BEANS.—B. R., Louth: Remove and burn a number of the leaves that are badly disfigured by the attack of red spider, and then hose the rows early every evening, taking care to use a fine movable nozzle so that the underside of every leaf may be thoroughly wetted. Spraying with a potassium sulphide solution at intervals of ten days is another method of settling accounts with red spider.

NAMES OF PLANTS.

R. G., Warwick.—1, Acanthus mollis; 2, Campanula turbinata.

J. L., Ware.—Sorry we are unable to identify the plant from the sketch sent.

D. S. G., Llanishen.—1, Ceterach officinalis; 2, Clematis viticella; 3, Menyanthes trifoliata.

F. V., Canterbury.—1, Bocconia cordata; 2, Rudbeckia laciniata fl.-pl.; 3, Menziesia polifolia; 4, Erica vagans.

R. R., Horsham.—1, Valeriana officinalis; 2, Pinguicula caudata; 3, send when in flower, appears to be Sarmienta repens.

CATALOGUES RECEIVED.

WM. PAUL AND SON, WALTHAM CROSS, HERTS.—Besides a well-arranged bulb list, this catalogue contains descriptive lists of camellias, spring flowering trees and shrubs, and strawberries.

GEORGE BUNYARD AND CO., LIM., ROYAL NURSERIES, MAIDSTONE.—A descriptive and cultural list of strawberries, grape vines, figs, violets, and carnations, that is especially deserving of attention.

SUTTON AND SONS, READING.—A handsome, finely illustrated and descriptive catalogue of bulbs; collections are arranged for various purposes, and there are lists of hardy perennials, forcing plants, climbers, forcing potatoes, and sundries.

DICKSON AND ROBINSON, CATHEDRAL STREET, MANCHESTER.—This well illustrated bulb catalogue also includes descriptive lists of strawberries, roses, and sundries.

CHRISTOPHER BOURNE, SIMPSON, BLETCHLEY.—Mr. Bourne's second catalogue is a very handy and useful production, descriptive, informing, and well illustrated. Only daffodils are listed, and these are arranged according to the R.H.S. classification.

WM. BULL AND SONS, CHELSEA, S.W.—Bulbs of all kinds for spring flowering are catalogued and illustrated; collections for various purposes, and hippeastrums are specially dealt with.

E. H. KRELAGE AND SON, HAARLEM, HOLLAND.—This Dutch firm issues a very comprehensive catalogue of bulbs, in which a large number of subjects not usually listed are described, in addition to the general collections.

JAMES VEITCH AND SONS, LIM., CHELSEA.—A beautifully illustrated catalogue showing special varieties, and also the effects of planting in beds, borders, and masses. Retarded bulbs are given special attention.

STUART LOW AND CO., BUSH HILL PARK, ENFIELD.—A thoroughly well illustrated and amply descriptive list of perpetual, Malmaison, and border carnations, the former occupying the post of honour.

BEES, LIM., MILL STREET, LIVERPOOL.—The special early bulb list is of great interest, as attention is directed to irises, colchicums, nerines, and the earliest of tulips, hyacinths, and narcissi.

G. REUTHE, FOX HILL, KESTON.—This is a combined catalogue of bulbs, new and rare hardy plants, and flowering trees and shrubs. It is an interesting production.

CARTER AND HOWARD, FIFE HOUSE, KINGSTON-ON-THAMES.—A catalogue of distinctive designs of pergolas, summer houses, tea houses, plant and fruit houses, water gardens, and conservatories, and frames and pits. Heating apparatus is included, and a section is devoted to rustic garden furniture.

ARTHUR R. BROWN, LIM., WYCHALL NURSERIES, KING'S NORTON.—A particularly useful catalogue of carnations, the varieties described and arranged in their several sections. New varieties are included, and there is a list of discarded varieties that must prove useful to beginners.

ILLUSTRATIONS.

Portrait of Mr. John Highgate, 619; Trichopilia Lenmanni, 623; The Crown Flower Bed in the West Park, Wolverhampton, 625; Pelargonium Blandfordianum, 626; Pelargonium cordatum, 627; Pelargonium multibracta, 628; Pelargonium artemisioides, 629.

The only resemblance between a Pine Spray Syringe and others is in the shape of the barrel. The metal is more substantial. For the rest, the combination spraying head renders Spray, Rose, and Bend instantly obtainable without the addition or removal of a single fitment, while the adjustable leather bucket plunger gives perfect suction, never allows water to escape past it and up your sleeve, and wears interminably.

A written request from your ironmonger or seedsman, and a Syringe will be sent in 24 hours for your approval. Price **10/6.** Sole proprietors and manufacturers, **Robinson Bros., Ltd., West Bromwich.**

PINE SPRAY SYRINGE (patent).

Employment THE GARDENERS' MAGAZINE Register.

The charge for an Advertisement INCLUDES A FREE ENTRY ON THE REGISTER. Immediate Notice must be given when an engagement is secured.

A List of Gardeners on the Register will be supplied to employers only upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.

SUTTON'S BULB CATALOGUE for 1911.
Beautifully illustrated. Now ready.

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

KELWAY'S MANUAL OF HORTICULTURE is the best of all Garden Books. 2s. post free, from KELWAY and SON, LANGPORT, SOMERSET.

Capt. ———, Londonderry.
10th February, 1911.

"I have received your Horticultural Manual, and on looking through it, I felt compelled to write and thank you for it. To an enthusiastic amateur gardener like myself, who, through reading the weekly papers on the subject, is familiar with many of the names but not with the corresponding flowers, this book must be absolutely invaluable, and the artistic way in which it is got up, and the beautiful photographs with which it is embellished, make it a treasure well worth having. I have had the Catalogues of most of the leading firms sent to me, but nothing compares in the remotest way with yours."

ALPINES.—100 in 50 good varieties, carriage paid, £2. Half and quarter quantities at same rate.
WHITELEGG and PAGE, Chislehurst.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

The Plane Trees in the Mall.

So frequently do we hear complaints of the want of skill shown in the pruning of trees growing alongside the roads in or adjacent to towns, and open spaces generally, that it is extremely pleasant to read now and again of those under the care of public authorities that afford evidence of the application of sound practical knowledge, combined with scientific principle, in the pruning of trees in relation to their environmental conditions. There are in the Mall four rows of young plane trees that we have frequently admired for their symmetrical form and healthy appearance, and our admiration has also extended to the skill displayed by those responsible for their welfare and training, which, necessarily, has to be accomplished by the use of the knife. Early in the year they received their annual pruning, and as this operation attracted the attention of some Members of Parliament many were the questions asked in the House of Commons; and, evidently with a view to allay the fear that the trees had not been skilfully pruned, the First Commissioner of Works undertook to have a report from a leading authority on the manner in which the pruning had been done. In giving effect to this promise he commissioned Professor I. Bayley Balfour, F.R.S., Regius Keeper of the Royal Botanic Gardens, Edinburgh, to report upon the pruning of these planes, and, as briefly stated in our last issue, the report has been recently published. In his opening remarks Professor Bayley Balfour states that he cannot subscribe to the criticism that the trees have been overpruned, for there is no immediate evidence of overpruning in the present condition of the trees, nor suggestion of it in their promise for the future. The plane tree in its youth, it is pointed out, naturally develops an exuberance of primary lateral branches on its stem, and there is a contest for leadership amongst those at the top. As in the case of some other trees, no one of these branches continues its growth by a terminal bud. Arrest and self-pruning takes place, and the elongation of the shoots proceeds from lateral buds nearer to, or farther from, the primary tip. The continuation bud may be the one immediately behind the point of abscission of the shoot tip, but, as is often the case, the shoot may die back to some distance behind the normal abscission line of self-pruning, and, consequently, the elongation of a shoot in any one season is no measure of the permanent addition in length that is to be made to the axis. If the tree grows freely without natural or artificial curtailment a relative heavy brush head is formed of intricate zig-zag branches, of which the tips of some of them may be dead. In the case of trees that are allowed to form these close heavy heads, the surface exposed to the wind is large, with the consequent risk of injury. Many of the primary branches do not survive, in whole or in part, the struggle for air and light with their fellows, and interfere with the development and leafage of the branches that are ultimately successful. In rich soils these characters are naturally exaggerated, and, as a consequence, there is increased risk of injury to the trees from high winds. Necessarily, the art of pruning takes into account all these characters in each individual tree in relation to the conditions both above and below ground, and it is highly gratifying to read that, in Professor Bayley Balfour's opinion, the trees in the Mall "are a picture of the correct art of pruning in relation to environment." The chief factors in the situation in the Mall which have had full consideration from Professor Bayley Balfour in connection with the pruning of the trees are: The soil conditions are such as to promote vigorous growth, with all its advantages and disadvantages; and, planted as isolated specimens in line to form an avenue, the trees are individually exposed in this wide thoroughfare to the full force of the gusty, dust-laden winds that sweep down it. The discipline to which the trees have been subjected in the circumstances of their growth has, in Professor Bayley Balfour's opinion, been admirably adapted to this environment, and in dealing with the details he states that: "(1) The excess of lateral branches has been properly diminished, and the head of the tree has, therefore, been adequately lightened in relation to wind currents, so that risk of upset of the whole tree, and of breaking of branches, has been lessened. (2) There is practically no dead wood on the trees to interfere with the development of healthy branches, or to serve as a seat of infection of disease. (3) The branches which remain have been selected with judgment so as to form a right framework for the future extension of the crown of the tree, and their lateral extension has been checked judiciously so that they have been stimulated to produce quantities of well-placed, leafy shoots which, by their distribution, more than make up for the struggling feeble shoots lost by the removal of the surplus primary lateral branches and the trimming of weak branchlets. No feature of the pruning struck me so forcibly as this one. The checking of these laterals has been most skilfully performed through careful continuous tending of the trees; there has been no vicarious heroic lopping of the kind which frequently passes for pruning. There is no mark of mutilation on the branches; the development of feathery twigs is wonderfully perfect, and an ample leaf surface for the work of the tree in water lifting, breathing, and assimilation has been maintained. (4) The pruning of the laterals has encouraged the steady upward growth of the main stem without forking or divarication of the top. The

MR. R. P. BROTHERSTON.

exuberance of apical growth has, however, been wisely kept in check, and a balance between the apical growth and development of laterals has been thus maintained." Considerable space is devoted in the report to the development of the leaders of plane trees, the manner in which trees in a state of Nature check their leaders, and the necessity of systematically shortening them in the case of trees growing under artificial conditions for the purpose of reducing the risk of their being injured by the wind, and of maintaining a proper balance between the apical and lateral growth. Nothing is said with reference to the proportions of the trees, and it will, therefore, be of interest to mention that, assuming the trees have a height of sixteen feet, the main stem and head are six and ten feet respectively, and the lateral spread of the lower branches is seven feet. These dimensions give as perfect a specimen of the London plane as is possible under the environmental conditions that obtain in towns, and the planes in the Mall may therefore well serve as models for the pruning of this popular tree.

Mr. R. P. Brotherston, the chief of the gardens of Tynninghame, the fine East Lothian seat of the Earl of Haddington, is so well known and highly esteemed throughout the United Kingdom that in presenting our readers with his portrait there is no occasion we should refer to his career otherwise than in the briefest manner. When undergoing the training which fitted him for the important position which he has now for so long a period occupied, Mr. Brotherston had the advantage of spending a portion of his time in good gardens on both sides of the Border. For example, he served his apprenticeship with Mr. Thom, gardener to Lady Eleanor Balfour, at Newtown, Don, and as both mistress and servant were keen gardeners he profited accordingly. Subsequently he went to the gardens of Loxford Hall, which were then under the charge of Mr. James Douglas, V.M.H., and famous for florists' flowers, orchids, chrysanthemums, grapes, and not a few other subjects. At Loxford Hall Mr. Brotherston spent five years, and passed through all the departments, and it is evident that the stay was both pleasant and profitable, for he invariably speaks in appreciative terms of that period in his gardening career. After occupying the position of head gardener for about two years in an establishment near Wimbledon, Mr. Brotherston received in 1874 the appointment of head gardener at Tynninghame, where, with the highly appreciative support of his noble employers, he has done splendid work. Tynninghame gardens are of great extent, and during the past thirty-seven years the walled garden has been greatly altered, and long stretches of hedges, yew, box, and others, with specimen cut cypresses, yews, etc., introduced. There have been other additions, such as a lengthy covered walk of apple trees, herb gardens, little orchards, extensive borders of herbaceous plants, rose and honeysuckle walks, gravel walks altered to others of grass, and borders of rare flowering shrubs. The flower garden proper has not undergone any change in the groundwork, but the schemes of planting and the plants employed are frequently altered. Mr. Brotherston has achieved much distinction as a writer on horticultural subjects, and in the course of his writings, both in his books and his contributions to periodic literature, he has displayed a remarkable knowledge of the old works of gardening. Mr. Brotherston regards himself as having been very fortunate in securing employment with delightful people, and in not having experienced any of the drawbacks or the uncomfortable situations that some have had to bear with. At Tynninghame he has always been treated with, not consideration, but the greatest kindness and indulgence. With such experience it is not surprising he should consider few avocations more desirable than that of a gardener who secures a standing with a good family.

Presentation to a Scottish Amateur Gardener.—A deputation waited upon Mr. William Kilgour, Kincardine, Blair Drummond, Perthshire, the other evening, and presented him with a purse of sovereigns, on the occasion of his retiring, after thirty-six years' service, from the post of head master of Kincardine School, and going to reside in Glasgow. Highly appreciative references were made to Mr. Kilgour's services, and he made a suitable reply. Mr. Kilgour also received a handsome present from Lady Georgina Home Drummond and Captain Home Drummond Moray, of Blair Drummond, and the pupils of the school gave him a rose bowl. Mr. Kilgour is one of the most experienced and able Scottish amateur gardeners, and his acquaintance with his brethren of the craft—professional and amateur—is a wide one. Long ago he entered on the cultivation of the auricula and other florists' flowers, and he has not lost his liking for these early favourites of his, although he has cultivated well many other subjects. He is highly esteemed by all his brother gardeners.

The Charms of Alpine Scenery should, in the opinion of some writers, be enjoyed by those only who have ample leisure and sufficient means to enable them to travel considerable distances in mountainous regions without the aid of railways; and usually we have in the holiday season at least one expression of opinion upon this point. In this connection it is interesting to recall the fact that Ruskin states as his opinion, in "Modern Painters," that "The best image which the world can give of Paradise is in the slope of the meadows, orchards, and cornfields on the sides of a great Alp, with its purple rocks and eternal snows above; this excellence not being in any wise a matter referable to feeling or individual preferences, but demonstrable by calm enumeration of the number of lovely colours on the rocks, the varied grouping of the trees, and the quantity of noble incidents in stream, crag, or cloud presented to the eye at any given moment." Whether able to accept Ruskin's views of the Alps or not, there is no difficulty in giving expression to the opinion that it is impossible for anyone possessing ordinary intelligence and some love of Nature to visit alpine regions, with their wondrously beautiful scenery and wealth of flowers, without having the mind refreshed and the body strengthened. If this be so, why object to those who have but little time for holiday-making visiting them? Dr. Horton tells us, in a recent issue of the "Sunday at Home," that an "awful depression" settled upon his mind as he realised when in Switzerland last year what holidays are making of that country. "Holidays," he writes, "like a colossal and miasmatic mist, have crept over even the Alps." Then, after giving vigorous expression to his views on what is being done as the result of ordinary folks spending their holidays in Switzerland, he states: "Trains run everywhere, not only along the valleys, but up the mountains"; and then he asserts: "Boring through the mountains, they worm their way up the summits. The foul smoke of the engines defiles the cowl of the Mönch and the stainless robe of the Jungfrau." But we would remind Dr. Horton that assertion is not necessarily fact, and ask him since when has the Jungfrau Railway reached the summit of that mountain? Also since when have "engines" deriving their motive power from electricity given off "smoke," foul or otherwise, that has ascended to a height of between 3,000 and 4,000ft.? It is beyond our province to discuss holidays and railways in a general way, but we hold very decided views as to the enormous advantage of spending holidays, whether at home or abroad, where it is possible to fully enjoy the varied charms of Nature.

The Pageant of Empire Rose Show, to which reference was made in our last issue, will, according to the present arrangement, be held on September 28 and 29.

Proposal to Replant the Appian Way.—A wealthy lover of the civilisation of ancient Rome has proposed to the city that if the city will take out the acacias and other plants which now encumber the Appian Way, the "Queen of Roads," he will present to the city a thousand cypress and umbrella pines, that the road may be replanted as it was in the great days of Rome.

Weeds of Ontario.—The Ontario Department of Agriculture has issued a bulletin (No. 188) devoted to the weeds with which cultivators in Ontario have to contend. The bulletin has been prepared by Mr. J. E. Howitt, who may be heartily congratulated on the success he has achieved in his endeavour to provide both gardeners and farmers with trustworthy information on "plants out of place," which, in Ontario, as elsewhere, add materially to both difficulties and cost of crop productions. The bulletin is freely illustrated, the descriptions are clear, and the directions for the eradication of the several kinds are of an essentially practical character.

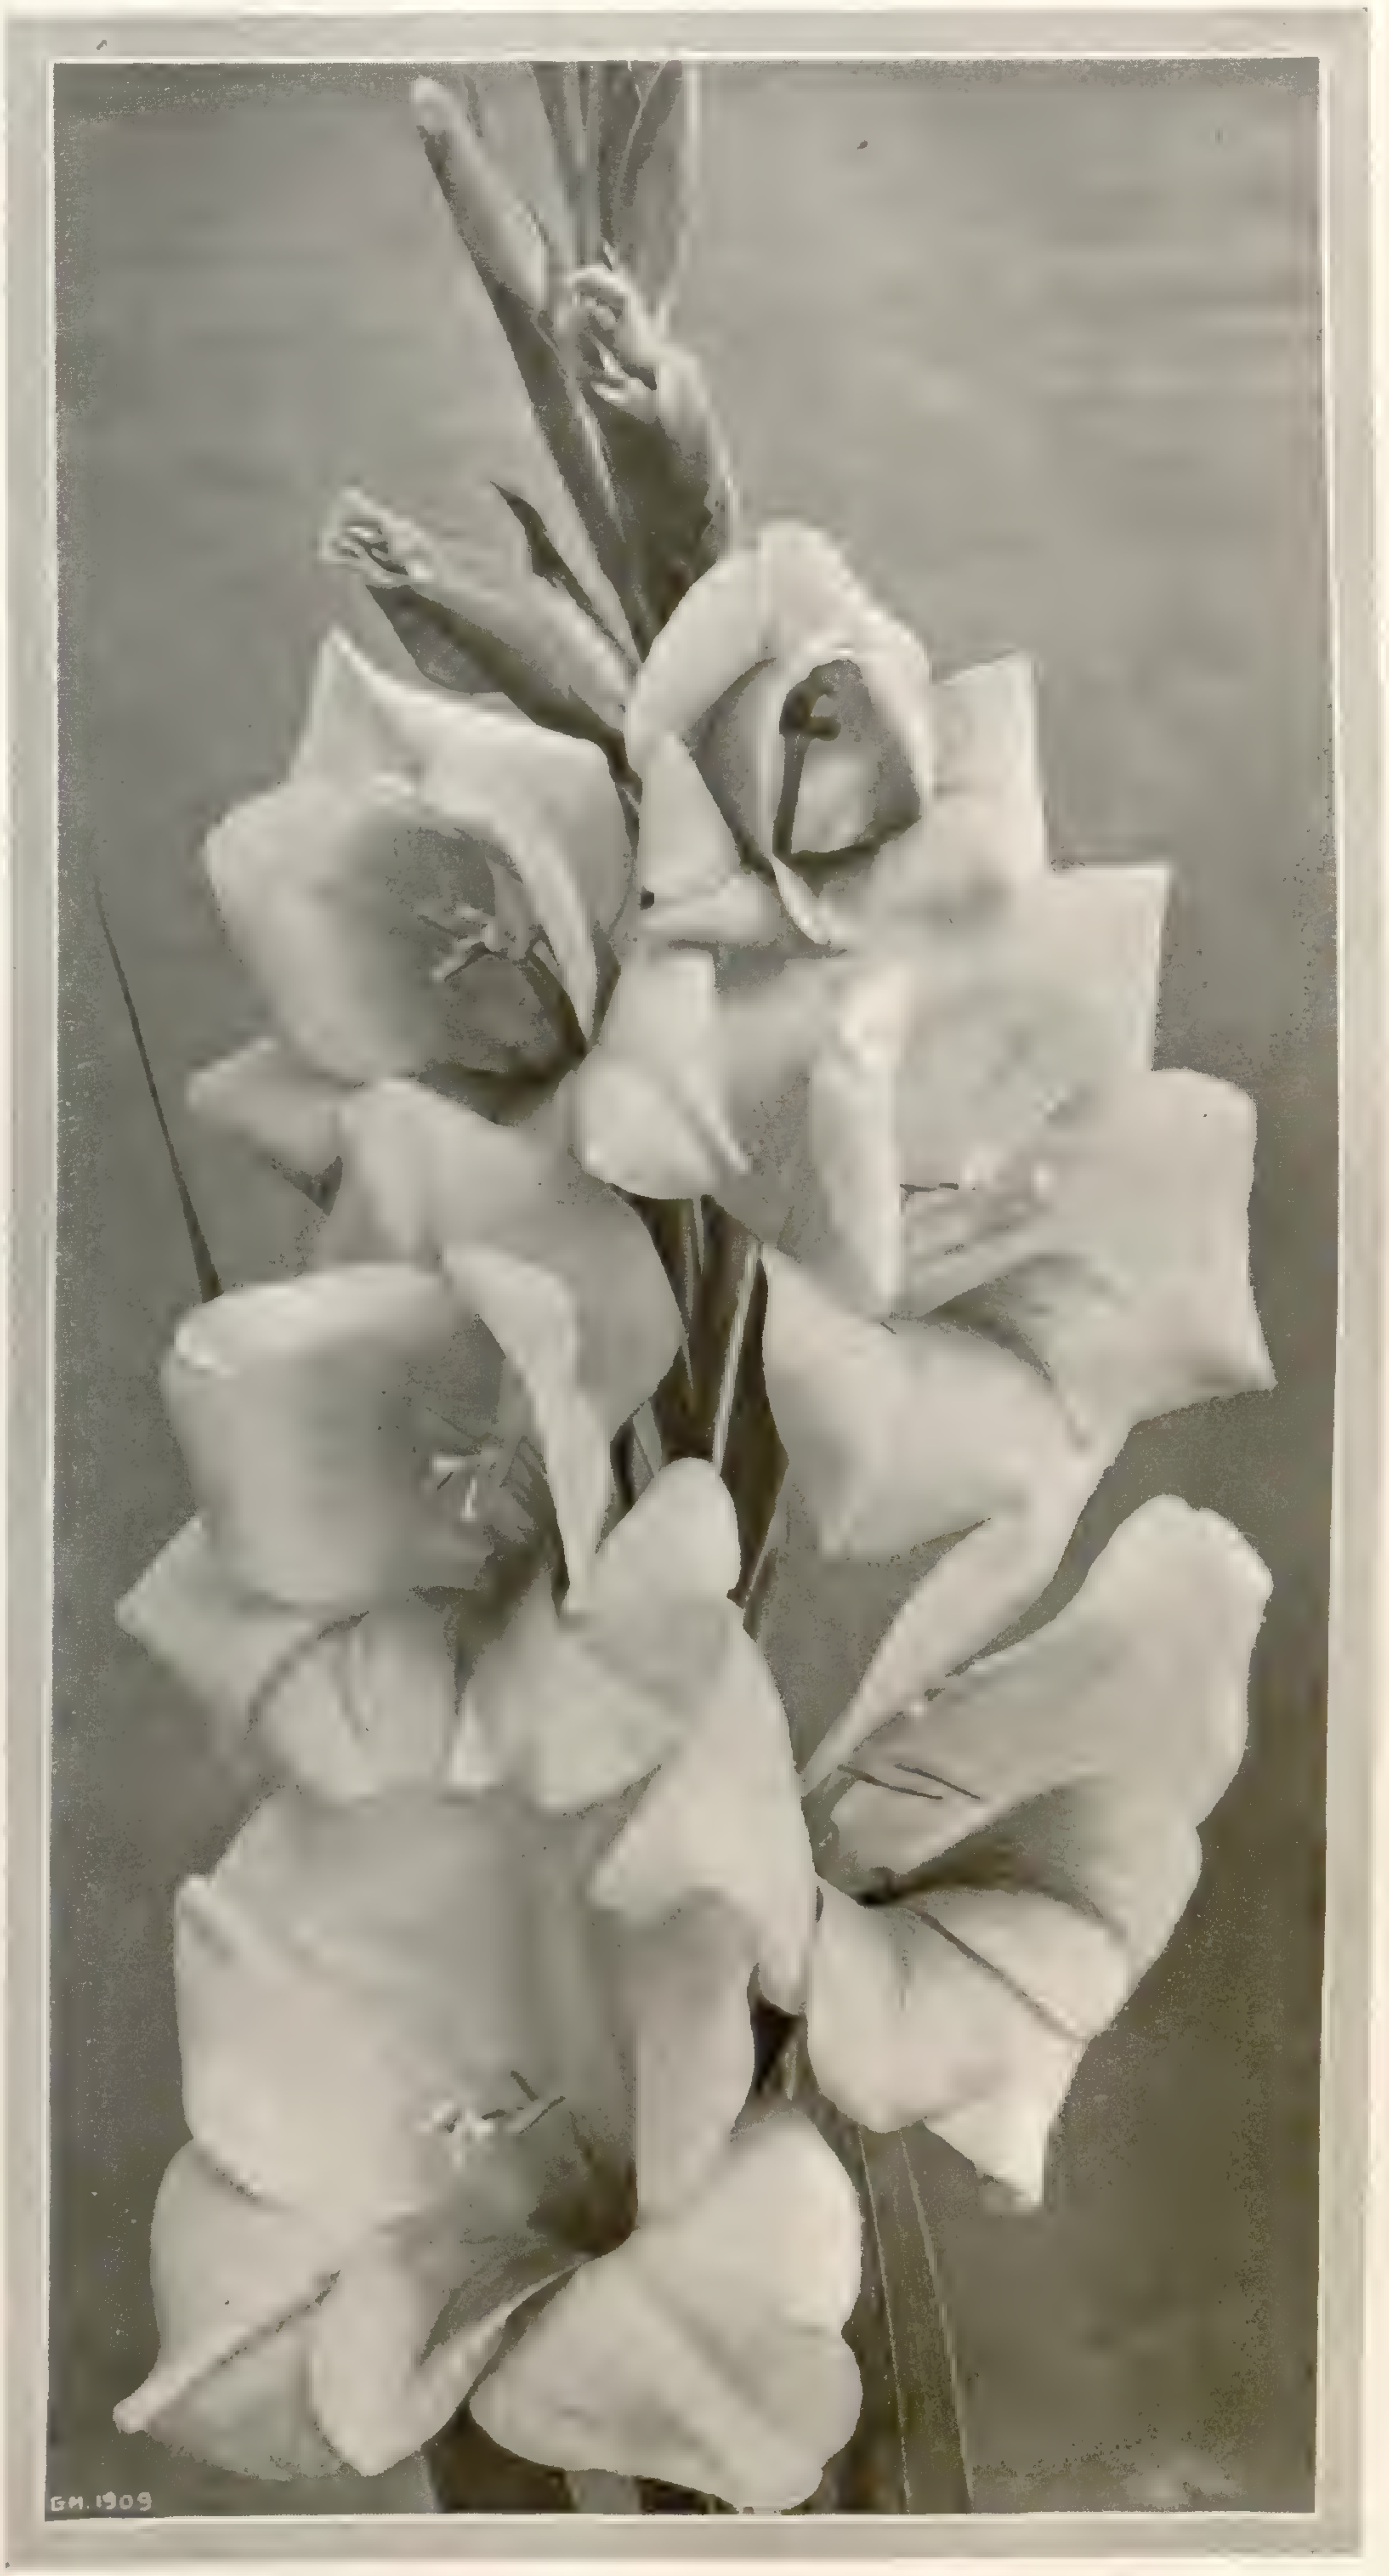
Apple Orchard Competitions in Ulster.—With a view to bringing about an improvement in the management of orchards in the North of Ireland, the Ulster Horticultural Society instituted, some eight years ago, a series of competitions among owners of orchards, which have created much interest, and proved highly beneficial in their influence upon orchard management. The society offered two challenge cups, known respectively as the Aberdeen and Gibson Cups, with substantial prizes in cash. For a time the competition for these prizes was limited, but it has increased so rapidly of late years that there were sixteen competitors for the two challenge cups and the cash prizes. The Aberdeen Cup is offered for competition among owners of orchards without limit as to their area; and the competition for the Gibson Cup is limited to those whose orchards do not exceed three acres. Until last year the society mentioned provided the whole of the prizes, and defrayed the cost of making the awards, but this season, the Department of Agriculture, recognising the immense influence for good that the competitions are exercising, has rendered substantial assistance, financially and otherwise. Two-days were devoted to the judging, and the judges were accompanied by representatives of the Department of Agriculture, and Ulster Fruit Growers' Association, and the committee and secretaries of the Ulster Horticultural Society. The orchards were judged by a scale of points as under: 1. Cultivation and treatment of ground: (a) Cleanliness, 15 points; (b) condition, 20 points; (c) freedom of apple trees from injury caused by cultivation or cropping, 15 points—total, 50 points. 2. Treatment of apple trees above ground: (a) Health, freedom from moss, lichen, insect, and fungoid pests, 30 points; (b) pruning and training, 20 points—total, 50 points. 3. Quantity of apples, irrespective of age or variety of tree, 40 points. 4. Quality of apples: (a) Size, colour, freedom from blemish, or disease, 30 points; (b) commercial value per acre, 30 points—total, 60 points. Total, 200 points. At the close of the tour of inspection the judges made their awards as under: Aberdeen Cup.—First prize, Mr. Felix Coyne, Moy, 179 points; second prize, Mr. J. Bonis, Moy, 157 points; third prize, Mr. J. Donnelly, Blackwater Town, 151 points. Gibson Cup.—First prize, Mr. J. Moffett, Lisnamintry, 168 points; second prize, Mr. R. Graham, Tydannet, 166 points; third prize, Mr. Thomas Lavery, Summer Island, 157 points.

Reading Horticultural Society will not hold an exhibition this year, and with reference to this matter Mr. Herbert W. Dunlop, chairman of the committee, has issued a circular intimating that in consequence of the trying season and its effects upon horticultural produce generally, it is considered very doubtful whether it would be at all possible to obtain a really representative or successful exhibition this year. The committee, he states, have, therefore, very reluctantly decided not to hold a show, as they consider they would, under the circumstances, be running great risk in attempting it. They trust that both exhibitors and subscribers, who have a full knowledge of the society, will appreciate the position, and agree that the decision is a wise one. The committee express the hope that the supporters of the society will continue their subscriptions although there will be no show, as the financial position is not a strong one, and this will enable them to make renewed efforts another season.

Prize-winning Station Gardens.—The annual competition for the prizes offered for the best-kept station gardens along the line of the Glasgow and South-Western Railway has been concluded, and the awards of the judges have been published. The gardens along the railway are generally maintained in good order, and some are the object of high praise on the part of travellers along the system. According to the rules, so many stations at which prizes have been previously awarded are ruled out for the year, and the following have been awarded the premiums: First Class, £6.—Dalmellington, Mr. Taylor; Racks, Mr. Craig; Mountgreenan, Mr. Blackwood; Lochanhead, Mr. Mirrey; Cunninghamhead, Mr. Hamilton; Glenside, Mr. Stewart. Second Class, £4.—Sanquhar, Mr. Yeudall; Maxwelltown, Mr. Faulds; Maybole, Mr. Kerr; Moniaive, Mr. Macdonald; Saltcoats, Mr. Frew; Closeburn, Mr. Faulder; Killywhan, Mr. Kelly; Paisley West, Mr. Hay. Third Class, £3.—Carronbridge, Mr. Dunlop; Kirkgunzeon, Mr. Patrick; Kilkerran, Mr. Reid; Maidens, Mr. Taylor; Dunure, Mr. Bechet; Alloway, Mr. Gillies. Fourth Class, £2.—Gretna Green, Mr. Gibson; Tarbolton, Mr. Reid; Mauchline, Mr. O'Hagan; Houston, Mr. Harvey. Fifth Class, £1.—Auchincruive, Mr. Walker; Southwick, Mr. Wallace; Holywood, Mr. M'Cardle; Pinmore, Mr. Dunlop; Newtonairds, Mr. M'Dougall; Knoweside, Mr. Stoddart.

WINTER SALADS.

The seemingly ever-increasing demand for material to replenish the salad bowl entails upon the grower a considerable amount of forethought and painstaking labour to maintain a full supply the whole year round. This, of course, is more difficult of accomplishment at midwinter and early spring than at other times; although, in many places, the present summer, owing to the excessive heat and lack of moisture, has proved very unfavourable to the quality and lasting properties of many plants, notably lettuces, which are regarded as the mainstay at this season. The cause of this was not due to paucity of growth, but the reverse—the plants advancing to the seeding stage ere they attained a useful size, and the crisp succulent heart so much prized in hot weather was wanting.



GLADIOLUS YELLOW BEAUTY.

A beautiful variety, the flowers soft sulphur yellow, lemon yellow at the base of the lower segments. A.M., R.H.S., August 29. Messrs. Kelway and Son, Langport.

Lettuces and Endive.

Seeds of both of these committed to the soil in a partially shaded position a short time ago will now have produced seedlings, and every possible care, by way of timely thinning out, waterings, and frequent stirring of the surface soil should be carried out. The surplus plants withdrawn from the rows may with advantage be replanted upon a well-prepared site, taking the precaution before doing so to immerse the roots for a time in a mixture of soot, soil, and water of due consistency, and if temporary shade can be afterwards afforded until re-establishment takes place much benefit will accrue therefrom.

Lettuces thus manipulated will probably have to be removed in due course to some form of shelter, where they will be safe from excessive wet and severe frost. In this way frames at present containing various seasonal crops can be turned to good account as these are cleared, the plants referred to being lifted with a ball of soil attached to each, and, after being divested of decaying leaves, be planted in such a way that space for growth and a circulation of air is left between them.

Endive, being considerably hardier than lettuce, is correspondingly of less trouble to grow, though it is not advisable to leave the early curled forms unprotected during frost, and all full-grown plants, even of the Batavian variety, which is the most enduring of any, should be efficiently protected by the middle of November, previous to which date mats or other coverings placed over the plants during the short sharp spells of frost that may occur are sufficient.

As the early-sown plants become developed some means of blanching the central part, or heart, must be devised. This may be done in various ways, as by placing an inverted flower pot over them, or by gently drawing the outer leaves together in the form of a cone, and making secure with a strip of matting. When the season becomes further advanced the best course is to lift the plants, whether from the open or frames, and place them in a quite dark position in a slightly heated room, stable, or outhouse, where, in about ten days, the leaves become white, and quite crisp. The number of plants thus treated should be carefully regulated by the demand, thus preventing waste, for when thoroughly blanched symptoms of decay soon appear.

Whichever method is adopted, interference with the plants should be carried out only when these are quite dry. A further sowing of both lettuce and endive seed for obtaining plants for spring and early summer use may now be made, as with slight protection in very inclement periods these will pass through the winter safely, and prove very useful at the seasons named. Of the former Bath Cos and All the Year Round cabbage are reliable, while Batavian is, as already stated, the most hardy endive.

Beetroot.

Small, well-tapered roots are preferable to large ones, hence late sowing in moderately rich, well-worked soil gives the best results. Where specially grown for salad a portion of the crop may with but little risk of injury from frost be left where grown until wanted for use, better flavour and higher colour being thereby assured.

Onions.

In the young state these are often in request for mixing with other ingredients, consequently sowings at various times, from early spring until September, should be made to maintain a regular supply. The earliest sowings may be made in boxes in a brisk warmth in January, while later, and throughout the summer, the usual methods of open-air culture may be adopted.

Radishes.

With many these are considered indispensable, and they are not difficult to cultivate in spring and early summer. In very hot weather the roots become tough and unpalatable rather quickly, even when grown in a cool situation. For earliest use the smaller types, like Giant Forcing, French Breakfast, and Wood's Frame are best. For summer the Crimson Olive-shaped is unequalled, while for autumn and early winter the last-named, the turnip-rooted, and Black Spanish, will carry on the longest possible supply. Any of the three latter may be sown this month, after which outside sowings are valueless.

Celery.

This moisture-loving crop has, owing to the drought, caused much labour this season, but where the work of watering has been well carried out ample reward will doubtless be forthcoming. From now onwards, next to water supplies, will be the need of properly blanching the plants. A soil fairly free from worms and grubs, or that can be rendered so by applications of soot or salt, may be placed directly around the plants after cleaning the latter of any side growths or bad leaves, using not more than six inches in depth of soil in the first instance, but adding more from time to time until the head of foliage only appears above. In soil much infested with insect life a sheet of brown paper folded neatly around each plant previous to soiling is of great assistance in obtaining the desired length and purity of blanched stalk.

Mustard and Cress.

This well-known combination is quickly and easily grown where slight warmth and moisture are available, and the modes of culture vary considerably. In general a level surface of rich soil, upon which the seeds may be thickly sown, and simply pressed in, applying shade and moisture as may be necessary, is the most certain of any.

Besides the foregoing such adjuncts as tarragon, chervil, chives, and garlic are often asked for, though probably less frequently at the present time than formerly. All are of easy culture, and, with the exception of chervil, are lasting when once planted. The last-named must be sown several times during the growing season to maintain a continuous supply.

James Day.

BACTERIOSIS OF THE POTATO AND TOMATO.

The disease termed bacteriosis of the potato and tomato has been known for some time in the United States, where it has been carefully studied by Dr. Erwin F. Smith. The organism concerned is called Bacillus solanacearum, E. F. Smith. Potatoes, tomatoes, and egg-plants are attacked, sometimes on a large scale, in America. In Great Britain the disease was first observed in 1902 in small quantity on potatoes grown in the North of England and in Scotland. During 1910 it attacked tomatoes to a somewhat serious extent, examples having been received at Kew from two localities, where it was stated to be present in an epidemic condition.

Description.

Tomatoes.—The symptoms indicating the presence of the disease on tomatoes are well marked. Infection usually takes place at or near the tip of the stem, the disease gradually working downwards, passing into the leaves and flowering shoots as it does so, until the root is reached. Shortly after infection the uppermost leaves commence to wilt, curl up, and turn yellow. The leaves become marked with many rather small, scattered, blackish-brown blotches, and long dark-brown streaks appear on the surface of the stem. If the stem be cut across, the vascular bundles or woody portions present a brown appearance, and on microscopic examination the vessels are found to be teeming with bacteria. The fruit also becomes more or less covered with dark-coloured blotches, which at first are quite superficial, but gradually increase in size and assume a watery consistence, finally collapsing and forming irregular pits on the surface of the fruit. After the spots on the fruit, which are at first crowded with bacteria, have collapsed, various kinds of fungi and bacteria gain an entrance through the broken fruit, which is speedily reduced to pulp. Diseased plants gradually droop and die from the top downwards.

Potatoes.—In potatoes the symptoms are somewhat similar to those described above. The uppermost leaves droop first, and the stem becomes very conspicuously marked with blackish longitudinal streaks. The vascular bundles are also browned, owing to the presence of the bacteria, which travel along the vessels of the underground branches and pass into the tubers, where their presence is indicated by a more or less decided brown ring situated a small distance from the outside of the tuber, and corresponding to the position of the vascular-bundle ring of the tuber. As an infected tuber increases in size the bacteria encroach on the central mass enclosed by the vascular ring; the central mass then gradually assumes a brown colour, and finally becomes soft and rotten, leaving a thin outside crust intact. This shell is usually broken when the potatoes are lifted, and its contents, swarming with bacteria, remain in the land.

Preventive and Remedial Measures.

1.—Bacteria have occurred abundantly in the substance of partly ripe tomatoes; hence, owing to the difficulty experienced in thoroughly removing the glairy coating from the seed, it is highly probable that bacteria would become locked up in this substance as it dried round the seed, and on being released during germination would endanger the crop. Seed obtained from fruit grown in an infected area should therefore not be used.

2.—In the case of potatoes, Dr. Smith has shown that the rapid spread of the disease is caused by insects of various kinds, which feed alternately on diseased and healthy plants. The numerous isolated patches of disease on the fruit and leaves of the tomatoes examined at Kew support this view. To prevent this the plants should be sprayed with Bordeaux mixture containing an insecticide, such as Paris green, which would answer the double purpose of warding off insects and preventing the appearance of Phytophthora infestans, Cladosporium fulvum, and other pests. A suitable mixture for the purpose may be made as follows:

Paris Green and Bordeaux Mixture.

Quicklime	10 lb.
Bluestone (copper sulphate)	10 lb.
Paris green	8 ozs.
Water	100 gallons.

Mix the Paris green into a paste with a little warm water, then add to the Bordeaux mixture, and stir thoroughly.

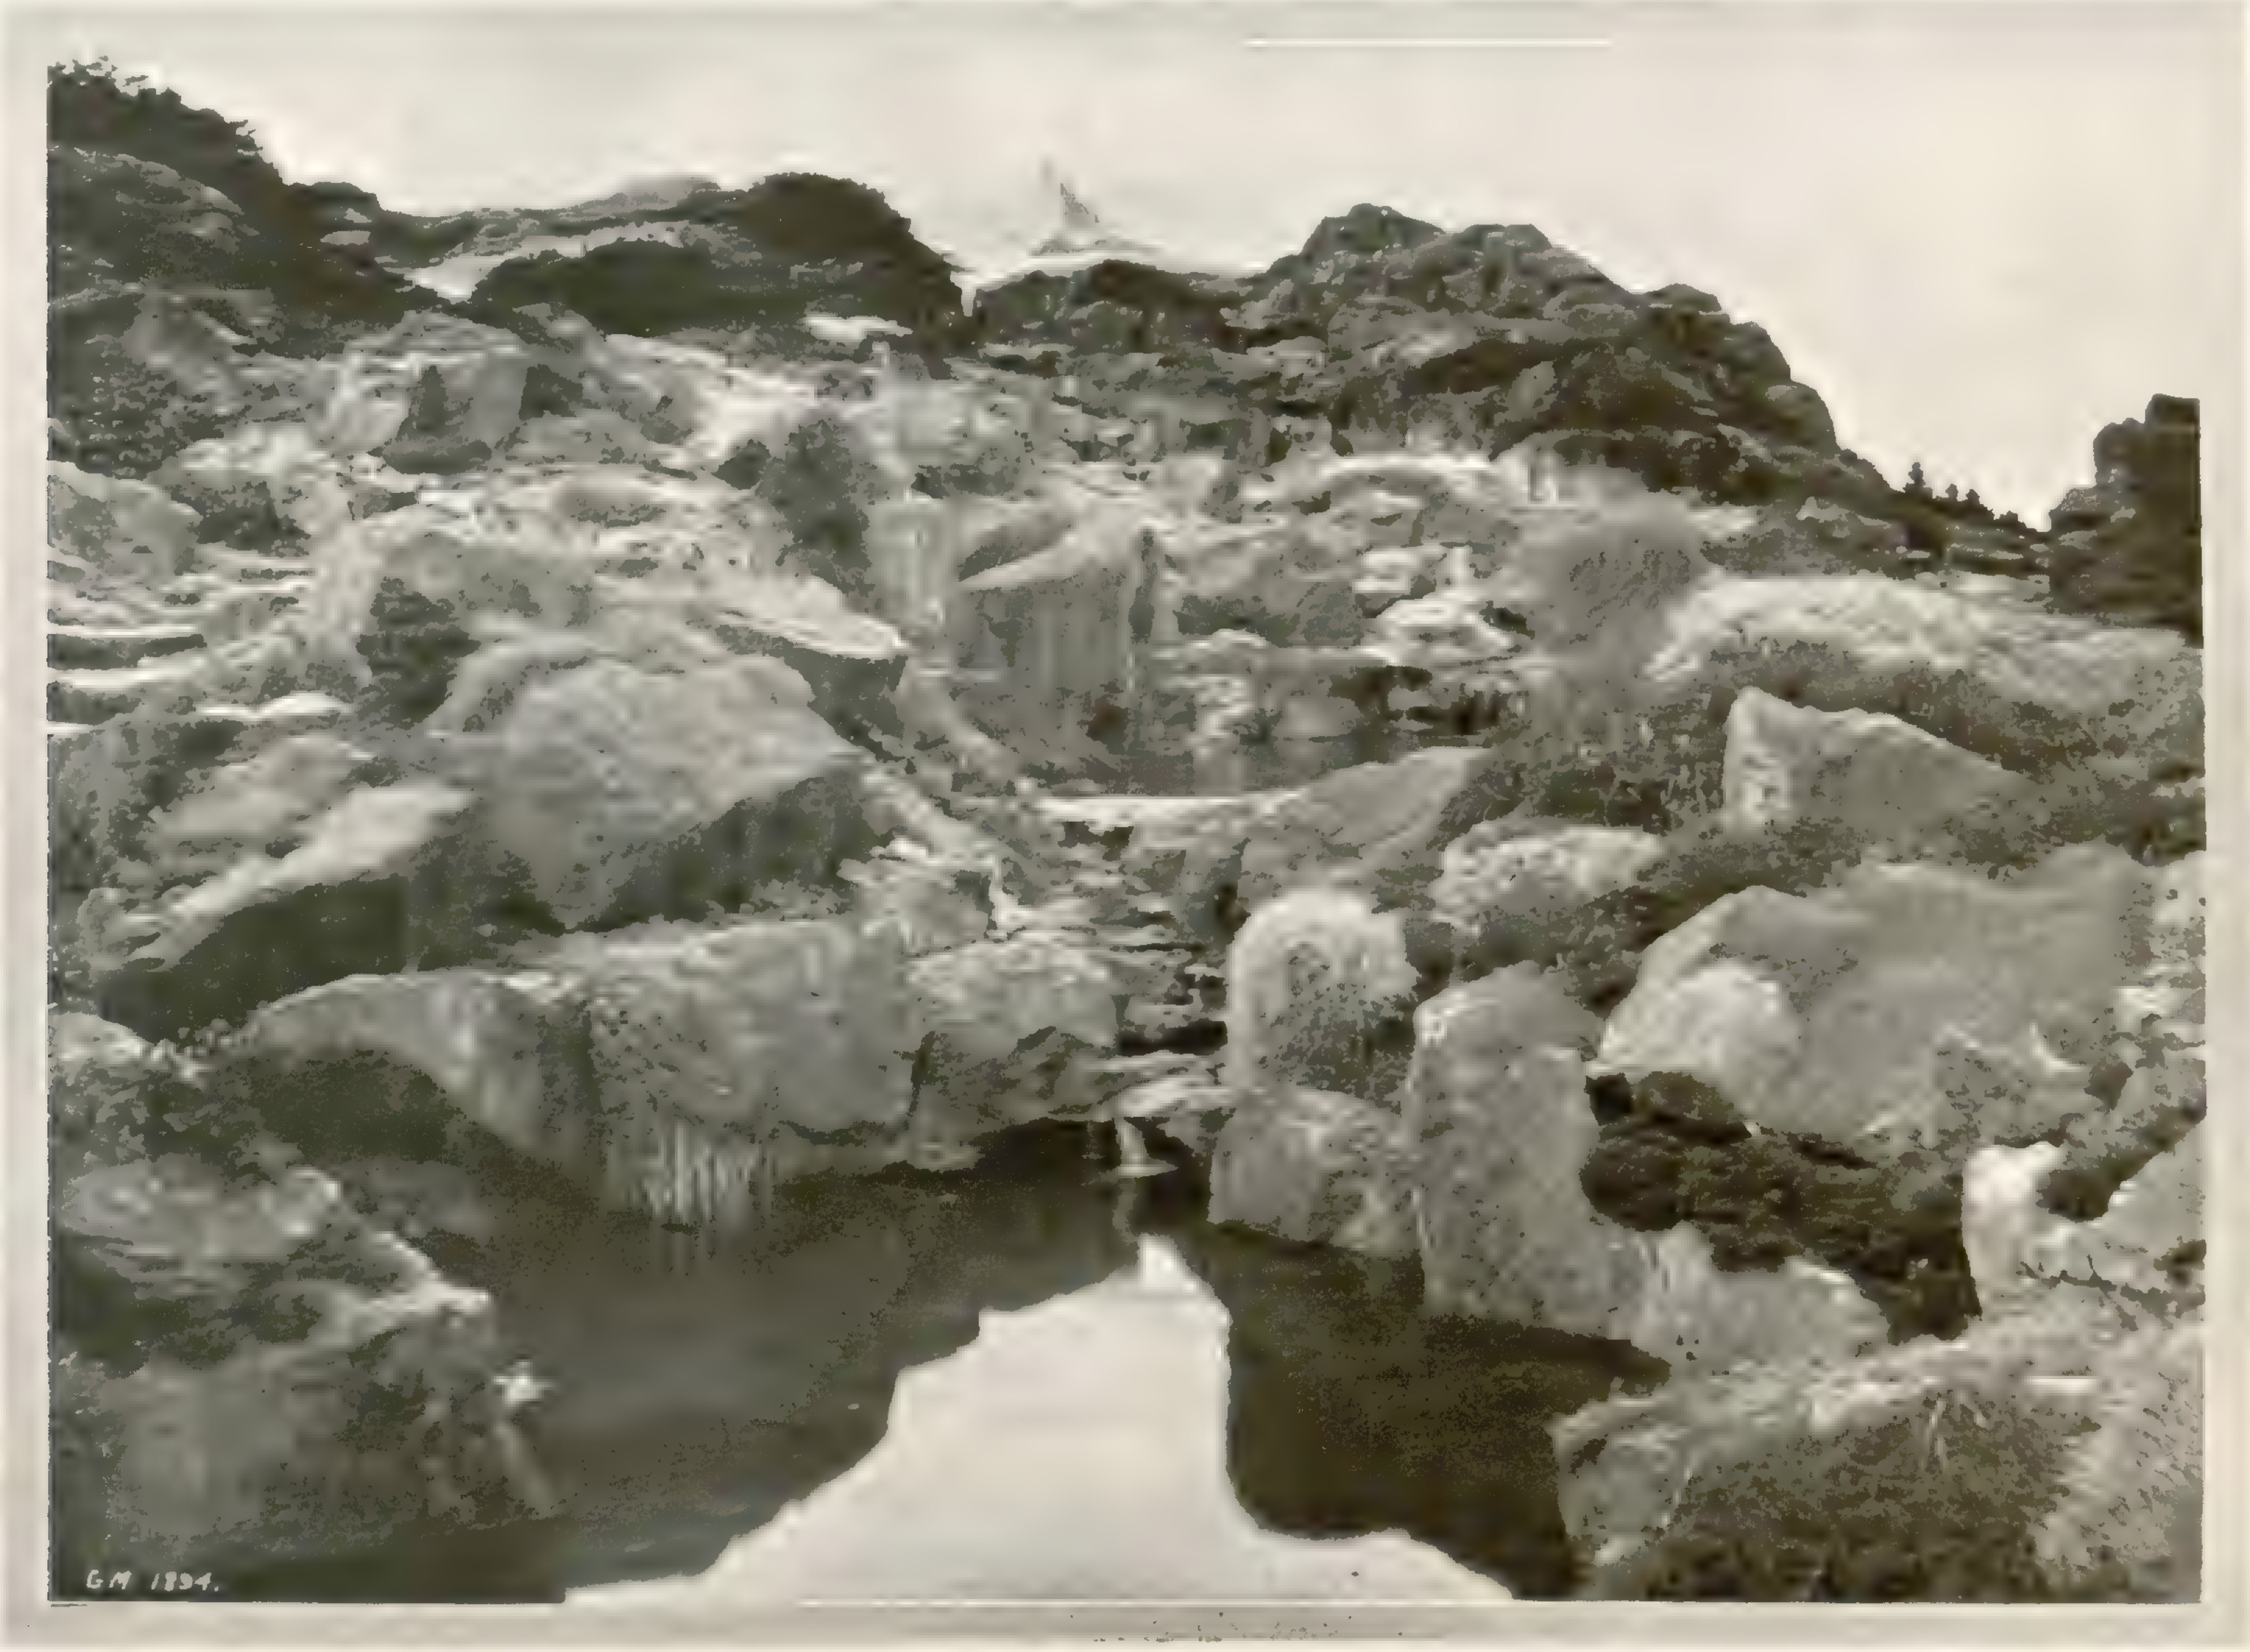
3.—Potato tubers showing the slightest trace of an internal brown ring should not be used for "sets"; in fact, potatoes from an infected district should be avoided.

4.—Soil that has produced a diseased crop should be treated with gas-lime or with superphosphate of lime.—Board of Agriculture Leaflet.

Begonia Triomph de Lorraine.—This is one of the best of the double-flowered forms of Begonia semperflorens, several of which were put into commerce a few years ago. Triomph de Lorraine is of somewhat upright growth, reaching a height of eighteen inches or thereabouts. The foliage under exposure to the sun acquires a rich bright crimson tint, and, as a contrast to light-foliaged subjects, it is for bedding much appreciated. From the fact that the flowers are of somewhat the same colour as the leaves the foliage is regarded as the main attraction.—W. T.

FRIAR PARK ROCK GARDEN.

Friar Park, Henley-on-Thames, the home of Sir Frank Crisp, by virtue of its immense collection of plants, both rare and familiar, represents an absolute Paradise, not only for the botanist, but for everyone inspired by a real love for Nature's unsophisticated vegetation, and the result of man's intervention as a selective factor. When it is stated that at least some fifteen thousand different species and varieties of plants find there a congenial home, whether as tree, shrub, or minuter specimens, it is clear that anything like a comprehensive description of the place and its contents would mean volumes, and that an article can only embrace a section, and even then only treat it superficially. When Sir Frank first took up his residence at Friar Park the spot now occupied by his world-renowned rock garden which has been selected as my theme was but an open sloping area, entirely unbroken; a faint idea of what it is now may be gathered by the two illustrations given herewith. None, however, but the contriver and his able assistant, his head gardener, Mr. Knowles, can grasp the amount of careful study of geological conditions, and the needs of alpine plants, destined to occupy it, together with the pains involved in the arrangement of bold rockery scenery, and means of access to all points by apparently natural and entirely unobtrusive pathways and steps which were involved in carrying out the bold conception whose fulfilment was aimed at.



[Photo: H. N. King.

A VIEW IN THE ROCK GARDEN, FRIAR PARK, WITH A GLIMPSE OF THE MATTERHORN.

Many thousands of tons of huge rock masses, many of them seven or more tons in individual weight, had to be brought hither from long distances, mostly from Yorkshire, and an immense excavation was necessary to form a veritable valley, whose sides were destined to be walled in and diversified on natural lines with such material. Over and over again these unwieldy masses had to be shifted and rearranged to satisfy the fastidious taste of the owner, and, meanwhile, as we have said, it was not a mere question of picturesque massing, but also of contriving the myriad congenial nooks, recesses, pockets, and tiny platforms, in and on which alpine plants could thrive, and make themselves truly at home. Bit by bit, however, the desired end was accomplished, and, finally, as a crowning touch to the whole, the bold idea was conceived of creating the "Matterhorn" on the highest point.

The result is nothing less than wonderful. Seated in or near to the pretty châlet deep down the valley, we now gaze up a deep tortuous ravine, traversed by a stream which forms a series of cascades and still pools in which the trout are entirely at home, while all around the rock faces and recesses are clothed with lovely vegetation. Nowhere can there be detected a trace of artificiality, and, looking upward and around, it is indeed all but impossible to divest oneself of the belief that the whole "creation" is not the outcome of a human idea, but the work of purely natural forces. Leaving the châlet, we find that innumerable mountain paths and stepping stones permit of easy access to the botanical treasures which peep everywhere from minute chinks and crannies, fill larger recesses beneath the sheltering rocks, sweep in veritable sheets of intermingled flower and foliage over the rocky slopes, or tower upwards as shrubs, or even trees where the circumstances permit of bolder growth, to form a background.

On the bare crests of some of the rock masses the sedums, saxifrages, androsaces, and other more or less dwarf gems of alpine vegetation form beautiful clumps and clusters. The arabis, aubrietias, alyssums, and similar more spreading growths form vegetable cascades down precipitous slopes, and in the late spring clothe them with brilliant sheets of flowers, to be followed later on by even more glowing displays of the dianthus, or pink family, which then forms one of the most attractive features of the glen. Every nook we pass has its appropriate tenant, and out of sight, but always there, we may find its name on an unobtrusive, but imperishable label. Devious side paths conduct us to ever-new surprises; one near the bluffs which terminate the prospect below the "Matterhorn" peak reveals a fine collection of native ferns in all their beauty, sheltered from sun and wind by huge masses of rock, and rooting in carefully prepared mould between their gaps and crevices.

Everywhere, indeed, we see the most assiduous care devoted to the individual needs of the plants concerned, as regards soil, position, and the other factors which mean successful culture. Quite recently this rockery has been largely extended beyond the "Matterhorn" peak, and to the left of our picture, thus affording room for a largely increased number of plants, whose name is already legion. One of the greatest charms of the valley described is the fact that at no point is anything visible to clash with the illusion; the very entrance to it from the adjacent mansion, which entrance is depicted in the second of the illustrations, is built up of huge rocks, through which a devious path, lined with ferns and other naturally located plants, leads us to a point just above the châlet. Here the jocular side of our host is probably evidenced by the loan of an opera glass, through which we not merely see the "Matterhorn" in detail, but even a group of chamois on the heights below the snowfield, at its foot, these, of course, consisting of tiny models placed there to enhance the illusion, but often the source of considerable amusement, and sometimes amazement, to puzzled visitors who do not suspect a joke. In the pools of the stream we see the beautiful waxen flowers of Aponogeton distachyon, some choice water lilies, and a number of rare aquatic plants, while here and there on the slopes, near the pools, water turtles may be seen basking in the sun. In short, when the visitor considers the transformation implied in our short description of the original site of this extraordinary rockery and its present appearance, he can hardly fail to be astounded at the natural result; but he is likely to be still more astonished when told that much of the natural scenery beheld is permeated below by labyrinthine caves, caverns, grottoes, and icy recesses, forming an underland as marvellous almost in its artificiality and humorous contents and contrivances as the "overland" in front of him.

It is not, however, our province to deal with this "section" of the attractions of Friar Park. It would demand an article to itself, in which, with humour and a love for the grim and weird, would be exemplified quite outside our own special domain of horticulture. Suffice it to say with regard to this, and the many other wonders of Sir Frank Crisp's domain, that he very kindly permits the public to visit them every Wednesday from May to September from 2 p.m. to 6 p.m. for a small fee imposed for the benefit of certain charities, and that he has written a "Guide" which in itself is an epitome of learning, humour, and botanical lore.

Chas. T. Druery, V.M.H., F.L.S.

THE TURNIP FLY AND GREEN CROPS.

It has been a very difficult matter, during the recent dry weather, to rear seedlings of green crops, especially those of turnips. In the "Chester Chronicle," the writer of "Farm Notes" refers to the experience of a Wiltshire farmer who drilled in four pounds of black sulphur per acre last year, and did not lose any plants, although in the same neighbourhood where the plants were not thus treated, the fly did great havoc amongst them. Other cultivators have acted on his advice this year with equally satisfactory results. I have also heard that if the seeds are first soaked in turpentine for a few hours, then allowed to dry in a cool place for a similar period before being sown, that the fly will not touch the young seedlings. I have not tried the remedy, or rather, preventive; it may act very well, but I would advise inexperienced cultivators to try it on a very small scale first. I have had much experience in growing turnips in a very light soil, and I found that if road dust was sprinkled over the seedlings very early in the morning, while they were moist with dew, the fly did not do them much damage. The frequent use of the Dutch hoe is also a deterrent.

G. B.

The Chimney Campanula (Campanula pyramidalis).—When the summer is on the wane many of the occupants of the greenhouse that have done duty for some time lose their freshness, and it is then that this campanula is particularly valuable. It is a plant that well repays attention, for if starved during its most critical period, that is as the spikes are developing, it will give a comparatively poor display. Not only is this campanula of value for the embellishment of the greenhouse, but it is often used to break up the formal outline of groups of plants at many of the exhibitions, which are so numerous at the period when it is at its best. Some magnificent examples were shown last August at a meeting of the Royal Horticultural Society, and one of them was illustrated in the Gardeners' Magazine of October 15.—W. T.

AUGUST IN THE WILD GARDEN.

A few notes upon the wild garden just at the present time may perhaps be of interest to garden-lovers. The drought that prevailed from the beginning of July has hastened the departure of many blossoms, and trees and plants are alike suffering for the want of rain.

Gladioli, which give such glorious colourings grouped upon the slopes among other subjects, were early in coming into beauty. In effect the tall spikes of blossom are decidedly pleasing, especially if grouped near lighter habited and paler hued flowers. Gauras, which are always a delight when grouped by the sides of the stone pathways, or with the astilbes at the waterside, have not failed to make good growth again this season, but the great heat and soil dryness have tended to shorten the duration of the blossoms more than usual. The large numbers of the sprays of white butterfly blossoms form an attractive feature in any garden, and this species and its companion, Gaura coccinea (which unfortunately is so rarely offered), are deserving of far greater appreciation than they receive at the present day.

I must record, too, the value of the "blue thistles" for wild gardening. Take, for instance, the blue globular blossoms of Echinops ritro, and the exquisite metallic blue shades, and interesting forms of Eryngium amethystinum, E. Oliverianum, E. planum, and E. tripartitum. These are superb arranged in bold groups, and if one adds the silvery Echinops sphærocephalus, and the ivory-hued Eryngium giganteum and E. spinosum, the blues of the foregoing forms are greatly enhanced by the contrast with the latter.

Though the main display of the delphiniums was greatly affected by the dryness, the plants produced secondary spikes of great beauty. It is notable that young plants bedded out in spring are much better for producing successional blooms than older established clumps, proving the advantage of a frequent renewal of stock by propagation and transplanting. We have now the spring-raised plants of the Belladonna hybrids in flower, and the dainty spikes of pale blue, in combination with the very similar continuous spikes of Persimmon, produce a quite pleasing effect in the garden.

Very notable also were groups of the annual Statice sinuata, sinuata alba, and S. Bonduelli, which luxuriate in the dry, warm soil of the banks. The pink-flowered S. Suworowi does not withstand drought so well, but appears from self-sown seeds each spring, and blossoms freely throughout the summer.

Dwarf campanulas arranged on the high banks between the ericas, veronicas, and other dwarf shrubs, are of the utmost value at this period. To my mind they are seldom used freely enough, and plantings should always include C. profusion, C. muralis, C. G. F. Wilson, C. turbinata, C. rhomboidalis, C. pulla, C. pusilla, C. pusilla alba, and the best forms of C. carpatica. From these one obtains those haunting shades of blue just as in the taller campanulas, and the effect of these hues upon a landscape is always good.

Tritomas, ever pleasing, lift their glowing torches above companion plants. Nowadays we usually write of them as kniphofias, but the better-known names of tritoma and torch lilies will remain as long as a love of the plants exists. Few plants, if any, create more striking effects than the torch lilies, and no garden should be without them. A few especially good forms are John Benary, Beacon, Lemon Queen, Star of Baden-Baden, Redcap, Leda, R. Wilson Ker, Solfatare, and R. C. Affourtit. These are all telling varieties, and light up a landscape splendidly. The small-flowered light-habited species and varieties, such as T. pauciflora, T. breviflora, T. rufa, T. modesta, T. Goldelse, T. Torchlight, etc., are delightful in many situations, and give sheaves of blossoms of the daintiest character.

Phloxes gave a series of rich colourings, and did well in a fairly moist situation. So many fine varieties are in existence that one has little difficulty in making a good choice of colours. The pure white, bright scarlets, and the clear pink and rose shades are the most desirable for garden decoration, and wherever possible, they should be grouped against a background of foliage. Michaelmas daisies and early-flowering chrysanthemums are coming on apace, and have withstood the drought pretty well. A good selection of both groups contribute greatly to the glory of the late summer garden. Gaillardias are still covered with richly-coloured blossoms, while heleniums, romneyas, senecios, mimulus, and many other plants are still very attractive.

Lilium Batemanni is fully out now, and the earliest of the tigrinum and speciosum groups are following them rapidly. Lilies of almost all types are valuable for planting in the wild garden, but many of them require special attention in the matter of soil and situation.

Hardy heaths are rapidly pushing forward their blossoms, soon to render effective assistance to the landscape. The heaths are almost invaluable at this season, and give breadths of dainty blossom, which is particularly attractive when the area devoted to them is broken and undulating. With heaths one can associate many things (choosing subjects, of course, that harmonise), especially plants that blossom at other seasons.

P. S. Hayward.

THREE GOOD ORNAMENTAL GRASSES.

Elymus glaucus giganteus is a most ornamental grass with long narrow leaves of intense glaucous blue-grey colour, and attaining a height of four to five feet when in flower. It forms an ideal subject to group beside water, but should not be planted in ground constantly wet, as the plant succeeds best in ordinary soil, and is liable to die off if kept too damp in winter.

Eulalia japonica variegata is another excellent and most distinct grass for ornamental planting; in this case the canes rise to a height of five and six feet with leaves of medium length that gracefully recurve; they are striped with broad bands of white that impart a silvery aspect to the leaves. It stands a greater degree of moisture than the elymus, and, like it, is excellent for waterside planting.

Arundo Donax macrophyllus glauca is a distinct form of the "Great Reed," a plant common on the Mediterranean regions; the canes rise to a height of eight to ten feet, and are clothed with broad-pointed leaves of a rich glaucous blue-grey colour, that flutter as pennons in the lightest breeze. It requires a rich, heavy soil, with plenty of water during the growing season, but in winter somewhat drier conditions should prevail. The old canes are best retained during winter, as these protect the fresh shoots that appear somewhat early in spring, and, as its habitat indicates, the plant is none too hardy under the extreme variableness of our English winters.

Thomas Smith.

ARISARUM PROBOSCIDEUM.

From the height of beauty to the fantastic in Nature seems but a step, so in the garden we do not wander far until we come upon a plant at the base of a slope of the rock garden, a plant which appears to have been created in one of Mother Earth's frolicsome moods, and which is always intensely amusing, yet strange, to those who see it in flower. True, it shares some of its peculiarities with others of the aroids, but it is one of the few which can be placed with profit among the alpine flowers. Singular though it is, however, this Arisarum proboscideum, it carries with it but little suggestion of its singularity when we observe its pretty masses of what a writer of excellent books calls "mats and beds of emerald arrows." Its fresh green, glossy leaves are arrow-shaped, and the effect of a group is decidedly pretty, and not in the least out of harmony with the neighbouring alpines—chaste, charming, or gay as they may be. The little chocolate and white hoods which form the flower have their extremities lengthened into a thin proboscis-like feeler. What the precise purpose of this is I know not, but this is thrown through the foliage, and looks like some little tentacle of brown. Draw the leaves aside, and we shall see in their season the quaint flowers, which the writer referred to has likened to "a mouse, with waving tail, diving down some hole." Hear what he says in his unconventional way! It forms "great mats and beds of emerald arrows, among which the diving brown mice frisk and sport in the most exciting manner, waving their tails in every direction." There is here, perhaps, a little pardonable picturesque word painting, but at all events, the little Arisarum proboscideum will not disappoint those on the look-out for singular plants for the alpine garden which will not fail to interest. Then it is an accommodating plant, apparently hardy everywhere. I first saw it years ago in a cold Leeds garden, and I have grown it since then. In a dry place it will grow well; in a moister one it will flourish; and in a bog it will thrive apace indeed.

S. A.

STRAWBERRIES.

Except for a few showery days, the weather was exceedingly favourable for strawberries this season. Many of the larger growing kinds not only produced heavy crops, but the individual berries grew to an enormous size, the flesh being solid and the flavour excellent. The soil at Wrotham is rather light and porous, resting on gravel and sand, so that a heavy mulching of manure is most essential, and not less necessary are copious supplies of water at the roots at intervals during dry weather. Our best late variety this season was Laxton's Latest, a very large-fruiting kind, and Givon's Prolific. Reward, although not as late as Laxton's Latest, produced fine fruits that ripened after several of the midseason kinds were over. President and Sir Joseph Paxton both cropped heavily, the flavour of the former, it is needless to say, leaving little to be desired. Louis Gauthier did very well on young plants, but, owing to drought, the older plants did not yield the crop they usually do. Viscomtesse Hericart de Thury is grown chiefly for preserving; the fruit is not too large, the colour good, and the crop is generally very heavy—in fact, for preserving, etc., I prefer this variety to all others I have grown.

We do not grow a large number of varieties, but a few of those that are best adapted for our soil and purposes. Our earliest variety from which to gather in the open is Royal Sovereign, and of this we prepare and plant annually a goodly number to meet rather a large demand. The variety Leader succeeds well here, ripening a few days later than Royal Sovereign. This year our first fruits ripened about June 10, coming in nicely after those forced, and thus preventing a break in the supply. The individual berries grew to a large size, and especially where the fruits and trusses had been thinned. Strawberries, like most other fruits, derive much advantage from a change of soil and stock, and should not be neglected in this respect. I know only too well that snug borders are not at all times available, and that the old site must be utilised for several years in succession. When this is the case, much can be done to assist the plants by the introduction of a little fresh sweet soil at the time of planting the young stock. In our case, as soon as the fruits have been gathered, the plants are immediately removed, the land carefully cleaned, and then well dressed with soot, lime, wood ashes, and fresh soil, and deeply dug, so that by the time the young stock raised in another part of the garden is ready to plant, the soil has become somewhat settled. At the time of planting around the balls of roots is placed two or three handfuls of fresh prepared soil, rammed tight, well watered, and, subsequently, the soil between the plants is kept clean, and any runners removed, so as to encourage good sturdy crowns.

A PATHWAY UP THE SLOPES OF THE ROCK GARDEN, FRIAR PARK.

"CARNATIONS, PICOTEES, AND PINKS" will tell you plainly how to propagate and grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams as to layering, taking cuttings, fertilising blooms, etc. Price 2s. 6d. net. by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

NOTES FROM KEW.

Achimenes.

Extensive use is made at Kew of these beautiful summer-flowering gesnerads, and a large number are now in bloom in the cool compartment of the T range. Particularly noticeable among those now in bloom are A. gloxiniæflora discolor, a ruby-red flower, with a bright orange throat; A. grandiflora, a tall-growing kind, with large mauve-purple flowers; A. longiflora and its varieties, the pure white alba being very noteworthy; A. coccinea, a West Indian species, with very small flowers, but they are of a very bright crimson or deep scarlet colour, and borne in great profusion; and a striking garden variety, De Stopfi, the flowers of which are of a French-white tint, veined with blue, especially towards the mouth.

Jacobinia suberecta.

This is a very uncommon species of jacobinia, and still more rarely does it flower. It is, however, in bloom in the old Water Lily House No. 15. The plant is growing in a suspended basket, for which mode of culture its procumbent habit eminently fits it. This jacobinia, which is a native of Uruguay, has a spreading stem, furnished with small ovate leaves clothed with a whitish down. The flowers, borne in terminal spikes or clusters, are reddish, and not particularly showy, but for all this it is a very interesting plant, being so different in general appearance from the other and more generally cultivated Jacobinias.

Dissotis plumosa.

This West African melastomaceous plant is a first-rate subject for growing in suspended baskets, under which conditions it is now seen to considerable advantage in House No. 15. The long, slender shoots hang down for at least four feet, and are thickly clothed with small, neat, deep green leaves. Among these nestle the flowers, which are about one and a-half inches in diameter, and of a bright magenta-rose colour. It is very uncommon, and I have not met with it elsewhere than at Kew, but its value as a basket plant should lead to its extended cultivation.

Cannas.

The garden varieties of canna are sometimes referred to as dwarf-growing, and this term, when the plants are limited to comparatively small pots, does not seem at all inappropriate. Some specimens, however, standing in the tank of House No. 15, at Kew, have, under the influence of ample root room, plenty of moisture, and a stove temperature, developed to such an extent that one scarcely recognises them as the varieties we are accustomed to see. They are flowering freely, and certainly look very happy in their unusual surroundings.

Solanum aviculare.

In one of the sheltered bays outside the Temperate House this New Zealand species of solanum is flowering freely. It is a shrubby species, with divided leaves about a foot in length, and of a very deep green colour. The flowers, which are borne in clusters, are in size, colour, and general appearance, very suggestive of the well-known S. Wendlandi, but in S. aviculare the clusters are fewer flowered. Under favourable conditions the flowers are succeeded by egg-shaped seed pods, which become yellow when ripe. In the extreme South-west of England this solanum is much valued as an outdoor shrub. It is there only injured during severe winters, and young plants are readily obtained from seed.

Sutherlandia frutescens.

Some specimens of this, in close proximity to the solanum just mentioned, show well the appropriateness of its popular name, as the comparatively small plants are each bearing several large inflated seed pods just as in the case of the coluteas. The greyish pinnate foliage of this sutherlandia is very pretty, and the flowers are a good deal like small examples of Clianthus puniceus. This sutherlandia is sometimes bedded out during the summer months.

K.

TREES AND SHRUBS TO FLOWER DURING JULY AND AUGUST.

A census of the trees and shrubs which blossom during July and August reveals the fact that while the number is considerably less than in the two previous months there is still a fair number upon which we may rely. Early in July few more charming sights can be found than the golden-flowered Genista æthnensis, for it rises to a height of fifteen or eighteen feet, with slender pendant branches, each one of which is covered with flowers. About the same time the Japanese Syringa japonica produces its large panicles of cream-coloured blooms. This is a rather rare plant, and one which might be more widely planted with advantage. Contrasted with this we have Styrax japonicum, a shrub whose beauty lies in its pendant white blossoms. Another styrax, S. obassia, is also an ornamental shrub or small tree, but, unfortunately, one rarely sees it to advantage. Both are of Japanese origin. In Cornus macrophylla we have another showy shrub bearing cream-coloured flowers. This differs from the majority of the dogwoods by being of tree-like habit. In addition to its showy flowers it is notable on account of its large distinct leaves.

The privets, though common, and often despised, produce several species which are of decorative presence. It is only necessary to direct attention to such species as Ligustrum sinense, which blooms freely during the early part of July; japonicum, which blooms in August; and lucidum, which blossoms towards the end of August. The last two are evergreen, and are worthy of consideration from gardeners for that reason alone. A charming plant during July and August is found in Tamarix pentandra, or T. hispida var. æstivalis, as it is often called. This is one of the showiest introductions of recent years, for shoots three feet or so in length, which have been formed during the current year, are clothed throughout three parts of their length with axillary racemes of showy rose-coloured blossoms, each shoot forming a large inflorescence. The best results are obtained by cutting the shrub hard back each spring. The dwarf Chestnut, Æsculus parviflora, is very ornamental about the end of July and early August, for many of the shoots are terminated with inflorescences nine to twelve inches long of white flowers. Two other kinds may be noted early in July, for the Indian Chestnut, Æsculus indica, a large-growing tree, and the smaller Æ. californica, both bloom at that period.

Where good-sized examples of Koelreuteria paniculata exist their terminal panicles of yellow flowers may be looked for in August, and the same may be said of Sophora japonica during a sunny summer. Very often, however, the cream-coloured flowers of this tree do not open before September. One of the aristocrats of the shrub world may be looked for in August, for at that period the large white camellia-like flowers of Eucryphia pinnatifolia are at their best. Good examples of this Chilian shrub are rare. Three kinds of Stuartia, namely, pentagyna, pseudo-camellia, and virginica, bloom during July and August. All bear large showy white blossoms, but good examples are scarce. The various hypericums provide a display of yellow-flowered shrubs. Such dwarf kinds as calycinum, Moserianum, Bucklei, and olympicum are good subjects for positions where low-growing plants only may be used, while stronger-growing sorts, such as elatum, hircinum, Hookerianum, patulum, Henryi, and uralum may be used where shrubs from two to three feet high are required. Another group of hypericums is that made up of small-leaved kinds, such as prolificum, densiflorum, galioides, and kalmianum. All are very floriferous, and are suitable for the front of a shrubbery or border.

The genus Spiræa again offers a wide selection of species. On the one hand we have strong-growing kinds, such as Aitchisoni and Lindleyana, with terminal panicles of white flowers, sometimes between one and a-half and two feet in length, and discolor, with panicles of cream-coloured blossoms, and, on the other hand, the group composed of such sorts as Douglasi, salicifolia, japonica, Menziesi, etc., and their respective varieties, which have an extended flowering period from early July until September.

Among magnolias there are several which bloom during July and August. M. grandiflora is perhaps the most showy one. Its large white blossoms are conspicuous in many a garden either on plants grown against walls or on trees or bushes in the open ground. Lovely, however, as the type is, it is eclipsed in beauty by the shapely flowers of the variety gloriosa. Other kinds on which blossoms may be found are M. tripetala, M. glauca, M. hypoleuca, M. Thompsoniana, and M. macrophylla. Turning to the erica family, we find a number of very showy plants; Erica cinerea and its numerous varieties are very beautiful; the same may be said of E. vagans, E. ciliaris, E. Mawiana, and E. tetralix, while Calluna vulgaris and Dabœcia polifolia are responsible for a briliant display over a period of six or eight weeks at least. On many commons and hillsides the French Gorse, Ulex Galli, is conspicuous by reason of its rich golden blossoms. Where this does not exist in a state of Nature it might readily be introduced into the more natural parts of a garden.

In the southern counties, and more particularly in the vicinity of the sea, several escallonias make a brave display. E. macrantha, E. exoniensis, E. philippiana, and E. rubra are specially worthy of notice. Olearia Haasti is another free-flowering July shrub suitable for many gardens. Hydrangea Hortensia is conspicuous in many gardens in the milder parts of the country, as also are the various shrubby veronicas and the hardier kinds of fuchsia. Further north Hydrangea paniculata and the variety grandiflora thrive well, and bloom profusely during August, whilst in many gardens Clerodendron trichotomum and C. fœtidum are conspicuous in August. The end of August sees the various clethras in bloom, while the catalpas are at their best about the end of July and early in August. These serve to show that an extensive variety of flowering shrubs may be had in July and August, but those named by no means exhaust the list. W. D.

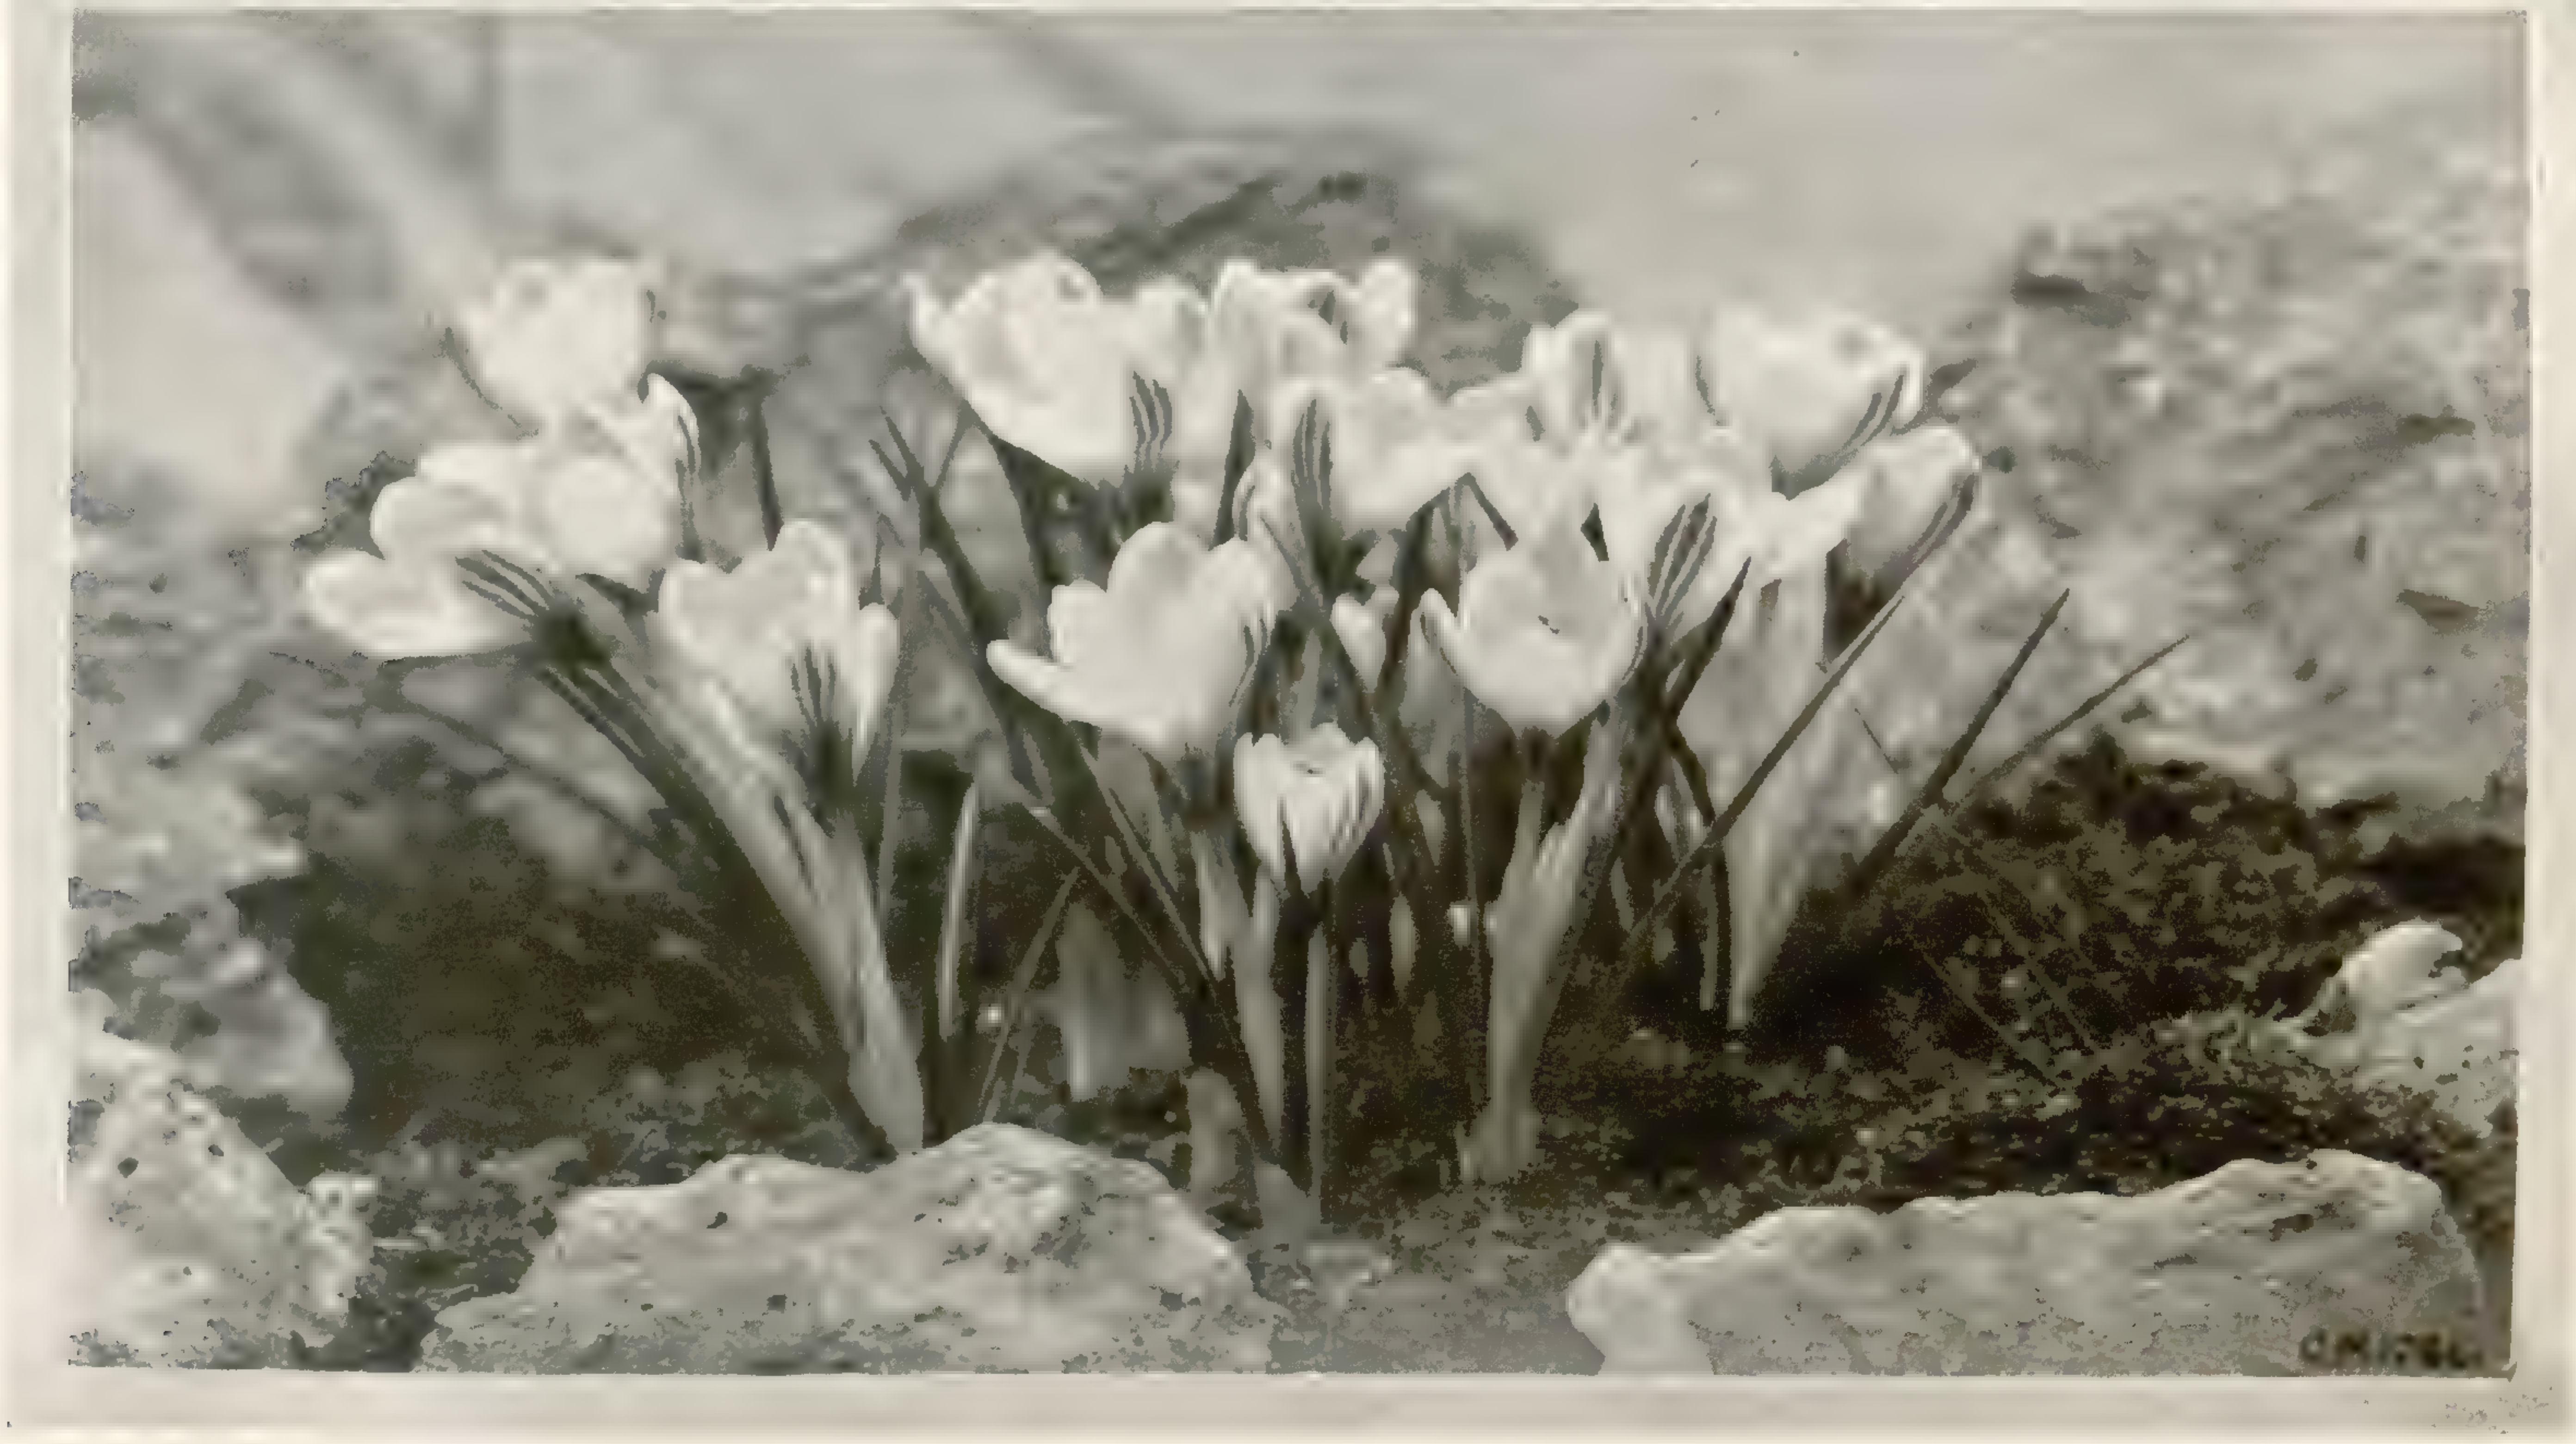
CROCUS VERSICOLOR.

Probably one of the reasons why alpine gardening has made such headway recently is that it enables one to find congenial homes for so many and varied early spring-flowering plants. The quick drainage of the rock garden prevents the soil lying unduly wet in the winter months, while many of the sheltered corners and nooks formed by adjacent rocks enables many dainty and early flowers to stand for a considerable time without undue damage from cutting winds and driving rains, thus contrasting favourably with the wind-swept border, where all too soon these early visitors are laid by the wintry gust.

One of these charming harbingers of spring is Crocus versicolor, inhabiting the sunny South of France. It is really surprising that it should take so kindly to our climate, and delight us with its glistening flowers so early as January and February. It is best planted in little colonies, where it will receive what small amount of wintry sunshine is available, and if the soil is composed of sandy loam and a little leaf-mould it thrives amazingly.

The appearance of the clump is considerably enhanced if some carpeting plant, such as Arenaria balearica, is planted over the place where the bulbs have been inserted. It is indeed a welcome sight when these lovely little plants bloom, with their white or faintest lavender petals veined with rich purple-blue, while glistening within this beautiful protecting cup the golden stamens gleam forth when the day is fine enough for the flowers to open wide.

Reginald A. Malby.



[Photo: R. H. Malby.

CROCUS VERSICOLOR.

Flowers white veined with purple-blue.

Watering Vine Borders.—When watering the borders the liquid should not be used indiscriminately, but some system of measuring the quantity given should always be used, or in hot weather more moisture may be given than is really necessary; every portion of the border should have an equal supply, and if a fertiliser is used, this should not be given at every watering, but a damping-down with soot water several times a week will keep the foliage healthy.—W. A. Cook.

AMONG THE ROSES.

July and August were, up to the last few days of the second month, so hot and dry that few of our roses could grow away with their usual freedom. I am alluding to the increasing number of teas and their hybrids, which, with a few hybrid perpetuals, such as Mrs. R. G. Sharman-Crawford, Victor Hugo, Ben Cant, Ulrich Brunner, and Frau Karl Druschki afford us a continuation of flowers almost unknown before their introduction. The usual continuous crop of blossoms upon these has been almost entirely stopped by the heat and drought. In the case of hybrid perpetuals that were largely grown upon the Manetti stock a few decades ago, we did not look for many flowers after the first main crop, but with the more general use of seedling and cutting briers as stocks, with their extended time of active growth, together with the introduction of more suitable varieties, our roses have afforded an almost uninterrupted display of blossom from early in June until the first frosts arrive.

It is these facts that make the present check of blossom and growth so noticeable. But there is, fortunately, every prospect of a grand autumnal crop if we have cooler and moister weather. The present semi-ripened wood will probably respond to such conditions even better than usual, and with the many free autumnal bloomers now grown, I look forward with some confidence to a good autumnal display.

I have noticed how exceptionally well a few of our older, and, in many cases, almost extinct roses have done during this peculiar season. I may particularly mention Madame des Tartas, introduced by Bernède in 1860, and difficult to find in the present-day catalogues. We have also found a great difficulty, both here and on the Continent, in procuring a few more plants than our own stock afforded last winter. Comparatively speaking, this variety has been unaffected by the weather, and at the time of writing, is carrying many of its immense trusses that will certainly extend well into the autumn. Such free and constant bloomers as G. Nabonnand, Madame Ravary, Peace, and Madame Antoine Mari have not given such universal satisfaction during the season as the old and rather despised Madame des Tartas. In this neighbourhood, too, it is doing well upon a wall, which is not only red brick, but faces due south, so that it is evidently a variety that will stand hot weather with impunity. Many of these almost forgotten roses appeal to me quite as much as the newer and more lauded kinds.

Although there is every prospect of continuous bloom upon Mrs. Aaron Ward, Madame Ravary, Madame Antoine Mari, Corallina, Madame Paul, General MacArthur, and a few more, they have not, and at present do not approach the dwarf forms of polyanthas, which have been the most continuous during this trying season.

We found some difficulty with the budding this summer, and have not finished yet. Scarcely any of the stocks made the necessary growth to provide sap enough for lifting the bark, and I fear not a few others had the same experience. Indeed, constant watering was necessary to keep the stocks alive upon some quarters. Still, on the whole, the buds inserted first have a promising appearance, and the "take" seems well up to the average.

Favourable as cuttings of brier and other stocks looked in the late spring and early summer, they have suffered greatly during the last month of hot weather. It is not surprising when we find a number of well-established trees dying that almost unrooted stocks failed to pass through such an ordeal.

The absence of mildew is pretty general in this district; indeed, in many cases it would not be easy to find young foliage for this disease to feed upon.

A. P.

Roses may be grown to perfection by following the instructions given in Roses and their Cultivation, by T. W. Sanders. A selection is given, with description of all the best varieties, and full details for culture outdoor and under glass. Price 2s. 6d. net, by post in box 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

FRUIT BOTTLING FOR SMALL HOLDERS.

(Concluded from page 629.)

Any fruit may be preserved by the bottling process, either whole, or sliced. Apples, pears, apricots, peaches, limes, shaddocks, and lemons may all be used, though the bulk of bottled fruits consists of plums, gooseberries, cherries, raspberries, loganberries, and currants. Plums and gooseberries are probably most largely used. When once properly sterilised and the bottles quite airtight, the fruit will keep almost indefinitely, plums, gooseberries, raspberries, blackberries, and currants bottled in 1903 being quite good in the winter of 1910-11.

THE USE OF SYRUP.

The use of syrup is not essential, pure water being equally as suitable and a little more transparent, and thus improving the appearance of the fruit after sterilisation. Moreover, a thin syrup spoils the natural flavour of the fruit without making it sufficiently sweet to render further sweetening unnecessary when used. Sugar, therefore, should either not be used, or it should be used at the rate of from ½ to 1 lb. (according to the acidity of the fruit) of pure cane sugar to one quart of water. Raw beet sugar should not be used, as it renders the syrup "cloudy," but pure cane sugar leaves the syrup tolerably clear.

SELECTING AND PREPARING THE FRUIT.

The degree of ripeness of the fruit has a considerable effect on the appearance of the fruit after the bottling process is completed. Fruit should be slightly under-ripe for bottling, as the skin does not then break so readily during the process of preservation; with ripe fruit, breaking of the skin can hardly fail to occur, and the appearance is apt to be spoiled. In this respect under-ripe fruit will bear a higher temperature without injury than ripe fruit; but in no case need the temperature rise higher than 200 deg. F., and in practically all cases 190 deg. F. is sufficient. All fruit used should be sound and without speck or injury of any kind. It is best gathered dry; but if it be damp or wet it should be heated a little longer. All fruit should be carefully graded, only that of equal size being placed in the same bottle. Good results are not attained by mixing large and small fruits, while such mixtures have not a satisfactory appearance. "Windfall" apples and pears may be bottled if damaged portions are rejected.

Preparation before bottling varies somewhat according to the fruit concerned—for instance, gooseberries should be topped and tailed; currants shredded from their stalks with light fingers; rhubarb skinned and cut into pieces of a uniform size; cherries must be stalked, and, if possible, stoned; the hull should be removed from raspberries; plums, greengages, and damsons must have their stalks removed; large juicy plums may be cut in halves before being placed in the bottle; peaches and nectarines should be skinned, stoned, and halved; apples and pears must be peeled and "quartered." A silver or plated knife only should be used for preparing fruit.

Great care should be taken in placing the fruit in the bottles, for if these are imperfectly filled some fruits (e.g., strawberries) after sterilisation will rise, and leave a large space at the bottom without fruit. Many have experienced this in their first attempts at fruit bottling. A stout stick or piece of wood, about twelve inches in length—blunt at one end and rather pointed at the other—is very useful in arranging and gently pressing fruit into position in regular layers. The fruit should be selected of nearly equal size and then arranged in the bottles systematically, pressing it into place by means of the stick when necessary. The bottles should be filled to the top of the neck, still using a little force in packing if requisite. Soft fruits like gooseberries and currants require shaking together in order to ensure close packing; rhubarb should be placed as far as possible in upright rows; plums should be arranged in rows, as by this means more fruit can be placed in the bottles.

As the bottles are filled with fruit, water may be added to within half an inch of the rim, or syrup as described above may be used. In the case of bottles with screw caps, the latter may be placed on loosely and partly screwed down in order that they may be readily screwed down tightly directly the sterilising process is completed. In the case of bottles with caps (either glass or metal) and springs the rubber rings should be softened in hot water, the cap should be placed on, and the spring placed in position ready for fastening down directly sterilisation is completed.

STERILISING.

When the bottles of fruit are ready they should be placed in the boiler or steriliser and the temperature raised quite slowly, perhaps at a rate of 2 deg. F. per minute, otherwise bottles may crack and the skin of the fruit may break and the appearance of the produce be spoiled. The temperature necessary will vary with the kind and ripeness of the fruit; but a lower temperature than 165 deg. F. is quite unreliable, and a higher temperature than 190 deg. F. or 200 deg. F. is unnecessary. The necessary temperature should be maintained for a time suitable for the fruit being sterilised, and the bottles then securely fastened down; in the case of screw caps the tops should be screwed further if possible as the bottled fruit cools. Each lot of bottled fruit should be examined two or three times during the first day or two, and if any doubt is entertained as to the condition of any of it the doubtful bottles should be re-sterilised at once. This may sometimes be necessary owing to faulty caps.

TEMPERATURES FOR STERILISING.

The temperatures at which fruits are bottled will in part depend on the period for which such temperatures are to be maintained. One authority states that the temperature should be maintained for fifteen or twenty minutes at about 165 deg. F. in the case of small fruits, such as gooseberries, currants, cherries, and raspberries, and at any temperature between 165 deg. and 190 deg. F. in the case of plums, apricots, peaches, and pears. For sterilising the latter fruits forty minutes at a temperature of about 165 deg. F. to 170 deg. F. will answer. As a result of experiments with plums sterilised in screw-top bottles in 1908, at various temperatures, it was found that sterilisation at 165 deg. F. to 170 deg. F. for 10 minutes produced more satisfactory results than sterilisation at 190 deg. F. to 200 deg. F. and 212 deg. F. respectively; and the samples were as beautiful in December, 1910, as they were immediately after bottling. In these trials the largest varieties of plums were most admired, the best of those sterilised at 165 deg. F. to 170 deg. F. being Belle de Louvain, Grande Duke, Monarch, Pond's Seedling, Washington, White Magnum Bonum, Coe's Golden Drop, Curlew, Diamond, Pershore, Sultan, and Abricotée de Braunau. Of those sterilised at 190 deg. F. to 200 deg. F. the following, out of 10 varieties, were preferred: Belle de Louvain, Reine Claude de Bavay, Red Magnum Bonum. Of seven varieties sterilised at 212 deg. F. one bottle only kept its good appearance, viz., Red Magnum Bonum. The whole of the bottles were kept at the different temperatures for the same length of time, viz., 10 minutes, after which they were taken from the fire and lifted out of the hot water a few minutes afterwards. Fruit in bottles filled with plain water kept as well as fruit bottled in thin syrup.

The following table of approximate temperatures and length of time to maintain the maximum temperature, may be useful:

Gooseberries (140-150° F.), 30-45 minutes, according to degree of ripeness.
Red currants (140-150° F.), 20-30 minutes, according to degree of ripeness.
Raspberries (140-150° F.), 20 minutes.
Black currants (150-160° F.), 30-45 minutes. (These may be treated a second time.)
Plums (150-160° F.), 30-45 minutes.
Apricots (160-180° F.), 45 minutes.
Peaches (160-170° F.), 45 minutes.
Tomatoes (170-180° F.), 30 minutes. (Treat twice.)
Gooseberries, currants, cherries, and raspberries (165° F.), 15-20 minutes.
Plums, apricots, peaches, and pears (165-190° F. or 165-170° F.), 15-20 minutes, or 40 minutes.

The temperatures can only be given approximately, as the quality of the fruit, the season, and a variety of causes must leave much to the common sense and intelligence of the worker.

Most of the varieties of fruit referred to above can be satisfactorily bottled by slowly raising them to the boiling point and keeping them at that temperature for ten minutes.

COST OF STERILISING.

The approximate cost of appliances is as follows:

A.—Cost of small steriliser for household use to hold ten bottles	£1	5	0
One gross of bottles, metal top	1	14	6
Oil stove (or gas ring) ...	0	9	9
	£3	9	3
B.—Cost of steriliser for work on a commercial scale to hold 14 bottles	£3	3	0
Two gross of bottles, glass top (these are recommended) at 50s. per gross	5	0	0
Oil stove (a gas ring is preferable)	0	12	0
Iron stand for steriliser ...	0	4	0
	£8	19	0

An outlay of £3 10s., or even £9, is not a large one, especially when the direct advantage of having good, wholesome fruit for use all the year round is taken into consideration. Small growers, however, may still find it difficult to spare the necessary capital, and in such an event co-operative methods may be employed. A small steriliser of this type could be used by several small growers, or if the amount of fruit to be bottled warranted it a larger outfit could be purchased.

In such a way several small holders and others may, by working conjointly, bottle the whole of their surplus fruit for winter use or for sale as the case may be, instead of selling it at a loss, or, as too frequently happens, allowing it to rot owing to heavy crops and unremunerative prices for the fresh article.

Though the word "sterilise" is employed it is not to be understood that the process of fruit bottling involves complete sterilisation, for some organisms may not be destroyed by heating to the temperatures suggested. Owing, however, to the absence of oxygen, the relatively high percentage of organic acids present, and the small amount of soluble nitrogenous matter in the fruit juices, such organisms are rendered incapable of further development, except in occasional instances, which do not necessarily arise from any defect in the process. For peas, beans, and other vegetables sterilisation should be complete; to effect this higher temperatures are necessary, for not only do these vegetables contain abundant nitrogenous matter, but they are deficient in organic acids.

Abutilon Triomphe.—Most of the garden varieties of abutilon are from the pendulous nature of their bell-shaped blossoms very graceful when in full bloom, a remark that does not apply to a few of the newer varieties, of which A. Triomph is one. The blooms of this are very large, and composed of an unusual number of petals. In shape they are far more shallow than those of the older kinds, being, in fact, somewhat saucer-like, and are semi-pendulous rather than strictly drooping. The colour is pink. Personally I much prefer the older type.—W. T.

PERPETUAL CARNATIONS AND SUMMER PESTS.

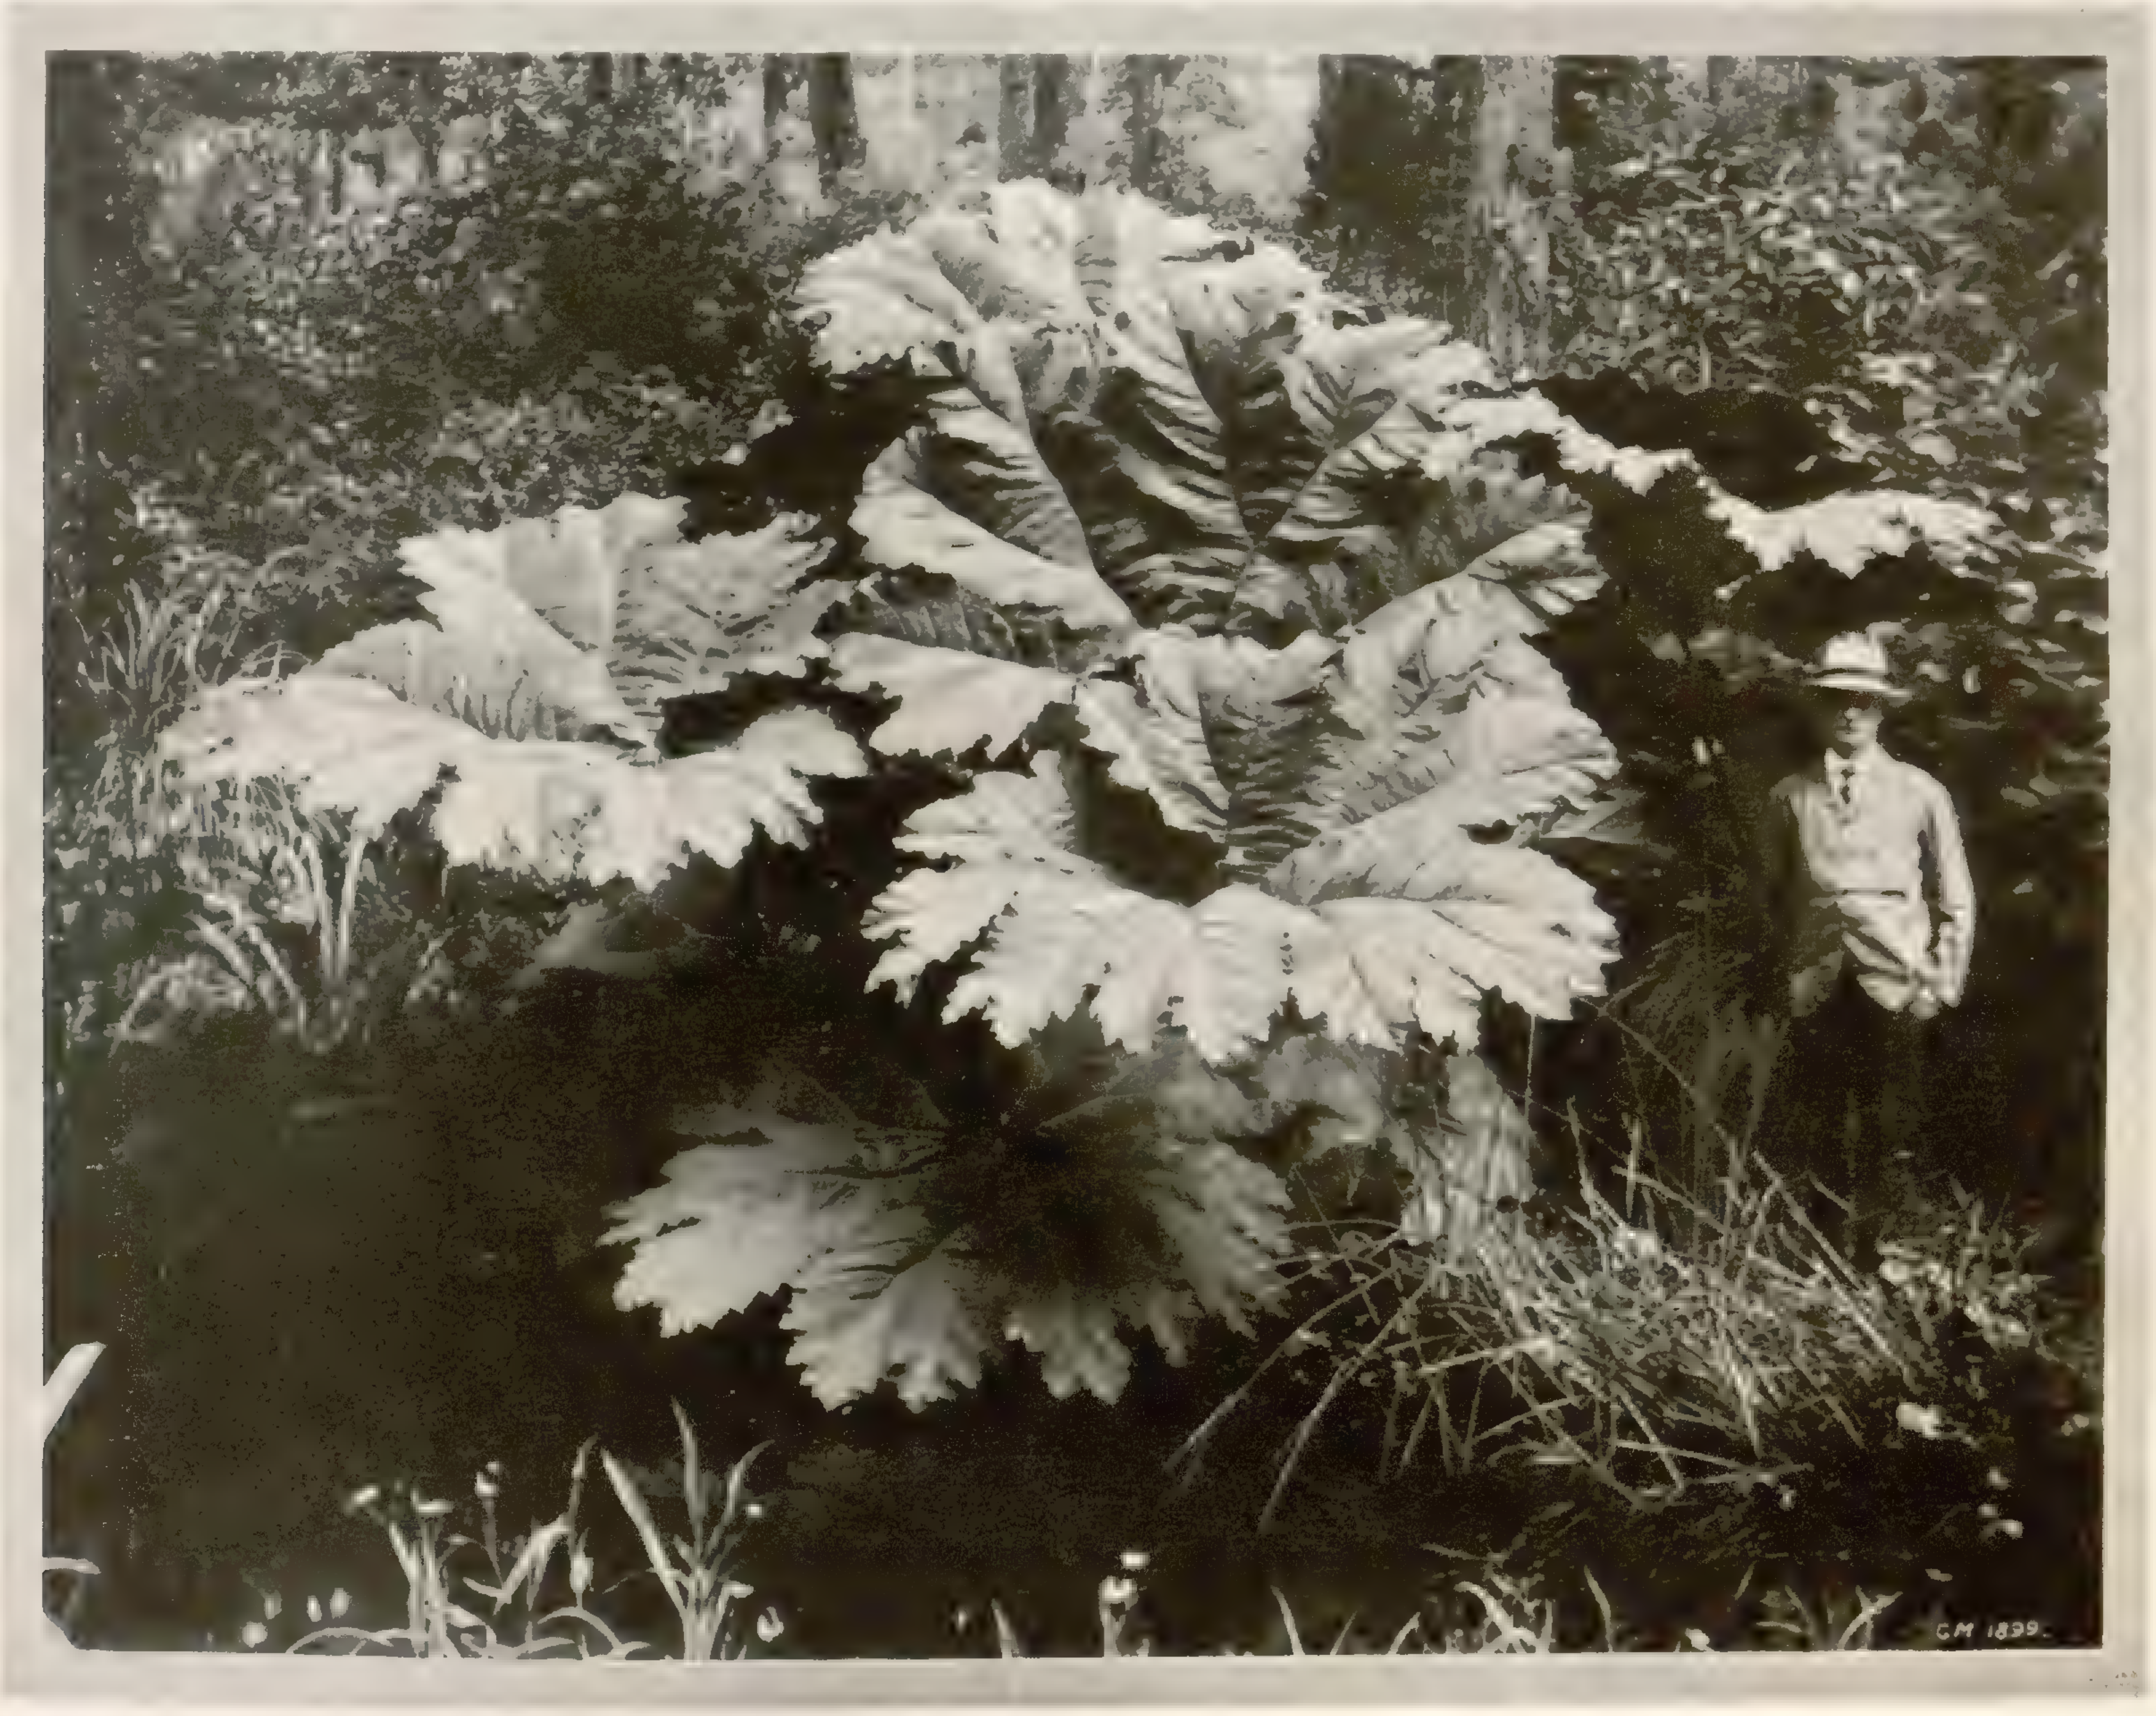
I am not a prophet, nor the son of a prophet yet for one to say that thrips are everywhere this dry season, and will spoil many of the early flowers this fall, does not require the gift of prophecy. It is a generally accepted fact. But the careful cultivator will guard against these common enemies. In a season such as the present one it is hopeless to try and keep your plants free from thrips out of doors, for every gust of wind that blows brings in thousands, and this little mite, which hides itself in the folds of the young leaves, or the basal bracts of the young buds, is difficult to reach and destroy by spraying. Practically the only means, therefore, at this present season of the year to free your plants from thrips, and thus ensure the autumn flowers coming unmarked, is to house your plants where fumigating and vaporising can be employed as destructive agencies. Naught but eternal vigilance can gain the reward of freedom from these pests. We have found that very early in the morning, how early I dare not say for fear of being disbelieved, but certainly before five o'clock, is the most effective time to wage war against thrips, both by spraying and vaporising.

In cases where it is impossible to house the plants persistency in spraying with some nicotine extract, or other reliable insecticide, regularly each week will check the thrip, but in very bad cases it will be best to remove the early buds, as the flowers will be practically useless if allowed to develop.

Red spider must have considered the present summer quite an excellent one, from their point of view, and most favourable to their prosperity. Unless the carnation grower is waging a ceaseless war against them, now that their extermination is more easy than later when less spraying can be done, he will be laying up trouble for the winter. A powerful spray of clean water will, I believe, do as much good as anything to destroy this bane of carnation life. I have often used with good effect a spray of one ounce of common salt to one gallon of water, sprayed on in early morning, and washed off two hours later with clean water. We also hear of other positive cures, but, in my opinion, the spray must strike direct upon the insect at a high pressure to be effective. Persistency is also essential. If all the stocks of perpetual carnations in Great Britain were examined, I venture to remark that one-half would be found to be affected with red spider. It is not enough for them to be invisible, they must not exist, for if they become so established as to be visible then the victory is theirs, and it will be most difficult, if not impossible, to free your plants of the pest and restore them to their normal vigour.

Red spider is very different to thrips, inasmuch as it attacks the old, fully-developed leaves, while the thrips prefer the tender young growths. The heavy dews of evenings have a check upon red spider, but these are not sufficient to destroy them, so that this pest is perhaps more easily coped with under glass, provided that the paths and stages are kept moist and the plants well sprayed on every favourable occasion, particularly the underside of the leaves.

Montagu C. Allwood.



A SPLENDIDLY-DEVELOPED SPECIMEN OF GUNNERA MANICATA
In the gardens of Leonardslee, Horsham, the residence of Sir E. Loder, Bart.

GUNNERA MANICATA.

The merits of this stately Brazilian plant are now so fully recognised by those who have a knowledge of the kinds with handsome leafage that are sufficiently hardy to be grown out of doors in this country, that there is no occasion to dwell upon them at the present time. It is, however, necessary in the interests of owners of gardens who have not a full acquaintance with hardy plants with ornamental foliage to keep its distinctive characteristics constantly in view, and probably there is no better way of doing this than by means of illustrations of specimens remarkable for their exceptional development. Hence we give herewith an illustration of the magnificent specimen that forms so noteworthy a feature of the waterside vegetation in the fine gardens of Leonardslee, the residence of Sir Edmund Loder, Bart. This, as so admirably shown, is of enormous proportions, the leaves being numerous, and individually of immense size. It will also be readily understood from a glance at the illustration that such specimens as this produce a striking effect when growing in association with other suitable vegetation on the margin of a running stream or silent pool. The conditions most favourable to the development of Gunnera manicata are a rich soil, a partially-shaded position, and a liberal amount of moisture. The position of the Leonardslee specimen is an ideal one, for the shade of the neighbouring trees is exactly adapted to its requirements, the roots have an abundance of moisture within their reach, and it may be assumed, judging from the dimensions of the leaves, that Mr. W. A. Cook, the head gardener, has been careful to enrich the soil.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

DECIDUOUS CALANTHES.—Plants of the deciduous species and their hybrids will in most cases have completed the development of their pseudo-bulbs, and some of them have their flower scapes well advanced with us. The sunny season appears to have suited them, and, as in similar seasons, there is very little of the unsightly spotting to be observed, either on the pseudo-bulbs or the foliage. I have invariably seen that, when we have comparatively sunless seasons, as was the case in this district last year, the unsightly spotting is most in evidence. It is very pleasant to record the fact that even the most delicate constitutioned among the inbred hybrids are free from spot, and that the pseudo-bulbs are larger than we have previously had them. I do not consider that with the more robust kinds there is any advantage in having extremely large pseudo-bulbs. We may procure a gigantic flower scape, but it is frequently the case that when the flowers have expanded they are generally wanting in texture and colour. I have no doubt this may be accounted for by the insufficient maturity of the pseudo-bulbs. There is always a difficulty in ripening the huge sappy pseudo-bulbs of calanthes, and, unless they are properly matured, it is scarcely reasonable to expect flower scapes of a satisfactory nature. To ensure the perfect ripening of large pseudo-bulbs, it is advisable to take full advantage of the assistance of the sun during the next few weeks. The plants should be placed in a position within reasonable distance of the roof glass, where they will be fully exposed to the light, only sufficient shade being used to prevent actual scorching of the foliage. Water must be freely given while the plants are in an active state of growth. Indeed, they must not be permitted to remain dry at the roots for any period until after the flowers have expanded. There is ample time to give the plants resting conditions after the flowering period is over.

MANURES FOR ORCHIDS.—As in previous years, I have been requested to state on more than one occasion what manures we use, and what we find most beneficial to the different kinds of orchids. I have repeatedly stated in my notes to the GARDENERS' MAGAZINE in past years that we do not make a practice of using artificial manure of any description. No manure has been used during the ten years I have had charge of this collection on any orchid; but, while abstaining from the use of anything except rain water from our tanks, there is no reason why others should not use suitable fertilisers who find them beneficial. There can be no doubt that many of the most successful growers find a great advantage from the use of soot water and cow manure liquid, and under favourable situations advantages are derived from these reasonably safe solutions after the plants have filled their pots with roots.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

CLIMBING PLANTS that have almost completed the season's growth may now be overhauled and have the weakly or undesirable wood removed. the permanent shoots being shortened and made secure in proper positions. September is an ideal month for autumn planting of creepers. Old-established plants growing in borders that have become sour may now be replanted in a newly prepared border. The compost should be made with fibrous loam and peat, with lime rubble and broken charcoal thoroughly incorporated. By planting climbers early in the autumn their roots become partly established before the time for starting them into growth next spring. Climbing plants that have been grown in large pots or tubs may with advantage be removed to a warm greenhouse to complete the ripening of the wood.

GLOXINIAS.—As their flowering season is over, gloxinias may be transferred to a fully exposed position where they will enjoy a free circulation of air and have a reduction in the supply of water at their roots.

CALADIUMS may be treated similar to gloxinias with the exception of the temperature, it not being safe to subject the tubers to a temperature lower than 55 degrees. Before storing away the tubers for the winter it may be found advisable to thoroughly cleanse them with a weak insecticide wash as a preventive of the attacks of insect pests.

HIPPEASTRUMS (Amaryllis). — Spring raised seedlings will now be ready for repotting, using pots of three or four inches in diameter. Extreme care must be exercised in watering, as the roots are so sensitive to over-much water. A temperature of 55 degrees with a minimum of 50 degrees at night will be found most suitable for the remainder of the year. Old-established bulbs will now be fully exposed to the sunshine; they will only need sufficient water to prevent shriveling. Throughout their resting period a minimum temperature of 50 degrees will be quite safe for their storage.

AUTUMN-RAISED SEEDLINGS of gloxinias, streptocarpuses, etc., are now almost ready for transplanting into shallow pans or boxes prepared for their reception. These will need a light shade for a few days until root action has been restored, after which they must be afforded a position near the glass and well exposed to the light.—JOHN DONOGHUE, Bardon Hill Gardens.

FRUITS UNDER GLASS.

STRAWBERRIES IN POTS. — These will now require a little more room if the layering and potting has been done as advised. The plants have grown very strongly and well, and have now filled the space given them. Therefore to afford them more light and air they must be placed just far enough apart for the foliage of one plant to be clear of that of its neighbour. Keep the pots on a firm bed of coal ashes, and when requiring more room sprinkle a little soot among the ashes. As a means of checking red spider, syringe between the plants every day in bright, hot weather, and syringe the plants morning and evening. This will keep them fresh and clean. There ought to be no trouble in building up good crowns this season, for I have not seen strawberries grow away better. As the pots become full of roots liquid manure should be given them about once a week, and a further watering with soot water also once weekly. Keep all small weeds pulled out of the pots as soon as seen, for when left to become established a good portion of the soil will be pulled up with them.

LATE GRAPES.—These are finishing up very finely, the tropical weather having brought them along quickly. During the continuation of the hot weather very little, if any, fire heat will be necessary, but if there is a sudden change to wet, then by all means use a little fire heat at night. Water thoroughly whenever necessary, and this will apply to all vine borders even if the fruit is cut, as upon no account must the soil be allowed to become quite dry, or much damage will be done to the vines.

MUSCAT OF ALEXANDRIA.—The houses in which Muscats that are intended to be kept through the winter are ripening must be freely ventilated. The crop is fast approaching maturity, and in order to lessen the evaporation of water give the border a heavy top-dressing. Cut out any stoneless and shanked berries. Young vines sometimes shank through overcropping, or too much water, or ineffective ventilation. Whatever the cause, it should be noted and corrected another season. The fruit should be closely protected from wasps by netting. I do not like bags, for they are apt to destroy the bloom when removed to examine the bunches, even by the most careful handling, unless they are unduly large. Keep the roots well supplied with water, and on no account suffer the border to crack, as that means a considerable injury to the roots. If outside borders exist, see that these have a plentiful supply, for borders in the front of a range of houses must have been much dried up during the late tropical sunshine. We have registered 95 deg. in the shade, and 141 deg. in the sun.

LATE MELONS.—Push these along rapidly now, as the days are rapidly declining, and with a return to dull weather we shall note it still more. Set the fruit on the latest plants as fast as possible. These will be useful for dessert about the middle of October. Those swelling away must be nourished by a stimulant about once weekly. Keep the laterals pinched off in the early stages, and admit all the light possible. The melons have suffered this season with too much sun in lean-to's facing south.—W. A. COOK, Leonardslee Gardens.

THE FLOWER GARDEN.

VIOLETS.—Frames must now be prepared for the winter violets, and the plants put in as soon as possible. The bed should consist of leaves, which must be well trodden in, and on this the soil for planting is to be placed. A suitable compost for violets is prepared with two-thirds loam, one-third well decayed manure, and a sprinkling of soot. This should be thoroughly mixed and put on the leaves to a depth of about six inches, and the whole allowed to remain for a week to settle before planting. The frames should be so prepared as to ensure the leaves being as close to the glass as possible without their touching it. If the weather is dry the plants should be given a good soaking daily for at least three days before being required for lifting. All runners must be trimmed off before replanting, and, in lifting, it is desirable to allow a fair amount of soil to remain on the roots. After planting it is necessary to give a good watering, and the frames should be kept fairly close and shaded for a few days until the plants recover from the removal and become accustomed to their new quarters, after which time the lights may be entirely removed and allowed to remain off until protection against the weather is necessary. Watering must not be neglected during dry weather.

THE NATURALISATION of bulbs in grass and woodland is deservedly popular, and many charming effects are obtained by planting a good selection from the many bulbous plants now offered. Woodland walks and glades are made beautiful and interesting, and grass meadows and banks transformed into flower gardens. An endless variety of narcissi may be obtained, using the strong-growing and handsome trumpets for exposed positions, and the more delicate Leedsi, etc., for the sheltered corners. Apart from daffodils, there are the anemones, snowdrops, winter aconites, muscari, leucojum, etc. A good group of Trillium grandiflorum growing in conjunction with the Ostrich Feather fern (Struthiopteris germanica) produces a very pleasing effect. Chionodoxas, scillas, and other bulbous plants of dwarf habit should be planted close to the paths in liberal quantities, so that good sized breaks or drifts are obtained. Before planting is attempted it is often necessary to break up the ground and prepare the soil by adding decayed leaf-soil. In many instances the ground is so hard that it is impossible to use a trowel or dibber before breaking it with a fork. With regard to planting daffodils in the rough grassy pasture, it is necessary first to cut the glass.

PROPAGATION. — This operation should be continued until the required numbers of the various plants are obtained. If much wet weather prevails, then it will be advisable to place all cuttings under cover, otherwise if allowed to remain exposed to too much rain they are liable to damp. Cuttings of calceolarias may be inserted in sandy soil in an unheated frame. C. amplexicaulis is so beautiful that it should be largely grown. It is not quite so hardy as the ordinary varieties, and frequently damps off if left in an unheated frame through the winter. If the cuttings are inserted in pots it is an easy matter to remove them to the greenhouse late in the autumn.—E. C. POOLEY, Gnaton Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

AUGUST 29.

The exhibition held by the Royal Horticultural Society on Tuesday last was a material advance upon several of its immediate predecessors, and very considerably above the average for August. The Horticultural Hall was well filled, and the exhibits were, for the most part, of much interest and highly attractive. A considerable number of the leading nursery firms were represented by contributions of much merit, and the most noteworthy of the exhibits from private gardens were the immense collection of new Chinese trees and shrubs exhibited by the Hon. Vicary Gibbs, Aldenham House, Elstree (gardener, Mr. E. Beckett), the splendidly grown standard specimens of Acalypha hispida, shown by Colonel Lockwood, Bishop's Hall, Romford (gardener, Mr. Craddick), and the bank of finely flowered plants of Vanda cærulea staged by the Duke of Marlborough, Blenheim Palace, Woodstock (gardener, Mr. J. Hunter).

FLORAL COMMITTEE.

Messrs. James Veitch and Sons, Lim., Chelsea, presented a miscellaneous display of flowering plants, the cannas being a fine feature, the varieties Geheimrat Borsig, Mrs. F. Dreer, A. Grimminger, Ottawa, and Duke Ernst being most conspicuous. Standard plumbagos, both blue and white, were very fine. Hibiscus in variety were well flowered, as were also plants of Solanum Wendlandi, and a collection of warm greenhouse rhododendrons nicely in flower.

Mr. James Box, Lindfield, Surrey, occupied a corner of the hall with a fine group of hardy flowers. Tall pyramids of rudbeckias, heleniums, and pentstemons occupied the background, while mounds of Gladioli America and Princeps were conspicuous features. Gaillardias, delphiniums, and montbretias were also in fine form. The same firm also had an extensive exhibit of phloxes, which included Iris, Dr. Charcot, General Van Hentry, Antonia Mercia, and Elizabeth Campbell.

From Messrs. Whitelegg and Page, Chislehurst, Kent, came a nice display of Salmon Paul Crampel pelargonium. This variety bids fair to become as popular as the well-known scarlet variety.

Messrs. W. Cutbush and Son, Highgate, presented a fine group of hardy flowers, arranged lightly and effectively. Lilium sulphureum was presented in splendid form, while Helenium Riverton Gem was most striking, as were also the groups of gladioli, pentstemons, delphiniums, and asters.

An immensely attractive collection of cannas from Messrs. H. Cannell and Sons, Swanley, received much notice, not only for their brilliant colours, but also the splendid condition of the plants. A few of the best of the many fine varieties were Carl Hansman, Niagara, J. B. van der Schoot, Venus, R. Wallace, and Herman Fischer.

Mr. G. Reuthe, Plant Farm, Keston, contributed a collection of hardy flowers.

Messrs. Kelway and Son, Langport, occupied an entire table with a fine selection of gladioli. These were remarkable for splendid development of the spikes, and the informal arrangement contributed materially to the beauty of the display. Some of the most striking varieties were Eugene Sandow, Rider Haggard, Peace Envoy, Princess Victoria, Mrs. F. Field, The Sirdar, and Lord Milner. Chief among the new varieties was Yellow Beauty, which is remarkable for the large size, fine form, and exquisite colouring of the flowers.

The dahlia season has opened well as far as the southern districts, at all events, are concerned, Messrs. J. Cheal and Sons, Lowfield Nursery, Crawley, staging a fine table of singles, pompons, pæony-flowered, cactus, and pompon cactus varieties. The single varieties included Lady Bountiful, Elaine, Mrs. Joynson Hicks Betty, Althæa, and Flora. The best forms of cactus were Mrs. Douglas Flemming, Prima Donna, Indomitable, H. H. Thomas, The Imp, Red Admiral, and Mrs. Landale. The most striking of the pæony-flowered varieties were Glenton, Bertha Von Suttner, The Geisha, Queen Emma, and Merveille.

The Guildford Hardy Plant Company, Guildford, had a nice exhibit of hardy flowers, in which were noted some good gladioli, delphiniums, phloxes, montbretias, and heleniums.

Mr. G. Koiginni, 35, Bessborough Gardens, S.W., had a small exhibit of Japanese dwarf trees growing in quaint receptacles.

Hardy flowers were staged in fine style by Messrs. T. S. Ware, Lim., Feltham. The chief features were masses of Liatris pycnostachya, heleniums in variety, phloxes, gaillardias, asters, and montbretias. Messrs. H. B. May and Sons, Upper Edmonton, had an exhibit of veronicas in a variety of colours, which were arranged in blocks, each consisting of one colour. The veronicas were arranged in association with decorative ferns and palms. A glorious bank of delphiniums came from Mr. Amos Perry, Enfield. The various shades of blue were blocked in masses relieved with grasses and bamboos. A few of the best forms were Persimmon, Carmen, Maggie Perry, Mrs. Creighton, Sultana, Gloriosa, and Jubilee, with a few really good seedlings. The same firm also had a nice pool of nymphæas surrounded with hardy ferns.

From Colonel M. Lockwood, M.V.O., Bishop's Hall, Romford (gardener, Mr. G. Craddick), came a fine group of standard Acalphya hispida, which attracted much attention. The plants were fully six feet high, with large heads, and a profusion of their crimson flower spikes presented a very fine appearance. They were marvels of cultural skill, nothing of the sort having been seen before at Westminster, or indeed at any other exhibition in this country.

The great feature of the show was undoubtedly the collection of trees and shrubs, exhibited by the Hon. Vicary Gibbs, Elstree (gardener, Mr. E. Beckett). All were raised during the past three years from seeds collected in China by the well-known collector, Mr. E. H. Wilson. They formed a wonderful exhibit, making a broad belt the whole length of the hall. Many of the specimens were twenty feet high. This applies chiefly to the forms of Vitis and Rubus, some of which have not as yet received specific names. A few of the former were most striking, especially V. armata, V. sinensis, and V. megalophylla. Other attractive subjects were Rhus Henryi, Rubus omiense, Liriodendron chinensis, acers in variety, cotoneasters, Hydrangea Sargenti, Actinidia chinensis, ligustrums, betulas, cydonias, viburnums, and smilax. The whole forming a wonderful collection of new plants. The cultural skill displayed in their growth must have been pleasing to all concerned.

Messrs. Jas. Stredwick and Son, Silverhill Park, St. Leonards-on-Sea, exhibited a dozen new seedling cactus dahlias, which included some very promising varieties. The best appeared to be Mrs. Stephens, Miss Hills, Golden Plover, Coronet, Turtle Dove, and Auckland.

Mr. H. Shoesmith, Woking, also sent a few seedling cactus varieties, the most promising being Florrie Wells and Nora Hopkins.

Mr. James Hudson sent from the Gunnersbury House Gardens cut flowers of several of the newer nymphæas, and of these the grand white N. Gladstoneana, and the rich pink, Mrs. Richmond, received distinction from the committee. Very fine also was N. Attraction, a magnificent variety with large, superbly-formed claret-coloured flowers, and much superior to the other high-coloured water lilies.

ORCHID COMMITTEE.

A beautiful bank of Vanda cærulea came from His Grace the Duke of Marlborough, Blenheim, Woodstock (gardener, Mr. G. Hunter). The plants were fine examples of cultural skill, and were effectively displayed with ferns and palms.

Messrs. Stuart Low and Co., Bush Hill Park, staged a small collection of orchids, which included some well-coloured plants of Vanda cærulea, Oncidium luridum, Cattleya Whitei—a finely coloured form, also C. Granulosa x Hardyana, and Dendrobiums Deari and D. formosum giganteum.

Mr. Edward V. Low, Vale Bridge, Haywards Heath, exhibited a small group, chiefly cattleyas. Some of the best were C. Gaskelliana Phyllis, C. adula var. E. V. Low—a highly-coloured variety, C. Dowiana x C. Granulosa, also well-flowered plants of Lælio-cattleya Bletchleyensis.

Mr. R. G. Thwaites, Chessington, Christchurch Road, Streatham, staged a few fine cattleyas, which included C. adula in various shades, C. Roupelliana, C. Pittiana, and C. Euphrosia.

From Messrs. Charlesworth and Co., Haywards Heath, came a small collection, in which were noted Stanhopea oculata, Brasso-cattleya Maroniæ, Vanda cærulea, Ærides Sanderiana with four good spikes, Miltonia Schroderiana, and Sophro-cattleya Marathon.

From Messrs. Hassall and Co., Southgate, N., came a small collection. The chief features were the Lælio-cattleyas, which included Walter Gott, a fine deeply-coloured form, also Cattleya Schofieldiana, C. Thurgoodi, C. Adula, and C. iridescens.

FRUIT AND VEGETABLE COMMITTEE.

From Messrs. Dobbie and Co., Edinburgh, came thirty-six baskets of potatoes, all in high condition, every tuber being perfect in development. Some of the best baskets were those of The Admiral, The Factor, Mr. Bresee, Dobbie's Red King, Dobbie's Favourite, Crimson Beauty, Midlothian Early, and Dobbie's Prolific; needless to add, the whole exhibit was staged in the most attractive manner.

Messrs. H. Cannell and Sons, Eynsford, Kent, presented a fine exhibit of apples, and a few dishes of plums. The former were of large size, and as clean and bright as could have been desired. Some of the best were Rival, Norfolk Beauty, Worcester Pearmain, Williams' Favourite, The Queen, Lady Sudeley, Peasgood's Nonsuch, Benoni, Titowka, and Duchess Favourite. The background was formed by apple and pear trees in pots, which were carrying fine crops.

Messrs. Laxton Bros., Bedford, exhibited fruiting growths of the Laxtonberry, the result of a cross between Raspberry Superlative and the Loganberry. The fruits, which are produced in abundance, appear to follow the former rather than the latter, both in the berry and the growing canes. They also submitted fruits of two new plums, one of which had an Award of Merit made in its favour.

Messrs. Jas. Veitch and Sons, Lim., Chelsea, occupied the end of the hall with a splendid collection of fruit trees in pots. In the centre of the group were fine specimen peach trees, all literally loaded with fruit. The varieties were Duchess of York, Sea Eagle, Marquis of Downshire, Thos. Rivers, and Late Devonian. The pears were next in importance, for though the trees were not large, they were all carrying a wonderful crop of good clean fruits, especially the varieties Dr. Jules Guyot, Triomphe de Vienne, Marguerite Marillat, Souvenir du Congres, Conference, and Doyenne du Comice. The plums were equally remarkable, especially the Early Transparent gages. Plants of the Canadian Huckleberry were a mass of their black berries, while mention should also be made of the fine clean apples, also two standard trees, richly endowed with mistletoe.

AWARDS.

Awards of Merit.—To Gladiolus Yellow Beauty, from Messrs. Kelway and Son; single dahlias, Bridesmaid and Killarney, from Messrs. J. Cheal and Sons; cactus dahlias, Turtle Dove and Mrs. Stephens, from Messrs. J. Stredwick and Son; nymphæas Mrs. Richmond and Gladstoneana, from Leopold de Rothschild, Esq. (gardener, Mr. J. Hudson, V.M.H.), Hibiscus syriacus Snowdrift, from Mr. Notcutt; Houlletia Wallisi, from Messrs. Charlesworth and Co.; and plum Laxton's Blackbird, from Messrs. Laxton Brothers.

Gold Medal.—To Hon. Vicary Gibbs (gardener, Mr. E. Beckett, V.M.H.), for collection of Chinese trees and shrubs; Messrs. J. Veitch and Sons, Lim., for fruit trees in pots.

Silver-gilt Knightian Medal.—To Messrs. H. Cannell and Sons, for fruit trees in pots.

Silver-gilt Flora Medal.—To Colonel Lockwood (gardener, Mr. Craddick), for acalyphas; Messrs. Carter Page and Co., for dahlias; Duke of Marlborough (gardener, Mr. Hunter), for Vanda cærulea.

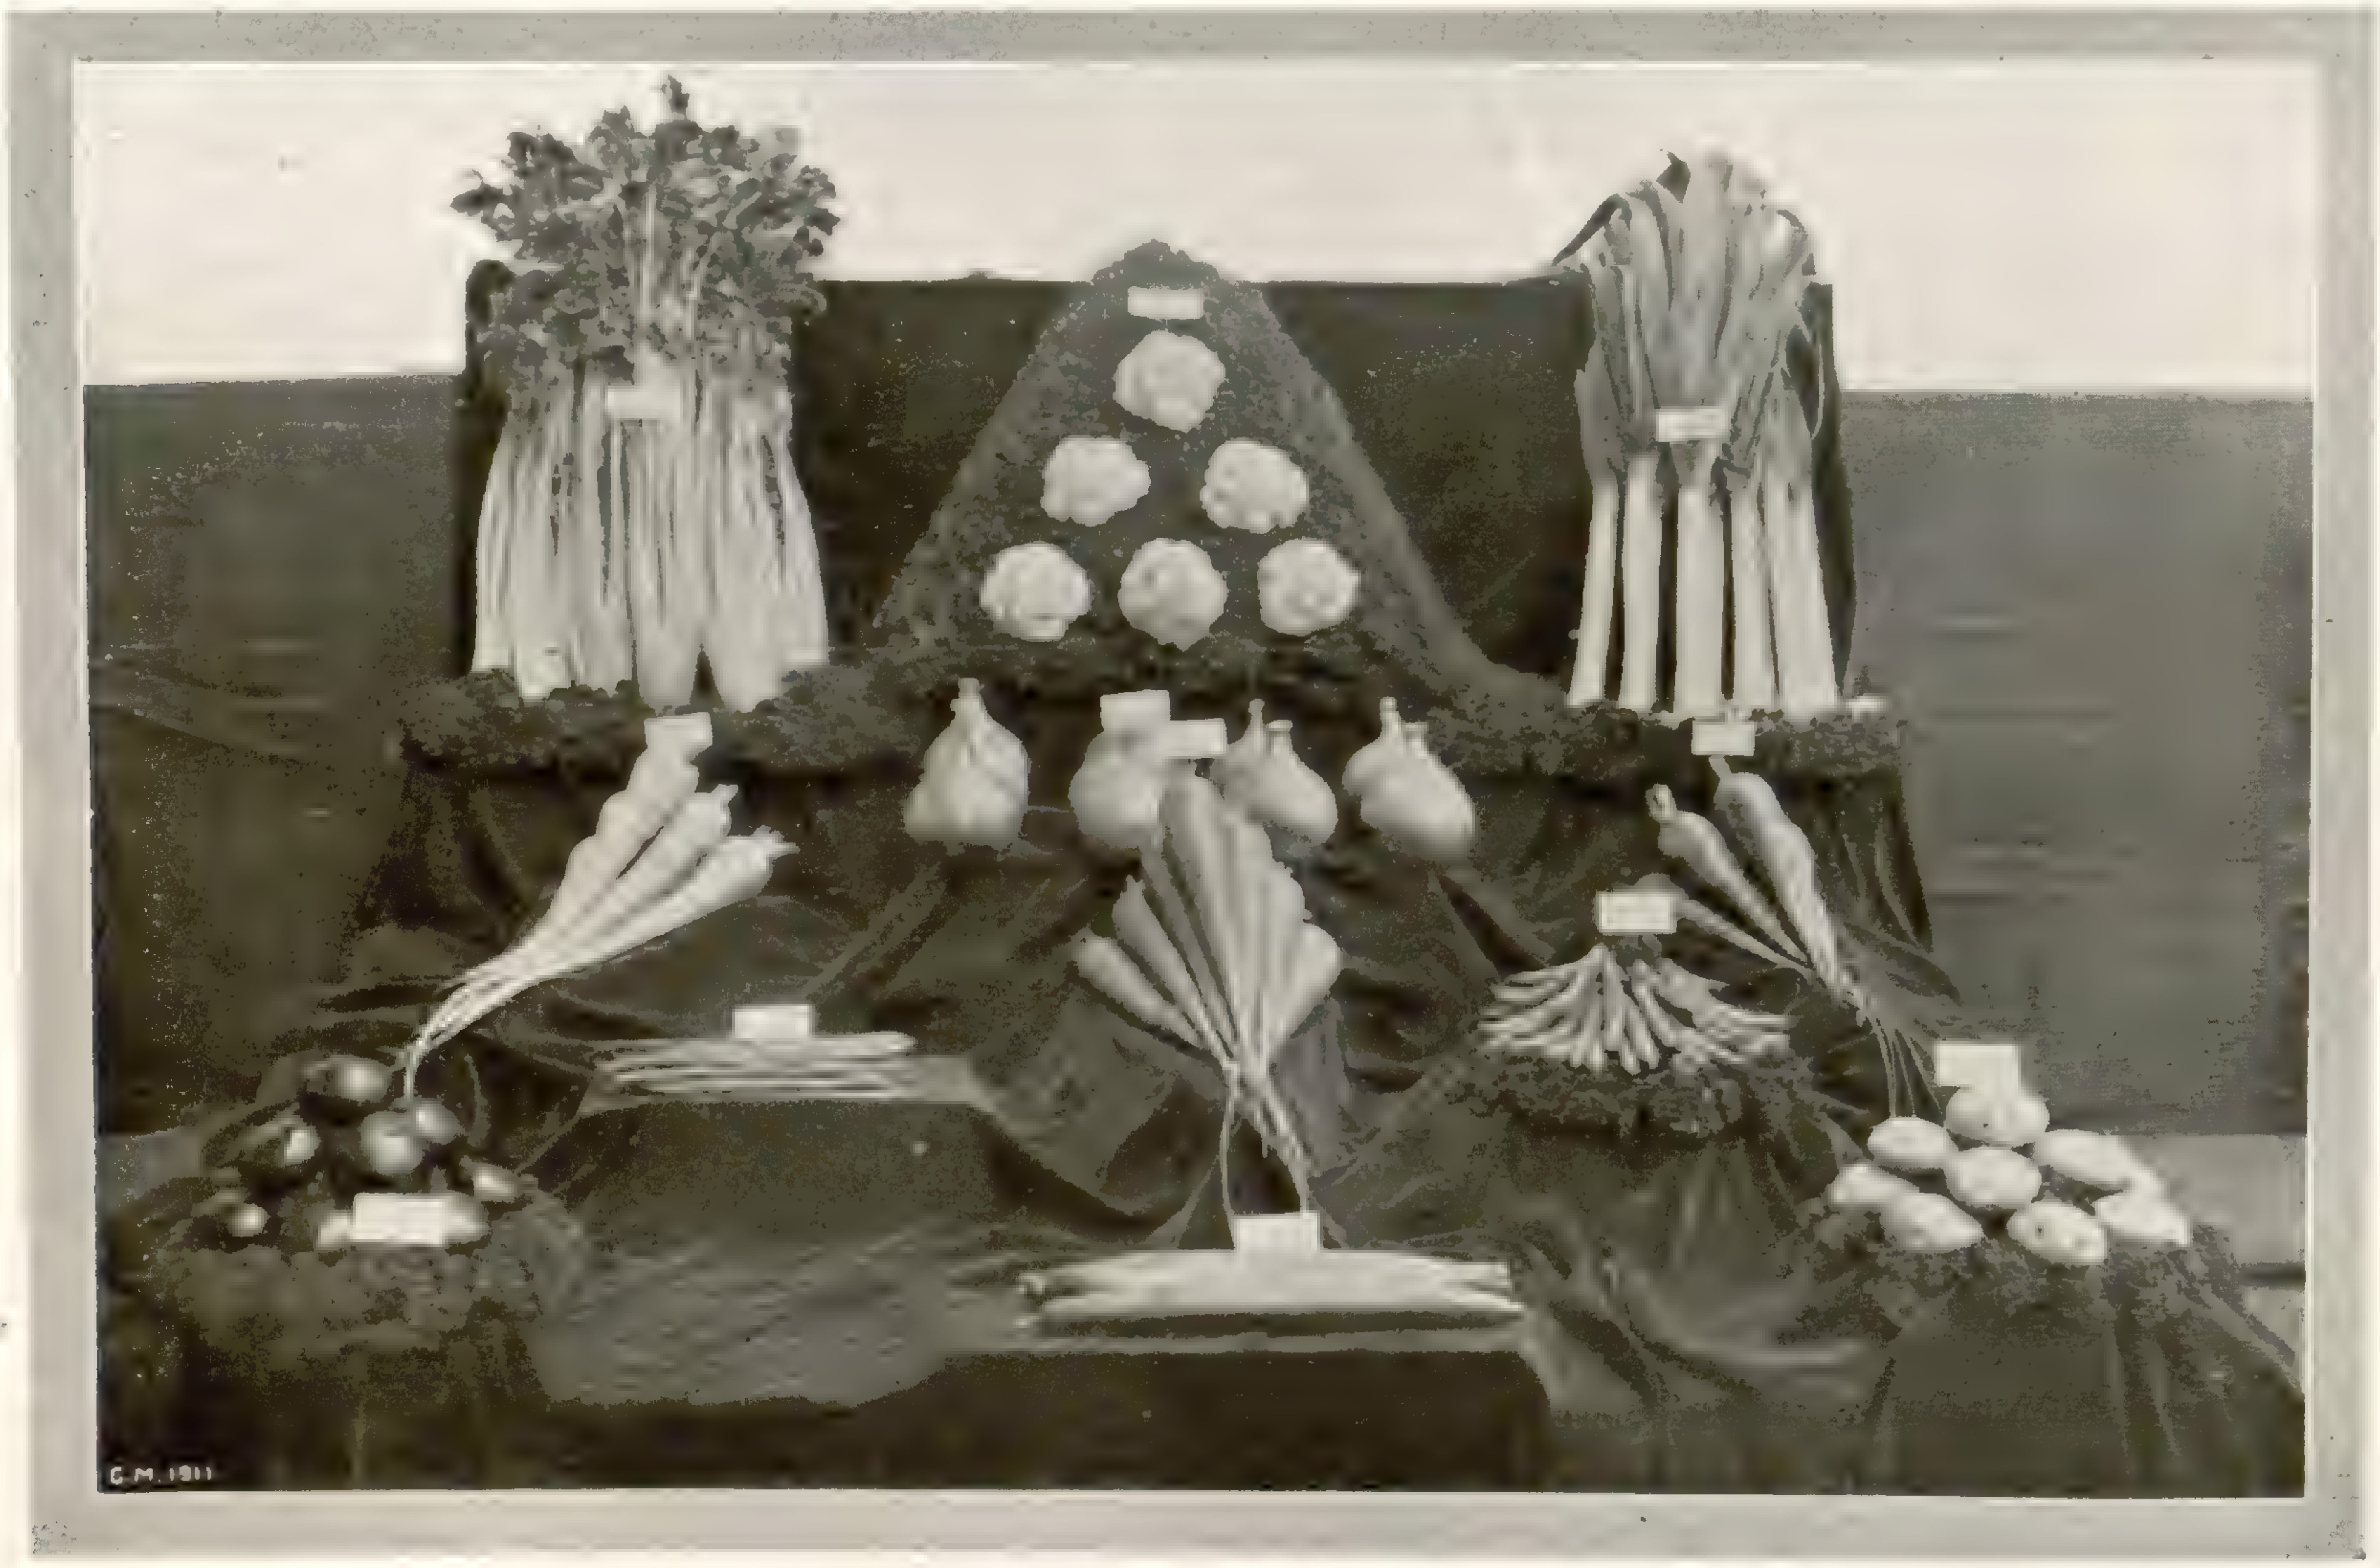
Silver Flora Medal.—Messrs. Charlesworth and Co., for orchids.

Silver Knightian Medal. — To Messrs. Spooner, for apples.

Silver-gilt Banksian Medal. — Messrs. Dobbie and Co., for potatoes.

Silver Banksian Medal.—To Messrs. J. Cheal and Sons, for dahlias; Messrs. W. Cutbush and Son, for hardy plants; Messrs. H. Cannell and Sons, for cannas and begonias; Messrs. Kelway and Son, for gladioli; Messrs. H. B. May and Sons, for veronicas and ferns; Messrs. J. Veitch and Sons, Lim., for cannas and miscellaneous plants; Mr. J. Box, for delphiniums and phloxes; Messrs. Stuart Low and Co., for orchids; Mr. E. V. Low and Messrs. Hassell and Co., for orchids.

Bronze Banksian Medal.—Messrs. T. S. Ware, Lim., for hardy herbaceous flowers; and Mr. Amos Perry, for delphiniums and nymphæas.



NATIONAL VEGETABLE SOCIETY—MR. J. GIBSON'S FIRST-PRIZE COLLECTION OF TWELVE KINDS OF VEGETABLES.

The British Pteridological Society.

The annual meeting of the members of this society was held this year at Barnstaple to enable the members to judge of the ferny possibilities of the Southern Counties of England, their visits hitherto having been confined to the Lake District or Scotland. Prior to the actual business meeting at the Golden Lion Hotel, at which Mr. Alex Cowan, as president, took the chair; several informal ones were held on the previous days, and a very large number of fern fronds were exhibited by Mr. Cowan on behalf of himself and Mr. Phillips, these embracing a number of remarkably fine varieties, clearly evidencing immense progress in the development of superior forms by selection, and some new "finds" of great merit. The most noteworthy were a splendid form of Osmunda regalis undulata, found by Mr. Phillips, and far excelling in foliose character an otherwise similar variety of that name found many years ago in the Azores. Lastrea dilatata crispa ochracea, shown by Mr. Cowan, had beautifully crispate fronds, liberally and constantly splashed with golden yellow. A cross effected by Mr. Cowan between presumably P. v. cornubiense and P. v. grandiceps Fox or Forster, has yielded a very fine "grandiceps" form of cornubiense, cutting P. v. c. grandiceps Cowan. Another very fine variety was a sub-plumose form of Lastrea filix-mas of a very promising type for cultural selection. Various excursions were made to Woody Bay, Helensmouth, and other ferny districts in the locality, but owing to the intense and long continued drought, hunting was severely handicapped, the ferns in many places being scorched and flaccid, and their growth so stunted as to mask their varietal character, if any, to an unrecognisable extent. Dr. Stanfield, however, found an Asplenium adiantum nigrum with multifid frond tips throughout, and some very foliose forms of L. montana. Mr. Druery, among other minor finds, discovered a Hart's-tongue on lobatum lines, but with all frond terminals symmetrically rounded off with sori radiating round the abruptly shortened midrib, like the figures on a clock dial, a rare variant which he named Scolopendrium v. lobatum radiosorum. Mr. W. B. Cranfield was the most fortunate, alighting upon two remarkably fine varieties, one a wild deltoid foliose form of Lastrea filix-mas with broad dilatata-like basal pinnæ, and the other, on private ground, a peculiarly fine foliose and imbricate variety of P. aculeatum on truly handsome lines, which had been found many years ago near Holsworthy.

National Vegetable Society.

AUGUST 30.

This new and vigorous society held its second annual exhibition at the Royal Horticultural Hall on Wednesday last, and, if the display was not quite equal to the magnificent show held last year, it far surpassed general expectations. The collections were especially noteworthy for the remarkable development of the various kinds of vegetables represented in them; and, in a careful inspection, one might have overlooked the fact that great heat and long-continued drought add materially to the difficulties experienced by growers in bringing vegetables to a high degree of perfection. The majority of the single-dish classes were also well filled; and, considering the character of the summer now rapidly coming to a close, the quality of the products was such as to reflect the highest credit on the numerous exhibitors. The arrangements were admirably carried out, and the members of the executive responsible for them are deserving of the highest praise.

The premier class for twelve kinds of vegetables, arranged in a space of twenty-four square feet, with prizes of ten, seven, and four guineas respectively, secured an entry of four contestants. The first prize, however, was easily secured by the Duke of Portland, Welbeck Abbey (gardener, Mr. J. Gibson). He staged a perfect collection, arranged tastefully on a base of green velvet. The dishes were celery Superb Pink, cauliflower Early Giant, leek Prizetaker, parsnip The Student, onion Ailsa Craig, Sutton's Black Beet, Red Intermediate carrots, pea The Gladstone, runner beans, Best of All, tomato Perfection, cucumber Delicacy, and potato Superlative. Mr. W. Folkes, Ampthill, Beds, was second with a nice exhibit, but the products were not named. Mr. W. J. Lobjoit, Heston Farm, Hounslow, was third with good potatoes, carrots, and parsnips; again no names. There were but two entries for nine dishes, and the first prize was well won by Mr. H. J. Tatham, Kendall Hall, Elstree (gardener, Mr. W. Grainger), who staged a fine even collection. His best kinds were Ailsa Craig onions, Giant White celery, A1 tomato, Satisfaction potatoes, and The Gladstone pea. Mr. John Keen, Loudwater, Rickmansworth, was awarded third prize with a nice even collection, the onions

NATIONAL VEGETABLE SOCIETY—REV. A. TURNER'S FIRST-PRIZE COLLECTION OF POTATOES IN MESSRS. CLAY AND SON'S CLASS.

being especially good, but the collection was unnamed.

There were four entries for six dishes of tomatoes, distinct, and all were of good quality. Mr. J. Gibson won first prize with fine even dishes of Princess of Wales, Eclipse, A1, Perfection, Best of All, and Polegate. Mr. J. Hudson, 7, Gimson Road, Leicester, was second with fine examples of Sensation, New Emperor, and Regina; while Mr. R. Stannard, The Gardens, Panshanger, Hertford, secured third with good clean fruit. There were no less than fourteen entries for a dish of nine tomatoes, to be judged for quality and flavour. The first prize was awarded Mr. J. Hudson for a fine dish of Webb's Conqueror. The second prize fell to Mr. E. G. Mocatta, Woburn Place, Addlestone (gardener, Mr. T. Stevenson), and the third to Mr. C. Newington, The Holme, Regent's Park (gardener, Mr. T. Abbott), who staged Moneymaker.

Lord Northcliffe's prizes for six kinds of vegetables secured three competitors. Mr. R. H. Comyns, Heath Farm House, Watford (gardener, Mr. W. Waterton), won first position with a nice level exhibit. His best kinds were: Celery, Pink Perfection; onion Ailsa Craig; and potato, Wordsley Pride. Mr. E. Deakin, Hay Hall, Birmingham, was second; and Mrs. Lewis Davis, Brynderwin, Hindhead (gardener, Mr. W. H. Masters), third.

For three tomato plants in pots there were two contestants, Mr. T. Abbott easily scoring first prize for well-fruited plants of Moneymaker, Monarch, and Queen Alexandra; the plants carried heavy crops, but splitting was rife among them, due to the late weather. Mr. S. Mortimer, Rowledge, Farnham, was second with Garrick, Fillbasket, and Ailsa Craig.

Of collections of six dishes of peas, there were two, Mr. J. Gibson winning handsomely with bright, well-filled pods of Duke of Albany, Centenary, Peerless, Alderman, The Gladstone, and Superlative. Mr. W. Waterton was second with smaller examples, though very bright and fresh. There were four collections staged in the class for three dishes of minor vegetables, Mr. W. Grainger winning first with nice clean examples of Silver Seakale beet, Kohl rabi, Earliest White, and celeriac. The Rev. A. Turner, Woborn Park, Weybridge, followed with fine celeriac and kohl rabi purple; while Mr. W. J. Lobjoit brought up the rear.

In the class for six dishes of potatoes, distinct, the prizes were given by Messrs. Clay and Son, and there was a splendid entry of fifteen competitors, the quality being excellent throughout. Mr. A. Turner won first with splendid dishes of Sensation, The President, The Factor, Windsor Castle, Progress, and Up-to-Date. The second prize was won by Mrs. Austen, Capel Manor, Horsmonden, Kent (gardener, Mr. A. Woodgate), who had fine dishes of Table Talk, British Queen, and The Scot. Third prize, Viscount Goschen, Seacox Heath, Hawkhurst (gardener, Mr. J. Gilmour), with fine table quality. Mr. T. Stevenson had to be content with fourth place, although he had tubers of high quality.

The prizes in the class for six dishes, distinct, open to cottagers and allotment holders in the county of Surrey, were given by Mr. A. Dean, V.M.H., and brought out five entries. Mr. J. Childs, Cranhurst Farm, Milford, won first place with good Factor potatoes, Ailsa Craig onions, and Intermediate carrots; Mr. R. Spooner, Park Cottage, Hambledon, was second; and Mr. C. Peacock, 39, Richmond Grove, Surbiton Hill, third.

The prizes in Classes 11 to 20 were offered by Messrs. Barr and Sons. Mr. W. Gaiger was the only entrant for six heads of celery, and was awarded first prize for New Solid Pink. There were six entries for a dish of Snowdrop potatoes, and capital examples were staged. Mr. J. Gilmour was first, Mr. T. King, New Road, Broomham, Chippenham, second, and Mr. J. H. Gilmour third. For six stump-rooted carrots Mr. A. Woodgate proved the victor with a splendid dish; Mr. T. White, Sandford Cottage, Bampton, Oxford, was second, and Mr. T. King third. For three heads of celery, Lord Curzon, Hackwood Park, Basingstoke (gardener, Mr. F. West), won first with fine heads; while Mr. W. Humphreys, 3, Ward's Lane Cottages, Elstree, was second.

Messrs. W. Cutbush and Son provided the prizes for a collection of vegetables, twenty-five dishes. Strange to say, there was but one entrant—the Hon. Vicary Gibbs, Elstree (gardener, Mr. E. Beckett), who staged a fine collection in his well-known style. The varieties represented were: Celery—Aldenham Pink and Matchless White; cauliflower—Snowball and Autumn Giant; leek—Prizetaker; parsnip—The Student; onions, which were superb—Barnet Hero and Ailsa Craig; beet—Cutbush's Black; pea—The Gladstone; carrot—Main Crop; Giant Brussels sprouts; egg plant—Long Purple; Exhibition marrow; runner bean—Champion; tomato—King of the Yellows and First and Best; Giant French beans; potatoes—Carltonian and King Edward VII.; Eclipse cucumber, Red Globe beet; and turnip, Model White Stone—the whole forming a fine example of cultural skill.

For two bunches of Moneymaker tomatoes Mr. T. Abbott won hands down with a fine exhibit, though the fruits were badly cracked. The second prize was won by Mrs. Bernard, Oakfield, Bridgewater (gardener, Mr. W. Cox); while Mr. E. H. Caterer was third.

Messrs. Dickson and Robinson provided the prizes in several classes, and in these the competition was keen and the quality high. There were fifteen entries for Messrs. Dickson and Robinson's Premier onion, Mr. F. West winning with enormous bulbs; Mr. E. Johnston, gardener to Mr. A. Gallials, Slough, was second; and Mr. T. Avery third. Mr. S. Barker, Clumber Gardens, Worksop, was first with Exhibition leek, staging clean, well-grown specimens. Mr. W. Cox was second; and Mr. J. Orton (gardener to Colonel Cox, Harefield Place, Uxbridge), third. Carrots secured a good entry, Mr. J. T. Jeeves, Holbeach, Lincs, winning first with Perfection Intermediate; Mr. F. West was second, and Mr. T. King third.

Mr. F. West led off for six neads of celery, Prize Pink, followed by Mr. T. Avery and Mr. S. Barker in the order named. Mr. T. Avery won first with beet Market Favourite; while Mr. W. Coleman was first for Giant Exhibition runner bean, in a competition of eleven entries. Mr. W. Waterton won first position for six sugar loaf cabbages with good green hearts; Mr. A. Basile was second, and Mr. R. Stannard third. Parsnips formed a fine class, Mr. F. West winning well with Hollow Crown; Mr. A. Basile was second, and Mr. W. Cox third.

Messrs. Dobbie's prizes brought out large entries. For six International leeks, Mr. R. Stuart, Thistlestone Castle Gardens, Lauder, Berwick, won first with clean, long stems. Mr. J. E. Ellison, Haydon Bridge, was second; and Mr. R. H. Thompson, Little Haywood, Staffs, third. (Twenty-five entries.) The competition for two dishes was equally keen, Mr. A. Basile being placed first with grand examples of The Chapman and The Factor. Mr. M. Hood, 86, Hythe Road, Willesborough, Kent, was second with the same varieties.

There were nine entrants for Mr. R. Sydenham's prizes for nine varieties of vegetables. Here Mr. E. Beckett won first place, staging excellent onions, potatoes, carrots, and leeks. Mr. W. Folkes was second, and Mr. T. White third. Mr. G. W. Bedford was first for a collection of six varieties, staging fine dishes of potato The Factor, onion Ailsa Craig, and tomato Holmes' Supreme. Mr. E. Deakin, Hay Mills, Birmingham, was a capital second, and Mr. A. Moring third. Mr. W. Folkes secured first position for eight onions with Ailsa Craig, beautifully finished; Mr. A. Turner was second, and Mr. D. W. Bedford third. For two dishes of potatoes, Mr. A. Turner led off with Windsor Castle and Up-to-Date. Mr. J. White was second; while Mr. T. Stevenson brought up the rear. Mr. E. Beckett was first for six heads of celery, staging Clayworth Prize; Mr. J. A. White was second, and Mr. W. E. Deakin third. Mr. A. Turner exhibited the best parsnips, having fine examples of Hollow Crown, followed by Messrs. E. Deakin and J. White in the order named.

There were two collections in Messrs. R. Veitch and Sons' class for six varieties, distinct. Mr. W. Cox was first with fine dishes of Sultan Prize celery, Veitch's Improved parsnip, and Cranston's Excelsior onions. Dr. Sandeys, Knowle, Exeter, was second.

The class for four dishes of tomatoes brought out a good competition, Mr. T. Sparkes, gardener to Mrs. Von Hartmann, Wimblehurst, Horsham, who had excellent dishes of Best of All, Invicta, and May's Favourite, being first; Mr. E. Beckett was second, and Mr. H. Folkes third.

Messrs. Wood and Son's class for four dishes of potatoes brought out a fine competition, Mr. A. G. Gentle, gardener to Mrs. H. Dennison, Little Gaddesden, Berkhampstead, who staged Royalty, Monarch, Goldfinder, and The Canon, being first. Mr. T. Stevenson was second with fine dishes of Sir J. Llewelyn and Mayfield Blossom; Mr. A. A. Humphreys third. Mr. H. Folkes won first prize for six onions, staging fine, well finished specimens of Ailsa Craig; Mr. T. West was second, with a fine half-dozen, though hardly so well finished. Mr. H. Wheeler, gardener to Mrs. Jenner, Wenroe Castle, Cardiff, third. (Fifteen entries.)

The amateurs' and cottagers' classes were well filled for the most part. Mr. W. Humphreys' first prize collection of vegetables were well grown and staged also, as were also the six onions from Mr. T. Jones, Ruabon, which won first prize. Many of the other classes were well filled with very creditable produce in such a dry season.

NON-COMPETITIVE.

Messrs. Barr and Sons, King Street, Covent Garden, staged a most attractive display of vegetables, the background being occupied with celery Barr's Champion, Solid White, Covent Garden, Tall White, and New Solid Pink, splendid heads of Silver Sea Kale beet and its red variety, cabbage Little Queen and Autumn Exhibition, beautiful hearts that knew not the drought, with leeks, marrows, and onions. The table itself was laden with tomatoes of various varieties, fine examples of onion Nelson's Selected and Ailsa Craig, parsnips, carrots, a fine variety of radishes, with Best of All runner beans, cucumbers, excellent dishes of potatoes, and fine lettuces.

From Messrs. Sutton and Sons, Reading, came a magnificent exhibit. The vegetables were arranged in tiers. On the top were well-set-up examples of Indian corn, with huge examples of onions, Ailsa Craig, Giant Rocca (grand), and Sutton's A1, with celery, leeks, marrows, and kohl rabi, splendid specimens of Sutton's new red Intermediate carrots, parsnips Tender and True, Early Giant cauliflowers, tomatoes in fine variety, beets, potatoes, peas, radishes, and cabbages. The minor subjects were well represented by capsicums, ornamental gourds, aubergines, maize, celeriac, butter beans, and other items, the whole making a fine representative display.

From the Mid-Kent Nurseries, West Wickham, came a couple of dozen fruits of melons, The Manchester. The fruits were of good size and well finished.

Mr. S. Mortimer, Rowledge, Farnham, exhibited four boxes of his new cucumbers, Cynosure and Unrivalled, both varieties were in splendid form, the former being the larger fruit.

Messrs. S. Spooner and Sons, Hounslow, staged a nice collection of fruit, arranged in baskets and dishes. The apples were very clean and bright, especially Early Strawberry, Middle Green, Williams' Favourite, and Lady Sudeley. Dishes of plums and pears were also in fine condition.

Messrs. Dobbie and Co., Edinburgh, had their exhibit of potatoes left from the previous day, and needless to add they proved a source of attraction with the vegetable experts present.

Messrs. W. Cutbush and Sons, Highgate, exhibited their group of hardy flowers from the previous day, except that they had renovated it for the occasion. It made a pleasing change from the long lines of potatoes and onions, etc.

From Mr. Robert Holmes, Tuckswood Farm, Norwich, came splendid bunches of his new tomato Kondine Yellow. The bunches varied from ten to twenty fully-developed and ripe fruits per bunch. The fruit itself resembled egg plums. Messrs. D. Dowel and Son, Hammersmith, had a large display of bowls for bulbs, and a large variety of horticultural sundries.

At the close of the judging the members of the executive, with the judges and the members of the Press, had luncheon at the Hotel Windsor. Mr. W. J. Lobjoit presided, and was supported by Sir John Llewelyn, Bart., Mr. Owen Thomas, V.M.H., Mr. W. Poupart, Mr. J. Gibson, Mr. E. Beckett, V.M.H., and Mr. George Gordon, V.M.H. The toast list was short and the speeches brief, among the speakers being the Chairman, Mr. A. Dean, V.M.H., Sir John Llewelyn, Bart., Mr. Robinson, Mr. E. Beckett, Mr. George Gordon, Mr. J. Gibson, and Mr. G. Wythes.

Royal Horticultural Society of Aberdeen.

Opened by a Princess, favoured with delightful weather throughout, and a turnout of some 1,600 entries, this exhibition proved a grand success. Than the Duthie Public Park, Aberdeen, kindly lent to the society by the Town Council, no more charming site could be wished for such an event.

PLANTS.

While there was a fine display in this section, it is evident that the times are changing, and the fine tall specimens of Seaforthia elegans or other graceful palm; the yellow-flowered allamanda, the well-trained Lapageria alba, or other hothouse-reared plants, are seldom seen. Their places have been taken by more modest examples of cultural art. In the class for the best four specimen plants in flower (orchids excluded), Mr. J. Leggat, gardener, Balgownie House, Aberdeen, was first with a finely-grown Statice profusa as his best specimen. Mr. John Elder, Norwood, Cults, Aberdeenshire, had a good win for four best specimen foliage plants, his entry comprising some fine dracænas and palms. Mr. Alexander Brebner, gardener to Colonel W. S. Gill, of Dalhebity, Aberdeenshire, won handsomely for the best specimen plant in flower with a well-grown Disa grandiflora. For best specimen foliage plant, Mr. Alex. Duncan, gardener to Mr. Adam Maitland, Rubislaw Den House, Aberdeen, was first with a maranta. Ferns were a capital lot, and for these Mr. Brebner, Dalhebity, was a fine first. Zonal geraniums were a good feature, and must certainly be classed amongst the best ever seen in Aberdeen. They were well flowered and finely coloured. In this section Mr. J. D. Brechin, gardener, Ardoe, Belhelvie, Aberdeenshire, carried off first and second honours. Pelargoniums, considering we are so far over in the season, made a wonderfully good show. Here, again, Mr. Brechin had the best. Fuchsias, although well grown and fairly well flowered, were not so large as we have seen them at Aberdeen. Mr. Gillespie (an amateur, be it noted), Northfield Place, Aberdeen, had the finest entries here. For liliums, Mr. J. D. Brechin, Ardoe, led the way. For six plants for dinner-table decoration not more than two of any one species, Mr. John Petrie, gardener, Crathes Castle, had matters pretty much his own way. Begonias, single and double, were fairly well shown, Mr. William Dick, 96, Queen's Road, Aberdeen, and Mr. George Davie, Hilton House, Woodside, Aberdeen, sharing the leading honours. Orchids were short in number, but the quality was good. Mr. Alexander Duncan, Rubislaw Den House, took first place here with fine, well-grown specimens of Epidendrum nemorale and Cattleya Harrisoni. Gloxinias were specially fine, and Mr. Alex. Brebner was first with finely flowered specimens.

CUT FLOWERS.

The marquee devoted to this section was well filled, the entries being of a high standard. Perhaps the outstanding feature was the fine table decorations, composed chiefly of self-coloured sweet peas set in sprays of gypsophila. For eighteen rose blooms, H.P. and H.T., or either, named, distinct varieties, a silver cup was offered by Messrs. James Cocker and Sons, and it was worthily won by Mr. A. Brebner, Dalhebity. There was a large number of entries for the trophy. For six bunches of decorative roses, Mr. Brebner again led, carrying off the society's silver medal with capitally-grown blooms. Pompon dahlias were fairly numerous, Mr. J. M. Dunn, Nellfield Place, Aberdeen, taking first place. There were a large number of cactus dahlias, Mr. W. Flockhart, Craigiebuckler Cottage, Rubislaw, Aberdeen, winning with flowers of rare beauty. Mr. Brechin, Ardoe, Belhelvie, made a capital second. A specially good feature was the collection of twenty varieties of cut flowers and fine foliage bedding plants, including annuals. Here Mr. Alexander Douglas, gardener to Mr. Thomas Ogilvie, Kepplestone House, Aberdeen, led with a very choice collection, which made a grand show of colour. Mr. W. Dick, gardener to Mr. Ledingham, 96, Queen's Road, Aberdeen, proved a worthy second. One of the most attractive parts of this section was the sweet peas. Evidently this flower has become very popular both with professionals and amateurs, and the flowers they put up on this occasion reflected the greatest credit on Northern growers. Mr. John Grigor, gardener to Mrs. Dunbar Dunbar, of Seapark, Forres, N.B., who has been having matters pretty much his own way of late in the north-east and midlands of Scotland where the sweet pea is concerned, won the handsome cup presented for the best sixteen bunches of sweet peas, distinct varieties, with a fine entry. His blooms were of great size and fine colour. He was run pretty close, however, by Mr. Petrie, Crathes Castle, whose second-placed entry was much admired. Mr. John Roy, Kingsford, Alford, N.B., had a well-deserved third. In competition for the prize for table decorations Mr. W. Cormack, Prospect Cottage, Dyee, Aberdeenshire, led with an entry that for colour, variety, and tasteful arrangement left nothing to be desired. Other leading prize-takers in the cut-flower section worthy of special mention were Mr. J. Davidson, Ferryhill Lodge (gladioli); Mr. John Reid, Woodside (French marigolds); Mr. Douglas, Kepplestone House (hardy herbaceous flowers); Mr. A. Duncan, Rubislaw Den House (carnations and picotees); Mr. J. W. Brechin (phloxes); Mr. J. Anderson, Aberdeen (chrysanthemums); Mr. J. D. Smith, 275, Union Grove, Aberdeen (hand bouquets and bride's bouquets).

FRUIT.

Here there was a very fine display, especially of hardy fruit, the single dishes being uncommonly fine. As is his wont, Mr. Harper, gardener, Tulliebelton, Perth, obtained premier honours in the class for hardy fruit, six varieties, with a capital collection, consisting of Kirk's plum, Hale's Early peach, Victoria plum, Lord Suffield apple, Williams' Bon Chretien pear. Apricots and plums were fair. Strawberries were few, but

All parts are numbered ready for easy re-erection by any handy man.

there never have been finer black currants seen in the North. Those sent in by Mr. James Ferguson, Linton Gardens, Sauchen, Cluny, N.B., were of large size, and easily gained for him pride of place. The fine summer we have experienced was reflected by the splendid display of apples and pears. Gooseberries, cherries, raspberries, red and black currants, all of which were well shown. Grapes were short in number, but good. Mr. John Petrie, Crathes Castle, led with well-grown, finely-formed bunches of Muscat Alexandria and Appley Towers. Mr. John Elder, Norwood, Cults, second, with Foster's Seedling and Black Hamburgh, the latter especially being well finished, made a good second. Other prominent winners here were Mr. J. Leggat, Balgownie House (cherries); Mr. Alex. Mortimer, 602, Holburn Street, Aberdeen (gooseberries); Mr. W. Scorgie, Springhill (melons); Mr. William Smith, Fintray House, Aberdeenshire (peaches and nectarines); Mr. George McLennan, Fetteresso House, Stonehaven, Kincardineshire (strawberries and baking apples): Mr. W. B. Greig, Balmedia House (pears and nectarines); and Mr. John A. Grigor, Seapark (tomatoes).

VEGETABLES.

Considering the season the display made here was very good. The outstanding feature was the magnificent display of potatoes; the quality was high, and the entries were very numerous. The prize-takers were: Mr. H. B. Smith, Burdshaugh, Forres; Mr. J. Ferguson, Linton House; Mr. Alex. Douglas, Kepplestone House; Mr. William Milne, Corsindae House, Midmar; Mr. John A. Grigor, Seapark; and Mr. William Webster, Muiresk, Turriff, N.B. For the best collection of vegetables, Mr. Scorgie, Springhill, occupied the post of honour. Mr. William Lawson, Cornhill, Aberdeen, gained first place for best collection confined to market gardeners. Both of these entries were very meritorious, and reflected no little credit on the growers.

NURSERYMEN AND FLORISTS.

This was a greatly admired section. The Messrs. James Cocker and Sons, Springhill and Sunnyside, Aberdeen, carried off for the third year in succession the society's silver challenge cup for best thirty-six rose blooms. The cup now becomes the property of the firm. Very tastefully were the blooms staged, and they were remarkable for their exquisite beauty in colour and form. Messrs. Adam and Craigmile took second place with a very meritorious exhibit. This last-named firm were first for twenty-four tea or noisette roses, with very fine blooms, and they also took the leading place for wreaths and ladies' sprays. Hand bouquets, although not numerous, were a very fine entry. For best hand bouquet (coloured) Miss Burns, 89, Victoria Road, Torry, Aberdeen, was first. Mr. Alex. Burns, jun., New Market, Aberdeen, had matters pretty much his own way for shower bouquets (white), and floral designs, being first and third for first-named, and first and second for designs.

MISCELLANEOUS DISPLAYS.

These formed a great attraction to the public. Messrs. W. Smith and Sons, seedsmen and nurserymen, Aberdeen, had an unusually large and excellent display of wreaths and other floral arrangements.

Messrs. James Cocker and Sons, Springhill and Sunnyside Nurseries, Aberdeen, staged a large collection of roses, the blooms being throughout of high quality. They also arranged a fine display of herbaceous flowers.

Mr. M. H. Sinclair, F.R.H.S., seedsman, Aberdeen, had an attractive display, the sweet pea section being specially worthy of notice. He had also a miniature pond furnished with aquatic plants, which formed a unique feature.

Messrs. Ben Reid and Co., Pinewood Nurseries, Aberdeen, were, as usual, well to the front with up-to-date varieties of herbaceous plants, autumn-tinted foliage, roses, very fine specimens of weeping standard roses, sweet peas, etc.

Mr. Dustan, Holburn Nurseries, Aberdeen, who makes a speciality of dahlias and early-flowering chrysanthemums, put up a very fine exhibition of these flowers.

As a whole, the show was one of the best ever held in the long history of the society, and to Colonel Gill, of Dalhebity, chairman; Mr. Alexander Milne, vice-chairman; Mr. J. B. Rennett, advocate, Aberdeen, secretary, with their hard-working committee, the highest praise is due.

Begonia Dregei.—This is a South African species of an old plant in gardens, and though viewed in the light of many hybrid varieties it cannot be considered showy, yet it is of neat, compact growth, well furnished with pretty leafage, and the pure white flowers are freely borne over a lengthened period. It forms a pleasing feature in the greenhouse during the summer, and apart from its intrinsic merit is of especial interest, as being one of the parents of the now universally grown B. Gloire de Lorraine, the other parent being B. socotrana, while in conjunction with the orange-coloured B. Sutherlandi it (more than forty years ago) yielded the pretty pink-flowered B. Weltoniensis, which for a long time was extensively grown.—W. T.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

AUTUMN-SOWN ONIONS.—P. R. T., Emsworth: A few days earlier would have been preferable, but if the work of sowing seeds is immediately taken in hand, there should be no real loss of time or crop. Level a piece of ground from which potatoes have been lifted or peas cleared, make it quite firm, and sow the seeds thinly in shallow drills. After sowing again make the surface firm. Sow such varieties as Ailsa Craig, Giant Rocca, or White Leviathan.

OLEARIA SEMIDENTATA. — H. K., Cork: You will find a full account of the attempt made by Captain Dorien Smith to introduce Olearia semidentata into this country from the Chatham Islands in the GARDENERS' MAGAZINE of July 2 and July 16, 1910.

NORTH OF ENGLAND HORTICULTURAL SOCIETY.—A. W. A., Durham: The secretary of this society is the Rev. J. Bernard Hall, Rawdon, Leeds. The subscriptions to the society are as follows: Life Fellows, £10 10s. (or more if desired): Fellows, £1 1s. per annum; Fellows of the Royal Horticultural Society, 10s. 6d.; amateurs employing a regular gardener and nurserymen, 10s. 6d.; amateurs not employing a regular gardener and working gardeners, 5s.; affiliated societies (membership over 50), £1 1s.; and affiliated societies (membership under 50), 10s. 6d. per annum. Individual members of such affiliated societies are entitled to be Associate members on payment of 2s. 6d.

SLUG WORMS ON ROSES.—J. E. B., Devonport: The slug worms or larvæ of Eriocampa rosæ do a vast amount of damage to roses in some districts and in some seasons. There are two broods each year, occasionally three. The slug worms eat away the upper epidermis and leaf tissues, leaving the foliage very disfigured and quite incapable of performing its functions. Leaves so attacked become bleached, and then die. These larvæ when full fed fall to the ground, form oval cocoons, and pupate in the soil. The best method of checking an attack is to spray the roses with hellebore wash, and, if the attack is a very severe one, remove the surface soil around the roses in winter and burn it, putting new material in its place.

HELLEBORE WASH.—J. E. B., Devenport: Mix one ounce of fresh hellebore powder and two ounces of flour in a little water until the whole is worked down to a smooth thin paste; then add sufficient clear water to make up three gallons of mixture. Keep well stirred, and apply through a fine spray nozzle.

HORTICULTURAL AND AGRICULTURAL LEAFLETS.—W. G., Haywards Heath: The Board of Agriculture and Fisheries is now drawing attention to the reduction in price of the sectional volumes of leaflets useful to farmers, gardeners, teachers, etc. The reduced price of a full set of the twelve volumes is 9d., post free. Large quantities of any particular volumes for distribution to allotment holders, schools, etc., may also be obtained at the reduced rate of 9d. per dozen copies, carriage paid. Remittances should be in the form of cheques, money or postal orders, made payable to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W., and crossed "Bank of England." Letters so addressed need not be stamped.

NAMES OF PLANTS.

W. W. H.—1, Abies pectinata; 2, A. nobilis; 3. A. brachyphylla.

F. K. — 1, Goniophlebium sepultum; 2, Didymochlæna truncatula; 3, Gleichenia flabellata.

H. S.—1, Rhociton volubile; 2, Ophiopogon Jaburan argenteo-variegatum; 3, Tremandra verticillata.

INQUIRER.—1, Hydrangea vestita; 2, Hypericum Henryi; 3, H. androsæmum; 4, Hibiscus elegantissima.

R. B.—1, Solanum Wendlandi; 2, Vanda cærulea, a poor variety; 3, Statice Holfordi; 4, Jacaranda mimosæfolia.

M. A.—Your plant is unquestionably Vallota purpurea, and not a hybrid between the vallota and a crinum, as you suppose.

R.—The small specimens you send are not sufficient for identification. If you will send larger specimens taken from those parts of the trees where they have been able to develop their characteristic features we shall be pleased to assist you.

FORTHCOMING ENGAGEMENTS.

SATURDAY, September 2.—Ibstock Horticultural Society.

Border Horticultural Society at Coldstream.

MONDAY, September 4.—National Chrysanthemum Society's Floral Committee.

TUESDAY, September 5.—Scottish Horticultural Association, 8 p.m.

WEDNESDAY, September 6.—Royal Caledonian Horticultural Society's Exhibition in Waverley Market, Edinburgh; two days.

Glasgow Horticultural Society; three days.

THURSDAY, September 7.—National Dahlia Society's Exhibition, Crystal Palace; two days.

MONDAY, September 11.—United Horticultural Provident and Benefit Society: Committee meet.

TUESDAY, September 12.—Royal Horticultural Society: Floral, Fruit, and Orchid Committees, noon; General Meeting with lecture on "The Small Holdings Movement," by Mr. T. Smith, 3 p.m.; Scientific Committee, 4 p.m.

Woodstock Horticultural Society.

WEDNESDAY, September 13.—Messrs. Dickson and Robinson Vegetable Competition at Manchester.

THURSDAY, September 14.—National Rose Society: Autumn Exhibition Horticultural Hall.

SATURDAY, September 16.—Paisley Florist Society.

The only resemblance between a Pine Spray Syringe and others is in the shape of the barrel. The metal is more substantial. For the rest, the combination spraying head renders Spray, Rose, and Bend instantly obtainable without the addition or removal of a single fitment, while the adjustable leather bucket plunger gives perfect suction, never allows water to escape past it and up your sleeve, and wears interminably.

A written request from your ironmonger or seedsman, and a Syringe will be sent in 24 hours for your approval. Price **10/6.** Sole proprietors and manufacturers. **Robinson Bros., Ltd., West Bromwich.**

PINE SPRAY SYRINGE (patent).

ILLUSTRATIONS.

Portrait of Mr. R. P. Brotherston, 637; Gladiolus Yellow Beauty, 639; A View in the Rock Garden, Friar Park, 641; A Pathway up the slopes of the Rock Garden, Friar Park, 643; Crocus versicolor, 645; A Splendidly-developed Specimen of Gunnera manicata, 647; National Vegetable Society—Mr. J. Gibson's First-prize Collection of Twelve Kinds of Vegetables, 650; National Vegetable Society—Rev. A. Turner's First-prize Collection of Potatoes in Messrs. Clay and Son's Class, 651.

Campanula Vidali.—This Azorean species of the Bellflower family is totally distinct from any other kind, and withal a charming summer-flowering subject, either for the greenhouse or the open ground. It is one of the few tender members of the genus, and must be free from frost to keep it safely through the winter. Campanula Vidali forms quite a woody stem, about six or eight inches high. From the upper part of this stem numerous branches are produced which reach a height of 18 inches to 2 feet. Their lower half is furnished with oblong-shaped fleshy leaves, and on the upper portion bare of foliage, the flowers are produced. They are of an inverted urn shape, contracted just below the middle, from 1½ to 2 inches long, and of an ivory-white tint, with an orange ring near the base of the interior. Unusually thick in texture, they last a long time.—W. T.

Employment THE GARDENERS' MAGAZINE Register.

The charge for an Advertisement INCLUDES A FREE ENTRY ON THE REGISTER. Immediate Notice must be given when an engagement is secured.

A List of Gardeners on the Register will be supplied to employers only upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.

Hatherley, Cheltenham.

THE POPULARITY OF XL ALL SPECIALITIES increases every year. All gardeners proclaim that nothing equals these celebrated preparations.

XL ALL NICOTINE VAPORISING COMPOUND, the gardener's favourite Fumigant, both Liquid and Cake.

XL ALL NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used.

XL ALL INSECTICIDE WASH B (sine Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown, both poisonous and non-poisonous, are XL ALL WEED KILLER, XL ALL FERTILISER, RICHARDS' ARSENATE OF LEAD PASTE, CUCASA POWDER (fungicide), etc. Don't forget to ask your N. S. or Florist for Richards' small pink list.

NOTES OF THE WEEK.

The "International" Admission Charges.

The charges that have been fixed for admission to the International Horticultural Exhibition to be held at Chelsea in May next is at the present time being much discussed in horticultural circles, and the trend of opinion is in the direction of their being too high. A few of those who hold decided views on this question have given public expression to them, and we learn on good authority that the Birmingham Committee have written to the directors urging them to adopt a lower scale than that to which objection is being taken. In discussing a question of this kind, there is no occasion to indulge in strong language such as some of the writers appear to have considered necessary in expressing their views, but there is an objection thereto, inasmuch as they are more likely to hinder than bring about a satisfactory solution of the question. As at present arranged, the charges are £2 2s. for the first day, £1 1s. the second, 10s. the third, 5s. the fourth, 2s. 6d. the fifth, and 1s. for the sixth, seventh, and eighth. That they are decidedly high, even for so important an exhibition as we trust this will be, there can be no doubt; but it is doubtful whether, with such scale, the general public will be present in sufficient numbers to make the exhibition a great financial success. The discussion has so far been limited to the charges of £2 2s. and £1 1s. for the first and second days respectively; but it appears to us that the charges for subsequent days should have further consideration. The exhibition opens on a Wednesday, with the result that 5s. will be charged on Saturday and half-a-crown on Monday, and the "splendid shilling" be unable to assert its power on either of the popular days during which the exhibition will be open. Financially this arrangement is likely to prove a mistake; for, owing to the practice now so general of spending the week-end out of town, Saturday's entertainments are largely dependent upon the middle classes of moderate means, who, whether they can afford it or not, will hesitate to pay 5s. for admission to a flower show. We believe that the best results financially would be derived from an admission fee of half-a-crown on the Saturday, as immense numbers of amateurs would be able to visit the show on that day who could not well afford to pay the higher fee, and one shilling for the Monday and the following days. If this revision be effected it will necessarily follow that the charges for the earlier days must be revised, as it is clear they should be, not in the interest of this or that section of the community, but because of the probability of the financial results proving more satisfactory. It is a point of some importance that the proposal for holding this exhibition originated with the Council of the Royal Horticultural Society, who undertook to contribute £1,000 and guarantee £4,000, on condition that the Fellows would receive admission tickets—not necessarily for the first day—according to the amount of their subscriptions, the rate specified being a ticket for each guinea paid annually. It was not assumed by the Fellows that the tickets would be presented to them gratuitously, but would be supplied at a price showing a substantial reduction as compared with the charge to the outside public. The directors have arranged to supply them at half-price to the two-guinea and four-guinea Fellows for the first and second days, but owing to the price of the tickets having been fixed so high there is a strong feeling among the Fellows that the sum they will have to pay is excessive. The one-guinea Fellows will not fare so well, for they will have to pay £1 10s. for admission on the first day, and 10s. on the second. The charges for an exhibition of this character must of necessity be higher than at an ordinary flower show, but they ought not to be so high as to prevent all but a comparatively small number seeing the products in their freshness and full beauty. We shall hope that long before the opening day of the exhibition wiser counsels will prevail, and the directors will adopt a scale such as will be readily accepted by the general public and the Fellows of the Royal Horticultural Society, and at the same time safeguard the financial success of the exhibition.

MR. WILLIAM J. MARLOW.

Bacterial Plant Diseases.

One of the sittings of the agricultural subsection at the British Association's meeting at Portsmouth was devoted to a consideration of bacterial diseases of plants, and, although no new discoveries relating to them were announced, much useful information was given in the course of the meeting. Professor M. C. Potter, of Newcastle, in opening the discussion, said the existence among plants of diseases that were caused by parasitic bacteria would hardly be questioned at the present day. The belief once generally held that the special features of plant structure, as the nature of the sap and the impervious character of the cell-wall rendered the plant immune to bacterial attack, had been shown to have no foundation in fact. It had, indeed, been proved by careful experiment, that certain bacterial diseases could be reproduced in healthy tissues with absolute certainty. The plant it has been proved possesses many vulnerable points of attack, and infection has been shown to take place through the water-pores, the stomata, the floral nectaries, and wounds, the last-named being very frequently used as a means of ingress by parasitic organisms. It had also been demonstrated that certain bacteria had the power of secreting a toxin and cytolitic enzyme which effected the destruction of the protoplasm and the degeneration of cellulose; moreover, the actual penetration of the bacterium through the cell-wall had been observed. Bacterial diseases of plants had been studied chiefly, though not exclusively, in cultivated forms. Those under cultivation differed materially from the wildings from which they had been derived, and the modification of cell structure, with the systems of cultivation which resulted in rapid growths of succulent tissue, rendered them more liable to attack. In Professor Potter's opinion, and those who have given any considerable share of their attention to the subject will not question its correctness, the diseases contracted by cultivated plants might be likened to those which were prevalent in human life under artificial conditions of modern civilisation. In combating these ills of humanity much had been accomplished, by attending to hygienic laws, improved sanitation, and the enforcement of methods of isolation, in lessening the evils arising from the activities of various bacteria. In the plant world, also, it was evident that much of the loss sustained by cultivators was due to the neglect of essential precautions and wrong cultural treatment. Until this is thoroughly understood and acted upon, cultivators will fail to grapple with the problems associated with plant diseases, and to appreciably diminish the losses from which they suffer. Professor Potter also pointed out that various beetles, slugs, and other pests, carried pathogenic germs, and by their bites, or by depositing them on wounds, enabled the bacteria to gain an entrance into the host in a manner similar to that of the carriage of malaria by mosquitoes. Many germs are, it was suggested, spread by man, and the careless handling of diseased material was regarded as responsible for much trouble. Attention was also directed by Professor Potter to the fact that susceptibility to disease was influenced by methods of manuring, and to the lowering of the power of the plant to resist disease by the too liberal use of nitrogenous manures. The injurious influence of the last-named fertilisers in the garden when used in excess is well known to experienced cultivators, but it is of the highest importance that it should be known to all, and Professor Potter did well to call prominent attention to the point.

Mr. William J. Marlow, whose splendid work at Hampton Court has been referred to in these pages on more than one occasion, has practically spent the whole of his life in the public service of England, Scotland, and Cape Colony, and the rapid progress he has made therein affords ample evidence that he has from the first shown abilities of a high order. Mr. Marlow first entered the service of the Royal parks and gardens from the Glasgow Botanic Gardens, where he occupied an important position for several years. Leaving Glasgow, Mr. Marlow received an appointment in the Hampton Court gardens, where he remained until he was promoted to the position of Superintendent of Greenwich Park. Five years later he succeeded Mr. W. Gardiner—who had been appointed to the charge of Hyde Park—as superintendent of the Hampton Court Park and Gardens, and during the four years that have elapsed since he assumed his higher responsibilities he has rendered services in the cause of the decorative aspects of the flower garden that could not well be overestimated. If mistakes are made in the preparation of a colour scheme for a private garden, it may be regrettable, but the consequences are not, as a rule, serious, because the scheme, when carried out, is seen by a limited number only. But in the case of great public gardens such as those of which Mr. Marlow has charge, it is a very different matter. Hampton Court Palace is annually visited by many thousands, the visitors embracing all classes of the community and coming from various parts of the United Kingdom. It is therefore of the highest importance that the whole of the arrangements should be bright, effective, and artistic, for it is impossible for large numbers of visitors to leisurely inspect an extensive garden without being greatly influenced by what they see. Whether the influence be good or otherwise, it will be reflected in many gardens in the following year. It has, therefore, been with much satisfaction that we have from time to time directed attention to the success achieved by Mr. Marlow in the embellishment of the Hampton Court Gardens in spring and summer, because we know that those who would be induced by our remarks to visit them would not only derive much pleasure from the varied and tasteful arrangements, but would obtain object-lessons of the most useful character.

"Gardeners' Magazine" Bulb Number.—Although we are still enjoying the brilliant sunshine and the high temperature that are usually regarded as characteristic of July, the time has arrived when due consideration must be given to the preparations essential to the production of displays of spring-flowering bulbs. We shall therefore devote our issue for the 16th inst. chiefly to the more important of the various classes of bulbous plants that bloom during the spring months. The contents will include papers on the notable daffodils of 1911, raising new daffodils, daffodils in the pleasure grounds; tulips, the value of Darwin tulips, good bedding tulips; spring-flowering bulbs by the waterside; poppy anemones, hyacinths for the conservatory and exhibition, hyacinths for bedding, Roman and Italian hyacinths, forced lily of the valley, and ixias and sparaxis in pots. The whole of the articles are written by well-known experts, and the issue will be profusely illustrated.

National Rose Society's Autumn Show. — Mr. E. Mawley, V.M.H., in writing to remind us that the autumn exhibition of the National Rose Society will be held at the Horticultural Hall on Thursday next, 14th inst., states that, owing to the drought, there will this year be a shortage in the roses from southern growers. To counteract this, as far as is practicable, several new classes have, he informs us, been provided, with a view to give growers a greater latitude in exhibiting than would have been possible under the original arrangements.

The Cornish Heaths.—A large number of members of the International Phytogeographical Society recently paid a visit to Cornwall and devoted several days to the investigation of the native flora, and were much interested in the heaths that are characteristic of the county. The foreign members of the excursion included: Professor F. E. Clements, Minneapolis; Professor H. C. Cowles, Chicago; Professor Drude, Dresden; Dr. Graebner, Berlin; Dr. Lindman, Stockholm; Professor Massart, Brussels; Dr. Ostenfeld, Copenhagen; Dr. Rubel, Zurich; Professor Schroter, Zurich; Professor Warming, Copenhagen; and Dr. Webber, Bremen. On the last day of the visit the members of the party were entertained at dinner at Truro, by the Royal Cornwall Institution. Mr. A. G. Tansley, lecturer in botany at Cambridge, said, in the course of the after-dinner proceedings, that the efforts of the Society for the Survey and Study of British Vegetation had brought a number of distinguished foreign botanists to England for a month to investigate the vegetation and discuss the various problems involved. The members of the committee and their foreign colleagues were delighted with the vegetation of the western-most county of England. They came particularly to see the heaths of the Lizard peninsula, with the glorious Cornish heath stretching over so many acres, almost square miles, and also to see the heath that grew in several places between Truro and Falmouth—Erica ciliaris.

New Open Space for Newmarket. For some years past the need of an open space for public use has been keenly felt by the residents in Newmarket, but hitherto it has not been found practicable to provide a suitable site without incurring a larger expenditure than the town could afford. The difficulty has now been removed by Sir Ernest Cassel presenting to the town Grafton House and grounds, which were the property of the late King Edward. The grounds have an area of about two and a-half acres, and are very convenient of access.

Trials of Potato Diggers and Sorters.—The Royal Agricultural Society have arranged for trials of potato diggers and potato sorters to take place on Mr. William Dennis's farm at Littleworth, Lincolnshire, commencing on Tuesday, the 26th inst. The fields on which the trials will be conducted are near the Littleworth station on the Great Northern Railway, and about six miles from Spalding. The trials should be of much interest to those concerned with the commercial culture of potatoes, for there are fourteen entries from seven different firms in the class for potato diggers, and six entries from five firms in the class for potato sorters.

Dundee Flower Show, which was held on August 31 and the two following days, was a great success. The entries amounted to 2,278, or 170 more than last year, and the exhibits were highly meritorious, plants and fruits being of great excellence. The Corporation Cup, which was offered as the premier award in the class for six bunches of grapes, was won by Mr. James Dickson, gardener to Lord Rowallan, Kilmaurs, with splendidly finished clusters.

Croydon Gardeners' Association.—The members of this association had their annual excursion a few days since, and as permission had been obtained to visit the Royal gardens at Windsor and Frogmore, a very enjoyable day was spent. Arriving at Windsor shortly after ten o'clock the forenoon was devoted to an inspection of the State apartments at the Castle, and, after lunch, a visit was made to the gardens. Need it be said that the members were much interested in the rock garden at Windsor, or that they greatly enjoyed the beautiful display of summer flowers on the East Terrace and the magnificent view obtained therefrom. From Windsor the party proceeded to the Frogmore gardens, and devoted several hours to an inspection of the objects of interest in the fine ranges of houses devoted to the cultivation of the various classes of plants.

flowers, and fruits that are grown under glass: to the magnificent herbaceous borders, and to the large walled-in enclosures wherein vegetables and hardy fruits are grown on a large scale, and to a high degree of perfection. At the close of a long and enjoyable day the members of the party turned homewards, much impressed with what they saw in the gardens over which Mr. Mackellar so ably presides.

The King's Acre Nursery Company, Lim., have been awarded the Grand Prix for their model orchard and collection of fruit trees in pots at the Festival of Empire Exhibition that is being held at the Crystal Palace.

Horticultural Sundries will have space provided for them at the International Horticultural Exhibition to be held at Chelsea next year, and those who purpose exhibiting in the sundries section are advised to make application for particulars before the 30th inst. By the term horticultural sundries is to be understood all subjects relating to a garden other than plants, flowers, trees, shrubs, seeds, and such like. Garden houses, garden furniture and ornaments, glass houses, heating apparatus, implements, appliances, tools, manures, insecticides, and garden recreations and games, etc., will be considered as sundries. Particulars can be had from Mr. Arthur J. Gaskell, Royal Horticultural Hall, Vincent Square, Westminster, London, S.W., to whom all communications respecting sundries, should be addressed.

The Blairgowrie Raspberry Harvest, which is now practically over, has been one of the most eventful since the cultivation of raspberries was developed in the district on commercial lines. The raspberry plantations in Perthshire extend over an area of 1,933 acres, and for a considerable period the raspberry industry was very profitable; but of late years, owing to over production or a want of co-operation among the growers, the profits have been very small. According to a correspondent of the "Scotsman," the total quantities of fruit despatched from Blairgowrie this year approached 2,400 tons, as compared with 3,100 tons last year, and 3,300 tons in 1909. During the season the prices have fluctuated in a remarkable manner. Early in the year a sale was reported at £12 per ton, which evoked much comment, because it is generally agreed that the cost of production is not less than £15 per ton. In the previous year the price dropped to £8 per ton, or only £3 per ton more than the cost of gathering the fruit. As the time for picking approached the price remained for a considerable period about £18 per ton. Subsequently the prices began to improve, and when the drought made evident the possibility of a short crop, they rapidly increased until £45 per ton was reached. The rains had the effect of lowering the prices somewhat, but the trade continued active at about £40 per ton. It is believed by those who are conversant with market conditions that next year's supply will be short of the requirements of buyers, as the boilers will not be able to carry over any portion of this season's stock to next year. The low prices of 1910 and 1909 had the effect of causing much land being devoted to other purposes, and, in some instances, prevented the growers properly manuring and cultivating the plantations. As raspberry growers are practically free from foreign competition, it should be possible to devise some means of co-operation in a district such as that of Blairgowrie, that would enable them to obtain remunerative rates for their fruit.

ROSE GARDEN GLEANINGS.

It is of no consequence if a rose has a park to look across or a wayside plot railed primly in as its surroundings; the tree, leaves, and blooms may be perfect; that is, perhaps, the chief reason for the popularity of the Queen of blossoms. As beautiful as the orchid, she needs no glass screen between the heavens and herself; for a shilling or two the same variety can be purchased that won the triumphs of all the great shows; and the cottage gardener may possibly cause it to exceed all previous records as to size and colour.

> "Whether by lake or velvet fields
> Of em'rald lawn, where sunshine yields
> Plumed shadows not a few;
> Or in the environs of thatch,
> Where not a window smiles to match—
> Of ev'ry tint but blue;
> The Roses laugh, and glow, and bless,
> Making all Summer one caress."

When we wish to glean information respecting roses, therefore, we can seek it far and wide; the tiny villa may be climbed by such Captain Christys as make us vow never again to taboo this rose on account of its short bloom season, or the new red walls may act as background to the glorious snowy cups of the Water-lily—resembling Frau Karl Druschki. A village smithy in the Midlands has become noted throughout several counties because of the scarlet-crimson masses of Gruss an Teplitz, aided by those of Cheshunt Hybrid, that completely canopy its roof. A humble little shop in a London suburb is yearly framed in such glorious rose-flushed Gloire de Dijon flowers as few country growers ever succeed in obtaining.

Neglected kinds of roses have, in many instances, proved themselves possessed of most valuable qualities this year. Cooling's Single Crimson Bedder has aroused immense enthusiasm for garden decoration, the large blossoms coming in trusses, and giving a feast of the true carmine shade that is always certain of appreciation; this is a Bourbon rose (known to not one cultivator out of ten), and belongs, therefore, to the class of Madame Isaac Perière and Mrs. Paul, Souvenir de Malmaison and Catherine Guillot.

The heat of sunshine generally faded all the coppery roses directly they unfurled, but it has been said that never have buds of Leonie Lamesch shown such rich vermilion as this season; their employment in quite a juvenile stage, without any opened blooms, with maidenhair fern, for table decoration, produced many a sensation. This dwarf polyantha seems to prefer to grow tall, and then gives many side-branching sprays of blossom; it is a charming variety for pot culture, and revels in a cool greenhouse. Window boxes of Baby Dorothy, a very dwarf polyantha, perpetual blooming, achieved another triumph; there is no reason why other of the miniature varieties should not be similarly employed, for though the trees will not thrive more than two years with roots so cramped, they can bo then added to the garden. Windows opening upon pink Mignonette, crimson Red Pet, or the double white, The Pet, would have an exceedingly fascinating foreground view.

The summer growth of ramblers has been slight in most places, owing to the lack of rain; it will be followed by prodigious blossoming next season in the opinion of scientists. Bushes, or pillars against walls, have such a rich effect, whether of ramblers or climbing hybrid perpetuals and hybrid teas, that lovers of artistic training of roses should bear the fact in mind. The trees, planted against a wall, as usual, are simply pruned, and tied so as to form huge sheaves of foliage and flower, instead of having their branches extended. H. S.

MODERN GENETIC SCIENCE.

Mr. W. Bateson, F.R.S., who was president of the agriculture sub-section of the British Association's meeting at Portsmouth, devoted his opening address to a consideration of the present position of genetics. The Council Chamber of the Town Hall, in which the sub-section held its meetings, was crowded, and the audience evinced much interest in the address, and heartily applauded the president at its close. The address was of equal interest to both agriculturists and horticulturists, and we give herewith a summary of the passages having special reference to genetics in relation to horticulture.

Research a Slow Process.

In his opening remarks Mr. Bateson said they were at the present time witnessing an outburst of activity in the promotion of science in its application to agriculture and horticulture. He therefore considered it necessary to point out, as a means of preventing disappointment hereafter, that in all sciences, whether pure or applied, research was nearly always a slow process, uncertain in production, and full of disappointments. Material advance must be especially slow in the case of an ancient art like agriculture, where practice represented the casual experience of untold ages and accurate investigation was of yesterday. The opportunities of discovery were so few that they could not afford to miss any, and it was to the man of trained mind who was in contact with the phenomena of a great applied science that such opportunities were most often given. Through his hands passed precious material, the outcome sometimes of years of effort and design. To tell him that he must not pursue that inquiry further because he could not foresee a direct and immediate application of the knowledge he would acquire was, he believed, almost always a course detrimental to the real interests of the applied science. In this country where the Development Commission would presumably for many years be the main instigator and controller of agricultural research, the constitution of the Advisory Board, on which science was largely represented, formed a guarantee that broader counsels would prevail, and it was to be hoped that, not merely this inception of the work, but its future administration also, would be guided in the same spirit. Let them, however, beware of giving false hopes.

He read lately in a newspaper an interview with a fruit farmer who was being questioned as to the success of his undertaking, and spoke of the pests and difficulties with which he had had to contend. He was asked whether the Board of Agriculture and the scientific authorities were not able to help him. He replied that they had done what they could, that they had recommended first one thing and then another, and he had formed the opinion that they were only in an experimental stage. He was perfectly right, and he would hardly have been wrong had he said that in these things science was only approaching the experimental stage. This should be notorious. There was nothing to extenuate. To affect otherwise would be unworthy of the dignity of science. Those who had the means of informing the public mind on the state of agricultural science should make clear that, though something could be done to help the practical man already, the chief realisation of the hopes of that science was still far away, and that it could only be reached by long and strenuous effort, expended in many various directions, most of which must seem to the uninitiated profitless wandering.

Application of Genetics to Practice.

With reference to the application of Genetics to practice, Mr. Bateson stated that when he went to the Temple Show or to a great exhibition of live stock, his first feeling was one of admiration and deep humility. Where all was so splendidly done and results so imposing were already attained, was it not mere impertinence to suppose that any advice they were able to give was likely to be of value?

But as soon as one entered into conversation with breeders, one found that almost all had before them some ideal to which they had not yet attained, operations to perform that they would fain do with greater ease and certainty, and that, as a matter of fact, they were looking to scientific research as a possible source of the greater knowledge which they required. Could scientists without presumption declare that genetic science was now able to assist these inquirers? In certain selected cases it undoubtedly could. On the other hand, it was equally clear that in a great range of examples practice was so far ahead that science could scarcely hope in finite time even to represent what had been done, still less to surpass the performance. They could not hope to improve the flavour of the Muscat of Alexandria grape or to excel the orange and pink colouring of the rose Juliet. Nothing that they knew could have made it easier to produce the rambler roses, or even to evoke the latest novelties in sweet peas, though it might be claimed that the genetic system of the sweet pea was as things go fairly well understood. To do any of these things would require a control of events so rare that for ages they must probably remain classed as accidents. On the other hand, the modes by which combinations could be made, and by which new forms could be fixed, were through Mendelian analysis and the recent developments of genetic science now reasonably clear, and with that knowledge much of the breeder's work was greatly simplified.

An interesting example was furnished by the work which Mr. H. M. Leake was carrying out in the case of cotton in India. The cottons of fine quality grown in India were monopodial in habit, and were consequently late in flowering. In the United Provinces a comparatively early flowering form was required, as otherwise there was not time for the fruits to ripen. The early varieties were sympodial in habit, and the primary apex did not become a flower. Hitherto no sympodial form with cotton of high quality had existed, but Mr. Leake had now made the combination needed, and had fixed a variety with high-class cotton and the sympodial habit which was suitable for cultivation in the United Provinces. Until genetic physiology was developed by Mendelian analysis, it was safe to say that a practical achievement of this kind could not have been made with rapidity or certainty.

"Rogues" in Crops.

One of the greatest advances to be claimed for the work was that it should induce raisers of seed crops especially to take more hopeful views of their absolute purification than had hitherto prevailed. It was at present accepted as part of the natural perversity of things that most high-class seed crops must throw "rogues," or that at the best the elimination of these waste plants could only be attained by great labour extended over a long period of time. Conceivably that view was correct, but no one acquainted with modern genetic science could believe it without most cogent proof. Far more probably they should regard these rogues either as the product of a few definite individuals in the crop, or even as chance impurities brought in by accidental mixture. In either case they could presumably be got rid of. The first question was to determine whether a given rogue had in it any factor which was dominant to the corresponding character in the typical plants of the crop. If it had, then they might feel considerable confidence that these rogues had been introduced by accidental mixture. The only alternative, indeed, was cross fertilisation with some distinct variety possessing the dominant factor, or crossing within the limits of the typical plants themselves occurring in such a way that complementary factors had been brought together. This last was a comparatively infrequent phenomenon, and need not be considered till more probable hypotheses had been disposed of. If the rogues were first crosses the fact could be immediately proved by sowing their seeds, for segregation would then be evident. Cross-fertilisation in culinary peas was excessively rare, but it was certainly sometimes effected, doubtless by the leaf-cutter bee or a humble-bee visiting flowers in which for some reason the pollen had been inoperative. But in peas crossing was assuredly not the source of the ordinary rogues, and he could not find any valid reason for doubting that the rogues were really recessives to the type. Whether this was the true account or not they would know for certain next year. Mr. Arthur Sutton had given him a quantity of material which they were now investigating at the John Innes Horticultural Institution, and by sowing the seed of a great number of individual plants separately, he anticipated that they would prove the rogue-throwers to be a class apart. The pure types then separately saved should, according to expectation, remain rogue-free, unless further sporting or fresh contamination occurred. If it proved that the long and attenuated rogues were really recessive to the shorter and more robust type, the case would be one of much physiological significance.

Academic Science and Practice.

There was another large and important class of cases to which similar considerations applied. He referred to the bolting or running to seed of crops grown as biennials, especially root crops. It had hitherto been universally supposed that the loss due to this cause—amounting in sugar beet as it frequently did to 5 or even more per cent.—was not preventable. This might prove to be the truth, but he thought it was not impossible that the bolters could be wholly, or almost wholly, eliminated by the application of proper breeding methods. If it proved to be so, they would have another remarkable illustration of the direct applicability of knowledge gained from a purely academic source. They had now the power to formulate rightly the question which the breeder was to put to nature; and this power and the whole apparatus by which he could obtain an answer to his question—in whatever sense that answer might be given—had been derived from experiments designed with the immediate object of investigating that scholastic and seemingly barren problem, "What is a species?" If Mendel's eight years' work had been done in an agricultural school supported by public money he could imagine much shaking of heads on the county council governing that institution, and yet it was no longer in dispute that he provided the one bit of solid discovery upon which all breeding practice would henceforth be based. He knew few lines of pure research more attractive, and at the same time more likely to lead to economic results, than an investigation of the nature of variation in size of the whole organism or of its parts. By what factors was it caused? By what steps did it proceed? By what limitations was it beset?

After referring at some length to animal life on the farm, Mr. Bateson said the question arose in regard to flax—How should a strain be bred which should combine the maximum length with maximum fineness of fibre? Now in this problem of the flax, and not impossibly in the others he had named, they had questions which could in all likelihood be solved in a form which would be of general, if not of universal, application to a host of other cognate questions. By good luck the required type of flax might be struck at once, in which case it might be fixed by ordinary Mendelian analysis; but, if the problem was investigated by accurate methods on a large scale, the results might show the way into some of those general problems of size and number which made a great part of the fundamental mystery of growth. That in all such examples the objective phenomena they saw were primarily the consequence of the inter-action of genetic factors was almost certain. In the economies of breeding a thousand phenomena were waiting for analysis and reference to their specific causes. What, for instance, was self-sterility? The phenomenon was very widely spread among plants, and was far commoner than most people supposed who had not specially looked for it. Why was it that the pollen of an individual in these plants failed to fertilise the ova of the same individual? A sexual multiplication seemed in no way to affect the case. The American experimenters were doubtless right in attributing the failure of large plantations of a single variety of apples or of pears in a high degree to this cause. If they could grasp the rationale of self-sterility they opened a new chapter in the study of life. It might contain the solution of the question, What was an individual?—no mere metaphysical conundrum, but a physiological problem of fundamental significance.

Increased Yields.

What, again, he asked, was the meaning of that wonderful increase in size or in "yield" which so often followed on a first cross? They were no longer content, as Victorian teleology was, to call it a "beneficial" effect and pass on. The fact had long been known and made use of in breeding stock for the meat market, and of late years the practice had also been introduced in raising table poultry. Mr. G. N. Collins, of the United States Department of Agriculture, had recently proposed, with much reason, that it might be applied in the case of maize. The cross was easy to make on a commercial scale, and the gain in yield was striking, the increase ranging as high as 95 per cent. These figures sounded extravagant, but from what he had frequently seen in peas and sweet peas he was prepared for even greater increase. But what was this increase? How much of it was due to change in number of parts, how much to transference of differentiation or homœosis, as he had called it—leaf-buds becoming flower-buds, for instance—and how much to actual increase in size of parts? To answer these questions would be to make an addition to human knowledge of incalculably great significance.

In the application of science to the arts of agriculture, chemistry—the foundation of sciences—very properly and inevitably came first, while breeding remained under the unchallenged control of simple common sense alone. The science of genetics was so young that when they spoke of what it also could do they must still for the most part ask for a long credit; but he thought that if there was full co-operation between the practical breeder and the scientific experimenter they would be able to redeem their bonds at no remotely distant date.

At the close of the address a vote of thanks was, on the motion of Mr. A. D. Hall, seconded by Mr. Leonard Sutton, accorded Mr. Bateson.

OBITUARY.

MR. ROBERT LAIRD.

It is with much regret that we have to record the death of Mr. Robert Laird, who died at his residence at Pinkhill, Corstorphine, on the 2nd inst., in his 52nd year. Mr. Laird was the second son of the late Mr. R. B. Laird, and occupied a prominent position in horticultural circles, and was held in high estimation by all who had the pleasure of knowing him. Mr. Laird was secretary of the Scottish Horticultural Association from 1891 to 1900, and subsequently was elected to a seat on the Council, and later as a vice-president of that important body. For many years he was a member of the Council of the Royal Caledonian Horticultural Society, a position from which he retired last year. Mr. Laird leaves a widow and six children, and to them we tender our heartiest sympathy in the great loss they have sustained.

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers is "Dahlias and Their Cultivation," by J. B. Wroe, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London

THE SUN-DIAL GARDEN, MADRESFIELD COURT.

The sun-dial garden, of which one-half is shown in the accompanying illustration, is only one of a number of surprise gardens that, with no repetition of anything, constitutes one of the chief characteristics of the horticultural aspects of Earl Beauchamp's famous Worcestershire seat. We reach this attractive garden by a curved path, passing amongst large irregular beds of lavender, rosemary, santolina, southernwood, and specimens of other fragrant subjects planted in the grass, leaving the celebrated maze on the left. In the sun-dial garden proper there is a magnificent collection of true herbaceous plants only, arranged in large irregular groups, according to the height and habit of the plants, of which no one variety is repeated or duplicated. The chief object aimed at is to have as varied and as long a succession of bloom as possible

The central part of the path is partly tiled, laid on dry gas ashes, so as to be comfortable to walk on during wet weather. The outer parts are of short-mown grass, which sets off the beauty of the flowers, and is available for walking on when the weather is dry and hot. The borders are about fifteen feet in width, enclosed between holly hedges, and trimmed carefully with the knife, and without formality.

Leading out of the sun-dial garden another surprise is Lady Mary's garden, the outer hedges of trimmed yew forming a Greek "M." planted entirely with hardy and half-hardy annuals, these being arranged in large groups, irregular in shape and size, and in accordance with a clearly defined colour scheme. These groups are intersected by well-kept grass walks. This garden of annual flowers has, during the past two months, been the gayest part of the gardens. That this should have been the case in such a hot and dry summer as the one we have experienced this year may come as a surprise to many of our readers, but those who have a feeling of surprise in reading this statement should remember that Mr. W. Crump, V.M.H., who has for a long period had charge of the Madresfield Court gardens, is, by common consent, one of the most able of present-day gardeners.

GLOXINIAS.

It seems to be a doubtful question to what genus the beautiful flowering subjects so much grown in gardens as gloxinias rightfully belong, but however botanists may differ, it is scarcely likely that the name fixed by long use will be generally superseded.

By some authorities the only recognised species of gloxinia in general cultivation is G. maculata, introduced from South America in 1739. This reaches a height of a couple of feet, the flowers being borne on the upper part of an erect leafy stem. They are of a purplish-blue colour. This gloxinia, which derives the specific name of maculata from the spots on the stem, especially on the lower half, varies a good deal in colour, some of the forms being quite pale compared with others. It flowers, as a rule, towards the end of the summer. According to the late Colonel Beddome, F.L.S., it is very commonly distributed throughout Southern India, where it grows like a weed, and flowers profusely.

The gloxinias of gardens, which are among the most beautiful of flowering subjects under glass during the summer months, belong to quite a different race from G. maculata. As one whose experience of these charming plants dates back many years it is impossible to overlook the fact that considerable improvements have been effected within recent times. This is particularly manifest in the manner in which gloxinias are now raised from seeds, for whereas at one time all the best forms were propagated by means of leaf cuttings, now seedlings from a reliable source can be depended upon to come true to character. However fine a collection is grown, and however large a quantity may be in bloom, gloxinias cannot be cut in sheaves for decorative purposes, and this is perhaps the reason that they are not more often met with. Again, they are looked upon as requiring a great deal of heat, but this is altogether a fallacy. True, they will readily respond to warm treatment, and, on the other hand, they may be grown comparatively cool. I have had them in good condition in summer without any artificial heat whatever after the month of May, not seedlings of the same year, of course, but strong one-year-old tubers.

An instance of the rapid development of gloxinias when raised from seed, and placed under favourable conditions, was shown at the meeting of the Royal Horticultural Society on July 18, when groups of the most strongly marked forms were exhibited. The flowers were very large, and represented altogether the finest things in gloxinias. These plants, which were in four-inch pots, were raised from seed sown a little less than six months previously, and were flowering freely.

W. T.

NEW PLANTS, ETC.

HOULLETIA WALLISI.

An attractive and rare species which was discovered by Wallis upwards of forty years ago, but for a long period has been lost to cultivation. The plant is of moderate growth, and has decumbent spikes bearing comparatively large waxy flowers, which are soft yellow, freely marked with light purple on the inner side of the segments. A.M., R.H.S., August 29. Messrs. Charlesworth and Co., Haywards Heath.

NYMPHÆAS.

Gladstoneana.—A beautiful white water lily; the flowers are larger than those of the other white varieties, and are of the finest form, and freely produced. A.M., R.H.S., August 29. Leopold de Rothschild, Esq., C.V.O., Gunnersbury House, Acton (Mr. J. Hudson, V.M.H., gardener).

NYMPHÆA MRS. RICHMOND.
Flowers of large size, soft pink, with carmine-pink centre. A.M., R.H.S., August 29. Leopold de Rothschild, Esq., C.V.O.

Mrs. Richmond.—One of the latest and finest of the many beautiful water lilies raised by the late M. Latour-Marliac. The flowers are of large size and superb form, and the colour is soft pink with deep carmine-pink centre. A.M., R.H.S., August 29. Leopold de Rothschild, Esq., C.V.O.

GLADIOLUS YELLOW BEAUTY.

A remarkably beautiful variety; the flowers large and of superb form; the colour pale sulphur yellow, with lemon-yellow blotch on the lower segment, and a few purple markings in the centre. An illustration of this gladiolus was given in our last issue. A.M., R.H.S., August 29. Messrs. Kelway and Son, Langport.

PLUM BLACKBIRD.

An excellent culinary plum raised from a cross effected between The Czar and Curlew, and, as evidenced by the branches shown, highly productive. The fruits are of medium size, ovate, and with deep purple skin, covered with a fine bloom; the flesh yellow, juicy, and richly flavoured. A.M., R.H.S., August 29. Messrs. Laxton Bros., Bedford.

DAHLIAS.

Bridesmaid.—A distinct single variety, remarkable for its high quality; the blooms are of medium size, even in outline, and the colour is a pleasing shade of salmon-rose. A.M., R.H.S., August 29. Messrs. J. Cheal and Sons.

Mrs. Stephens.—A cactus variety, equally remarkable for its fine form and high finish, the colour, pale yellow, passing to deep lemon-yellow in the centre. A.M., R.H.S., August 29. Messrs. J. Stredwick and Sons, St. Leonards.

Killarney.—An attractive single variety, with blooms of fine form, the colour light terra-cotta suffused rose, with crimson zone round the disc. A.M., R.H.S., August 29. Messrs. J. Cheal and Sons, Crawley.

Turtle Dove.—An attractive cactus variety, the flowers of good form, suffused with crimson. A.M., R.H.S., August 29. Messrs. J. Stredwick and Son.

CYPRIPEDIUM SPECIOSUM.

A handsome Japanese lady's slipper, which has been confused with Cypripedium macranthum, and also with C. Thunbergi, but it is now regarded as quite distinct from both species. The flowers are whitish or pale flesh-colour, veined with rose. "Bot. Mag.," t. 8,386.

ONCIDIUM SANDERÆ.

A handsome species of the same general character as the well-known O. Papilio, but more effective in colour. It is a native of Peru, and was found in the Mayobamba district some two years ago by Mr. Forget. The flowers are large; the petals are long and narrow, and reddish-brown, and the sepals are broad, much undulated, and bright yellow, freely spotted with brown, and the broad waved lip is yellow freely spotted at the margin with red-brown. Bot. Mag., t., 8,374.

LONICERA HENRYI.

A handsome species discovered by Mr. A. Henry in Hupeh, where it was subsequently found by Mr. E. H. Wilson, when collecting for the Arnold Arboretum. This honeysuckle has been in cultivation at Kew during the past three years, and promises to prove hardy in this country. Vigorous in growth, and blooming freely, it is regarded as a valuable addition to the evergreen climbers. The flowers are of medium size, pale yellow, the upper surface of the corolla lobes light red. Bot. Mag., t. 8,375.

VILLARARESIA MUCRONATA.

An interesting Chilian tree, with leathery dark green leaves that closely resemble those of a green-leaved holly, and bearing clusters of short racemes of white flowers. There is a fine tree at Abbotsbury, the residence of the Earl of Ilchester, which was planted in 1840, and has attained a height of between fifty and sixty feet, but the species is only hardy in England in favoured positions in the south-western districts. Bot. Mag., t. 8,376.

CATTLEYA REX.

A distinct and handsome cattleya, which was discovered by Mr. Bungeroth on the western slopes of the Peruvian Andes, and introduced to cultivation by Mr. Lucian Linden about twenty-one years since. It became rare in cultivation until nearly two years ago, when Messrs. Sander and Sons obtained a consignment from Mayobambo, in the Upper Amazon region. The flowers are ivory-white, with rose-coloured lip, veined with dark red. "Bot. Mag.," t. 8,377.

COLUMNEA GLORIOSA.

One of the most handsome of the species that have been introduced to cultivation, and were stove plants popular, it would be regarded with much favour by cultivators. It is of trailing habit, has opposite ovate-oblong leaves, densely hairy on the upper surface, and the flowers are axillary, standing erect on short peduncles, and are brilliantly coloured scarlet and yellow. "Bot. Mag.," t. 8,378.

PROSTANTHERA PULCHELLA.

A New Zealand under-shrub of considerable interest. It is of slender growth, and bears a profusion of light purple flowers. In the gardens of Tresco Abbey it grows freely in the open borders, but at Kew it has a place in the Temperate House, where it makes a satisfactory growth and blooms freely. "Bot. Mag.," t. 8.379.

SAUSSUREA VEITCHIANA.

A species of a genus of composites that is of considerable interest, and may prove useful in the wild garden. The flower heads are rather small, purple, and more or less enclosed in membranous veined bracts or upper leaves, which are coloured green and rose. "Bot. Mag.," t. 8,381.

VIBURNUM RHYTIDOPHYLLUM.

An evergreen shrub distinct in character and handsome in aspect, introduced from Western China some years since, and now generally known. It is quite distinct from all the other viburnums, and has large oblong-lanceolate rugose leaves, and bears terminal cymose flower heads, which are followed by bright red fruits which, with age, become quite black, and are much polished. "Bot. Mag.," t. 8,382.

THE SILVER WATTLE IN NEW ZEALAND.

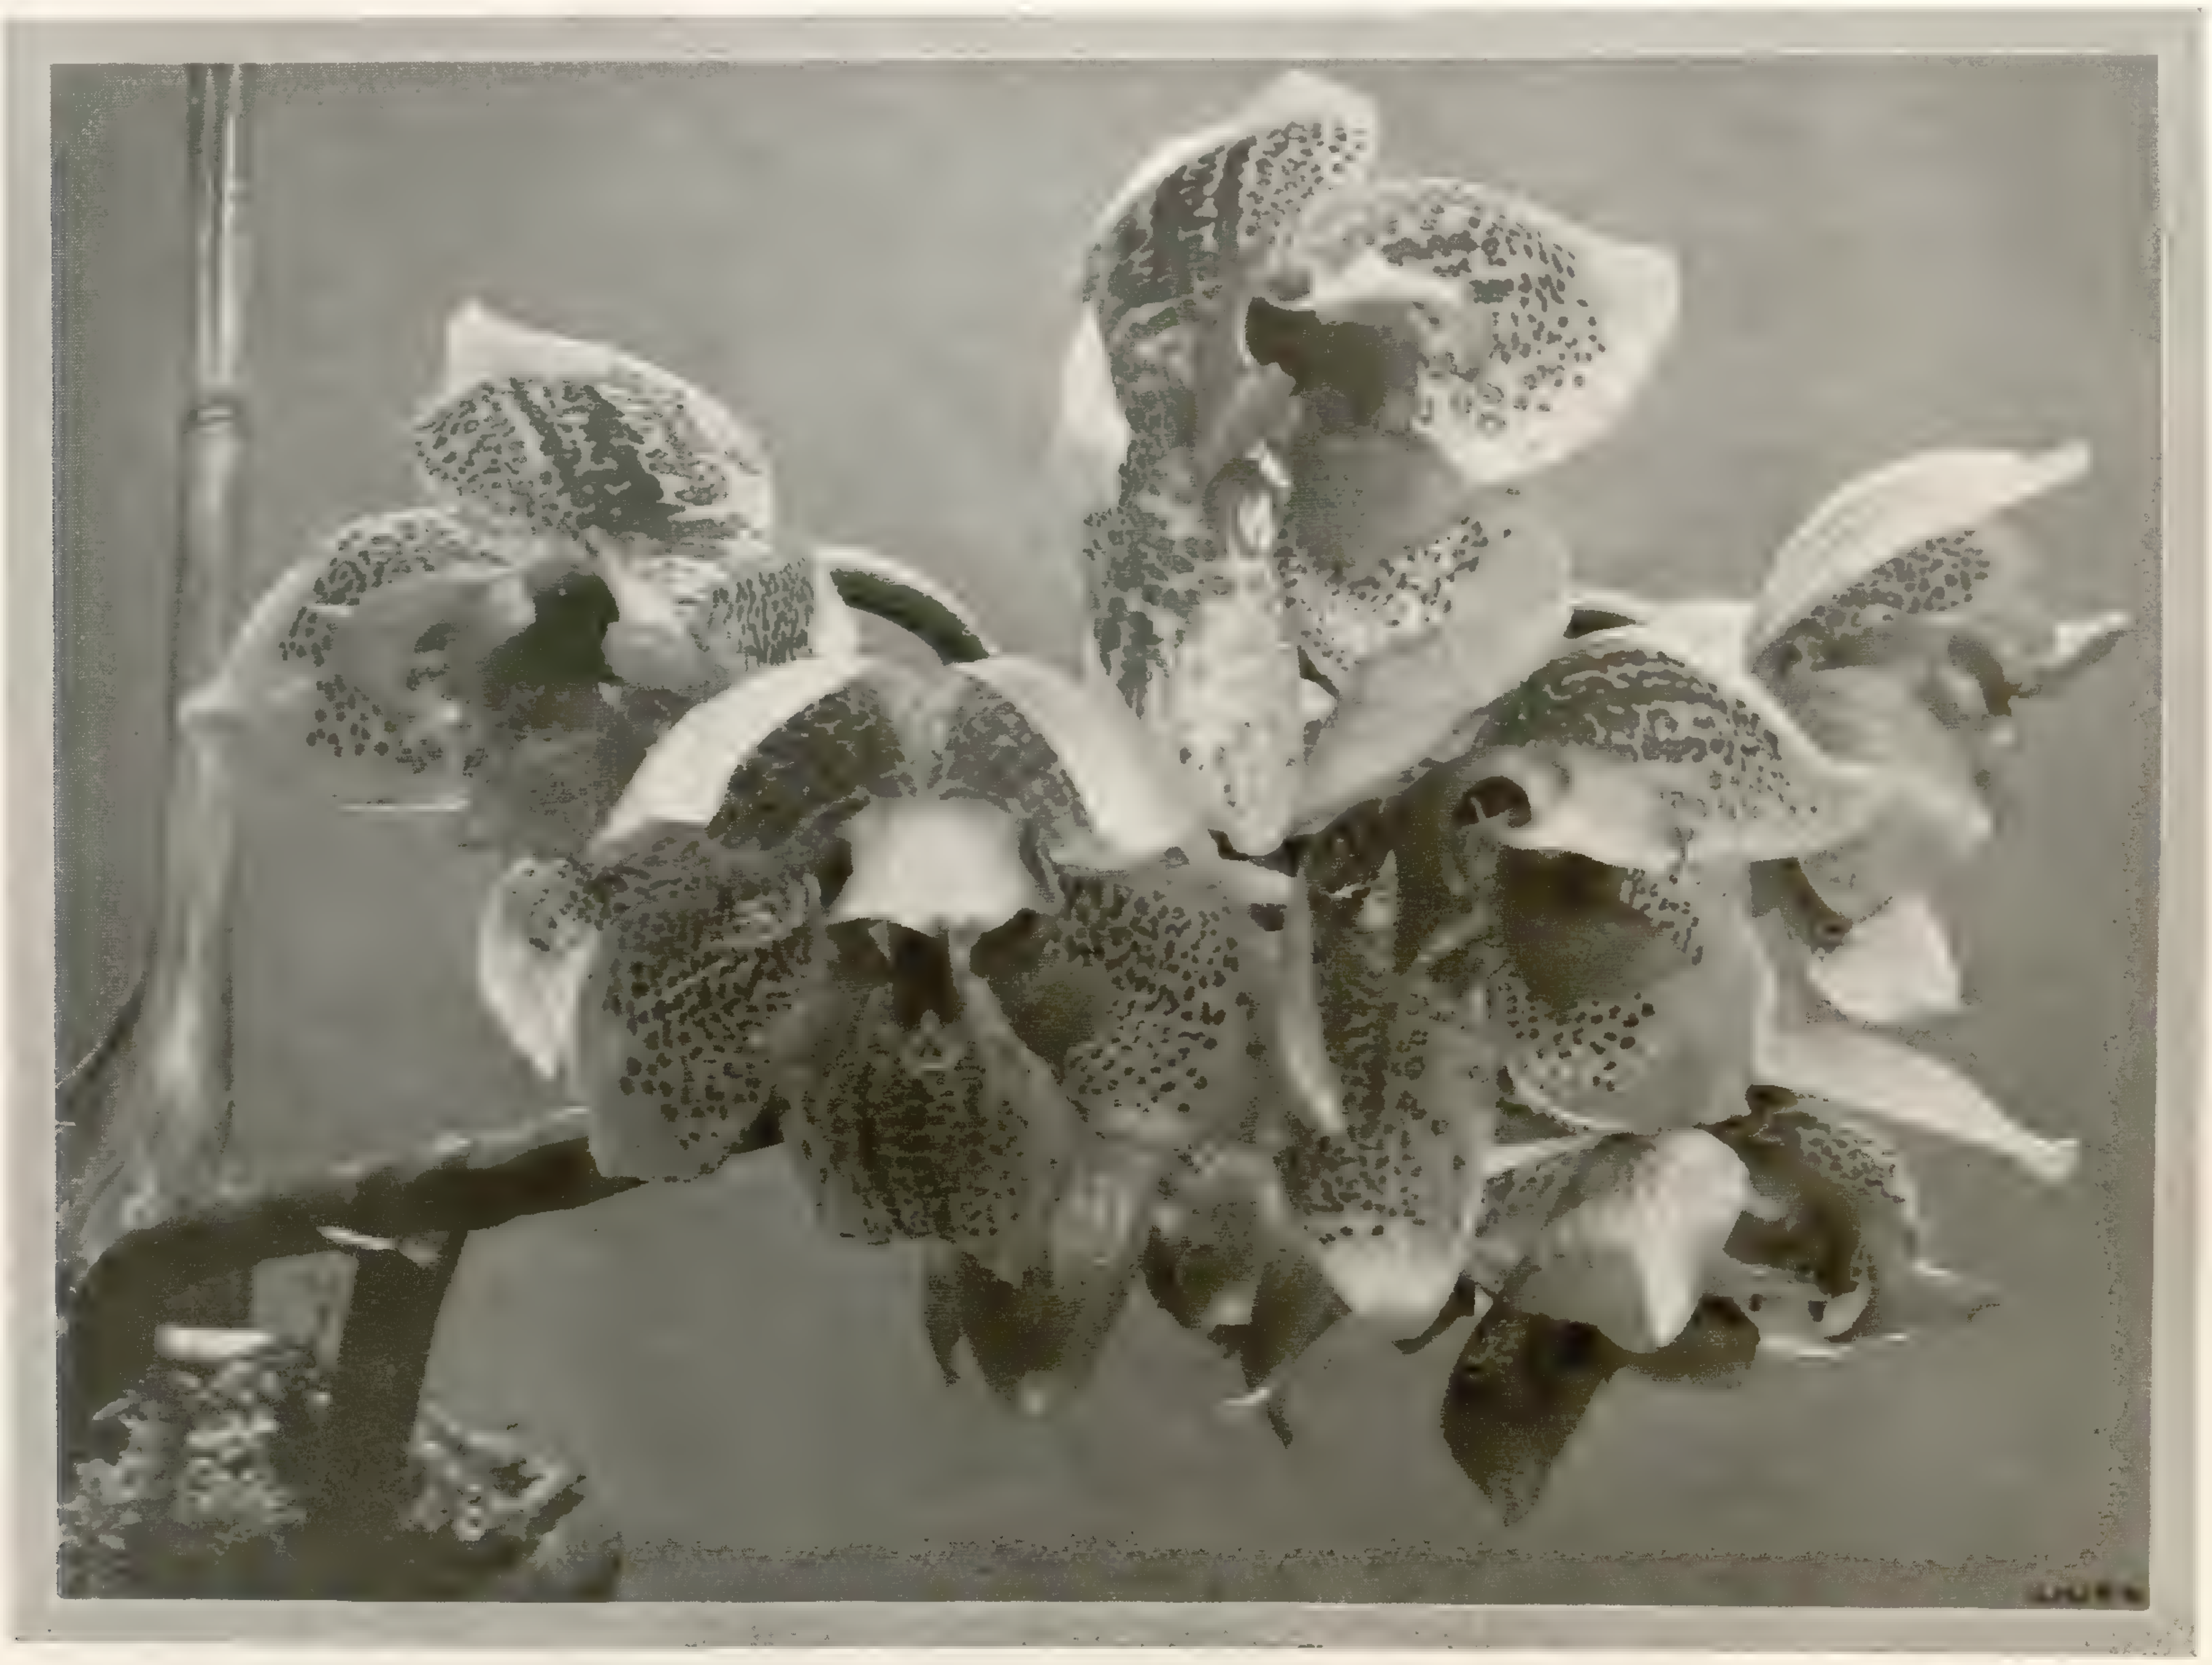
I was much interested in an article that appeared in the Gardeners' Magazine a short time since, on the Silver Wattle (Acacia dealbata), and its value as a decorative plant, and I thought that the following might interest some of your readers. In this district (Auckland, N.Z.) large quantities of the Black Wattle (Acacia decurrens) are grown commercially for the bark. The bark is stripped from the tree when about eleven years old, and when the tree is from six to nine inches in diameter. After drying the bark is ground, and used for tanning purposes.

The silver wattle contains so little active tanning principle that it is commercially of no value, and if once introduced becomes a pest, and extremely hard to exterminate. When the industry was first started here by some means a quantity of silver wattle seed was sent in place of black wattle, and wherever it was sown it remains a perfect pest. It is no use cutting or firing it, as every root will throw out shoots, and it will come up as thick as couch.

It is a pity that such a beautiful flowering tree should become such a nuisance; it is but another illustration of how very careful people should be in introducing new plants, particularly to tropical or sub-tropical districts. The silver wattle, if allowed to grow, makes a splendid upright tree, having a trunk several feet in diameter, and with the trunk perfectly upright, and up to 100 feet high.

There is another acacia out here which is a splendid variety, in fact, one of the best; I speak of Acacia Baileyana. It does not make as tall or as fine a tree as the silver wattle, but the silvery-grey foliage, and the deep golden flowers, make it a perfect picture when in bloom. It flowers here during the winter, and for that reason is doubly welcome.

G. Mills.



HOULLETIA WALLISI.

Flowers pale yellow, freely marked with purple. A.M., R.H.S., August 29. Messrs. Charlesworth and Co.

THE POTATO CROP IN SCOTLAND.

The present season of abnormal spells of drought and excess of warmth, however inimical it may have been to certain crops, has, upon the whole, proved favourable to the potato, and should the remaining portion of the growing period be fairly genial, large crops of fine quality will undoubtedly result. On very shallow or light land the tubers, though numerous, will most likely be on the small side, but where conditions the reverse prevail, or upon well-manured and deeply-worked soils, sound and bountiful crops are pretty well assured.

Garden Crops.

Of these the more precocious kinds were ready for raising ten days or a fortnight earlier than usual, and, although the produce from the warmer sites, as raised borders having a southern aspect, was not, as stated, particularly large, on the other hand, there were but few very small or unusable tubers, and the quality throughout was of the best.

Second earlies followed very closely upon these in regard to maturity, and occupying, according to custom, a somewhat cooler site in the more open quarters of the garden, these have, and are still being, turned out of the soil in the best possible condition, and it would be difficult to particularise any one of the well-known varieties as being of outstanding merit. All are good both in regard to crop and in cooking qualities. The sorts grown comprise Sharpe's Express, Midlothian Early, Sir John Llewelyn, British Queen, Sutton's Abundance, and a few others. All of them are ready for raising, the haulm in most cases being decayed or fast approaching that condition.

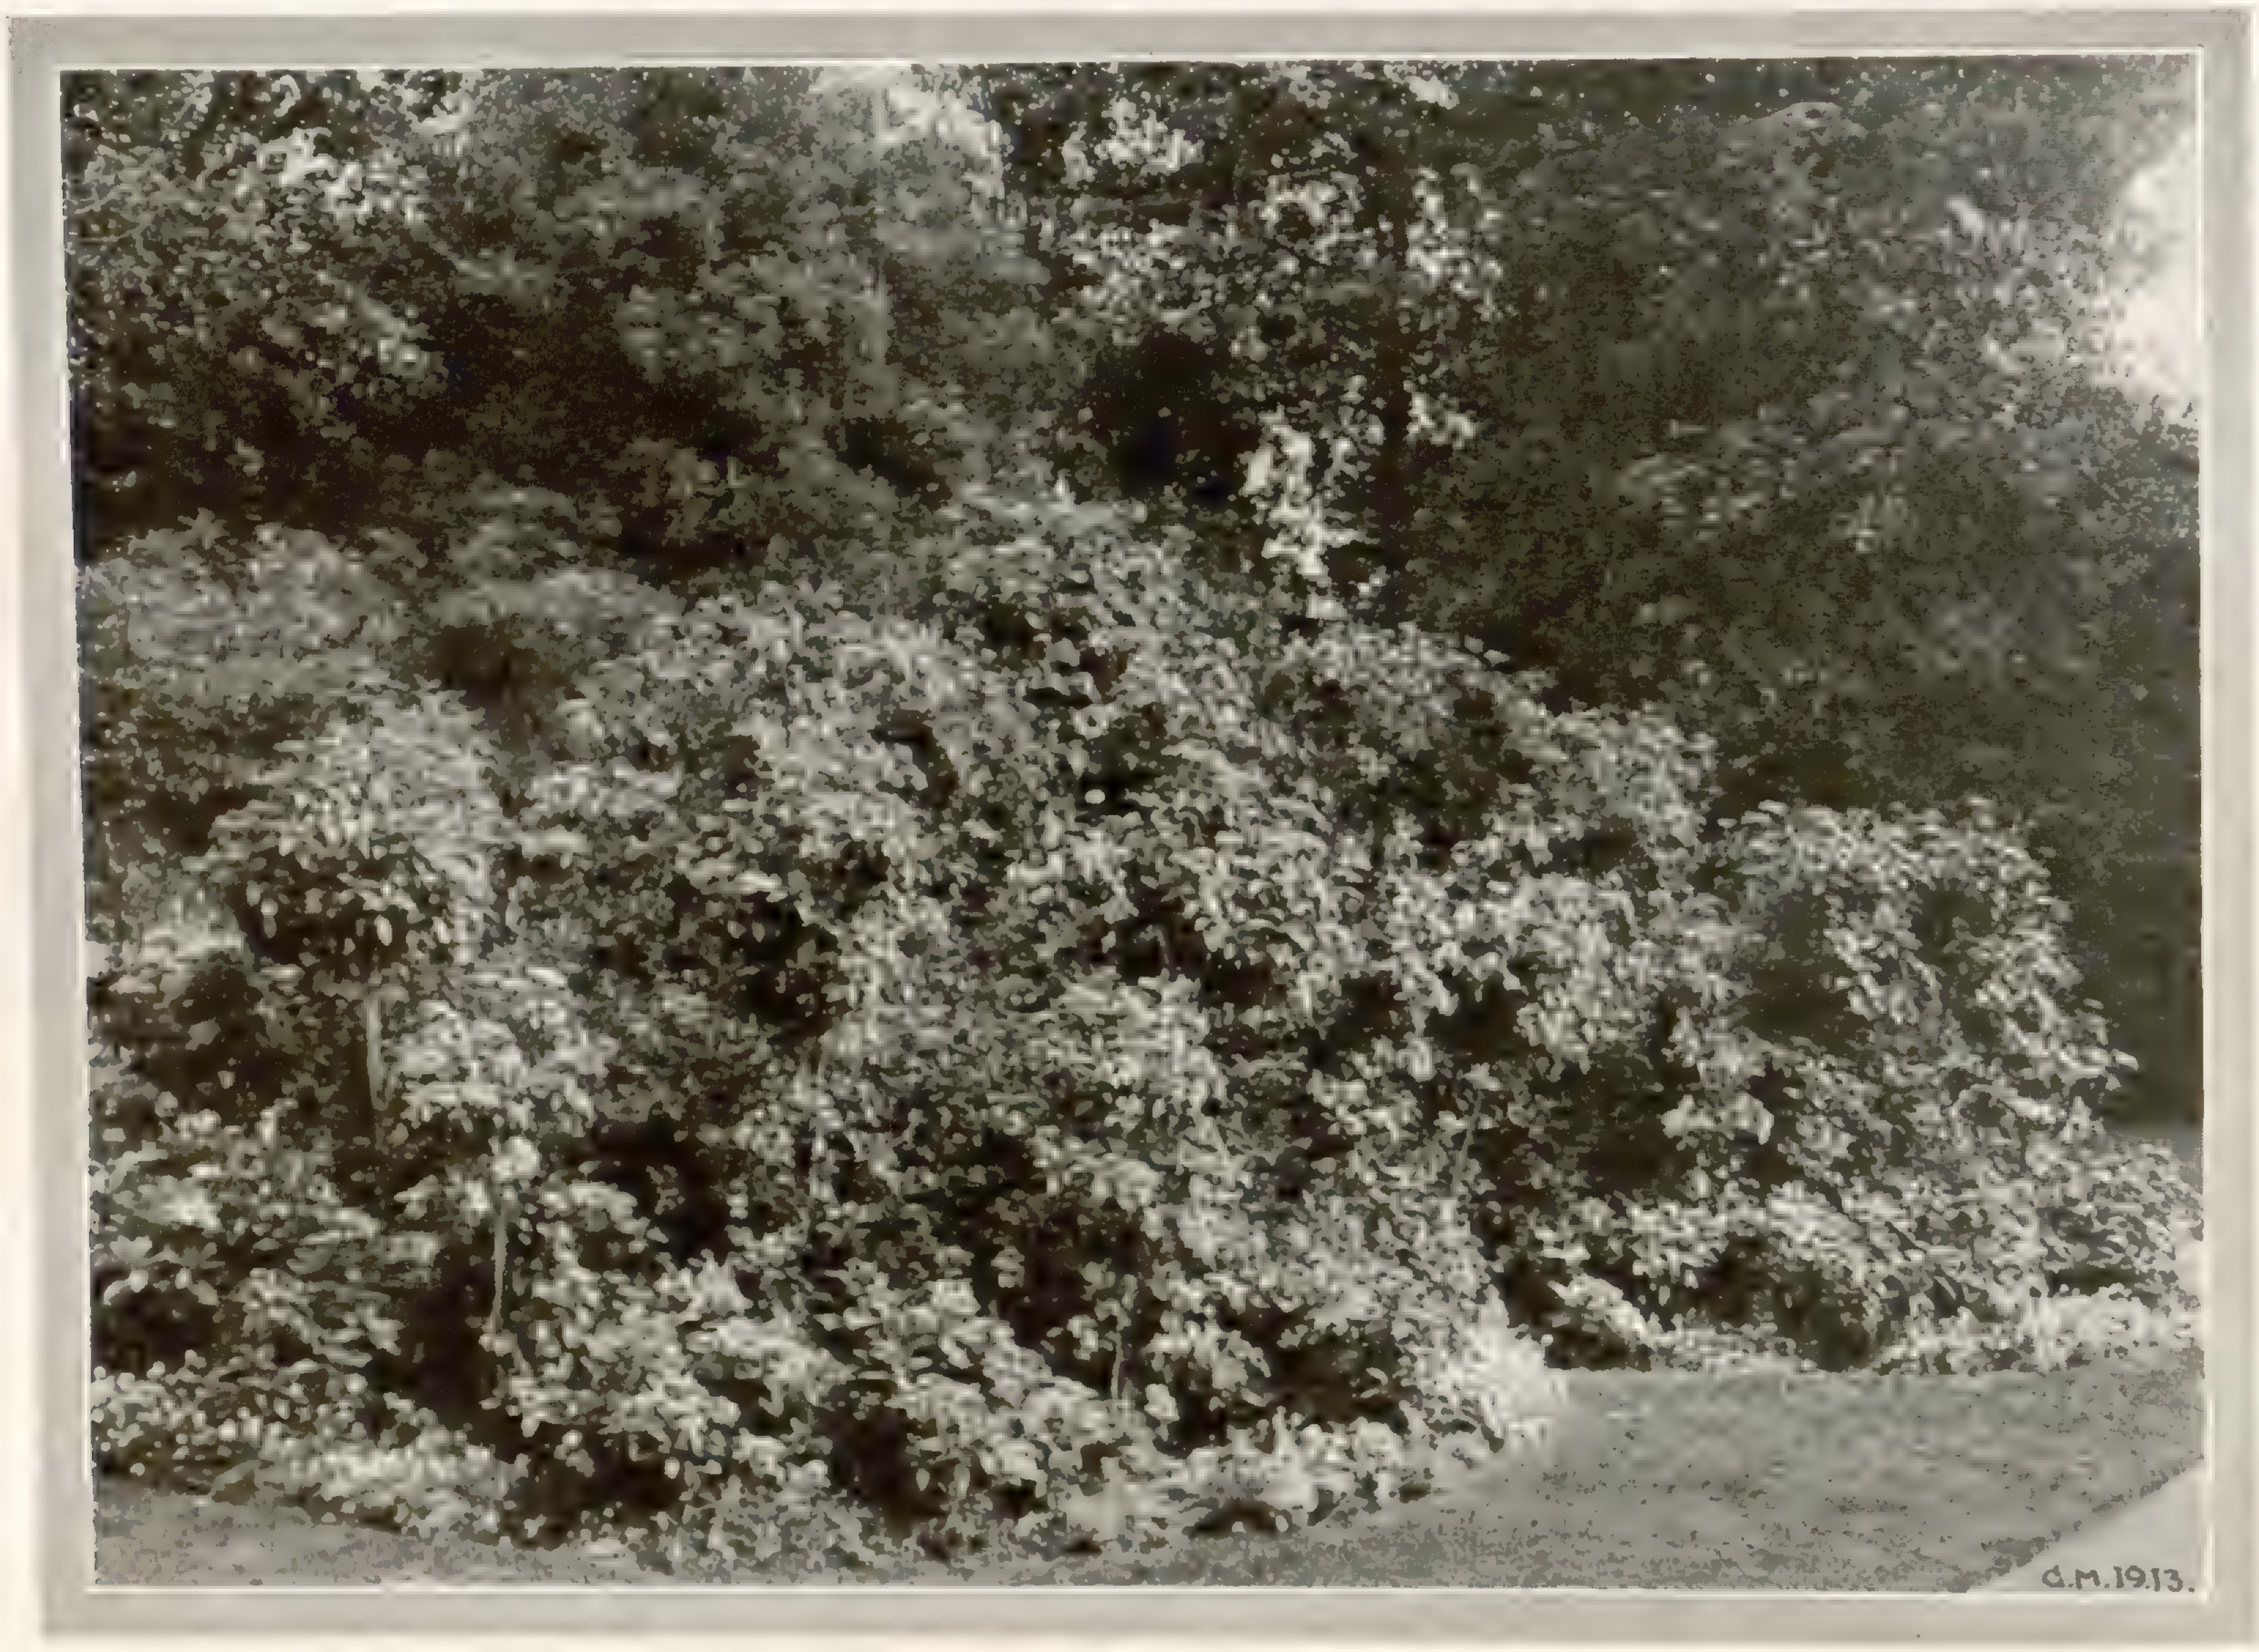
Field Crops.

As the later varieties constitute the greater portion of these, it is too early as yet to dwell very closely upon the eventual yield, but if strong and healthy growth hitherto can be taken as a guide the results in due course should be very satisfactory. This season apparently less use than usual has been made of the spraying machine, which may probably be accounted for owing to the dry, warm weather, growers considering spraying as a preventive of disease unnecessary. Whether the course adopted was correct remains to be seen, but at present there are not lacking signs that the foliage of these later crops will very rapidly disappear, when further swelling of the tubers must cease. Spraying with the usual mixture might or might not have prevented this early loss of foliage, but it evidently arises from a cause other than maturity or ripeness of the crop. For several years past this early shedding of foliage in the southern counties of Scotland has been very noticeable, as it takes place from a fortnight to three weeks earlier than is the case with the same variety of potato growing, say, in the Lothians, where soil and climatic conditions are very similar. Around Dunbar and Haddington the potato haulm continues healthy and fairly verdant until late in September, long after it has disappeared in Wigtownshire.

James Day.

A FINE LAWN GROUP OF HELIOTROPIUMS.

In a brief reference to the illustration herewith of the beautiful group of heliotropiums which, at the present time, forms so delightful a feature of the gardens of Gunnersbury House, the residence of Leopold de Rothschild, Esq., C.V.O., it is not necessary to dwell upon the exquisite colouring and the grateful perfume of these flowers. That they possess the charms of colour and fragrance in a marked degree is a matter of common knowledge, and we need not do more than express a strong sense of satisfaction that the heliotropiums are being freely used in beautifying the flower garden during the summer months, and in a manner that displays their distinctive characteristics to the best advantage. Within recent years we have had opportunities for seeing a considerable number of excellent beds and groups of heliotropiums, and we cannot call to mind one that has not favourably impressed us, or failed to contribute appreciably to the colour-scheme of which they formed a part. In some cases the groups have been formed with tall pyramidal and dwarf bushy plants; in others pyramidal heliotropiums have been associated with similarly trained specimens of other subjects; and in, comparatively speaking, a few instances, dwarfs and standards are associated in the formation of groups. The Gunnersbury House group belongs to the latter category, and a more valuable object-lesson in the use of heliotropiums in the embellishment of the flower garden could not well be had or desired. As will be seen, Mr. J. Hudson used standards of varying heights, and dwarfs that must have been of goodly proportions when they were bedded out and probably differed somewhat in size. The result is a group that is free from formality, and as both dwarfs and standards are flowering with the greatest profusion, the colour effect is such as to at once attract attention, and for a considerable distance around the group the air is laden with their characteristic perfume. The situation occupied by the group is somewhat secluded, at the head of the lake, in which all the newest and best of the water lilies have a place, and with the foliage of trees and shrubs as a background, the soft colouring of the flowers is seen at its best.



A BEAUTIFUL ARRANGEMENT OF DWARF AND STANDARD HELIOTROPIUMS.
In the gardens of Gunnersbury House, the residence of Leopold de Rothschild, Esq., C.V.O.

SUMMER BEDDING.

It seems but a short time ago that we were in the midst of bedding out, yet one's attention will soon be drawn to propagating for another season's display. Before this actually commences it behoves everyone to consider the points of this year's plan, and make notes of any little alteration or improvement which may be made for next year. A change here, something different there, greatly adds to the charm of every garden, disturbing the monotony caused by the same things or colours being in the same places year after year. Perhaps it is not always a decided improvement, yet it is a change. When this is well thought out beforehand one knows how to propagate, and in what numbers, the various subjects that will be required. Close attention must be paid to the beds now to maintain a neat appearance. All decaying blooms and discoloured foliage should be removed, and the beds kept clear of weeds. Where there is any space to work a small hoe, the surface of the soil should be frequently stirred.

E. C. Pooley.

STANDARD SPECIMENS OF ACALYPHA HISPIDA.

This denizen of tropical regions, which also passes under the name of Acalypha Sanderi, is so well known that there is no occasion to refer in a general way to its usefulness in contributing to the attraction of the plant stove and for decorative purposes. But a few particulars of the manner in which it may be successfully grown in standard form can hardly fail to prove of interest or to be useful. It is evident the suitability of this acalypha for culture as standards is not generally known, for many of my gardening friends whom I met at the Horticultural Hall on August 29, when I exhibited a group of specimens grown in that form, expressed surprise that the plant could be so grown, and made inquiries of my method of procedure. Well-flowered standards are so distinct from anything I know, and are, moreover, so effective, that they invariably attract much attention from those who have not previously seen Acalypha hispida grown in that form.

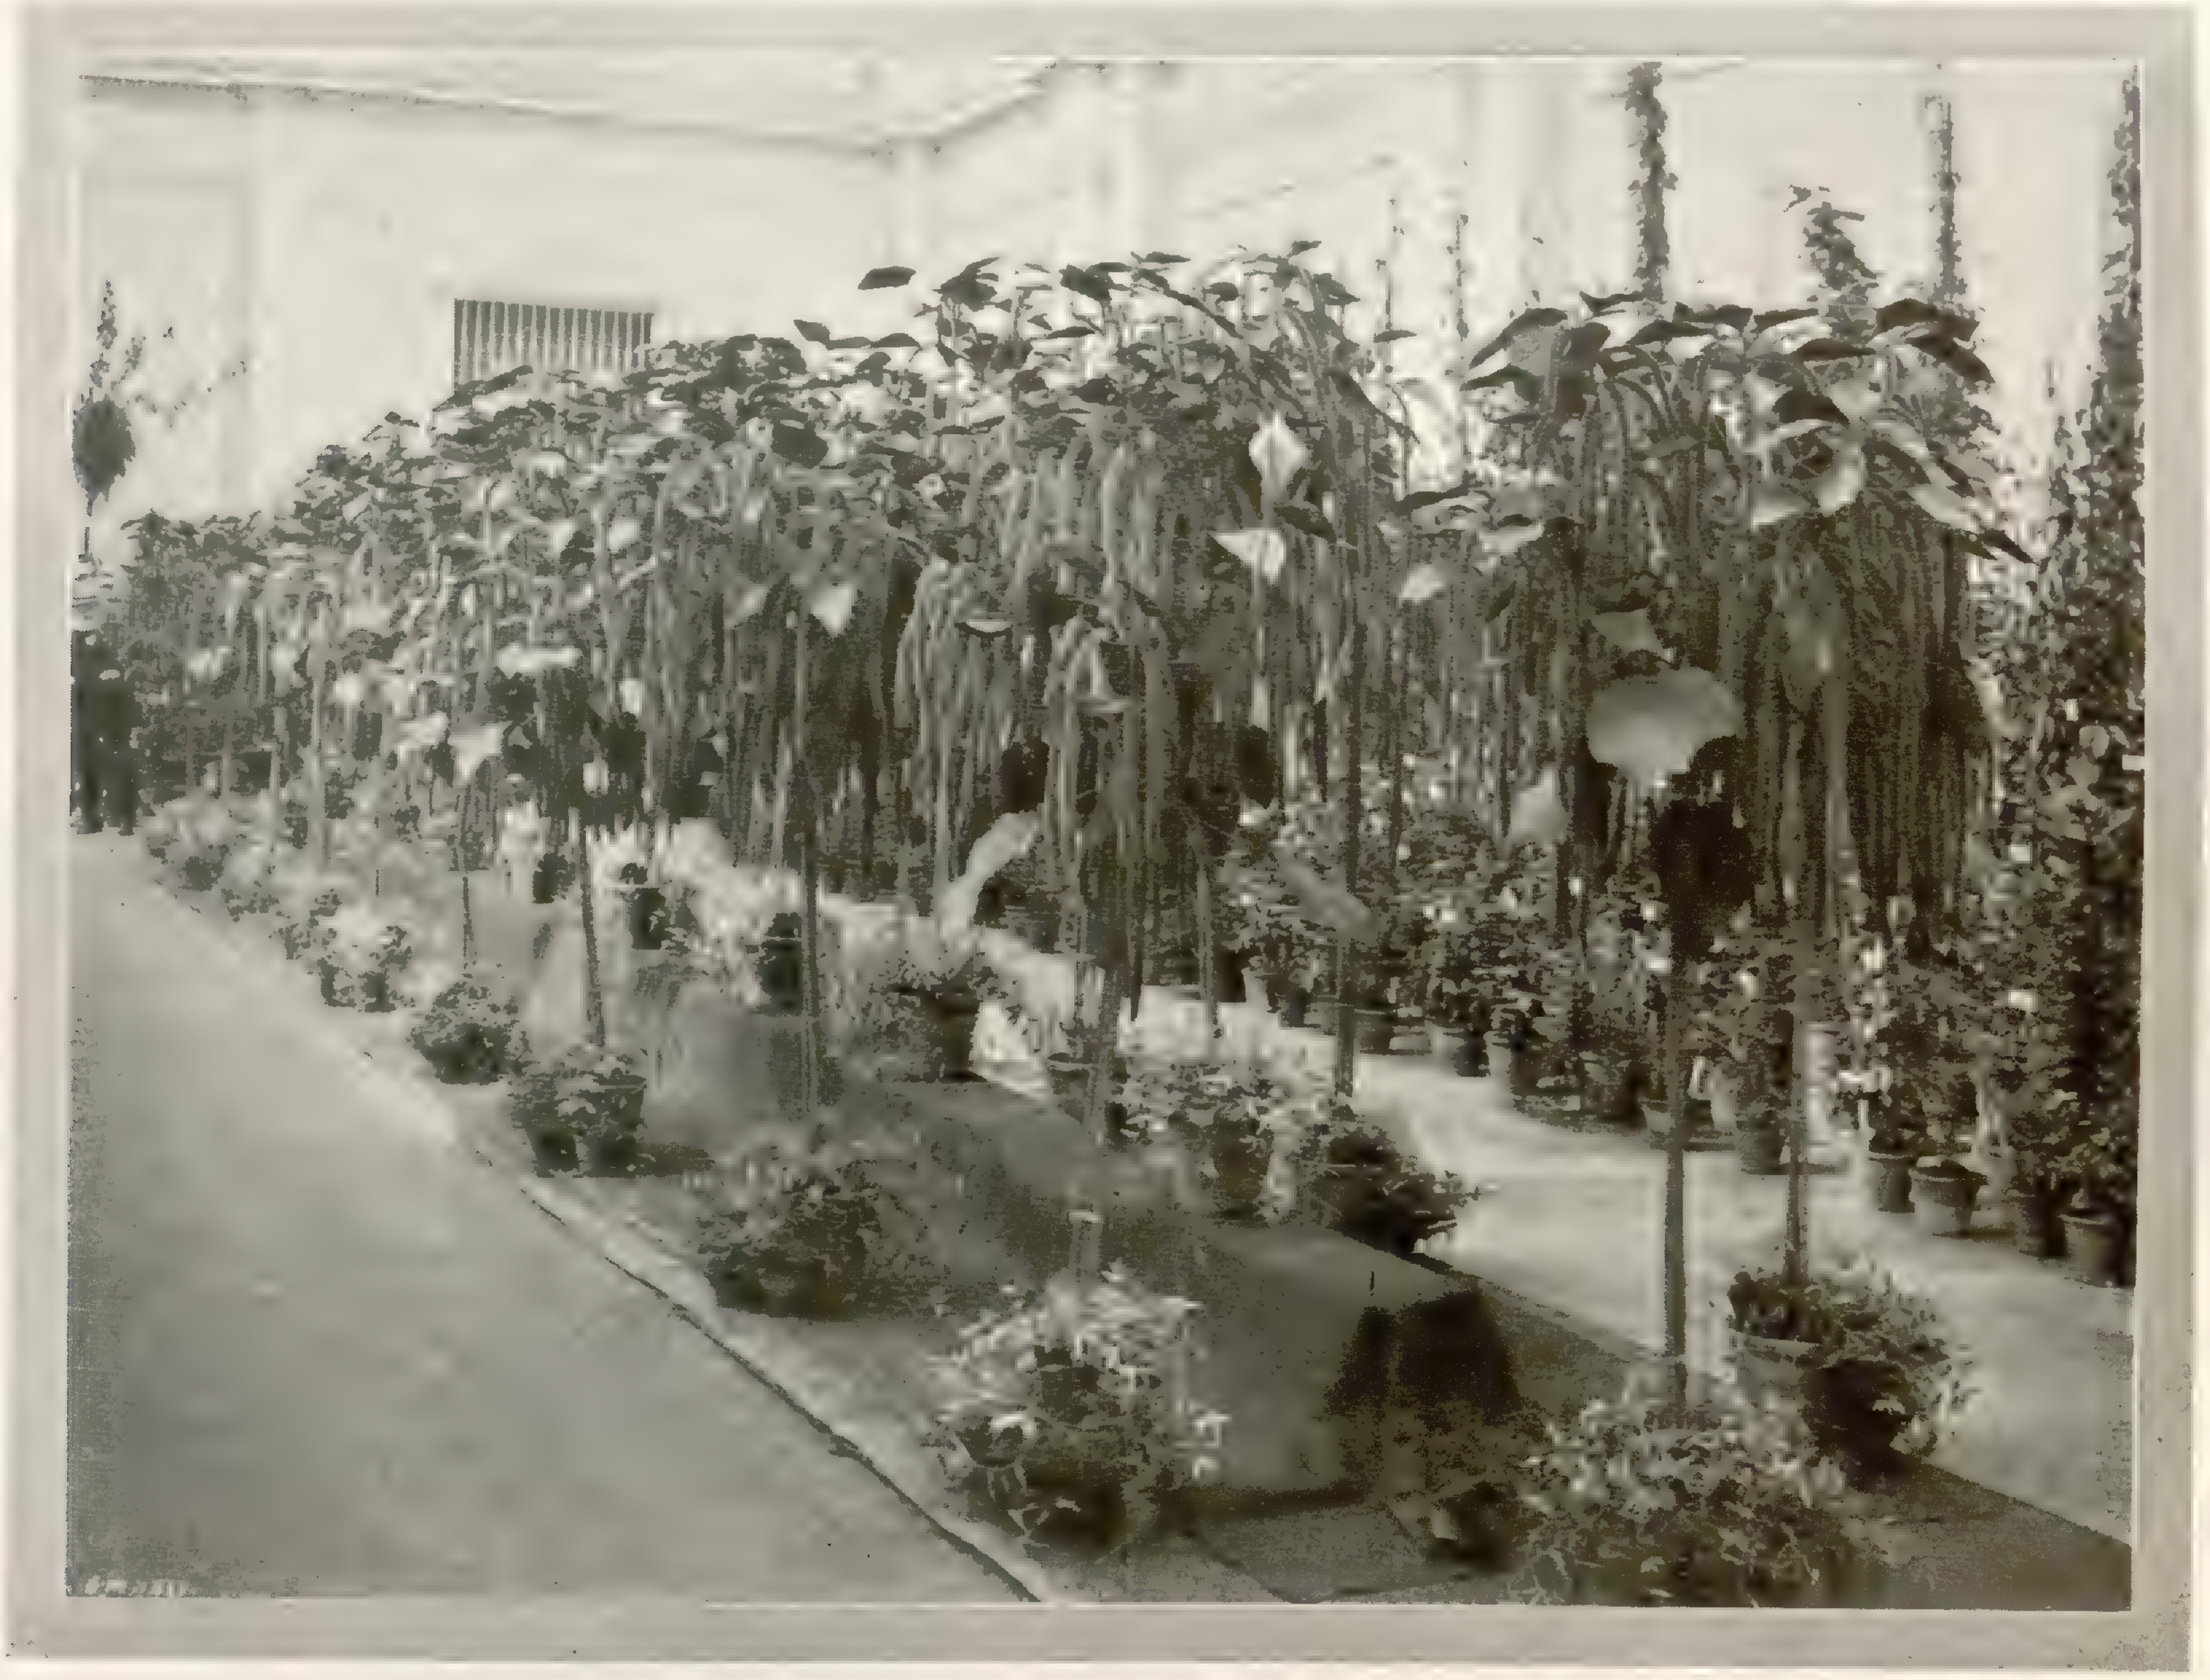
The first step is to raise a stock of plants from cuttings, and the best time for doing this depends upon the time when the specimens are required at their best. September and October are probably the best months in which to root the cuttings; they are certainly good ones, for the results are invariably satisfactory. The tops of good shoots should be secured, and after the removal of the lower leaf, or leaves, as the case may be, be inserted singly in large 60's, that have been filled with a mixture of fibrous loam, peat, leaf-soil, dried cow manure, and sand. Put the pots in a rather close warm corner of the plant stove, and spray them overhead with tepid water at such intervals as may appear desirable.

When nicely rooted remove them to a rather lighter position, and when the pots are filled with roots, but before they have become potbound, shift into others six inches in diameter. The compost used for this shift should be the same as that used in filling the cutting pots, but as a matter of course, the loam and peat should be used in a rougher state. The final shift should be given into ten or twelve-inch pots, and it may be direct from the six-inch pots, provided, and this is a most important point, the watering is done with special care until the roots are running freely in the new soil. The compost should be similar to that advised for the first shift, but to the other materials a little nitrogenous fertiliser may be added.

With regard to the training, which requires careful attention throughout, the first step will be to put a stake to each plant when potted off, and, as the growth increases, stronger stakes of greater length must be used. Four feet is the most suitable height for the stem, and seven branches make a finely-developed head. Remove the side shoots carefully when quite small, but if tails are required the whole length of the stem leave one quarter of an inch of each shoot.

The plants should be grown in the stove, or in some other structure in which a similar temperature is maintained. Syringe them liberally, give plenty of water, and shade the base of the stem if leaves are required throughout the whole length. Eight weeks should be allowed for development, and during this period we assist the plants with artificial manure.

G. Cradduck.



A GROUP OF FINELY-GROWN STANDARDS OF ACALYPHA HISPIDA.

Exhibited at the Royal Horticultural Society's Meeting, August 29, by Mr. G. Cradduck, gardener to Colonel Lockwood, Bishop's Hall, Romford.

DWARF CAMPANULAS.

Campanulas are among the choicest and most valued of our garden flowers, and those which are of dwarf habit may be ranked as including the most fascinating of the race. They are truly indispensable for the garden, and there are few who have ever cultivated them who have not a great affection for these charming flowers.

In dealing with them now it has been necessary to strike an arbitrary line of demarcation, and only those which do not generally reach more than a foot in height are mentioned, although under certain conditions of soil and moisture some may exceed this at times.

Campanula Allioni.—This is a lovely species, with quite close mats of foliage and handsome rosettes of silvery leaves whence rise a solitary large bloom of violet and of a fine bell shape. This is choice, but scarce, both in and out of cultivation, and difficult to keep in a garden. It thrives with the writer on a very dry, sunny bank, in sand and grit with a little loam, and top-dressed twice a year with similar material. It wants thorough drainage, and the modern treatment in a moraine is certainly the best for this lovely bellflower.

C. alpina.—It is difficult to obtain the true C. alpina, which is a neat thing, with small tufts of hairy leaves and little spikes of drooping bells of a deep steely blue. The plant generally known as C. alpina is only a handsome form of C. rotundifolia, well worth having, and a really better grower than the true alpine, but very different in its way. The true one has a bad habit of dying after flowering, and of leaving no offsets to perpetuate the race. It is otherwise easy to grow, except that it is a plant which dislikes lime.

C. barbata. The bearded bellflower is one of the most lovely of all, with its large pale porcelain-blue bells hanging from their stems, and all beautifully fringed at the mouth with hairs. It is some six or nine inches high, and not difficult to cultivate, always provided that it is kept dry at the neck in winter, when it is liable to rot off if the season is wet, and the surface of the earth retentive of moisture. It, also, seems to do well on a moraine, and I have seen excellent self-sown plants on a gravel path. There is a beautiful white form.

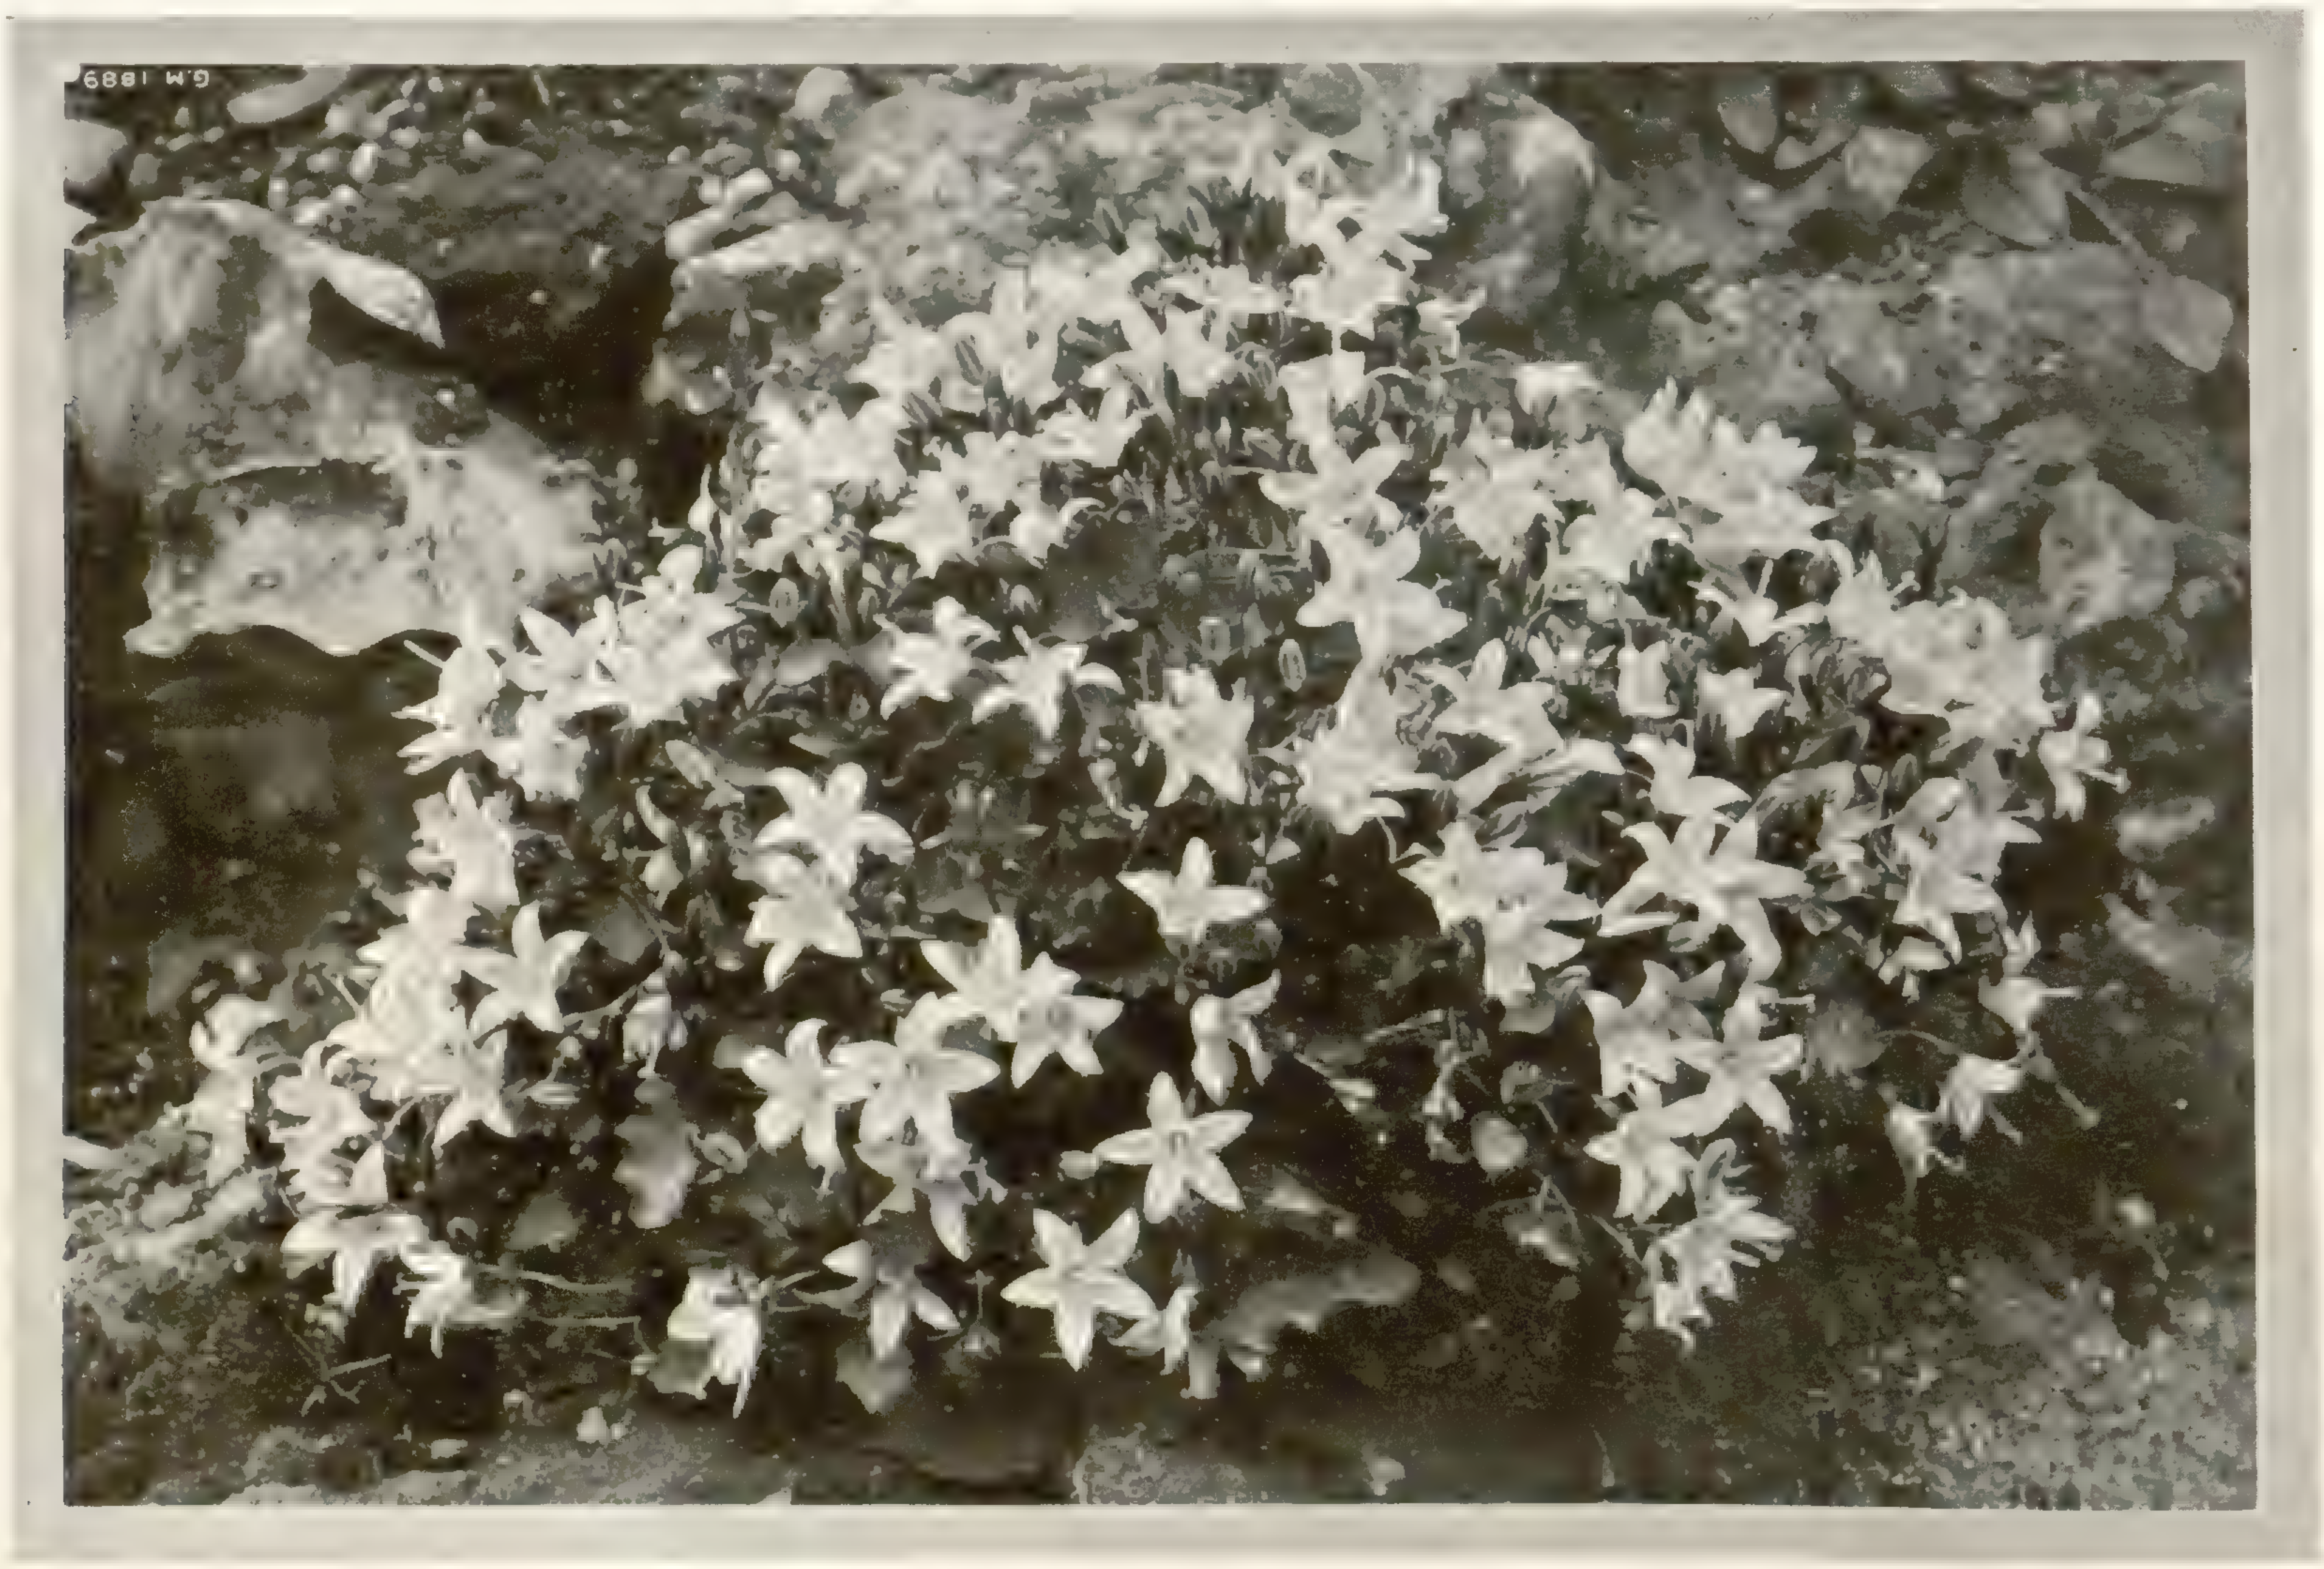
C. carpatica.—This is a species which admits of some discussion, e.g., whether we should include the C. turbinata forms when dealing with it or not. For convenience, it will be better to speak of them both at once. For garden purposes the true C. turbinata will be found distinct in its lower-growing habit, its somewhat hairy leaves, and its only bearing one flower on a stem. It is a lovely thing, indeed. C. carpatica itself is well known, and varies very largely in height; so much so, indeed, as almost to render some of its forms properly out with this review of the dwarf campanulas. It is a beautiful thing, with upright flowers of varying shades of blue. There are, the type with good blue flowers; pallida, pale blue; and alba, white. There are also Dickson's variety, white; and Parker's one, of a fine blue. New varieties derived from these are the open-flowered Isabel, blue; White Star, a replica of this in white; and a distinct, pretty variety seemingly rather scarce, with very pale blue, flat flowers, and called pelviformis.

Riverslea is a very handsome new blue variety.

C. cenisia.—This is another difficult plant except on a moraine, and is after the fashion of C. Allioni, but has small open cups of a hard, rather steel-blue. It makes close carpets of little tufts of leaves, and is a lime-lover, although not actually requiring that constituent in the soil.

C. elatines and C. elatinoides.—Rather like each other, and both rather troublesome subjects, inasmuch as they seem to detest our wet seasons, are these two. They must have plenty of sun, and thorough drainage, and should either be tried in a hot chink or in the moraine. Slugs are their great enemies and difficult to ward off these choice plants with their neat growth and branching stems of light and dark blue flowers.

C. excisa.—A dainty little campanula is C. excisa, whose wiry stems rise only a little above the soil, and give attractive little pale blue, deeply lobed bells, each lobe having, as it were, a little round hole cut out at the end. It is a creeping species, and is one which seems to like the moraine, although it will also succeed on a dry bank with some gravel about it. It is supposed to be a lime hater.



CAMPANULA GARGANICA.
A handsome species of trailing habit, bearing blue flowers with light centre.

C. garganica.—This is a lovely and most useful bellflower, with trailing branches of glossy leaves and pretty blue flowers. It is well shown in the accompanying illustration, and is an excellent subject for the rockery or for pots. There is also a good white variety. Of even greater beauty is the variety hirsuta, which has greyish hairy leaves and blue and white flowers. There is also a white variety of this. The plant sold as Erinus is understood to be a form of it, and fragilis, Barriereli, and others are allied but more tender.

C. muralis or portenschlagiana.—One can hardly overpraise this handsome bellflower with its shiny leaves and its fine blue flowers. It is an excellent front row or rock garden plant, but its variety called bavarica is still finer. Easy doers both, they are excellent in every way.

C. planiflora.—This quaint little miniature of C. persicifolia is not so plentiful as at one time, but is worthy of being searched for. It has longish leaves, and little six-inch spikes of flat open flowers. There are four forms at least: one with single blue flowers; another with these of white, and two respectively with semi-double blue or white blooms. It is not difficult to cultivate if top-dressed annually and not in too dry a place. It is often known as C. nitida.

C. pulla and pulloides.—In Campanula pulla we have one of the gems of the alpine world, but one, unfortunately, difficult to retain in some places, while in others it spreads rapidly. What is established, however, is that it is a lime-hater, and that it likes a peaty or sandy soil, with a cool place to live in. C. pulloides is a hybrid with much of the character of pulla, but even more charming, and apparently requiring the same treatment.

C. pumila.—With this we may rank cæspitosa, pusilla, cochliarifolia, and one or two others. They vary but little, and in nurseries and gardens the names are far from definite. All are lovely little fairy bellflowers, making close carpets of foliage, and carrying multitudes of little bells of blue, pale blue, or white. Miss Willmott is the name of a new pale blue variety now being offered.

C. Raddeana.—This is a beautiful and attractive little subject, which thrives well in ordinary rockwork, and is a charming thing, with its neat leaves and its purple blue flowers. It seems a good doer, and one of the best of recent years' introductions.

C. Raineri.—The true C. Raineri is a scarce plant, and not one of the most desirable, with its little turbinata-like flowers, but it is not so good as that pretty campanula. A more ornamental thing is one known as pseudo-Raineri, but this is now difficult to secure. They can be well grown if top-dressing is attended to, and water supplied in dry weather, but they dislike excessive winter wet.

C. rotundifolia.—This is the common harebell. It has many forms, some of which are very beautiful, and all are of easy cultivation in sun or shade. A good white variety is C. r. alba major; while the double variety of C. r. soldanellæflora is a beauty, the single one being a curious, but not pretty flower. There is a dainty double form of the common harebell, but Hosti and the variety called alpina, or Valdensis, are the gems of the set. Hosti is a magnificent thing, with dark blue bells, and alpina has hairy leaves and deep bells.

C. tommasiniana and C. waldsteiniana.—These are often said to be synonymous, but, as I know them, they are different, although the former is very scarce. It has neat little bushes, with erect stems of drooping tubes of light purple; while the latter has six-inch bushes of stiff stems and pretty light blue flowers set off by a white eye. Neither is difficult to cultivate in gardens.

C. Zoysi.—This is a lovely plant, with small leaves, and quaintly-shaped narrowed bells of a pretty blue. It is said to be an easy plant to grow, but slugs are fond of it, and it is thus difficult to keep.

Hybrids and Other Species.—Hybrids have been raised, and several of these are very pretty. Among these may be named C. G. F. Wilson, of which there are two forms, both raised by Mr. Anderson-Henry. They have nice blue flowers, but one has yellowish leaves, of a rather unhealthy colour. Both have been sold as C. Raineri. C. haylodgensis, another of Mr. Anderson-Henry's, is a nice plant, with trailing growth and yellowish leaves and light blue flowers. It seems practically the same as C. Profusion, raised by Mr. E. H. Jenkins. Stansfieldi is another lovely dwarf hybrid campanula, and delights in a cool place, where it gives pretty lilac flowers of tapering bell shape.

S. Arnott.

ANEMONE NEMOROSA THE QUEEN.

Some years ago the late Mr. James Allen, of Shepton Mallet, raised several seedlings from Anemone nemorosa Alleni, a lovely variety in itself. Some of these were of a charming blue of different shades, but among them was a magnificent white one, which the raiser, with true loyalty and with real appreciation of its rare and surpassing beauty, named The Queen. It has now been in the writer's garden for a good few years, and, from a little plant giving only a flower or two, it has increased until there is each year a goodly number of the charming blossoms. It is a vastly glorified variety of our ordinary wood anemone, which makes our woodlands in so many places delightful with its chaste and fragile flowers. This variety, The Queen, is much more vigorous, giving larger leaves on a taller plant and an abundance of large, well-formed flowers of great substance and perfect purity. In the convulsion caused by the removal of my plants to my present garden a few years ago, The Queen was not given a place entirely suited to her queenly mien, but this is now to be remedied, and in time to come I hope to have it in quarters more in unison with the regal magnificence of this lovely wood anemone. S. A.

MESSRS. E. WEBB AND SONS' EXHIBIT AT SHREWSBURY.

The non-competitive contributions to the Shrewsbury Flower Show were numerous, and, as a whole, of a high order of merit, and prominent among them was the extensive, interesting, and attractive arrangement of melons, flowers, and vegetables for which Messrs. E. Webb and Sons, of Wordsley were awarded the gold medal. This remarkably fine exhibit was duly referred to in the report of this exhibition, which appeared in our issue of August 26, and there is consequently no occasion to do more in presenting the illustration herewith than to say that it fully maintained the high reputation of the Wordsley firm, both as regards the great excellence of the various stocks of flowers and vegetables with which their name is associated, and the tasteful manner in which they were presented to public notice. With the aid of the illustration our readers will have no difficulty in obtaining an adequate idea of the style of arrangement that was adopted, and of its suitability for the effective display of garden products.

Cabbage.—The planting out of the main crop of cabbage should not be delayed. The position from which the onion crop is removed is always suitable to receive spring cabbages. Failing this ground that which has carried peas or potatoes is excellent. It is a good plan to select the extra large plants, and form a plantation of them on a south border at one foot apart each way. These will then turn in early for the first cuttings in April, and give a supply until the main crop is ready. The cabbage revels in rich soil, and this should be taken into consideration at this time for the main plantation. If the land chosen is not in good condition, or if of a light nature, then a good dressing of manure should be given and forked in. Plant in rows at two feet apart, and at one foot apart in the row. Medium-sized plants are perhaps less subject to go to seed, and are to be preferred for the large and principal bed.—Charles Flack, Cholmondeley Castle Gardens.

THE ADVENT OF AUTUMN.

Autumn comes in, not by any date of calendar, but gradually, with the passing of summer flowers, the unclosing of September blosoms, the tint-deepening and changing of many leaves, the falling dead-ripe of some berries, and the colouring of others; there are other indications too numerous to describe in detail, such as the extension of shadow lines across the lawns and meadows, the change in the songs and habits of birds, the appearance of special insects, the dewy mistiness of mornings, and the chill of evenings.

Happy is the gardener who has well prepared for autumn during the hot summer time. An overcrowded border at this season does not mark neglect if perennials grow there, for the time for lifting and dividing those has not yet come; but either borders or beds crowded up with spent annuals, or choked by spring subjects, such as pinks, arabises, and alyssums, that could have been removed, not only betrays the owner's indolence, but means that the soil is in an unexhausted state.

MESSRS E. WEBB AND SONS' GOLD MEDAL EXHIBIT AT THE SHREWSBURY SHOW.

Then the latest flowers of the year cannot be obtained in their best condition unless the plants have received liquid manure and a sufficiency of water during summer; autumnal splendours, in some gardens, far exceed those of others for this reason, that they have been zealously prepared for. While buds are forming and opening on late Michaelmas daisies, heleniums, rudbeckias, Pyrethrum uliginosum, and chrysanthemums, supplies of liquids should be continued.

After beds have been cleared of spent plants there is often a bare look, even when planting has been of the wise artistic kind that mingles autumn species with those of summer and of spring in all arrangements. One very successful scheme adopted by a Northern gardener is the inclusion of dwarf early chrysanthemums in every ornamental bed; the geraniums, marguerites, asters, stocks, salpiglossis, heliotropes, cannas, and marigolds look all the better for the association with the soft neutral gray of the chrysanthemum foliage, and when the failures among them have been lifted there is budding promise of beautiful colours. Another plan well worth adopting is the bedding out in autumn of pot plants of chrysanthemums, the simple sinking of these wherever gaps are noticeable, or a want of rich or brilliant colour, or of the relief of white, can be discerned. When violas are used for carpets or edgings there ought to be an increased yield of bloom late in the year; if the plants have been picked over, mulched, and kept from drought or seeding, this will not fail to be the case.

Do we make enough use of autumn-tinted shrubs and plants? On the whole, it seems to be only in the gardens of great estates that the value of coloured leaves is understood, and exhibited, yet the smallest plots require even more careful preparation for the passing of summer splendours unless they are to show a premature dreariness. Rugosa roses are of such distinct merit as providers of orange-shaded leaves and ruddy fruits that room in the worst parts of small pleasure grounds should always be given them; their habit of spreading underneath the soil renders them unfit for the near neighbourhood of any but the most robust plants, but there are usually shaded or sun-scorched bits of border, overgrown by ivy, privet, London pride, periwinkles, or a prodigality of sunflowers, where a bush or two of these Japanese roses would thrive, and be productive of far more pleasure.

The Guelder Rose, Viburnum opulus, gives autumn tints and effective berries; the leaves of Stephanandra Tanakæ become bronze, and remain brown-red of stem all winter; the double Spiræa, S. prunifolia fl. pl., can be especially recommended; the Sumach, Rhus typhina laciniata, becomes gorgeous; the golden-flowering shrub known as Koelreuteria paniculata turns to bronze; the common berberis has a real splendour of crimson; but Berberis Thunbergi is yet more handsome, and Berberis dichtyophylla lasts longer, in orange and scarlet tintings. Finally, no garden should be without Sorbus discolor, the species of mountain ash that has cut leaves of every imaginable autumnal tint, and the incomparable Maple, Acer ginnæ, that flames up into vermilion, amber, and carmine at this same season. M. H.

"CHRYSANTHEMUMS AND HOW TO GROW THEM FOR EXHIBITION," by J. B. Wroe.—Full details on timing and stopping for Northern, Southern, and Midland growers, selections of the best varieties, illustrated instructions on taking the buds, cuttings, staging, etc. Prices 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

COOL HOUSE ORCHIDS.—The unusually dry season will have delayed the general repotting of the odontoglossums, masdevallias, and other cool house orchids. It is many years since we have experienced a summer with so little rainfall, and the dryness of the outside atmosphere has been such that where it has been absolutely necessary to repot plants in this division, considerable difficulty has been experienced in assisting them to retain their normal plump state. Extreme measures are not always beneficial to the future well-being of orchids, for, unless particular care is taken in the shading, the leaves quickly change their colour and fall. With the recent rains and the cooler and more favourable outside conditions, the work of repotting the odontoglossums may be proceeded with without delay. In dealing with the annual general repotting of odontoglossums, I have on previous occasions pointed out the impossibility of dealing with all the plants in one's charge at the same season. This is owing to their flowering at different periods. It is therefore impossible for all of them to be in the most desirable condition for repotting at this or any other season of the year. The greater proportion of them are either just commencing to form their pseudo-bulbs or are in a rather more advanced stage of development. It is at this stage we find the plants beginning to root or to be furnished with roots in an active state. In dealing with all sappy cool house orchids, experience teaches us that the season to repot is at the time when repotting may be done with the least possible check, which is generally admitted to be when root action commences. By attending to repotting when the plants are just commencing to root, we avoid to some extent the danger of injury which is possible in the process of repotting when roots have become more advanced. In dealing with the general annual repotting it is best to carefully examine every plant, although many will not require repotting, and remove any dead leaf bracts about the base of the pseudo-bulbs, and also decaying matter on the surface. It may not be necessary to repot all, but some will require the surface moss removed and replaced with new material. This is particularly desirable when dealing with larger specimens. Smaller examples are best suited by annual repotting. The quantity of root moisture given during a year generally renders it desirable that the material should be annually renewed. See that the pots used are perfectly clean inside, place a single crock over the hole at the bottom, and fill to at least one-third the depth with chopped bracken roots. We find that a mixture of about equal portions of fibrous peat and moss, with a liberal sprinkling of broken oak or birch leaves, and sufficient sand to render the whole porous, suits our plants best. They must be kept well shaded after repotting, and ample moisture be maintained in the atmosphere.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

PERPETUAL - FLOWERING CARNATIONS.—By this time all these carnations should be housed and placed in their permanent winter quarters. Each plant must be carefully examined in the removal for any signs of disease or rust, and if diseased leaves are found they must be picked off and burnt. In staging allow plenty of space for the air to circulate freely among the foliage. The house must be liberally ventilated to secure a buoyant atmosphere throughout, so that the plants do not feel any inconvenience by being removed inside. One of the chief essentials in the successful cultivation of carnations is the maintenance of a free circulation of air on every possible occasion. Watering must be carefully done, aiming at a medium between wet and dry. As soon as the plants are housed, a light fumigation should be given to prevent thrips, greenfly, etc., doing serious damage.

WINTER-FLOWERING PLANTS.—Such subjects as callas, bouvardias, solanums, eupatoriums, and marguerites that are grown for winter flowering which have been planted out in frames and borders, may now be taken up and potted. The plants are more likely to lift with a better ball of soil if well watered a few days before potting commences. When this is finished stand them on the north side of a wall, where they will be shaded during the hottest part of the day. This will prevent their flagging, and allow them to overcome the check before being removed indoors. A light spraying overhead twice a day will greatly assist them.

TUBEROUS BEGONIAS. — The earliest batch of these will now be passing out of flower, and water must be gradually reduced. A light airy position near the glass should be given them to enable the tubers to ripen thoroughly.

HARD-WOODED PLANTS. — Advantage should be taken while these subjects are still outside of giving a thorough cleaning, to rid them of all insect pests. Lay each plant on its side, and give a good syringing with an approved insecticide, paying particular attention to the underside of the foliage.

LILIUMS. — Directly the bulbs are received they should be potted, as there is the risk of their deteriorating if kept out of the soil any length of time. A good sandy loam with peat in equal quantity, leaf-soil, and sharp sand form a good potting compost. Place the bulbs low down in the pots, leaving room for subsequent top-dressings. Stand the pots in a cold frame, but give very little water until the growths show through the soil. Before potting the bulbs dust a little powdered charcoal between the scales as a preventive of disease. Lilium longiflorum and L. Harrissi may be forced so as to be in flower by Christmas, when they will be found very valuable.—A. Grubb, Porter's Park Gardens.

HARDY FRUITS.

STRAWBERRIES.—Some difficulty has been experienced this year in securing sufficient runners of many varieties of strawberries, even Royal Sovereign, one of the most prolific of parents, producing but few. This has no doubt been caused by the strain upon them in ripening such extraordinary crops of fruit. Where new plantations have not already been formed, the work should be pressed on, and planting be done without delay immediately the layers have sufficient roots to ensure success. The preparation of the site having been previously carried out, a final dressing of soot, burnt refuse, or dried mud, the latter excellent on light soils, may be applied. Rake over the surface, and tread the beds quite firm, planting the layers at an equal level, pressing the soil well about them with the fingers, and finish by giving a good soaking of clear water.

MANURES.—Artificial manures carefully applied to fruit tree borders at the present time will be found very helpful in finishing this season's fruit, and also assist the trees to develop the fruit buds for next season's crop. Nitrate of soda is an excellent stimulant, acting at once by liberating the manurial properties already in the soil, particularly where the land has received liberal dressings of farmyard manure. It is best applied during light showers, and better results are usually obtained by applying it in small dressings at intervals of a week rather than in one large dressing. Apples will be found especially responsive, but great care must be taken not to use an excess or allow the nitrate to come in contact with the foliage or fruit.

LIQUID MANURE.—Every encouragement should be given to all trees that are finishing their fruit. A good liquid stimulant may be obtained by collecting manure from the cattle yards or poultry pens. This may be put in bags and immersed in water for a day or two, when the liquid will be ready for use. Soot water will also be a great help, either given separately or in conjunction with liquid manure, a thorough soaking of this will be more effectual than if given in driblets.

GATHERING FRUIT.—Much time and care must of necessity be devoted to this most important detail. All fruits require careful handling, but those for the winter supplies especially so. Allow the fruit to become quite dry before gathering for storing. Apples for late supplies will keep longer and in much better condition if stored in quantities rather than in layers, there being less evaporation and consequently less shrivelling. Pears should part from the twig quite readily when lifted to a horizontal position, and it will be found that many of the late varieties may not be in the right condition until the end of October. The secret of having very late pears, such as Josephine Malines, Glou Morceau, or Duchess de Bordeaux fit for dessert is in allowing them to hang on the trees as long as possible. Peaches and plums, if gathered a little under ripe and stored in a cool, dry place will have their season much prolonged.—J. Whittle, Cheveney Gardens.

THE KITCHEN GARDEN.

CARROTS.—The main crop of carrots will have sufficiently completed their growth for lifting, and to be stored away for the winter. They are liable to crack if left too long, especially if the weather is wet. Allow the roots to dry somewhat for a few days, and afterwards store them in the root house or shed in moderately dry sand. See that only sound specimens are packed away. Those that are slightly damaged may be utilised for rough culinary purposes by the cook.

ONIONS.—These will be ready for pulling, as after the hot summer they will be thoroughly ripened. It is very important that this crop is stored away in a dry condition. If the weather is suitable, the bulbs may be left for a few days on the ground and frequently turned; if not, a vinery or peach house that is at rest will serve to dry them in. Afterwards they may be roped at convenience, and placed in a cool, dry, airy room or shed to keep through the winter.

TOMATOES.—Outside tomatoes grown against walls have in most cases been a success this summer. Remove all fruit that is approaching ripeness, and place it under glass to finish. It will relieve the plants, and enable them to swell up the less developed fruit. The plants that have been grown on in pots outside for winter cropping will need to be placed under glass in a light, airy house. Top-dress the plants to assist root action, and give weak applications of manure water at short intervals.

POTATOES.—Lift the main crop of potatoes as soon as the tubers are ripe. With the ground at a high temperature and heavy rain following, there will very probably be a "steamy atmosphere" conducive to the spreading of disease. Carefully sort over and remove the unsound potatoes to prevent their contaminating the good ones, and see that they are not too damp before storing. A quantity for present use may be kept in the store-house, and covered with straw, and the bulk of the crop clamped in the usual way. This is a good time to select sets for next year's planting. Subject these to exposure for a short time to harden their skins before placing them in boxes for the winter.

CELERY.—The principal batch of celery will be growing freely. All side growths and yellow leaves should be removed. A good dusting of soot, with a watering or two with liquid manure will render substantial aid. A commencement will need to be made with blanching by adding a little soil to the plants. Beginners must be reminded of the necessity of being careful to keep the soil from the hearts by tying them up or holding the leaves erect firmly with the hand while the soil is being placed round. A dry day is essential for earthing-up purposes.—Charles Flack, Cholmondeley Castle Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C

EXHIBITIONS AND MEETINGS.

National Hardy Plant Society Conference at Shrewsbury.

On the second day of the Shrewsbury Show, August 24, the members of this society met in conference in the Concert Room of the George Hotel, Mr. A. J. Macself occupying the chair.

In accordance with the announcement that had been made, two papers were read, one on "Ways and Means of Advancing the National Hardy Plant Society," and the other on "Possible New Methods of Exhibiting Hardy Flowers."

Mr. W. H. Paine, of Tully Nurseries, Kildare, dealt with the first topic in an extempore address, and he included in his fifteen minutes' discourse many really excellent ideas and suggestions, which provided ample food for thought and discussion. First of all, said Mr. Paine, the National Hardy Plant Society should find out exactly what is being done by other special societies, such as the National Carnation Society, the Midland Daffodil Society, and other bodies whose work was devoted to one particular class of plants. That would safeguard the National Hardy Plant Society from duplicating or overlapping, and enable all energy to be directed to work that does not come within the province of existing societies. So far as the Royal Horticultural Society is concerned, it can scarcely be expected that hardy flowers shall be treated by them as other than an item in the programme, and there was without doubt need for a body of specialists and experts to protect and foster the interests of hardy flowers, and that was work the National Hardy Plant Society could do.

Mr. Paine favoured the idea of sending deputations to provincial shows, and suggested that the work in this direction would be enhanced in value if the deputation could co-opt some of the judges appointed by the society holding the show. It would be advisable, in Mr. Paine's opinion, to establish branches in various parts of the kingdom, with local secretaries and committees to keep things in their particular district up to the mark. The holding of migratory provincial shows in conjunction with established flower shows would, Mr. Paine thought, be an excellent means of advancing the society, as it had been in the case of the National Rose, Sweet Pea, and other societies. He emphasised the importance of educational work. We must realise that the society's existence will not be justified unless it does good work in disseminating knowledge and information on all matters relating to hardy plants. He was of opinion that steps should be taken to organise a series of lectures by prominent authorities on various sections of the hardy plant world, to be delivered under the auspices of the National Hardy Plant Society before gardeners' societies throughout the kingdom. Another good plan would be to arrange for a lecture to be given wherever a large and important show was being held.

Mr. Paine's address was listened to with keen interest, and a brisk discussion followed. Mr. Pinches was of opinion that the ideas brought forward were in the nature of ideals that would be difficult of realisation owing to the lack of funds that would be necessary to meet the heavy expenditure involved. He thought at present the most pressing consideration was how to obtain new members and subscriptions. Mr. Brunton supported Mr. Pinches' contention, while he greatly admired the enthusiasm of Mr. Paine, and remarked that the excellent ideas put forward should be kept on record, and would no doubt be fully considered as soon as the society could afford to launch out.

Mr. Harkness was much impressed by the address, and hoped the society would be able to proceed along those lines before long.

Mr. Matthew Todd, Edinburgh, thought that the growth of the society would only become satisfactory when it is seen that members will obtain some real benefit from the society. The difficulty is that nothing can at present be shown to prospective members as to what advantage they will gain by subscribing to the society's funds. Mr. Todd approved the idea of lectures, and stated that if the society would send a lecturer to Edinburgh, he would undertake to see that a good audience was forthcoming.

In a brief reply to the comments upon the address, Mr. Paine said he did not think the expense involved in carrying out his suggestions would be at all heavy. In fact, he believed most of his ideas could be carried out with no more expense to the society than a trifle to cover postages. At any rate, if the society is to be a powerful and useful society, it most certainly must adopt a bold, progressive policy.

Mr. A. J. Macself followed with a paper on

POSSIBLE NEW METHODS OF EXHIBITING HARDY FLOWERS.

Without a doubt we see more glorious banks of hardy flowers at the leading shows to-day than ever before, but I have the hope of seeing great improvements yet in methods of staging.

What, then, are the defects in the present methods adopted? First, to my mind, too many flowers are crowded on to a restricted space, producing, it is true, gorgeous banks of colour, but not a graceful and artistic display. The prevalent tiered staging renders it practically impossible to so arrange the flowers as to demonstrate their natural habit and charm; in fact, we do not obtain a natural effect.

Those of us who were at York saw something of an attempt at natural arrangement in the new class provided for a display on the ground. It was a step in the right direction, although the class was not treated quite in the manner it was intended it should be. What is needed is to so arrange the flowers as to represent a bit of an actual border of growing plants. I am firmly convinced that in this direction lie the greatest possibilities for future advancement. Anyone who is capable of arranging plants in a border to produce a pleasing effect should be able to display flowers of those plants on a stretch of ground to reproduce the effect of the border. I advocate not only these mixed borders, but beds of individual subjects. A bed of delphiniums, a bed of phloxes, or of any plant suitable to the purpose would do much toward popularising hardy flowers for use on lawns, terraces, or where striking effects are desired. It should be the work of this society to have new classes introduced to schedules, and if our members support us by exhibiting in new classes when obtained progress will be assured.

Colour schemes are another departure that could well be taken up, and here unlimited scope would be found for the floral artist as well as the cultivator. Most growers have collections of certain familes of plants, such, for instance, as veronicas, campanulas, primulas, etc., and I should very much like to see classes for the most complete collection of any one family.

Again, in the case of new and unproved varieties of hardy flowers it should become the general practice to show these side by side with the older types or varieties from which they have been obtained, or to which they are held to be superior. This would greatly facilitate comparison, and ensure fair judgment when under consideration for awards.

Alpine and rock plants are exhibited in a manner far in advance of border flowers, for we see them now exhibited on improvised rockeries, the plants being placed in the nooks and crevices between the stones. No new method can well be recommended to supersede this, but a good deal of improvement might be effected by exercising greater care in placing the plants in appropriate positions, and in the more rigid exclusion of shrubs and other subjects that do not properly belong to the rock garden. If I were judging a class for a rock garden, I should deal rather severely with an exhibit that had such things as standard roses, Hydrangea hortensis, etc., wedged between stones, or, as occasionally seen, big plants of Abies pungens glauca on the top of a mound where there is no more root run than would properly accommodate a helianthemum. However lengthy may be my remarks, I cannot go far beyond the central idea that all the new methods we require are methods by which we can show the uninitiated the natural beauty and real purpose of the flowers shown, whether for border, bed, rockery, or damp morass.

In the discussion which followed, Mr. Frank Bouskell said he wished to fully endorse the remarks that had just been listened to. It would, without doubt, add considerably to the interest of the hardy flowers at a show if they were shown on the ground after the manner suggested. Mr. Bouskell mentioned that he had arranged an exhibit on these lines at Leicester, and found it possible to make a good show with about a quarter the flowers required for a collection on staging, and consequently the system was to be recommended on the score of economy, as well as on æsthetic grounds.

Mr. Harkness considered the reader of the paper had been unnecessarily hard on present-day methods of staging, which, after all, have served good purposes, and been largely responsible for the growing popularity of hardy flowers. He had, however, no doubt some change on the lines suggested would be beneficial, and, although he thought it would mean more expense in conveying material for these border exhibits with full length of stem, etc., he hoped we should see some good classes of the kind. There is also, the speaker said, much need for more concise wording of schedules, and he would like to see a limit of either three or four inches diameter put upon the tubes and receptacles used. This, he thought, would largely check the heaviness and overcrowding that had been complained of.

Mr. Paine was of opinion that natural effect could not really be obtained from cut flowers at all, and that it would be necessary to have pot-grown plants. The expense involved would be prohibitive, and he thought the evils of to-day could largely be overcome by limiting either the number of stems or the size of the vases, and by having stages about 1½ft. above ground level, instead of 4ft.

Mr. Brunton mentioned that, after all, an exhibit of the border style would only represent the flowers in bloom just at the time of the show, and could not serve as a reliable guide for the formation of a general herbaceous border. It would, however, be possible to demonstrate the value of a mass of any given subject.

At the close of the discussion, a vote of thanks to the readers of the papers was proposed by Mr. Brunton, and seconded by Mr. J. Harkness, and carried unanimously.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, August 29.

Present: Mr. W. Botting Hemsley, F.R.S. (in the chair), and Messrs. J. W. Odell, J. Fraser, W. Hales, J. O'Brien, R. Hooper Pearson, and Gurney Wilson.

"BITTER PIT" OF APPLE.—Mr. W. A. Voss submitted specimens of tall, oval and flattened round apples gathered from the same tree (Old Hawthornden). Practically all the former were attacked by "bitter pit," whilst the latter were in no case affected by the disease. The taller fruits develop no colour, while the flatter ones do.

WHEATEAR CARNATION.—Mr. Chittenden sent an example of the well-known "wheatear" carnation. The present examples differed from the usual form, in having not only the continued repetition of the bracts, but above these of the calyx. The first few whorls had the bracts arranged opposite to one another as usual, above these were some not so regularly arranged and occasionally connate below, while above, the leaves were in whorls of five and connate as the calyx is usually.

NARCISSUS FLY IN HABRANTHUS.—Mr. Chittenden also sent some bulbs of Habranthus pratensis, from Norwich, attacked by the grubs of the narcissus fly, Merodon equestris. This insect appears to be extending its feeding habits to several other bulbs besides the narcissus.

ADIODA X "ST. FUSCIEN."—This new bigeneric hybrid (Cochlioda Noezliana x Ada aurantiaca) was exhibited by Monsieur Henri Graire of St. Fuscien, Amiens.

OAK GALLS.—Mr. Hales showed specimens of the common oak attacked by the artichoke gall (Aphilothrix fecundatrix), the Oyster gall (Leuroterus ostreus), and the Spangle gall (Leuroterus numismatis). Mr. Odell also showed shoots of Quercus coccinea, Q. cerris, and Q. Robur, collected from trees growing in the immediate vicinity to one another, but whilst the two former were healthy and green, the common oak was badly galled with Leuroterus ostreus (Oyster gall), and the leaves were browned.

MINTS.—Mr. Fraser called attention to the many mints in general use for culinary purposes, and submitted several specimens of different forms. Mentha spicata is the mint for sauce as generally sold in the markets, whilst M. longifolia is the one generally found in private gardens. He had tested the various forms, and concluded that M. spicata is the best flavoured. Mr. Odell said he considered M. candicans the very best of all, as the result of trials he had made.

BRITISH ORCHID HYBRID.—Mr. Botting Hemsley showed a figure of a British orchid found on Reigate Hill in the third week of April last. It had three spurs, no pollen, and many other abnormalities. It was somewhat like Habenaria viridis, but the labellum rather more resembled that of an orchis. It was apparently a hybrid, and too abnormal to connect with any British species.

Sandy.

The forty-third show held by the Sandy and District Floral and Horticultural Society took place on Thursday, August 31, in the park of Sandye Place, kindly lent by Mrs. Graves. A more suitable place for a big show it would be difficult to find, and the committee is fortunate in having such a friend as Mrs. Graves. Sandy show is an extensive one, and about a score of tents are needed to house it. Poultry, pigeons, cats, dogs, and rabbits are exhibited in large numbers, and attract fanciers from all parts of the country, and also add materially to the crowds of visitors.

Five big tents held the bulk of the horticultural exhibits; one was devoted to fruits and vegetables, one to groups and plants, one to cut flowers, one to table decorations, and one to market garden and farm produce.

The present season has not been a good one for the later shows, and so at Sandy there was a great falling-off in the cut flower, fruit, and vegetable classes. Still, there was a good display, and as the day was a fine one, there were crowds of visitors.

GROUPS AND PLANTS.

Messrs. Jas. Cypher and Sons, Cheltenham, secured the first prize for a large group of miscellaneous flowering and foliage plants with a fine exhibit that was arranged somewhat after the style of their group at Shrewsbury. Crotons were fine, and such flowering plants as Brasso-cattleyas, oncidiums, Dendrobium Phalænopsis, Cattleya Iris, liliums, and ixoras were used with great effect. Mr. Macdonald gardener to Sir G. H. Kenrick, Whetstone, Edgbaston, Birmingham, a good second, and Mr. W. Vause third.

In the special class for a group arranged on 75 square feet, Mr. J. Macdonald won chief honours with a rich arrangement of ixoras, palms, crotons, liliums, oncidiums, and bamboos. Mr. H. Tysoe, gardener to the Misses Fitzpatrick, Bedford, second, his Acalphya hispida and dracænas being particularly good; Sir C. S. Hamilton, Bart., Hatley Park, third.

The finest group of foliage plants was a very beautiful one, set up with great taste by Mr. J. Macdonald; this occupied 150 square feet, and the premier award was £10. Crotons were lavishly used on the arching background, as well as in the foreground; caladiums, selaginellas, alocasias, and ferns were the other subjects used. Messrs. J. Cypher and Sons came second, their group lacking something in colour; Mr. W. Vause third.

In the plant classes Viscount Peel beat Mr. Lockie, gardener to A. J. Thornhill, Esq., Diddington Hall, for six specimen zonal pelargoniums, and each contributed huge plants. Specimen fuchsias were good, and for one example Miss Cormick, Sandy; and Viscount Peel were first and second respectively. Viscount Peel also led for six ivy-leaved pelargoniums, for six begonias, and for six hardy ferns.

Mr. Tysoe was a capital first for six stove and greenhouse ferns, and he showed some excellent nephrolepis; Viscount Peel second, and Mr. W. Vause third. Mr. Tysoe was successful for one specimen foliage plant with a fine Dracæna Victoriæ, and also for one stove or greenhouse plant in flower, with a big standard Acalypha hispida.

The class for six foliage plants found Messrs. J. Cypher and Sons, Cheltenham, to the front, with Mr. Vause second, and Mr. Tysoe third; all showed well, and the class made a good display.

CUT FLOWERS.

Dahlias were good, and Mr. John Walker, Thame, led in the class for thirty-six show and fancy blooms with splendid examples of Purple Prince, T. J. Saltmarsh, J. Cocker, D. Johnson, T. W. Girdlestone, Mrs. Saunders, Emin Pasha, Dandy, Golden Gem, etc.; Mr. H. Tysoe, gardener to the Misses Fitzpatrick, second. Mr. M. V. Seale, Sevenoaks, was the only exhibitor of two dozen show and fancy dahlias, and he was deservedly awarded the first prize.

For twenty-four cactus dahlias, on boards, distinct varieties, Mr. J. Walker was a capital first, with Dr. Roy Appleton, Helium, Thos. Parkin, Red Admiral, H. F. Robertson, Ivernia, New York, Mercury, etc.; Mr. M. V. Seale was placed second; and Mr. A. Moules, Stebbing, Stevenage, third.

Messrs. Burrell and Co. were a capital first for twelve bunches of pompon dahlias, ten blooms in a bunch, and they set up pretty flowers of Nerissa, Louise, Bacchus, Tommy Keith, Little Beeswing, Mariette, Daisy, Amelie, Censor, Annie Doncaster, Adelaide, and Queen of Whites; Mr. J. Walker, second; and Mr. M. V. Seale third.

Mr. H. Tysoe scored in the amateurs' section for a dozen show dahlias, and he was followed by Mr. J. W. Cooper, Houghton Conquest. For three fancy dahlias, Mr. R. H. Harrison, Bedford, won first prize with excellent blooms. Mr. A. Brown, Leagrave, scored for six bunches of pompon dahlias, and was followed closely by Mr. H. Brown, Luton, and Mr. R. H. Harrison.

Roses were not in good form. There were four entries in the class for forty-eight blooms in not fewer than thirty varieties, and here Mr. F. M. Bradley, Peterborough, obtained the lead, and his best flowers were of Mdme. J. Dupuy, Horace Vernet, Dupuy Jamain, Chas. Lefebvre, and Frau Karl Druschki; Messrs. G. and W. Burch, Peterborough, came second, and Messrs. W. Crisp and Son, Colchester, third.

In the amateurs' section, Mr. W. O. Times, Hitchin, was the only exhibitor in the class for two dozen roses, in not fewer than a dozen varieties; he had a very fair set of blooms, and staged good specimens of Dean Hole and Hugh Dickson.

Double zinnias were very fine, the blooms being of splendid colour and great depth, the florets piled upon each other in handsome fashion. There was a close competition for six blooms, and the awards were made in order of merit to Mr. B. J. Walker, Market Deeping; Mr. M. Sadler, Bucklersbury; and Mr. J. E. Roddis, Bedford. Viscount Peel, The Lodge, Sandy, was placed first for a dozen zinnias, with fine flowers.

In the class for twenty-four bunches of cut hardy herbaceous and bulbous flowers, Messrs. W. and J. Brown gained the first prize. Mr. T. Lockie, the veteran exhibitor from Diddington Hall Gardens, won first prize for a dozen bunches of stove and greenhouse plants with an interesting collection.

FRUIT AND VEGETABLES.

Mr. Birkenshaw, gardener to Sir G. Hunter, Bart., Hatley Park, had the best collection of six kinds of dessert fruits; he also scored for two bunches of Black Hamburgh grapes; for "any other black," with Alnwick Seedling, for two bunches of Muscat of Alexandria, and for "any other white" with Chasselas Napoleon. Mr. R. Waters, gardener to C. W. Stanley, Esq., Merton Grange, had the best peaches (indoor), and Mr. G. W. Newton, Croxton Park, the best outdoor peaches. Mr. Lockie led for nectarines and for plums, while Mr. Birkinshaw led for dessert apples, and Mr. A. Briscoe, Longstowe Hall, scored for kitchen apples.

Messrs. Sutton and Sons offered special prizes for six kinds of vegetables, and here Mr. Lockie was first, showing splendid onions and tomatoes; Mr. Tysoe second. In Messrs. J. Carter and Co.'s class Mr. Tysoe scored, and here his Ailsa Craig onions were grand. Mr. Tysoe was again first for six kinds in a class provided by Messrs. E. Webb and Sons.

In the other vegetable classes Mr. T. Lockie was a persistent first prizewinner, but Mr. Tysoe and Mr. T. Chennells, Wheathampstead, were also successful.

NON-COMPETITIVE.

There were a few effective non-competitive displays, notably those of roses from Messrs. W. and J. Brown, Peterborough (gold medal); of carnations, from Messrs. W. Cutbush and Son, Highgate (silver-gilt medal); of sweet peas, from Messrs. H. Simpson and Sons, Birmingham (silver-gilt medal); of dahlias, from Mr. J. Knight, Wolverhampton (silver medal); of roses, from Mr. F. M. Bradley, Peterborough, and Messrs. W. Crisp and Son, Colchester (bronze medal to each).

The Horticultural Trades' Association.

ANNUAL GATHERING.

The thirteenth annual meeting of nurserymen and seedsmen took place this year at Exeter, under the presidency of Mr. Peter Veitch, proprietor of the famous Exeter nurseries. The visitors were favoured by ideal weather, which helped to make the meeting one of the most enjoyable ever held. The first day was filled by business meetings, and inspection of the local nurseries, Cathedral, and the old Guildhall with its interesting Stuart portraits, regalia, etc., etc. The second day was spent at Bicton, by kind permission of Lord Clinton, where the magnificent colletion of conifers, and gardens filled with rare plants and flowers which require the shelter of glass in the north, provided a horticultural feast, of which a glorious plant of the lovely single white Macartney rose was an item which will perhaps linger longer in the memories of those present than any other. A steam along the coast from Exmouth to Dartmouth, and up the Dart, to Totnes, was the concluding item of the programme, providing a varied panorama of exquisite scenery which defies adequate description. These gatherings, in addition to affording opportunity for the discussion of trade problems and difficulties, bring together members of the nursery and seed trades from every part of the United Kingdom, and by pleasant social intercourse promote a feeling of good fellowship and harmony beneficial to all concerned. Mr. A. W. Paul (Waltham Cross) was elected president for the coming year.

NOTES OF OBSERVATION.

Erythrina Humei. — During the latter part of the summer Erythrina crista-galli may often be met with bedded out in our public parks. The comparatively large bright red flowers make a goodly show, and from their uncommon character they arrest attention. In E. crista-galli the flower stems are of annual duration, and after flowering die back to the thickened root stock. E. Humei, however, behaves in a different manner, and forms quite a woody trunk, that branches out usually at a height of 6ft. or thereabouts, and towards the upper part of its sturdy branches bears erect spikes of scarlet flowers. In its native country of South Africa it becomes quite a tree in stature.—W. T.

Solanum Wendlandi.—When this solanum was first introduced, or rather when public attention was first directed to its merits, it was regarded solely as a vigorous climber suitable only for a good-sized structure. Treated in this way it forms a really magnificent object when in flower, but at the same time it may be grown in a perfectly satisfactory manner in a more limited space. Comparatively dwarf examples, each carrying a large head of blossoms, are now frequently seen at the summer exhibitions, where, owing to their distinct colour and striking appearance, they are often employed for grouping. Thorough ripening of the wood seems to be very essential to the production of flowers in a small state.—W. T.

Lilium candidum.—Many failures to grow this lily may be attributed to the fact that the bulbs are planted in December instead of August. Being an almost evergreen species, it is naturally injured by the bulbs remaining out of the ground any length of time; in fact, unnecessary disturbance of the bulbs is injurious. Of course, for commercial purposes, the bulbs are bound to become dried to a certain extent, yet, even then, much loss could be averted if the purchaser would obtain and plant the bulbs as early as possible. When an established clump has become overcrowded, it is necessary to divide the bulbs and replant. This operation should be carried out carefully, and the bulbs must not be allowed to remain out of the ground a minute longer than necessary. No hard and fast rule can be laid down as to when to lift, only by the condition of the roots, which should be in as dormant a state as possible. This stage is usually reached immediately flowering ceases, and as this is governed by season and locality, it is advisable to examine the bulbs to discover when they are in a suitable state to lift. An ordinary free garden soil will grow them, and the bulbs should be planted quite nine inches below the surface, and as they increase, they push their way towards the surface.—E. C. Pooley.

Fig Trees in Pots.—Trees which are to be forced next season should now be examined and potted if necessary. Small trees may have pots a size or two larger, especially if the idea is to grow them larger, but it the trees are in large pots it is not by any means necessary to repot every year, as much can be done by top-dressing, and the drainage is perhaps the most essential thing with these established plants. The top-dressing should consist of some good fibrous loam with a good sprinkling of horse manure and bone-meal, and a little old mortar rubbish. With a pointed stick prick off as much as possible of the old soil, and place with the fresh mixture in position, ramming it as firmly as possible. Water sparingly, and the roots will soon permeate the fresh soil. In the case of young plants take care that the soil is well worked down by the side of the pots, so that the plants are not what is usually termed "hung"—water carefully till root action has commenced. Permanent trees, planted out and now yielding a second crop must be kept somewhat drier, and water and liquid manure should be given during the day while full ventilation is on the house.—W. A. Cook.

ANSWERS TO CORRESPONDENTS.

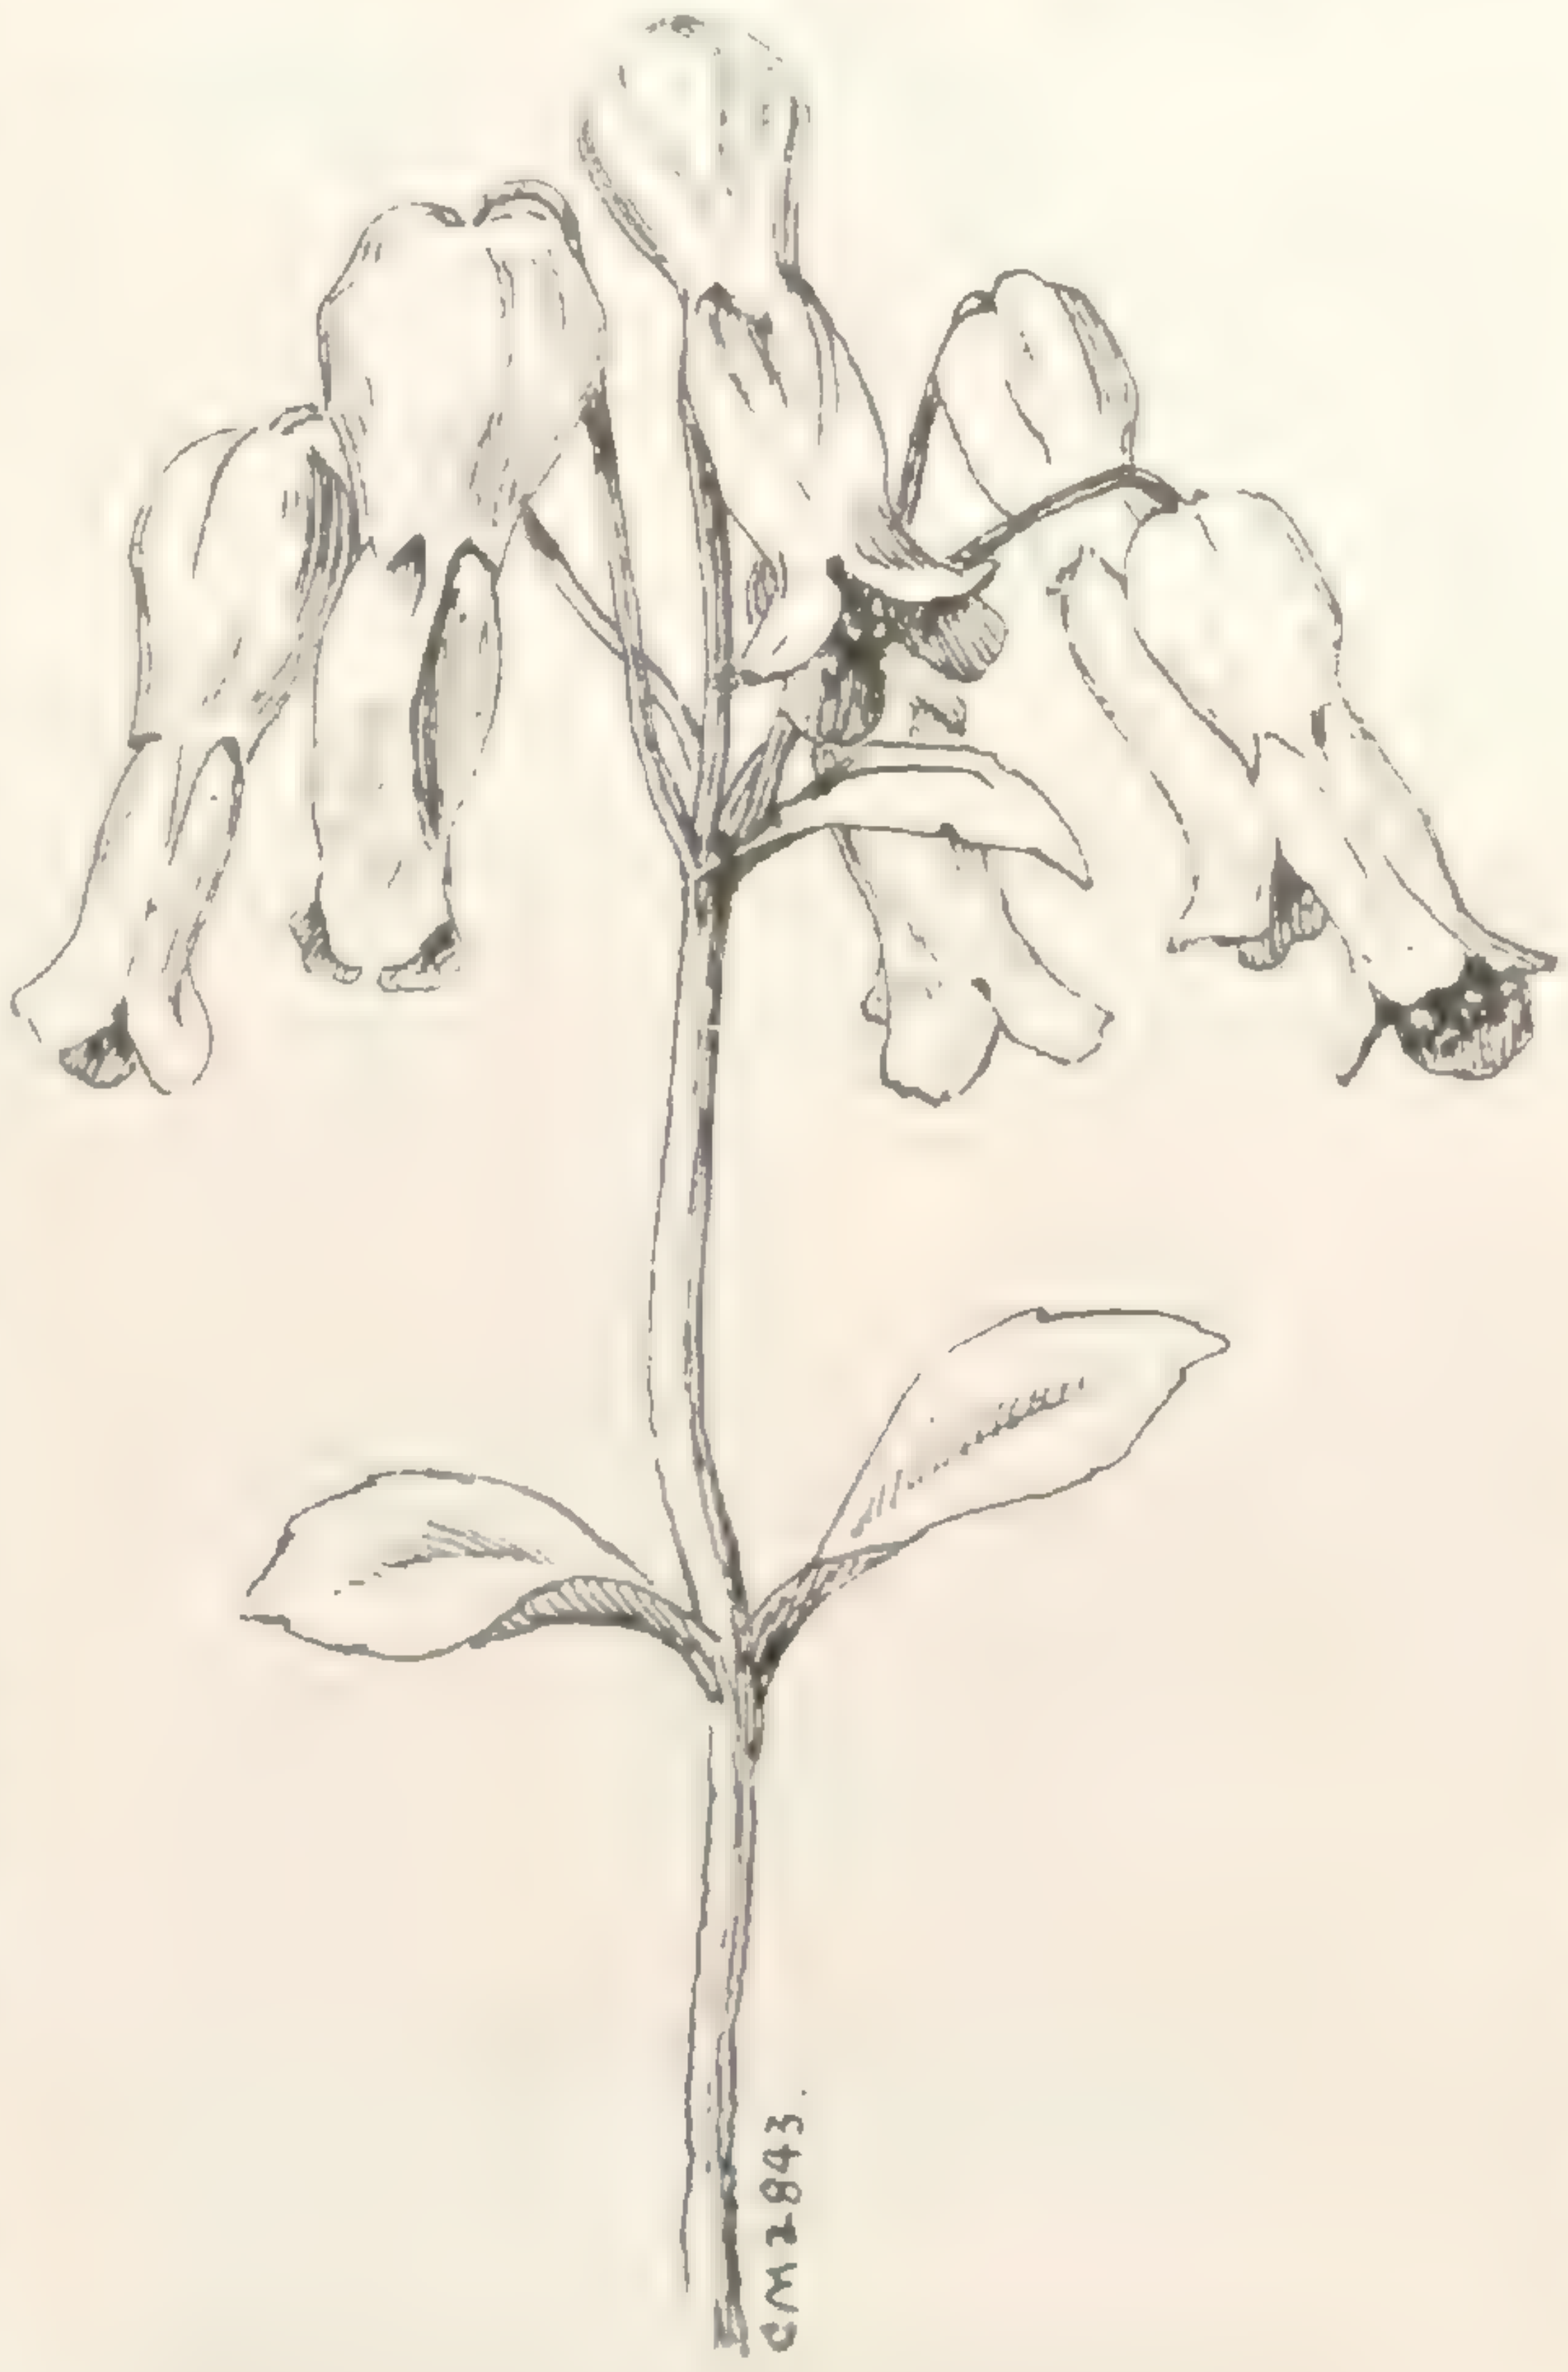
Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

BRYOPHYLLUM CALYCINUM. — S. W. A., Southsea: This old warm greenhouse plant is a succulent subject, and one by no means difficult to cultivate. It carries terminal clusters of pendulous flowers of yellowish or greenish-red hue. The great interest of the plant, however, lies in its capacity for producing plantlets from the indentations of the crenately margined leaves; these latter are not shown in the present illustration. The genus was founded by Salisbury, and the name was happily conceived from bryo, to sprout, and phyllon, a leaf; "for this plant possesses the singular property of germinating from the dark spot observable at the base of every indentation in the margin of the leaf, not only whilst growing, but as it decays. Thus, in attempting to dry a specimen, little germinating bulbs were produced in abundance, though there was no appearance of any before the plant was deposited between papers." This quotation is from the "Botanical Magazine" of just one hundred years ago. For compost use light, rich soil, and avoid overwatering.



BRYOPHYLLUM CALYCINUM.
Flowers yellowish-red; leaves proliferous.

PEAR TREES NOT FRUITING.—J. W., Dronfield: It is extremely difficult to assign a cause for the failure of your trees of Pitmaston Duchess pear to bear satisfactorily, because you omit to refer to two essential points. You do not say whether the trees are trained to a wall or growing in the open, or whether they annually make a moderate or an excessively vigorous growth. A gravelly soil is not one that is likely to promote an excess of vigour in pear trees, but a "rather gravelly soil" is somewhat indefinite, and it might by the liberal use of manure be made so rich as to promote a very vigorous growth. As the trees have occupied their present position fifteen years and are of large size, and have not produced two dozen fruits throughout the whole period, we are inclined to the opinion that they are growing too vigorously, and that judicious root pruning would be beneficial. It would probably not be well to prune the whole of the roots of the trees in one season, and we suggest that you prune the roots on one side of each tree at the end of October next, and those on the other side at the same period next year. An east aspect is not specially favourable to pears, and it may be that the flowers and embryo fruits are much injured by cold winds and spring frosts. If you will kindly send us two or three typical shoots of this season's growth, and give us information on the two points mentioned, we may be able to further advise you.

SPRAYING SOLUTION.—W. H. T., High Wycombe: In the preparation of solutions for the spraying of chrysanthemums, as of other plants, it is advisable to use materials that have passed through the whole of the processes of manufacture. We therefore advise you to use sulphide of potassium in its most refined form. If you have a few plants that you can spare for experimental purposes, you might prepare a solution with the material you mention, and spray them with it, and then compare the results with those obtained in the use of potassium sulphide.

PLANTS FOR AN AMATEUR'S GREENHOUSE.—M. G. W., Bicester: A good work on greenhouse plants is "The Amateur's Greenhouse" (post free 5s. 6d.; W. H. and L. Collingridge, 148, 149, Aldersgate Street, E.C.), which contains descriptions and cultural advice concerning a very large number of plants suitable for the greenhouse or conservatory of an amateur like yourself.

NATIONAL HARDY PLANT SOCIETY. —F. E. S., Bideford: This new society exists for the encouragement, the extension, and the improvement of hardy plant culture—whether for the garden, for decorative purposes, or for exhibition. Hardy plants shall be deemed to include hardy border, alpine, and bulbous plants. The objects of the society are: (1) To encourage the production of new and improved varieties of hardy plants by examining and reporting upon the merits of such as may be submitted to the society for the purpose. (2) To collect and disseminate trustworthy information respecting the adaptability of particular kinds of plants to the varied conditions of soil, and locality, throughout Great Britain and Ireland. To undertake trials of plants and families of plants as occasion demands and when circumstances permit. (4) To report, for publication in the annual "Journal" of the society, on such plants as have received recognition by the society during the year. (5) To give advice through the solicitor to the society to members on points of horticultural law, and at the discretion of the Council to prosecute in flagrant cases of dishonest trading. Mr. F. Bouskell, Market HarHarborough, is the secretary of the society.

INSECT STINGS.—D. L., Cheriton: Some folks suffer far more than others from the attentions of insects, but few escape altogether. The best thing we can suggest is the use of liquid ammonia, rubbing this well into the affected parts of the body.

GARDEN TRELLISES.—E. D., Leytonstone: Trellises are useful for ensuring the seclusion of the garden, shutting out unsightly objects, and as wind screens. The dimensions of these will depend upon the position they are to occupy, but they should be substantial in construction, for when clothed with the plants, the strain imposed upon them in windy weather is very great. They may be made of wood in classic or rustic design, or of wire or lattice work. The wire squares are preferable to stout wire netting, because of their greater strength; the latter may be used, but it should have a mesh of four inches, and be of the highest strength. For the support of the wire work and the wood lattice uprights four or five inches square should be provided, and let two feet into the ground.

SCAB ON APPLES.—N. B., Repton: The scab marks on the apples are caused by a fungus named Fusicladium dendriticum. This is one of the most destructive of pests which attack apples and pears, as it renders the fruits practically worthless from a market point of view, especially in the case of dessert varieties. The disease attacks both growth and fruit, thereby injuring the tree and spoiling the crop. The best method of attack is spraying the trees three times with Bordeaux mixture, the first time just before the flowers open, the second time when the petals have fallen, and the third time when the fruits are about as big as small gooseberries.

NAMES OF PLANTS.

G. C., Ipswich.—1, Colutea arborea; 2, Senecio clivorum; 3, Pteris scaberula.

A. L. D., Haywards Heath.—1, Asclepias tuberosa; 2, Habrothamnus elegans; 3, Cosmos bipinnatus.

O. F. E., Hastings.—1, Prunus Pissardi; 2, Acer Negundo variegata; 3, Iresine Herbsti; 4, Acalypha Macafeeana.

L. E. C., Lynn.—1, Selaginella cæsia; 2, Monstera deliciosa; 3, Costus igneus; 4, Sonerilla Hendersoni; 5, Garrya elliptica.

T. H., Sandy.—1, Helenium autumnale; 2, not recognised; 3, Berberis Wallichiana; 4, Epilobium angustifolium; 5, Trachelium cæruleum.

FORTHCOMING ENGAGEMENTS.

MONDAY, September 11.—United Horticultural Provident and Benefit Society: Committee meet.

TUESDAY, September 12.—Royal Horticultural Society: Floral, Fruit, and Orchid Committees, noon; General Meeting with lecture on "The Small Holdings Movement," by Mr. T. Smith, 3 p.m.; Scientific Committee, 4 p.m.

Woodstock Horticultural Society.

WEDNESDAY, September 13.—Royal Caledonian Horticultural Society's Exhibition in Waverley Market, Edinburgh; two days.

Glasgow Horticultural Society; three days.

Messrs. Dickson and Robinson's Vegetable Competition at Manchester.

THURSDAY, September 14.—National Rose Society: Autumn Exhibition Horticultural Hall.

SATURDAY, September 16.—Paisley Florist Society,

National Vegetable Society's Exhibition.—At the exhibition of this society, of which a report was given in our issue of the 2nd inst., the following awards were made for non-competitive exhibits: Gold medals to Messrs. Sutton and Sons, Reading; Messrs. Barr and Sons, King Street, Covent Garden; and Messrs. Dobbie and Co., Edinburgh. Silver medals to Messrs. Spooner and Son, Hounslow; Messrs. Carter Page and Co., London Wall; and Mr. S. Mortimer, Farnham. A cultural commendation was awarded to Mr. R. Holmes, Tuckswood Farm, Norwich, for his new yellow tomato.

Variegated Leaved Fuchsias. We have not many varieties of fuchsia with variegated leaves; indeed, only two may be regarded as in general cultivation. They are that clearly marked form of the pretty little Fuchsia gracilis, and the tricolor-leaved F. Sunray. Both are extensively used for summer bedding, under which conditions the foliage acquires a brightness of colouring which is not to be found under glass. Considering the number of fuchsias raised within recent years, it is somewhat surprising that we have not more variegated leaved kinds, for the two above-mentioned are very old. Fuchsia gracilis variegata has been in cultivation considerably over 40 years, and F. Sunray was distributed by Mr. William Bull, of Chelsea, about the early '70's. With regard to this last-named I have raised seedlings from F. Sunray, but have not obtained one therefrom which showed the least trace of variegation in the leaves, while the flowers showed no improvement. Large plants of these two fuchsias bedded out during the summer show both of them in a very favourable light, and when, as frequently happens towards the end of the season F. gracilis is laden with its little graceful blossoms, it is really charming. There are several kinds with coloured leaves, that is to say, in which the foliage is more or less suffused with red or yellow, but the true variegated kinds in general cultivation are limited to these two.—W. T.

The only resemblance between a Pine Spray Syringe and others is in the shape of the barrel. The metal is more substantial. For the rest, the combination spraying head renders Spray, Rose, and Bend instantly obtainable without the addition or removal of a single fitment, while the adjustable leather bucket plunger gives perfect suction, never allows water to escape past it and up your sleeve, and wears interminably.

A written request from your ironmonger or seedsman, and a Syringe will be sent in 24 hours for your approval. Price **10/6.** Sole proprietors and manufacturers, **Robinson Bros., Ltd., West Bromwich.**

MESSENGER & Co Ltd
HORTICULTURAL BUILDERS & HEATING ENGINEERS
LOUGHBOROUGH LEICESTERSHIRE
London Office 122 VICTORIA St S.W.

MODERN GLASSHOUSES

as supplied by MESSENGER and CO., Ltd., are made of the best materials, and only capable and reliable workmen are employed in the erection thereof.

The following letter was recently received by us on the completion of a contract for a well-known Member of Parliament.

February, 1911.

"I should not be doing my duty to your workmen if I did not at once tell you, on the completion of your work, how pleased I have been with each and all of them.

"They have been most obliging throughout the whole job, and have endeavoured to do everything in an efficient and thoroughly workmanlike manner, and I must congratulate you upon having such capable employees."

Printed and Published by W. H. & L. Collingridge, City Press, 148 & 149, Aldersgate St., London, E.C., and sold by all Newsagents, and at all Railway Bookstalls

THIS COUPON, duly filled up, should be forwarded not later than Tuesday for the next issue.

BUSINESS CARDS.

CARNATIONS.

R. H. BATH, Ltd., The Floral Farms, Wisbech.
The best New and Standard Varieties of Border, Malmaison, and Tree Carnations.

C. ENGELMANN, Saffron Walden, Essex,
Perpetual Flowering Carnations.
Largest grower in the Kingdom.

A. R. BROWN, Ltd., Wychall Nurseries, King's Norton.
The Champion Carnation Exhibitors.
The Largest Prize Winners every year since 1905.

ORCHIDS.

JAMES CYPHER & SONS,
Exotic Nurseries, Cheltenham.
Many Large Specimens and Rare Varieties.

EDWARD V. LOW, Vale Bridge, Haywards Heath.
"White" Cattleyas and Choice Cypripediums are leading features. Inspection solicited.

HASSALL & CO., late Stanley & Co., Southgate, London, N. (Tel.: 59, Palmers Green.)
Hybrids in flower, in great variety.

BULBS.

R. H. BATH, Ltd., The Floral Farms, Wisbech.
The best New and Standard varieties of Narcissi Tulips, Hyacinths, etc., Home-Grown.

PHLOXES.

GUNN & SONS, Specialists,
Olton, Warwickshire.
New and Standard varieties. Lists Free.

ROSES.

FRANK CANT & CO.,
Braiswick Rose Gardens, Colchester.
The World-famed Champion Rose Growers.

Terms for the insertion of these Business Card Advertisements may be obtained on application to W. H. & L. COLLINGRIDGE, 148 & 149, Aldersgate St., London, E.C.

THE BOURNE DAFFODILS

have gained many of the highest Awards at all the principal Exhibitions wherever shown. This is convincing proof of the **High Quality** of the bulbs and the care with which they are cultivated.

The **DAFFODIL** is the **QUEEN** of Spring Flowers, and can be grown by everyone, as the bulbs will grow in practically any soil.

But to secure success, either in the Garden or Conservatory, or at the Shows, it is essential that you should

(1st) Buy your Bulbs from a RELIABLE SOURCE, and

(2nd) Learn the elementary principles of cultivation.

YOU CAN DO THIS by (1) buying **THE BOURNE DAFFODILS**, which include all the best of the newest and choicest introductions as well as the older and cheaper varieties.

(2) by purchasing a copy of **The Book of the Daffodil**, by the late REV. S. E. BOURNE, which contains the fullest and the simplest information on everything that has to do with Daffodils. (**2s. 9d.** post free; if ordered with bulbs, **2s. 6d.**)

Send at once for my Illustrated and Descriptive Catalogue, post free from

CHRISTOPHER BOURNE, The Daffodil Specialist, **Simpson, BLETCHLEY.**

WINTER

At no time of the year are flowers in the garden and the house better appreciated than in the Winter months and early Spring, and NOW must preparation be made. Bulbs are the mainstay. We have of them excellent variety The finest and most reliable of Hyacinths and Tulips for bedding and pots; of Narcissi; of Crocus. Darwin Tulips choice and varied. Liliums for pots and the garden. We have, too, grand, well-budded Azaleas, Lilacs, etc., for forcing. Lily of the Valley crowns, ordinary and retarded. We cater for that cleanly and interesting way of growing bulbs in fibre in vases. We supply varieties the most suitable, a special compost, and dainty bowls. For Amateurs we have Bulb Collections specially advantageous in numbers of bulbs, quality and price. We will send our Catalogue free.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Seed Dispersion.

In the plant world, where successive generations are produced by means of seeds or spores, which, to obtain a fair start in life when they germinate, benefit greatly by wide dispersion, the innumerable contrivances which have been evolved to effect this form a most interesting branch of study. Every garden worth the name will display many examples, quite sufficient, indeed, to give an idea of the great diversity existing, since it is not merely our pet garden plants, but also the weeds, which, indeed, as a rule, are the past masters in the art of self-distribution. In the thistles, dandelion, and groundsel we see types of the plants which provide their seeds with downy plumes, which, when the seed is thoroughly ripe, expand, and, being carried off by the passing breeze, are wafted far and wide on their colonising mission. We may, on a windy day, see the air literally dotted as with floating downy snowflakes, careering wildly over the landscape, and every here and there being caught by some obstacle, when the shock will, in all probability, detach the comparatively heavy seed, the now unburdened plume flying away literally with the speed of the wind, while the precious seed has fallen to the soil, to declare itself as a plant in due course, miles, it may be, from its parent. If we have a damp place in our garden we may see the beautiful little Woodsorrel, Oxalis acetosella, and from amid its dense trifoliate leafage and snowy little flowers we may note the little seed capsules projecting here, there, and yonder. Touch one of these, and if it be fully ripe it will explode like a tiny bomb, and fire its shrapnel loading far and wide, not, indeed, so far as the "downy" dandelion and its like, but still, quite far enough to engender new colonies well away from the parental one, and hence achieve the object in view of a non-handicap to existence of the future brood. The balsams, the "noli me tangere" tribe, afford the most striking examples of this type of explosive scatterers, but some of the pea tribe manage to do the same thing on somewhat varied lines; the pods, for instance, of gorse or broom set up, when ripe and drying, so great a strain between their two divisions or shells that, sooner or later, these fly asunder, twisting as they do so, and thus violently fling out the peas within to considerable distances. Turn we now to the poppy, whether wild or cultivated, single or double matters not in this case, and we find on a calm day a large seed vessel, mounted stiffly on a long stalk, and devoid of any removable cap or apparent means of spreading the innumerable tiny seeds within. Closer examination however, reveals a row of small holes just beneath the rim of the seed vessel, and if we gently sway and swing this round and round or back and forth, as the wind will surely do instead, if we do not interfere, we shall see the seed scattered precisely as if from a pepper castor, through the holes in question, and thus sown more or less evenly over a large circular area. Among the weeds, the common burr and goosegrass are particularly cunning in their contrivances for securing foreign aid in seed dispersal. Both provide their seeds with tough bristly husks, each bristle having a curved tip forming a hook. Any furry or woolly animal, or even tailor-clad man himself, coming into contact with these plants at seed time, is fairly sure to have fur or clothing caught by these hooks, the result being the detachment of the seed, and its conveyance far away, until, accidentally or purposely, they are removed from their involuntary transporter. Wide scattering, however, would not always be advantageous to the plants, and those, for instance, whose habitats are walls or rocky clefts are apt to merely drop their seeds in their immediate locality. The little wall toadflax, for instance, Linaria cymballaria, does so, but in a clever and economical fashion. The little round seed pods are furnished like the flower itself, with a stalk, but this stalk bends so as to come in contact with the wall, and exercise some pressure on it; as it lengthens therefore in the maturing process, or is moved by the wind, it has a good chance of finding a chink or crevice in its way, which it then enters, and in which eventually the seed is shed. Obviously, did this plant scatter its seed like the oxalis aforesaid, the great majority would fall on the soil and germinate under conditions entirely unfitted for development. Despite, however, the general benefit accruing to seed distributed abroad, and thereby not only freeing the parental plant eventually from undue competition with its own offspring, but also profiting probably by its own isolation, there are some plants which sow or deposit their seeds on restricted lines. With the cyclamen, to wit, as the seed pods ripen the long straight flower stalk becomes a spiral and eventually carries the seed pod down, as it were, into the heart of the parent plant. The violet also produces seed pods which mature and shed their contents in a similar fashion. Every kind of plant, indeed, has its own peculiar way, and a little study will show many variants of the types which we have described, which are

MR. CHRISTOPHER BOURNE.

common to many species. There is, however, another type to which we have not alluded. This embraces seeds which, in themselves hard shelled and indigestible, are associated with pulps of a sweet and attractive character, which are consequently attacked and devoured by birds or other animals, the result being the eventual wide distribution of the resistant seeds under conditions which are highly favourable to germination. Fruit-eating birds particularly play a very important rôle in this connection, and are terrible rivals to man himself in their taste for the precious and luscious fruits which he cultivates for his own particular behoof, and, as a rule, without any idea that, primarily, in Nature's eyes, the sweet additions to the seed of pear, plum, apple, and all their kin, are of no importance at all except as mere secondary lures to assist in the distribution of the, to him, more or less obnoxious "pips."

Mr. Christopher Bourne, whose portrait we have the pleasure of giving herewith, has already obtained considerable prominence among the ever-increasing band of daffodil experts, and as he takes a keen interest in the flower, and possesses ability of a high order, there is full justification for anticipating that he will accomplish much useful work in the improvement of the flower, as well as in the distribution of its varied and beautiful forms. A son of the Rev. Eugène Bourne, who was one of the highest authorities on daffodils, and a successful cultivator, Mr. Bourne became at an early age greatly interested in the cultivation of daffodils in the garden of his father's rectory, and this interest has steadily increased until the present time, as evidenced by the fact that he now devotes the whole of his time to the flowers for which he has so strong an affection. Mr. Bourne considers that he learned all that he knows about daffodils from his father, with whom he was closely associated in their culture, and a better teacher he could not well have had. He left home to acquire a knowledge of estate management on Lord Londesborough's Yorkshire estate, where he acted several years as assistant manager, but with a still keener interest in daffodils, he started two years ago a specialist daffodil business at Simpson, near Bletchley. Since commencing business Mr. Bourne has been very successful as an exhibitor, a point of importance as evidence that he is fully acquainted with the details essential to the production of bulbs of the highest class, and of finely developed flowers. Mr. Bourne has not been at work long enough to enable him to introduce varieties of merit of his own raising, but he purposes devoting a considerable share of his time and attention to the hybridisation of daffodils, in which he is much interested, not only as a trader, but as a flower lover. In this aspect of his work we may with full justification anticipate that Mr. Bourne will obtain a full measure of success, for the collections that he has staged at the exhibitions have afforded the best possible proof that he has a full knowledge of varieties and rare judgment in selecting. His catalogue affords further proof upon this point, inasmuch as besides containing all the best varieties new and old that are in cultivation, it includes several remarkably fine varieties of which he holds the stock. One of these is the surpassingly beautiful Queen of Hearts, which obtained for Mr. Bourne an Award of Merit from the R.H.S. Daffodil Committee in April last, and is illustrated on another page of this issue. Dewdrop, an exquisitely beautiful Leedsi; Lemon Belle, a valuable addition to the triandrus section; and Tritoma, a handsome variety with bright orange-red bell-shaped crown, are hardly less noteworthy.

R.H.S. Exhibition of Bulbs, 1912.—A special exhibition of forced spring bulbs will be held by the Royal Horticultural Society on March 5 and 6, 1912, with the object of demonstrating the varieties best suited for gentle forcing, and large and small collections are invited from amateurs and trade growers. To such collections R.H.S. medals will be awarded according to merit. There will, in addition to the foregoing, be nine competitive classes, of which seven will be for hyacinths, and one each for tulips and narcissi. As preparations should be made at once by those who may desire to take part in the competition we suggest that full particulars be obtained from the Rev. W. Wilks, R.H.S. Offices, Vincent Square, Westminster, with as little delay as possible.

Summer Weather in Great Britain.—In a recent issue of the Weekly Weather Report the Meteorological Office gives a summary of the weather for the summer, comprised by the thirteen weeks from June 4 to September 2. The mean temperature for the period was above the average over the entire kingdom, the excess ranging from about 4 degrees in the East of England to rather more than a degree in the North of Scotland. The extreme temperature exceeded 90 degrees in all the English districts, and was as high as 98 degrees in the Midlands and 97 degrees in the East of England. The rainfall was deficient over the entire country, except in the North of Scotland, where the excess was only 0.05 inch. The largest deficiency was 3.16 inches in the South-East of England, and 3.00 inches in the South-West of England. The aggregate measurement of rain ranged from 3.34 inches in the South-East of England to 10.62 inches in the North of Scotland. The number of rainy days was everywhere deficient, the greatest deficiency being 19, in the Channel Islands. The duration of bright sunshine was everywhere largely in excess of the average, the greatest excess being 225 hours in the South-East of England. The absolute duration ranged from 476 hours in the North of Scotland to 861 hours in the Channel Islands, and 838 hours in the South-East of England.

Festival of Empire Rose Show.—The schedule of this exhibition, which is to be held on September 28 and 29, has been issued, and, as in the case of the schedule of the exhibition of roses held at the Crystal Palace in June last, is comprehensive in character and sufficiently liberal to stimulate a keen competition among those cultivators who are fortunate in the possession of roses of exhibition quality. There are upwards of fifty classes, and the first prizes include twenty-seven silver cups and pieces of plate, and Messrs. Clay and Son offer a large gold medal as a prize for the "best rose in the show." Schedules may be obtained from Mr. T. G. W. Henslow, Festival of Empire Offices, Crystal Palace, S.E.

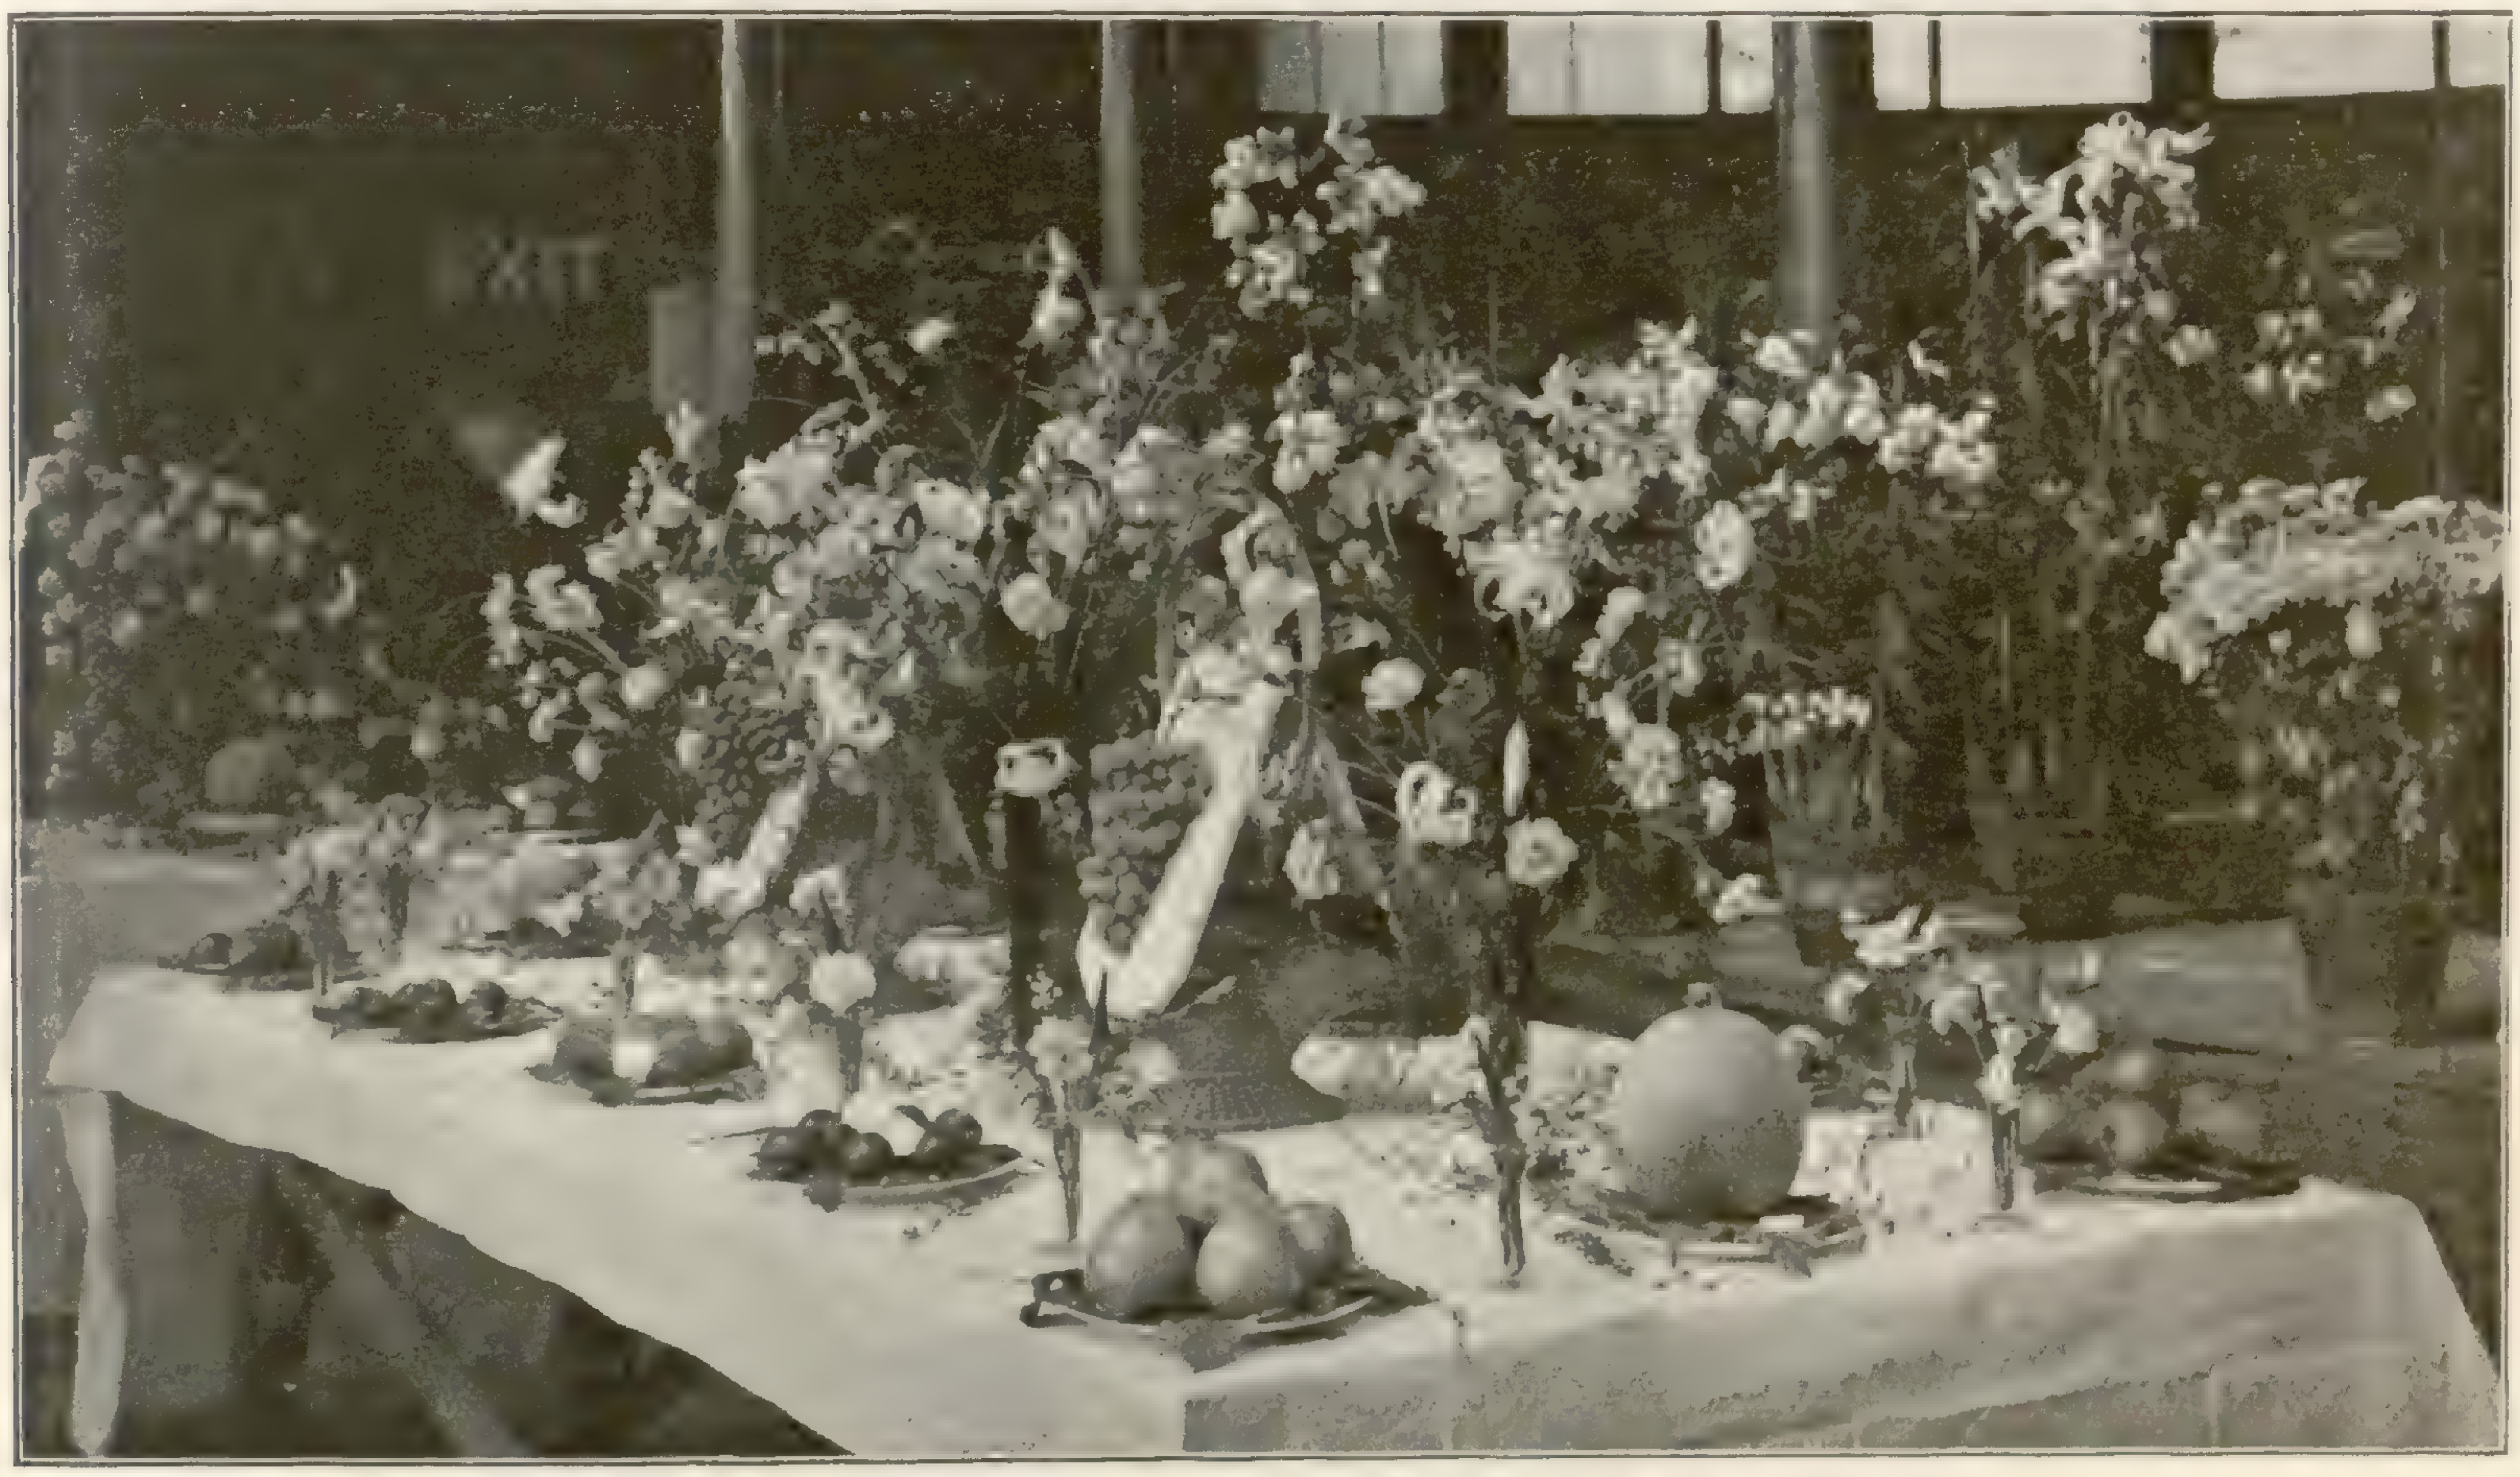
Teaching Museums.—Mr. Jonathan Hutchinson, of Haslemere, has written a somewhat lengthy letter to the "Times" of the 11th inst., in which he advocates the employment of some portion of the £50,000 that has been allocated by the Government to research in, and local investigation of, such subjects as plant physiology, plant pathology, mycology, plant breeding, fruit culture, plant nutrition and soil problems, to the formation of local museums. These museums are not to be wholly devoted to miscellaneous natural history objects or curiosities, as in the case of many of the local museums at the present time, but chiefly to objects that are of special interest and practical importance to those engaged in gardening and farming. It is suggested that these museums should be placed under the charge of curators, whose qualifications should include a general knowledge of natural history and of the pursuits of the farmer and gardener. The duties of the curators would include the superintendence of the exhibits, which should have a direct bearing upon the above-named subjects, to answer questions, and give lectures from time to time. Mr. Hutchinson does not suggest that the duty of lecture-giving should be wholly left to the curators, but considers that a staff of lecturers on special subjects should be provided by the Board of Agriculture. He states that a large and important part of the museums as contemplated would consist of recent specimens not fitted for permanent display. No expense, and but little trouble, need be incurred in reference to the supply of abundant material. Zealous specialist observers abound, and there is a wholy army of gardeners, foresters, and others more or less skilled in botany and plant observation. To these we might look without risk of disappointment for production from time to time of much valuable material which the curator would be well able to utilise for teaching purposes. "In venturing on these statements," Mr. Hutchinson observes, "I am availing myself with confidence of the experience which we have gained during the last ten years at the Haslemere Educational Museum. This museum has become a local centre of reference for a wide district, and in all departments of natural history, especially in reference to such subjects as injurious insects and plant parasites, our curator is constantly referred to. Our museum has been enriched by specimens which have been brought merely for temporary exhibition; and, what is best, general interest in scientific observation on all matters concerning farming and gardening has been widely diffused in our district. It has become the habit whenever anything unusual is observed in farm, garden, or plantation, to bring it to the museum for identification, where it is usually made a matter of instructive demonstration, not only to those who bring it, but to all visitors who may be present."

British Pteridological Society.—The current issue of the "British Fern Gazette" is of special interest to those who appreciate the charms of the more beautiful of the varieties of the ferns indigenous to this country. It contains a considerable number of contributions on fern growing, fern hunting, etc., from well-known authorities, and a full report of the Barnstaple meeting. From the balance-sheet and list of members we learn that the society has now 122 members, and a balance of £74 6s. 9d. These figures are of much interest as evidence of the increased attention that is now being paid to British ferns.

Fungus Forays.—A fungus foray in connection with the Yorkshire Naturalists' Union, will take place in Mulgrave Woods, Sandsend, near Whitby, on Saturday, the 23rd inst., and from the 25th to the 28th inst. At several of the evening meetings papers will be read, and on the 25th inst. Mr. George Massee will lecture on diseases of plants caused by fungi. The annual fungus foray of the South-Eastern Union of Scientific Societies will be held at Hastings, on Saturday, the 30th inst. On the evening preceding the foray a popular lecture on fungi will be given by Mr. E. W. Swanton, at the Museum, Hastings.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

On Wednesday and Thursday, September 13 and 14, the spacious Waverley Market was occupied to its fullest extent by the plants, flowers, fruits, and vegetables in competition for the prizes offered in the comprehensive schedule issued by the Royal Caledonian Horticultural Society, and the non-competitive contributions from nurserymen. Consequently, the Scottish horticulturists, and, indeed, visitors of all classes, had an opportunity of seeing one of the finest flower shows that have been held in Edinburgh within recent years, excepting, of course, that with which the society celebrated its centenary. Not only were the entries more numerous than usual, but the products were, on the whole, considerably above the average in point of merit. This improvement was especially noticeable in the case of fruits, for in the classes for these there was an increase in the entries of 250 as compared with last year, and on no occasion during the past thirty years have we seen hardy fruits of Scottish growth staged in so high a state of development as on this occasion. The heat and drought for which the past summer has been remarkable has been felt in Scotland, but not to the same extent as south of the Border, and the increase in bright sunshine has greatly assisted growers in bringing hardy fruits to a high state of perfection. Hardy flowers were shown, more particularly in the non-competitive exhibits, in a manner that could hardly have failed to surprise many visitors from the southern counties. We confess to having been somewhat surprised by the remarkably fine display of sweet peas, which filled a table extended the greater part of the length of the market, and occupied a prominent position in several of the non-competitive exhibits. Vegetables were plentiful, and of high quality, and in the majority of the collections the cauliflowers were as near perfection as we can hope to see them. The plant classes were better filled than usual, and there appeared to be a distinct improvement in development in several of the sections.



DECORATED DESSERT TABLE ARRANGED AND EXHIBITED BY MR. W. GALLOWAY, OF GOSFORD, AT THE EDINBURGH SHOW.

The arrangements were, as is customary at Edinburgh, admirably carried out, and the visitors on the opening day appeared to be more numerous than usual.

DESSERT TABLES.

The decorated dessert tables formed an attractive and highly interesting feature. These tables had to contain sixteen varieties of fruit selected from a list given in the schedule, and had to be judged by points in accordance with the scale prepared by the society. The decorative arrangements have marks assigned them irrespective of the quality of the fruit, and the maximum points on this occasion were: Beauty of flowers and foliage, 8; harmonious blending of colours, 10; and general arrangement for effect, 10; the total being 28. In the result Mr. J. H. Goodacre, Elvaston Castle Gardens, Derby, was awarded the first prize for quality of fruit with 99 points out of a possible maximum of 128. Of remarkably high quality were the clusters of Black Hamburgh, Madresfield Court, and Muscat of Alexandria grapes, and not less remarkable for their splendid development were Princess of Wales and Nectarine peaches. Albert Victor and Victoria nectarines, Magnum Bonum plums, Taunton Hero and The Peer melons, Brown Turkey figs, Marguerite Marrilat and Pitmaston Duchess pears; and Washington and Cox's Orange apples were also meritorious. Mr. Goodacre was second for decorations with 19½ points out of a possible maximum of 28. Lilium speciosum was chiefly used, and the large vases were somewhat overpowering, and not well suited for a dessert table. Mr. W. Galloway was second for fruit, and staged grapes, peaches, nectarines, pears, and melons of high quality. He obtained 85 points from a possible maximum of 124. Mr. Galloway scored for decorations with 20 points from a possible maximum of 28. The flowers used were chiefly those of Lilium speciosum album, pink carnations, and the elegant Bridal Wreath, and with these were associated light sprays of Asparagus plumosus. The table was light and elegant, and afforded an excellent example of what a dessert table should be. Mr. George Mackinlay, gardener to the American Ambassador, Wrest Park, Ampthill, was third both for fruit and decorations. For fruit he was awarded 74 points out of a possible 124, and 13 points for flowers. Mr. Mackinlay used pink carnations exclusively, but it appeared to us that he used too many, and put them in vases of too large a size; moreover, covering the vases with smilax gave them a rather heavy appearance.

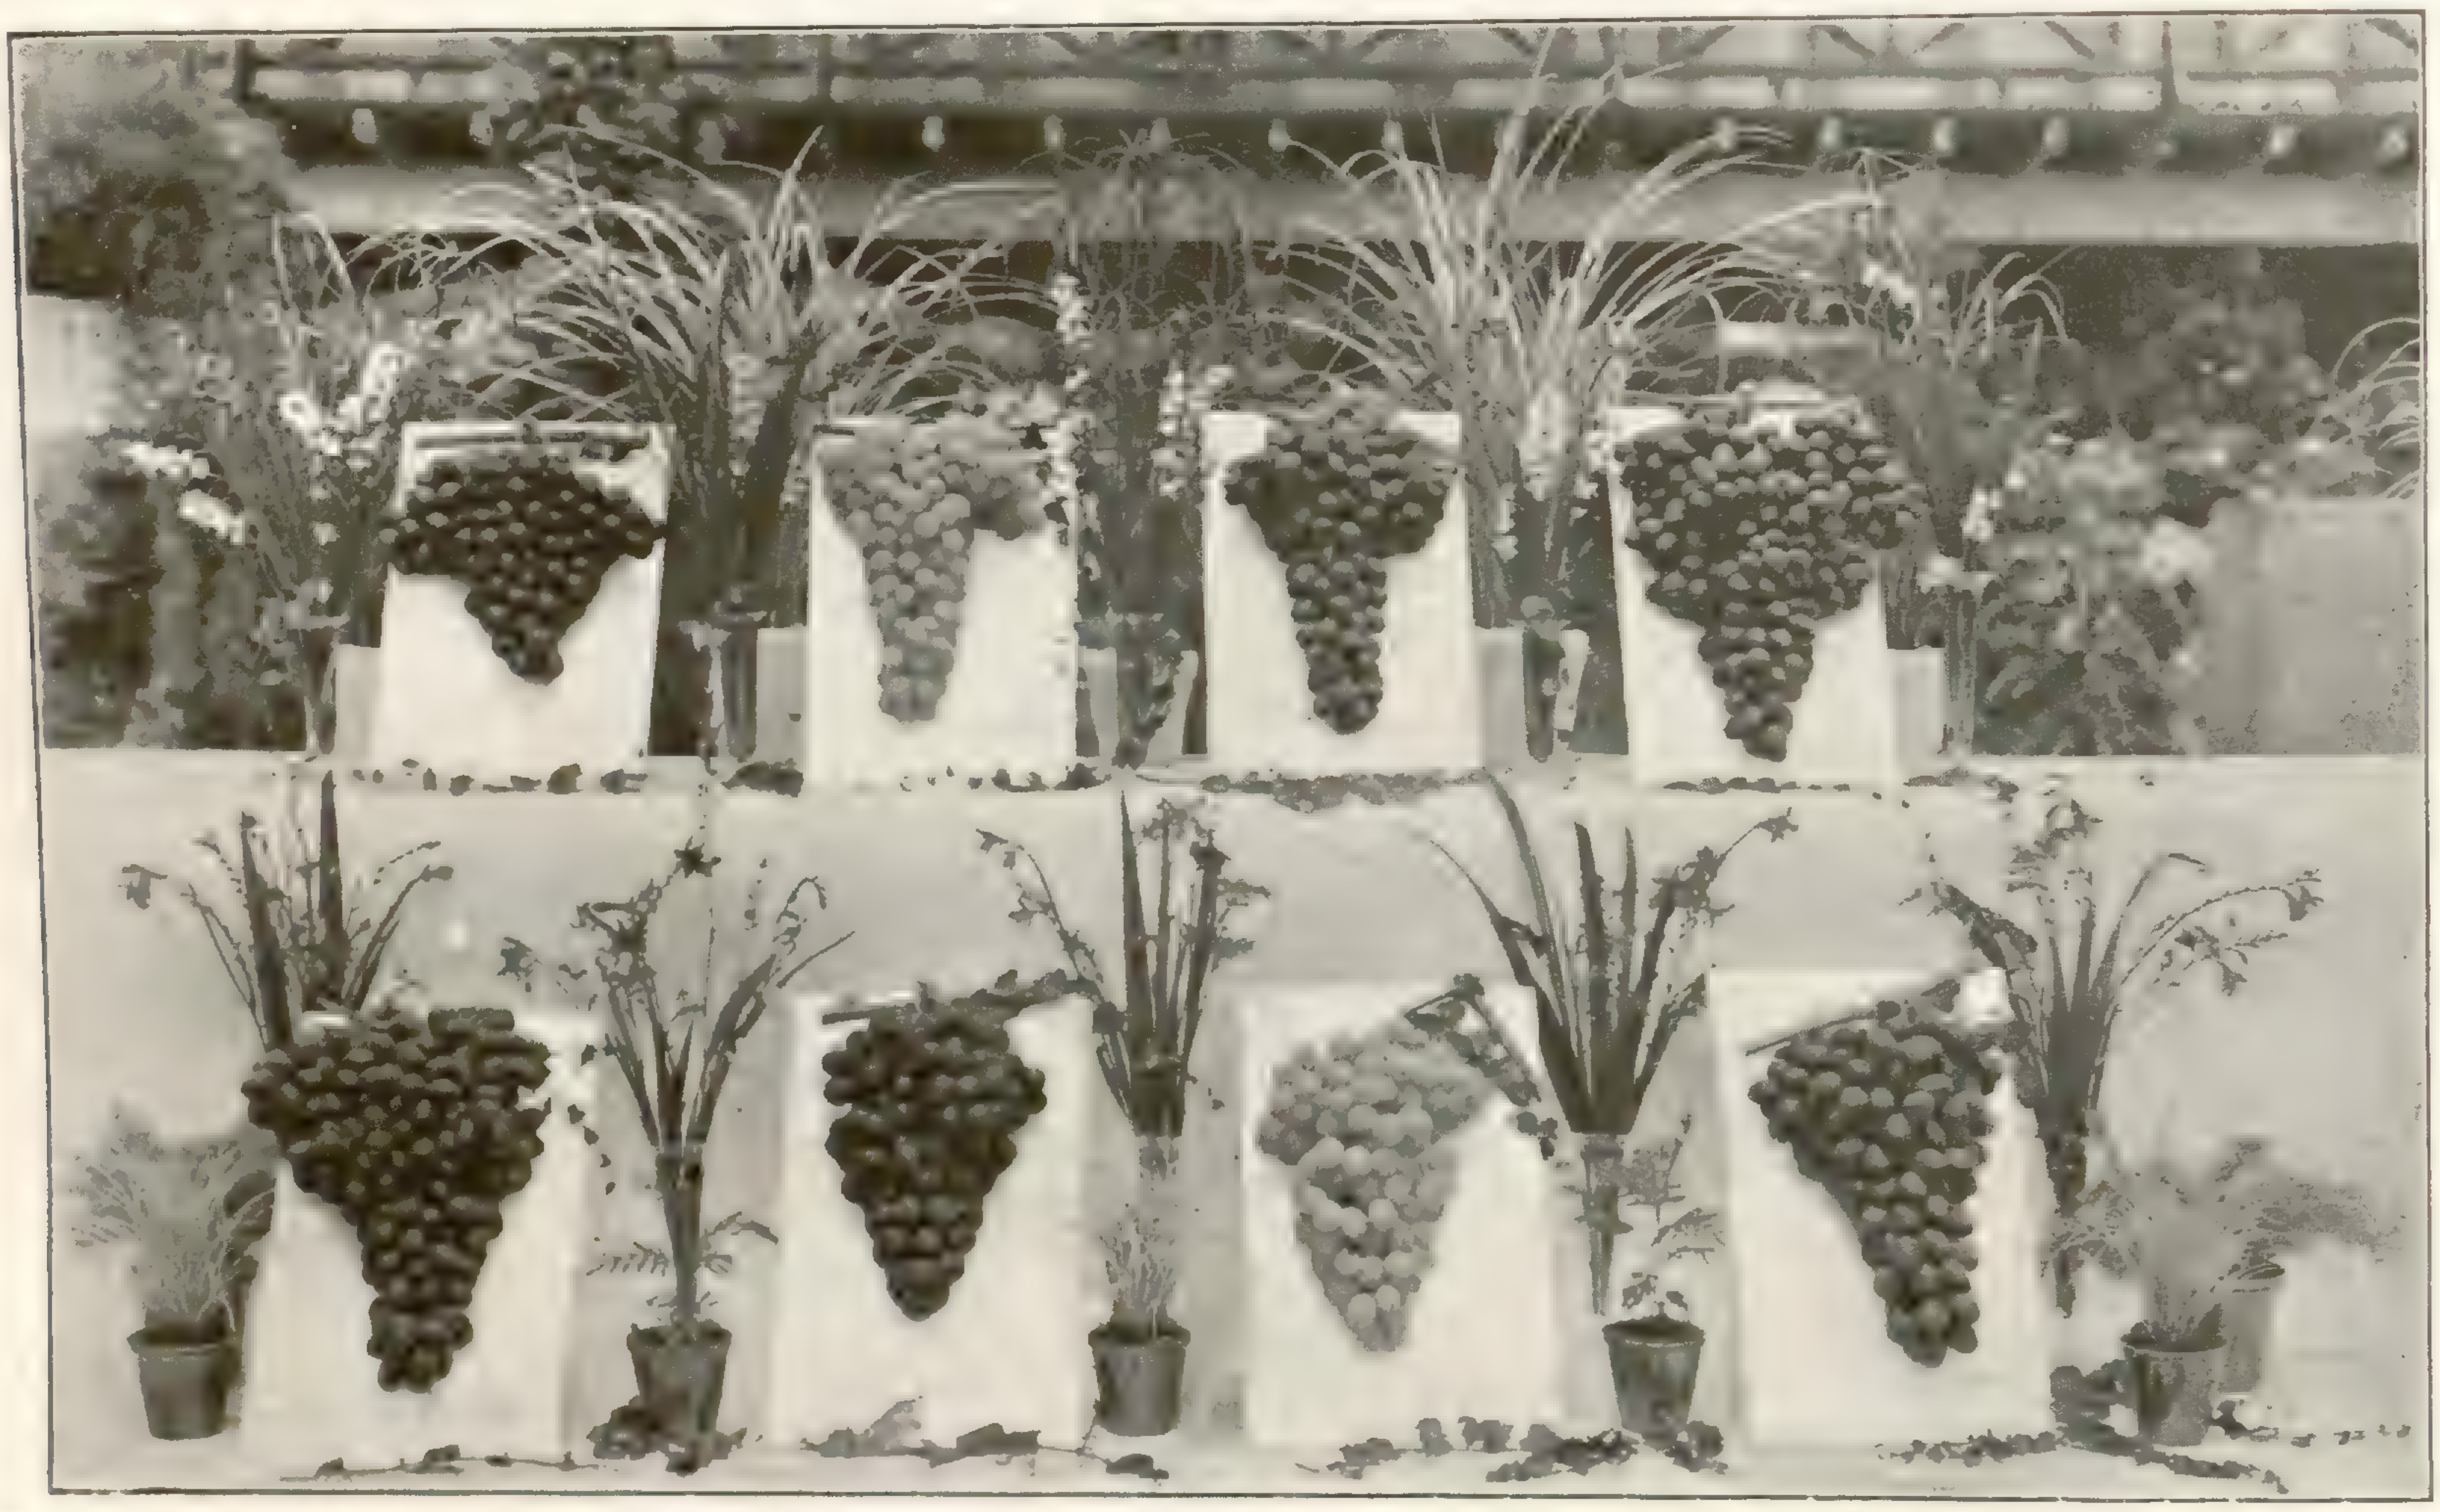
GRAPES.

Grapes, as is customary at the autumn exhibition of the society, formed a strong feature, for in the majority of the classes the competition was of the keenest and the quality was remarkably high. The most important of the several classes was that for eight bunches, in which the premier award consisted of a magnificent fifty guinea silver challenge vase, presented by Mr. W. H. Massie, and a cash prize. There were four entries, all more or less good, and at the head of the several competitions was Mr. James Dixon, gardener to Lord Rowallan, Kilmauns, who on this occasion surpassed himself as an exponent of high-class grape culture. Every variety was remarkable for its high quality as a table fruit, and every bunch was of large size and perfect in finish. The judging was by points, and the numbers awarded the several bunches were as under, the maximum points being given in brackets: Black Hamburgh (9), 7 to each of the two bunches; Muscat of Alexandria (10), 8 one bunch and 6 to the other; Madresfield Court (9), 8 to both bunches; Muscat Hamburgh (9), 7½ one bunch and 7 to the other. Mr. J. H. Goodacre followed for second place with well-finished clusters of medium size. His points were: Muscat Hamburgh (9), 7 both bunches; Black Hamburgh (9), 6½ both bunches; Madresfield Court (9), 6½ both bunches; Muscat of Alexandria (10), 7½ one bunch and 6½ the other. Mr. S. Gordon, gardener to Sir H. G. Maxwell, Bart., Monteith, Whauphill, was third, his clusters of Black Hamburgh and Buckland Sweetwater being the most noteworthy. For one of the bunches of each of these two varieties he obtained 7½ points.

In competition for the prizes for four bunches of grapes, distinct varieties, Mr. D. Kidd, gardener to Lord Elphinstone, Carberry Towers, Musselburgh, occupied the first place, with superb clusters of Gros Maroc, Muscat of Alexandria, Black Hamburgh, and Alicante, Mr. G. Pirrie, gardener to C. W.

Cowan, Esq., Dalhousie Castle, was a capital second, with a collection in which the bunch of Muscat of Alexandria was the most noteworthy. Mr. J. Middleton, gardener to W. Forbes, Esq., Callender House, Falkirk, was a close second. The class for two bunches of Muscat of Alexandria was well filled, and the entries were remarkable for their exceptional quality. Mr. J. Buchanan, gardener to the Earl of Mar and Kellie, Alloa, was first with rather large and finely-coloured bunches. Mr. W. Campbell, gardener to Col. J. Stuart-Mackenzie, Brahan Castle, was an extremely close second, and Mr. W. Galloway followed for second place. Very strong was the competition in the class for two bunches of Black Hamburgh, and the more perfect of the clusters of this useful grape were those shown by Mr. W. Galloway, who obtained premier honours. Very fine also were the two bunches from Mr. J. H. Goodacre, who was second. Mr. S. Gordon had good bunches for third, although rather lacking in colour.

The single bunch classes were better filled than usual, and occupied a long run of table. To particularise is not possible, but it may be mentioned that Mr. J. Buchanan was first for Muscat of Alexandria, Mr. J. H. Goodacre for Black Hamburgh, Mr. F. M. Urquhart for Alicante, Mr. J. Duff for Alnwick Seedling, which was particularly fine; Mr. J. Beisant, Castle Huntley, Dundee, for Gros Colman; Mr. D. Kidd for Lady Downes; Mr. J. Dixon for Madresfield Court, with a superb bunch; Mr. J. Middleton for any new grape, with a medium-sized bunch of Diamond Jubilee; Mr. Frann, gardener to Lord Balfour of Burleigh, Kennet Gardens, Alloa, for Gros Maroc, very fine in finish; Mr. Urquhart for any white grape, not specified, with Buckland Sweetwater, the colour particularly rich; Mr. J. McNeill, gardener to Major Thorburn, for the best bunch, remarkable for its bloom, variety unnamed, but probably Madresfield Court.



MR. J. DIXON'S COLLECTION OF EIGHT BUNCHES OF GRAPES, WITH WHICH HE WON THE SCOTTISH CHALLENGE TROPHY AT THE EDINBURGH SHOW.

FRUITS.

There was a good array of melons, and the premier award for green flesh was made in favour of Mr. Goodacre, who had a handsome and finely-flavoured fruit of The Countess; Mr. D. Kidd second with Best of All. In the class for scarlet-fleshed melons, Mr. Goodacre was again first, staging Manchester Red in fine form. Mr. Ness, gardener to the Earl of Stair, Oxenford Castle, was second with Gunton Scarlet.

There was a strong competition in the class for a dish of peaches, the entries being numerous and the fruit of large size and splendidly coloured. Mr. J. H. Goodacre scored with a grand dish of Sea Eagle; Mr. Ness second with Bellegarde, and Mr. G. Mackinlay third with Princess of Wales. Nectarines were less plentiful than peaches, but they were equal in form. Mr. Goodacre was first, staging large, finely-coloured fruit of Albert Victor; and Mr. Ness was second with Humboldt. Mr. J. Wood, Larbert, and Mr. T. Gordon were first and second for figs with excellent fruit of Brown Turkey.

There was a large display of culinary and dessert plums. Mr. J. Vert, gardener to Lord Howard de Walden, Audley End, Saffron Walden, scored for a dish of a gage plum with fine fruit of Reine Claude de Comte Althens. Mr. MacKinlay second with Transparent. The best dish of yellow plums was that of Jefferson's, exhibited by Mr. Duff. The best dish of red plums was Pond's Seedling, shown by the last-named exhibitor, who had this handsome variety at its best. Mr. Urquhart scored in the class for purple plums with Kirke's in exceptionally fine condition.

The prizes for a collection of four dishes of plums resulted in a spirited contest, and the premier award was made in favour of Mr. J. Vert, who staged Jefferson's, Golden Emperor, Late Orange, and Reine Claude de Comte Althens. Mr. A. McKinnon, Clifton Park, Kelso, was a close second. Mr. Vert was first also for four dishes of culinary plums, the varieties being Primate, Monarch, President, and Pond's Seedling; Mr. G. Mackinlay following closely for second place.

There was but one entry in the class for a collection of twelve kinds of fruit, and the first place was awarded to Mr. Goodacre, who had good clusters of Muscat of Alexandria and Madresfield Court grapes, large, richly coloured fruit of Lady Palmerston and Princess of Wales peaches, Victoria nectarine, Cox's Orange and Gascoigne's Scarlet apples, and good examples of Louise Bonne of Jersey and Williams' Bon Chretien pears.

Mr. Goodacre was first also for twelve dishes of orchard house fruit with a collection in which the peaches, apples, and pears were the most noteworthy. Mr. G. Mackinlay was second with fruit of much merit.

The contributions to the class for twelve dishes of apples were so numerous as to fill a large area of table room, and to form a most interesting and attractive display. The post of honour in this class was occupied by Mr. J. Lee, Kingscroft, Cheshire, with a collection that merited the highest praise. The fruit was throughout of the largest size, free from blemish, and highly coloured. Chief among the varieties were Charles Ross, Worcester Pearmain, James Grieve, Emperor Alexauder, Peasgood's Nonsuch, Gascoigne's Scarlet, Norfolk Beauty, Catshead, and Warner's King. Mr. R. Sinclair, Drem, was a close second with finely-finished fruit; Mr. Craddick, Ross, Herefordshire, third, with fruit rather smaller than in the above-mentioned collections, but superb in colour and finish. Even more severe was the competition in the class for twelve dishes of apples grown in Scotland, and Mr. Duff obtained premier honours with magnificent fruit, that was not less remarkable for its brilliant colouring than for its immense size. The varieties included Yorkshire Beauty, Peasgood's Nonsuch, Lord Suffield, The Queen, Cox's Pomona, and Duchess of Oldenburgh. Mr. R. Sinclair, Drem, was a capital second with fruit of superb quality, Lady Sudeley and Tibbet's Pearmain being especially remarkable for high colour. In the class for six dishes of apples Mr. Craddick was a capital first, and Mr. J. Lee a close second.

The classes for single dishes of dessert and culinary apples contained an enormous number of entries, and, as in the case of that staged in the collections, the fruit was of a high order of merit. Pears were staged in considerable numbers, and, if less attractive than the apples, they proved highly interesting. Mr. R. M. Whiting, Credenhill, Hereford, was first for a collection with splendidly grown fruit of the leading varieties. Mr. W. Galloway was a good second, and Mr. G. Mackinlay third.

ROSES AND SWEET PEAS.

Roses were admirably shown for so dry and hot a season. In the classes limited to amateurs and gentlemen's gardeners there were many good boxes; Mr. J. Simpson, gardener to the Earl of Dalhousie, Carnoustie, was first for twelve teas with good blooms. Mr. J. Black, Kinglossie, scored for the same number of varieties without restrictions as to class, and Mr. J. Simpson was second and Mr. J. Darling, Harward, Hawick, third. For twenty-four roses, Mr. Virtue, Lanark, was placed second,

(Continued on page 692.)

THE VALUE OF DARWIN TULIPS.

If I had a fairy godmother, and if, acting up to the traditions of her race, she offered me certain fulfilment of three wishes, for one I should unhesitatingly demand the stoppage of the clock for six weeks in the third week of May. It usually happens that by then the spell of N.E. wind and sunless cold days that always come in May (and no one seems to remember as occurring when they were young, in the good old days), has given place to the pleasantest sample of climate old England gives us in the whole year. The apple blossom, double cherries, Berberis stenophylla, and many flowering shrubs and trees are then at their best; it is not for their sakes I wish time to stand still, but because it is the moment when the Darwin tulips are in full bloom, and are so beautiful in their varying delights that I have never yet had sufficient time to fully enjoy them. Certainly, they last in beauty for at least ten days, but there are varying phases in that beauty. The effect of a bed of newly-opened buds, with small, stiff cups of a colour somewhat softened in tone by the waxy meal on the outside of a young flower, though perhaps equally charming, is quite different from that of the same bed in its later stage of widely-opened full-grown blossoms, each of which now displays the deeper or brighter hues of the inside of the flowers, and also the conspicuous eyes of varying shades of blue, or white, or combinations of both, that adds so greatly to the beauty and variety of the Darwins. For instance, Europe and Laurentia are much alike viewed from a distance, but at close quarters are easily distinguished, Europe by its white base or eye, Laurentia by a soft blue replacing the white. Again, they possess a double entity, depending on whether we view them in full sunlight or shade, and those who have not noticed these different effects will be astonished and delighted if they look at the same group lit up by the overhead light of noon and again at evening when the setting sun glows through them. Truly, then, we may say that for this period of the year Darwin tulips are indispensable for the pleasure they can give to those who will watch their varying phases.

Their greatest value in the garden lies, perhaps, in their suitability for massing in beds, and the best effects are attained by using only one variety for a bed. I have tried many flowering plants as a carpet for such beds, and have discarded all, including Alyssum saxatile, double arabis, polyanthus, primroses, and others in favour of the best dark forms of Myosotis alpestris, such as Warley Blue or Indigo Queen. The varieties of Darwin I prefer for this bedding are of distinct and uniform shades of colour rather than those which shade off to lighter tints at their edge or show a distinctly paler band up the centre of the segments.

I should advise Clara Butt, a tender pink; Europe, a rich salmon-scarlet; Mr. Farncombe Sanders, rosy-crimson, and one of the largest and most stately, perhaps the best of all for a distant effect. Erguste I prefer to all others of mauve or lilac shades, but I know that H. Ewbank is more popular, possibly only because better known. White Queen, also known as La Candeur, the nearest approach to a white, is effective for a small bed, but not good in a large mass. Zulu, if a tall habit is not objected to, or Faust, are both good as dark purples. Isis is undoubtedly the finest bright red, and King Harold as a dark ruby crimson cannot be beaten. All these I have named are now sufficiently reasonable in price to admit of their being planted in numbers, but for those who care to spend a larger sum, La Tulipe Noire is the finest dark flower, nearly black; Franz Hals, the best violet; and Yolande, or Duchess of Westminster, as it is now called, a magnificent salmon-pink.

Another important use is for cutting, and for this purpose I grow them in rows alternately with carnations, chiefly for economical reasons to save space, much on the same lines as the child who, when scolded for eating butter and jam together, said the same piece of bread did for both. I find if the tulips are lifted just before the carnations are layered, and both replanted in early October, all works well. An annual change of ground is beneficial to both. Besides those already mentioned, the following are especially useful: Suzon, Margaret, and Flamingo, soft pinks; La Tristesse, Mauve Clair, and Lantern, shaded lilacs; Henner, Heela, Dom Pedro, and Nigrette, for shades of brown and dark red; Mme. Krelage, Edmée, and perhaps Louis Mimmerel, for rose-pink, shading paler at the edge.

Yet, again, those who care for pot plants for decorating the house or conservatory cannot do better than to grow some Darwin tulips in pots, but they must not be forced to flower earlier than the third week in March. Here I should not recommend the later-flowering varieties, but such as Mme. Krelage, Painted Lady, which treated thus is almost pure white; William Copeland and Fraulein Amberg, for mauve and smoky grey; Professor Rauwenhoff, the best forcing red; Zanzibar, Zulu, and Donders, for dark shades; and Suzon and Fanny, for pale pink.

Lastly, I would like to speak of a little experiment I have been making, and which thus far has been so successful that I think others might like to try it, too. It is to plant Darwin tulips singly among herbaceous plants in the mixed borders. I find that by planting them rather deeper than usual they will throw fine flowers each year, and make but little increase. This saves the necessity of disturbing the permanent occupants of the border, and at the same time a fine bloom appears annually instead of several small ones, or possibly eventually only leaves. As an instance of the effect thus obtainable, I would suggest the dotting of a dozen or so Clara Butt among groups of grey-leaved plants, such as Cerastium tomentosum, Artemisia Stelleriana, and Santolina incana. E. A. Bowles.

AN EFFECTIVE ARRANGEMENT OF DARWIN TULIPS IN THE FORMAL FLOWER GARDEN, KEW.

ROMAN AND ITALIAN HYACINTHS.

The first-mentioned of these two hyacinths are general favourites, a position they rightly hold through the free production of delightfully scented and elegant spikes of flowers, which are much used in light decorative arrangements; and also for the comparatively easy manner in which they are obtained through the dullest season of the year when the supply of flowers is none too plentiful. With careful management it is possible to have them in bloom from the beginning of November to well into the New Year.

The Italian hyacinths, though very much resembling the Romans, grow somewhat stronger, producing more foliage and stouter flower stems, but any attempt at hard forcing will be disastrous; in fact, they give the best results when brought along steadily in a cool temperature. Nevertheless, they are very useful, and might with advantage be more largely grown than they are at the present time, coming in, as they do, when the last of the Romans are over, and, to a great extent, taking their place. I have in my mind while writing this note a lively recollection of the pleasure I had at a market nursery last spring in viewing several thousands of these hyacinths growing in shallow boxes. They had been brought along with scarcely any artificial heat, and they appeared to be simply oblong masses of flower, so profusely were they blooming. This at once removed the doubt I previously had respecting their free-flowering qualities. The grower informed me that he had undertaken to grow them that season as an experiment; he was more than satisfied with the result.

The most essential part in forcing hyacinths is, in the first place, to procure well-ripened and sound bulbs, and to have them well rooted before introducing them into heat. This can only be accomplished by early potting or boxing; so to have Roman hyacinths in flower at the beginning of November early ordering of the bulbs is necessary, as well as attention to potting or boxing immediately on their arrival. It is usual to try to extend their flowering season as far as possible into the New Year. This is greatly aided by potting the bulbs in batches at intervals of two to three weeks. A fairly rich and light compost will be found the most suitable, and it is advisable to use a fair amount of drainage to ensure the ready escape of surplus water, and thus admit of a generous use of stimulants in a liquid state when they are producing their flower spikes. Pots varying in size from three to six inches in diameter may be advantageously used, these being the most useful sizes for grouping, and from three to six bulbs should be put in each, according to its size. Where a quantity is grown for cutting it is the usual, and, indeed, the best, practice to grow them in shallow boxes, from which they can be readily transferred to china or fancy bowls for house decoration. If this is carefully done, and the roots not damaged, they are not in the least affected by the removal.

As the operation of boxing and potting proceeds care should be taken to make the soil firm round the bulbs, and to leave just the top of each uncovered. When this is finished give a thorough watering, and subsequently plunge the boxes and pots containing the bulbs, using either leaf-soil, sand, or ashes for the purpose. The plunging material should be about six inches above the bulbs. When treated in this way growth soon commences, therefore it is essential to examine them frequently, for if neglected at this stage the growths become drawn, and are liable to damage when removing them from the plunge bed. By taking them out when the growths are about an inch in length there will be no risk of injury, and it will be found on examination, that the bulbs are rooting freely. They should then be placed in an unheated frame, whence they can be removed to a structure in which a brisk temperature and a moist atmosphere are maintained to bring them into flower as required. Although they force readily when removed to the forcing house or pit, perhaps the best results are obtained by bringing them on gradually in a cool temperature.

Italian hyacinths require treatment similar to that advised for the Roman hyacinths as regards potting and plunging, but, as already stated, they are not so suitable for early forcing.

Much pleasure is derived by amateurs nowadays in growing hyacinths in shallow ornamental pans, and either of the types referred to will be found suitable for this very interesting manner of flowering them.

T. B. Field

TULIPS.

Regarded from any aspect of garden ornamentation tulips are a power to conjure with; few bulbous plants equal them in decorative qualities, none are more useful. The genus is a large one, and within it is found practically every tone of colour-value; in the self flowers this is full and brilliant, and in those having two or more shades the combination is usually of great beauty; a large number are richly perfumed, and it is this trait, in conjunction with long, stiff stems, and general lasting qualities, that win them such ready welcome in the open garden, and as cut flowers in the decoration of the home.

The natural flowering season of tulips is limited to some three months of the year, but under systematic pot culture this period is greatly extended, and the flowers may be enjoyed for quite six months by the aid of artificial heat. Bulbs, to produce the earliest flowers, are potted up early in August, using a compost of fibrous loam, leaf-soil, and sand, with the addition of some decayed cow manure, or that from a spent mushroom bed; pots or boxes are employed, the bulbs being potted firmly, and the apex kept level with the soil when finished. Water is applied once, and, after draining, the pots or boxes are plunged in cocoanut fibre or similar material, where they remain for a period of from six to eight weeks. Only the best-rooted samples should be subjected to early forcing, those indifferently rooted being returned to the plunge bed till a later date.

Bulbs of the Duc Van Thol class are most reliable for the production of early flowers, and can be had in bloom at Christmas; in habit the plants are dwarf and neat, having long pointed buds, the flowers for the most part are self coloured, represented by white, scarlet, yellow, blush, orange, and cerise-purple. Early single tulips to follow in succession include Duc de Berlin, Montresor, Proserpine, Vermilion Brilliant, Pottebakker White, all of which may be readily forced into flower for January, after which date the majority of single and double Dutch tulips respond to forcing.

Darwin and May-flowering tulips are valuable for carrying the display through April and May. These require rather more room in the pots, with a long growing season, and must not be subjected to any great amount of fire heat, but allowed to unfold their flowers by the aid of sun heat alone.

Tulips are extremely hardy, and the majority are inexpensive, so that one naturally exacts full measure from them in the open garden. Not only are they ideal subjects for formal spring bedding, but many of the species, along with the Cottage and Darwin sections, succeed either in grass, semi-shady woods, or grouped among shrubs in beds, and, when carefully placed in bold, informal groups, in positions as indicated, the result is altogether pleasing. In preparing positions for tulips in the open it is advisable to dig the ground deeply, working in a quantity of farm manure, which should always be in a thoroughly decayed state. The ground should lie at least ten days before planting, in order to allow it to settle. Bulbs may either be planted alone or in conjunction with some low carpeting plant, which, affording a dual display, at the same time keeps the soil more open by preventing the surface from being beaten by heavy rains. Geum montana, Festuca glauca, Arabis albida fl. pl., Santolina incana, aubrietias in variety, and similar subjects are suitable for this system, while in woodland glades a most delightful picture results from the free use of primrose and polyanthus, with Cottage and Darwin tulips.

Among tulipa species there are several dainty members that appear to best advantage in the rock garden. These include Biflora major, with cream flowers; Clusiana (the Lady Tulip), red and white, with violet centre; Greigi, enormous orange-scarlet flowers; Haageri nitens, orange-scarlet, with dark centre; Kaufmanniana (the Water Lily Tulip), having flowers that are creamy-white suffused with carmine-red; Lownei, rose-pink; and montana, brilliant scarlet. These should be planted in warm sheltered spots in a compost of light soil.

In considering a scheme of spring bedding with tulips alone much depends on individual taste as to the colours likely to prove acceptable. But little, if any, fault can be found with any of the varieties, so that one may safely be guided by a catalogue of repute, choosing such colours as appeal to personal taste. Single and double Dutch tulips flower in advance of the Cottage and Darwins, and may conveniently be planted in beds to be followed by summer bedding plants as soon as the flowers are past their best. The tendency of recent years, however, is to prolong the spring season in the formal garden, and the practice is becoming quite common to bed entirely with Cottage and Darwin varieties, and so prolong the display into the early days of June. This system, while yielding the happiest results, so far as a floral display is concerned, is not entirely to the gardener's interest, or that of the summer plants, which are generally ready for their quarters by the first of June. Rather than inflict a long list of catalogue names of tulips, I have given below a list of cottage and Darwin varieties that were incorporated in a charming bedding arrangement last season: Darwins.—Europe, rich carmine-rose; Margaret, flesh-pink; Clara Butt, delicate rose and blush; George Maw, deep rose-pink; Rev. Ewbank, silvery-heliotrope, a lovely shade; Pride of Haarlem, salmon-rose and scarlet; William Pitt, full blood-crimson, extra fine; La Tulipa Noire, very dark, almost black; Valentine, light violet and metallic blue. Cottage.—Parisian White, clear pure white, petals pointed; Bouton d'Or, deep golden-yellow; Inglescombe Pink, delicate rose-pink and salmon; Primrose Beauty, soft primrose and cream; Picotee, white, margined rose.

DUKE OF BEDFORD.—A large bold bicolor trumpet, **4/6** each.

EVANGELINE.—A fine well-formed Leedsii, **5/-** each.

FIREBRAND.—One of the richest coloured red-cups, **9/-** per dozen.

HOMESPUN.—A perfectly formed Incomp., **7/6** each.

LADY MARGARET BOSCAWEN.—A fine bicolor Incomp., **6/6** each.

LORD ROBERTS. — The finest Daffodil of the Emperor type, **6/6** each.

SCARLET EYE.—A good Parvi, with brilliant scarlet eye, **5/-** each.

ALBATROSS.—A fine Barrii, **8/-** doz., **9d.** each.

ARGENT.—A beautiful semi-double, very free, **6/-** doz., **7d.** each.

BLACKWELL.—One of the earliest red cups, **10/-** doz., **1/-** each.

BRANSTON.—A white Barrii Conspic., **18/-** doz., **1/9** each.

CROWN PRINCE. — Very good Barrii, **2/6** doz.

GLORIA MUNDI.—Very fine Incomp., with orange cup, **10/-** doz., **1/-** each.

GLORY OF LEIDEN. — A fine trumpet Daffodil, **5/-** doz., **6d.** each.

LUCIFER.—One of the best red cups, **10/-** doz., **1/-** each.

Mme. DE GRAAFF.—Still one of the best white trumpets, **5/-** doz., **6d.** each.

SEAGULL.—A good variety for any purpose, **4/-** doz., **5d.** each.

POETS.—Cassandra, **1/6** each; Chaucer, **1/-** each; Epic, **1/-** each; Homer, **1/3** each; Horace, **1/-** each; Virgil, **2/-** each.

Send for our full Catalogue containing nearly 200 varieties ranging in price from £32 10 0 per bulb to sixpence per dozen; besides a selection of Hyacinths, Bedding, May-flowering, and Darwin Tulips, etc., etc.

The Cheapest House in the Trade for Really Reliable Bulbs.

In writing please mention this paper.

IXIAS AND SPARAXIS IN POTS.

Although hardy in the favoured parts of these islands, especially where grown in a warm border, these charming bulbous plants must in most districts be looked upon as greenhouse subjects. In the greenhouse their delightful blossoms are sure to be much appreciated, not only from the light and graceful manner in which they are borne, but also from the charming colours which are to be found amongst them, while one of the ixias, namely I. viridiflora, is unique in the colour of its blossoms. They are of a distinct emerald green tint, with a dark centre, and conspicuous yellow anthers. Generally speaking, both the ixias and sparaxis (for they are nearly allied) have but small bulbs, from which rise grass-like leaves and firm wiry flower spikes. On the upper part of the spike, which often arches over in a pleasing fashion, the flowers are produced. They vary in colour from white, or nearly so, to deep crimson, different intermediate shades of pink, cerise, yellow, and orange, being also very plentiful.

An essential point to bear in mind in the cultivation of both ixias and sparaxis is that the bulbs are small, and quickly deteriorate if they are kept out of the ground too long. Such being the case, they should be potted as soon as possible, at all events before the month of September has left us. Effective specimens which are of considerable use for decorative purposes can be grown in pots five inches in diameter, from eight to ten bulbs being put in each. A very suitable compost is one consisting principally of good yellow loam, lightened by an admixture of leaf-mould, dried cow manure, and silver sand, the loam forming about two-thirds of the whole. The pots should be effectually drained, and the bulbs placed at such a depth that the upper part is about an inch below the surface of the soil.

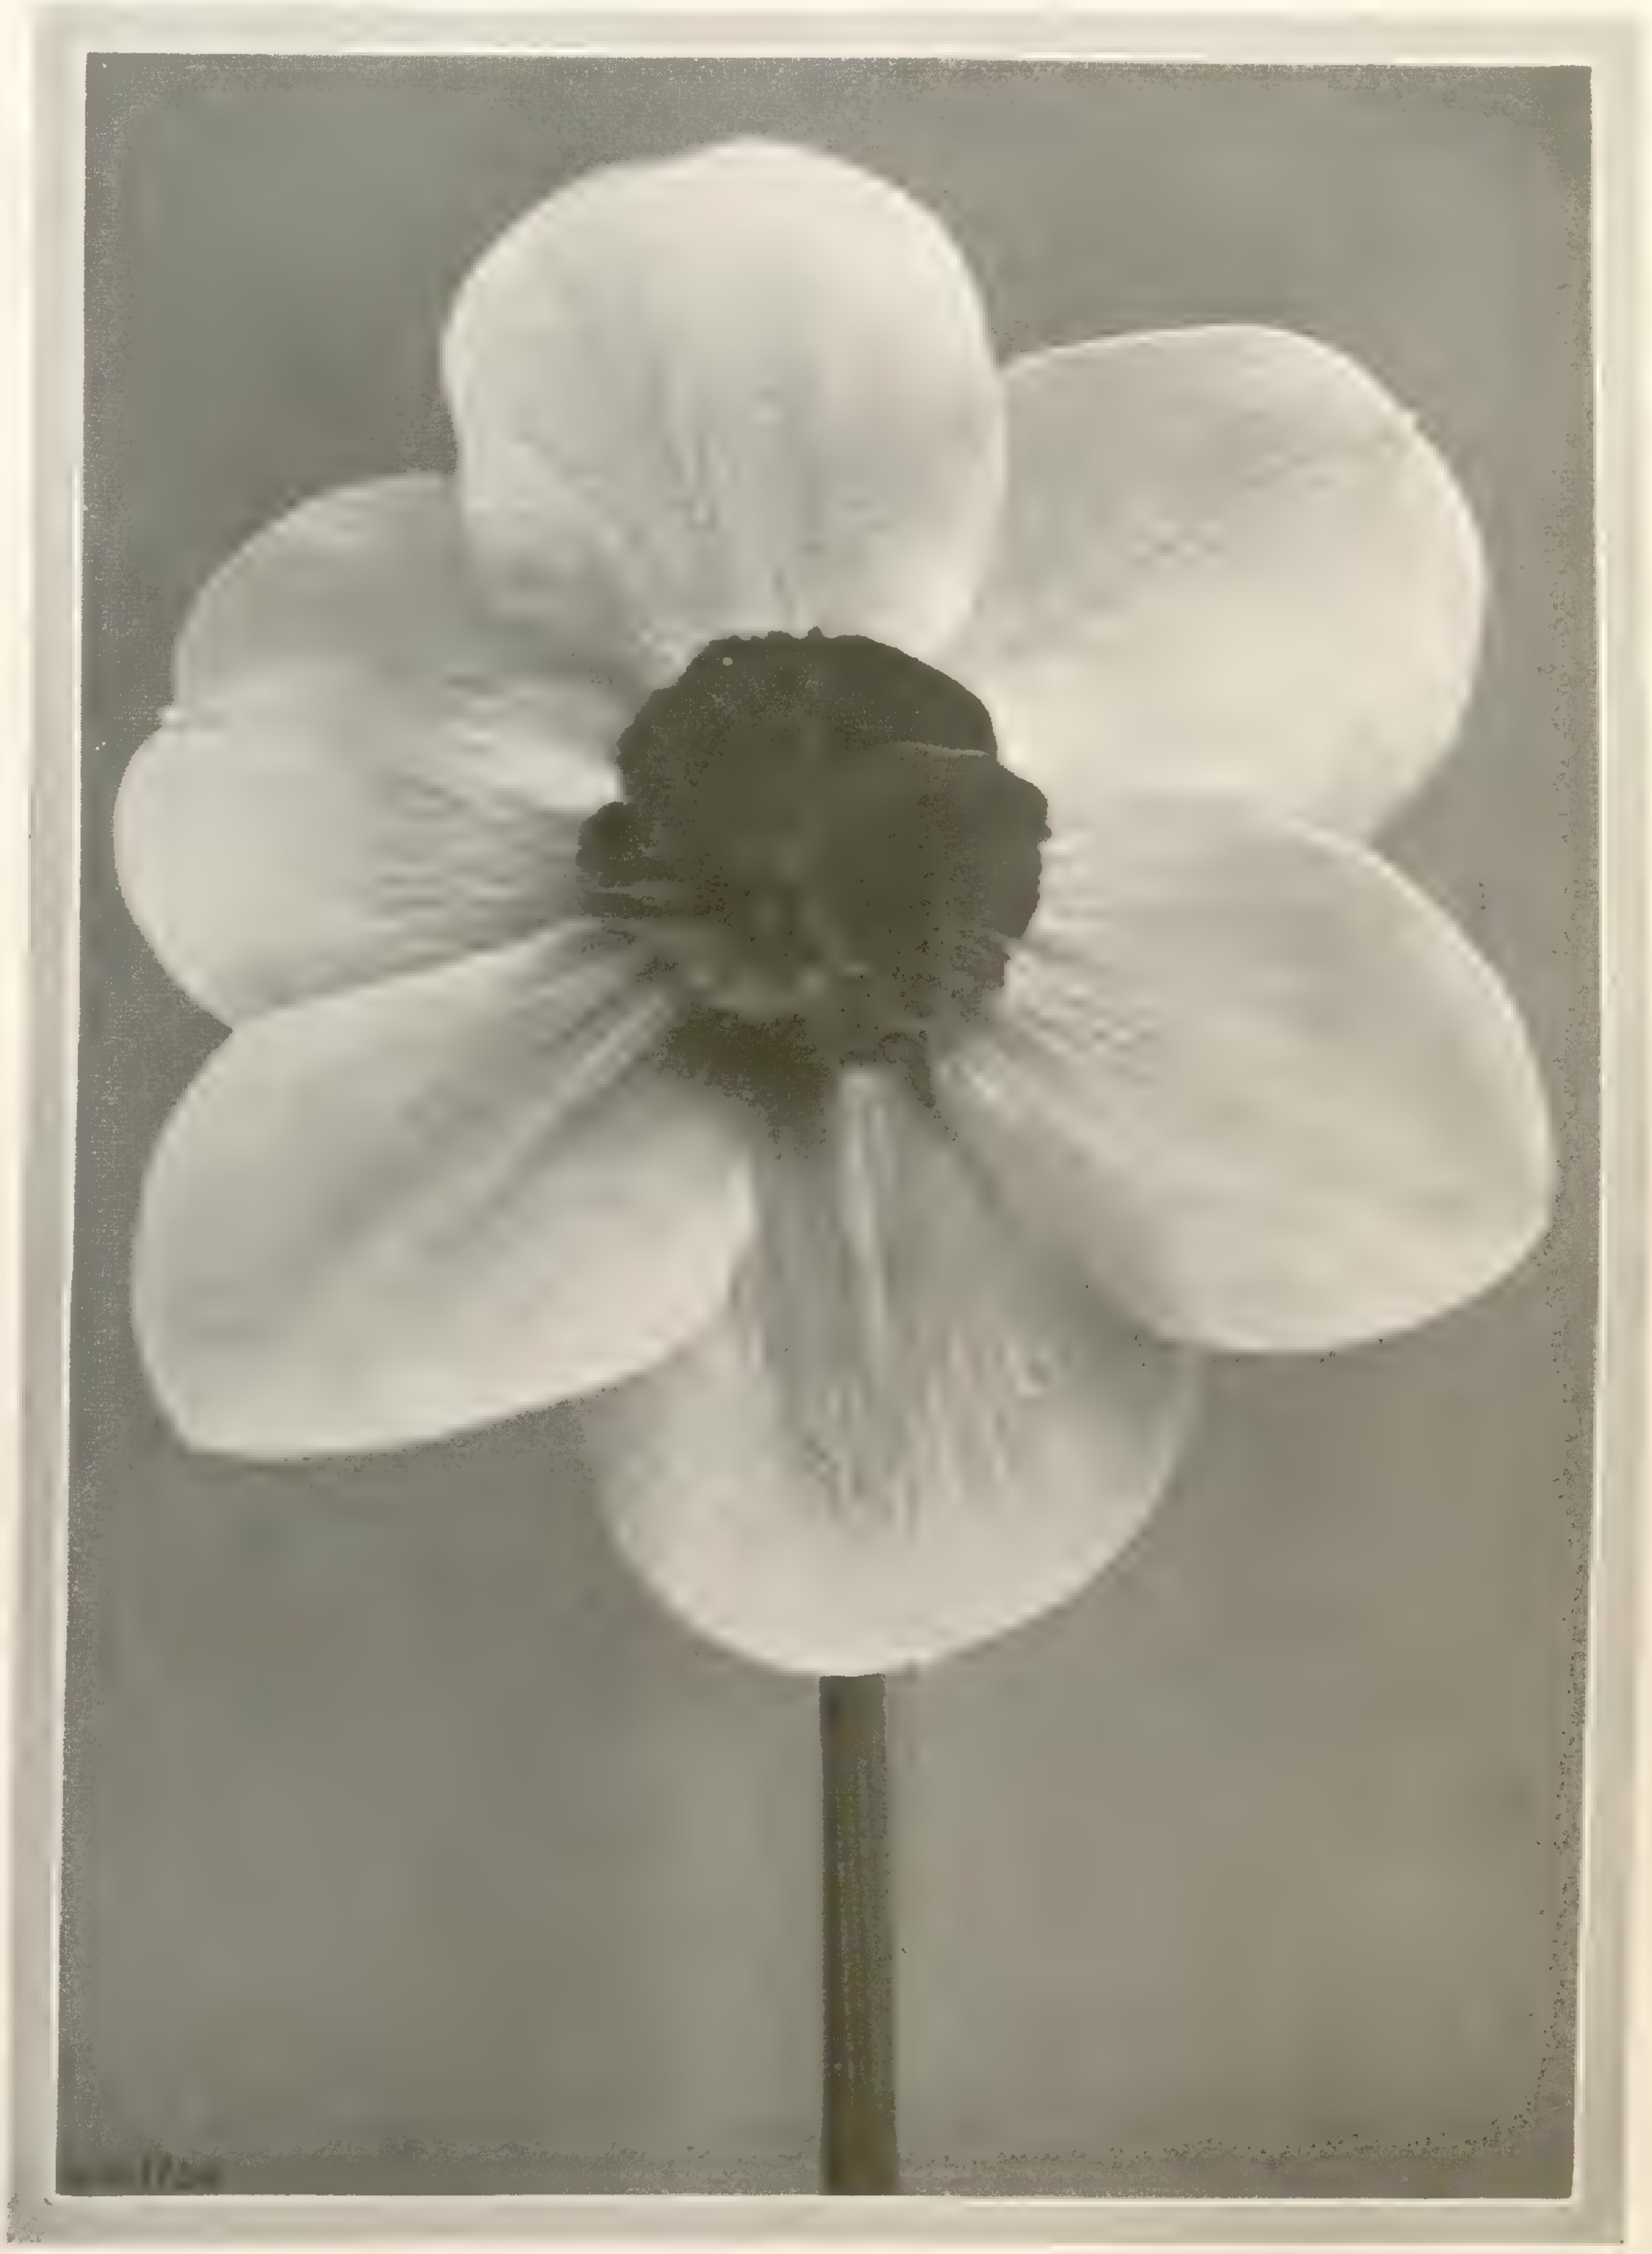
When potted place in a cold frame, giving just enough water to keep the soil slightly moist, and allowing plenty of air, the object being to encourage free root action before the leaves make their appearance. As the season advances and the foliage develops frost must be especially guarded against, a good plan being to take them into the greenhouse before there is any danger of their being frozen, giving them a light position therein, and so situated that air may be given whenever it can be done with safety. The object of this is to obtain a sturdy growth, for, like the well-known freesias, if grown too weakly they are apt to topple over. To obviate this, it is advisable, as the flower stems lengthen, to give them support. If four neat unobtrusive stakes are inserted equidistant from each other around the side of the pot and a band of stout neutral-coloured thread passed from one stake to the other, a good support will be afforded without being in any way conspicuous. Apart from their value as flowering specimens in pots, these bulbs are, from the firm wiry nature of their stems, and the pleasing manner in which the flowers are arranged thereon, of considerable value for supplying cut flowers.

There are a number of varieties of each of the two genera, but those of the ixias predominate. One which is probably grown more than any other is Ixia crateroides, a true species, which is by some authorities referred to I. speciosa. The flowers of this are of a bright cerise-scarlet colour. While bulbs of the different named ixias and sparaxis can be bought cheaply, mixed seedlings can be obtained even cheaper, and from the great variety which prevails among them they will by some be preferred.

After the flowering season of these bulbs is past it is very essential that they are allowed to perfect their growth under favourable conditions, otherwise, if dried off too rapidly, the bulbs will be greatly weakened, and the chances of their flowering another season much impaired.

W. T.

Crotons and Dracænas.—The excessive sunshine we have experienced for such a long period has been most beneficial in colouring crotons. I cannot call to mind any season in which such highly-coloured foliage has been developed, and this gives the plants a handsome and distinct appearance amongst other stove subjects. I am of opinion, however, that we shall suffer a loss of leafage throughout the winter months. Dracænas or crotons that have become unsightly through loss of foliage at the base may be notched, mossed up, and rooted before the winter arrives. Plants which are intended to be so treated may be removed from the general collection to the propagating houses where their unsightly appearance is not so much under notice.—J. Donoghue.



NARCISSUS QUEEN OF HEARTS.

A remarkably handsome variety of the Barri type, the flowers are large, with white perianth and shallow cup of an intense red. Received an A.M. from R.H.S., April 25, when it was finely shown by Mr. C. Bourne.

THE NOTABLE DAFFODILS OF 1911.

In making a few notes under this heading, I will not promise to adhere strictly to such varieties as have made their début this season, but will confine myself principally to the really new ones, leaving the older varieties for a future occasion.

Uncle Robert has been extremely fine with me; I measured one flower 4¾in. across the perianth, trumpet 1¾in. long, and 2¼in. across. It is a very pale bicolor trumpet, described by some as a white. It is the finest flower in size and shape of the Weardale type, though "Much the Miller," of Messrs. Cartwright and Goodwin's raising, runs it very close. Miss Willmott, though exhibited several years ago, has only just been put upon the market; it is a hybrid Poet, a fine large flower with a long and strong stalk, and should become a very popular variety when it gets within the reach of the many.

Crœsus is one of the very finest of the orange-cupped section. It is an Incomparabilis of large size, the segments being perfectly rounded and overlapping, of a creamy-white tint; the cup is very large and much expanded, and of a deep orange throughout; a perfect exhibition flower. Ormolu is a new Poet, really distinct even among the host of Poets now scattered about the country. It is a well-formed flower of the Poetarum type, with a lovely eye of russety-red. It was beautifully shown at the Midland Daffodil Show by Mr. A. Wilson, of Bridgwater.

NARCISSUS MISS WILLMOTT.

A beautiful Barri variety; the flowers very large, with white perianth and lemon-yellow cup, margined orange-red. Awarded F.C.C., R.H.S., in April last, when exhibited by Messrs. Walter T. Ware, Lim.

In Empire we have one of Mr. Crosfield's best things, and one of the best giant Leedsi's yet seen. I say this rather reluctantly, being responsible for a goodly number of giant Leedsi's, and feeling naturally jealous of the reputation of my own "children." Mrs. W. O. Wolseley is another beauty of the same class, shown at Birmingham this year by the Rev. Jos. Jacob. Challenger is a really magnificent Engleheart, and one of which Mr. Crosfield may be justly proud. I cut some quite tight buds of this, and took them to Birmingham this spring. On reaching the Edgbaston Gardens I put them into a greenhouse in a temperature of about 70 degrees, and they opened perfectly, and lasted the two days of the exhibition, a journey back to Lowdham, and only expired on the following Saturday, some ten days after being cut. The fine white perianth of this flower shows off to perfection the beautiful disc, which is yellow, edged with bright orange-red. Firetail, by the same raiser, is a very fine flower, and also a good laster. It comes very near to the Poets; the large, perfectly formed perianth is creamy-white, the flat disc is of a deep red throughout.

Sheba was shown by Messrs. Barr and Sons at Birmingham; it is a large pure white flower with an intensely brilliant red cup, about the sharpest contrast of colour I have yet seen. Queen of Hearts, shown by Mr. Bourne, is a fine red-cupped variety, with a pale maize-coloured perianth. Maud Müller, one of Mr. Wilson's flowers at Birmingham this spring, is a remarkably perfect pale bicolor or white trumpet daffodil. White Wolf, May Hanson, and Princess Ena, are all triandrus hybrids of great beauty, shown by Messrs. Cartwright and Goodwin this year at Birmingham. King Solomon, shown by the same firm, caught my eye as a new bit of colour in trumpet daffodils; it is a fair sized flower of P. R. Barr shape, and of a uniform clear lemon-yellow. White Star, also exhibited by them, is one of the finest and most refined flat-crowned daffodils in existence.

Picador, shown by Miss Currey, from Ireland, is a very bright and pleasing bit of colour; it has a well-formed creamy-white perianth, and a flat orange cup deeply stained scarlet. Miles Standish raised and exhibited by Mr. Mallender, of Scrooby, and purchased by my own firm, is a very refined pale bicolor trumpet, which I think is bound to make its mark upon the show bench in the near future. Marie Louise, exhibited by Messrs. Barr and Sons, gives us a wonderful bit of colour, a pure white perianth contrasted with a vivid orange disc. Macebearer, which was put upon the market for the first time this season, is a flower of great substance, the perianth segments are broad, thick, and overlapping, of a creamy-white shade. The cup is large and much expanded, pale yellow with a band of orange-red. This is a variety which is bound to come to the front as an exhibition flower.

King George, I must not say too much about, as it is one of my own productions; but I think it will earn its own reputation when seen in perfection; at present it has only been exhibited once, at Norwich, this year. It is a very large trumpet daffodil of a uniform clear bright yellow. A plant of extreme vigour. Westwick Giant is an enormous deep yellow trumpet variety, raised by Mr. Davison, noted as a raiser of new montbretias. It has now passed into the hands of my firm, but will probably not be seen for some time, as the stock consists of one bulb only. The flower, as grown by Mr. Davison, measured 5in. across the perianth, the trumpet being 1¾in. long, and 2in. across; while the stalk—as much as Mr. Davison brought to the show—was 23 inches long, truly a giant, but without a suspicion of coarseness.

Of really new Poets, the finest of all is Coronation, one of Mr. Engleheart's productions, and exhibited by Mr. Crosfield. Sarchedon, by the same raiser, and also exhibited by Mr. Crosfield, is also very fine, a late recurvus type of flower with a very deep band of crimson round the large eye. Other fine Poets which have not long been "out" are Snow King, Socrates, Hildegarde, Matthew Arnold, and Ruskin. I was forgetting to give a word to Whitewell, a very fine incomparabilis, lately sent out by the Rev. J. Jacob; it is a very bold and well-formed flower, good for the exhibition table, but its future lies on the lines of a garden plant; it is large enough to make a show in the distance. Miss Curry had a superb example of this variety on her stand at Birmingham. Prima Donna might also be mentioned; it is certainly not quite new, but only one bulb has been sold up to date. It is an absolutely distinct thing. The flower is perfectly round, of a pale maize colour, the flat disc, which measures 1½in. across, is yellow edged with orange. I had this variety very good either last season or the one before, and it caused more comment than any novelty of its year.

I feel sure that many good things have been missed in these few notes, but it is a long while since the spring shows and many things have happened to dull—if not efface—the memory of the many beautiful things then put before us.

One thing is quite certain, the limit in size, colour, and form in the daffodil has by no means been reached, as was plainly shown this season, especially at the Midland Daffodil exhibition at Birmingham, where a wonderful wealth of novelties was brought together. Of course, the steps in improvement are not now so great as they have been in the past, but though slower they are none the less sure, and with the host of hybridists now at work we may confidently look forward each returning season to novelties which shall quite outshine those of past years.

I hope I may yet live to see, if not a daffodil with a scarlet trumpet, at least a huge white incomparabilis with a scarlet cup as large as Sir Watkin. What a wonderful fascination our favourite flower has for its votaries! We may groan at the weather, and declare that growing daffodils means eleven months' waiting and one month's pain; yet, all the same, no sooner has one season passed than we begin to plan for, and anxiously await, the next, always hoping that it may prove the one perfect season we have so long awaited in vain.

J. D. Pearson.

GOOD BEDDING HYACINTHS.

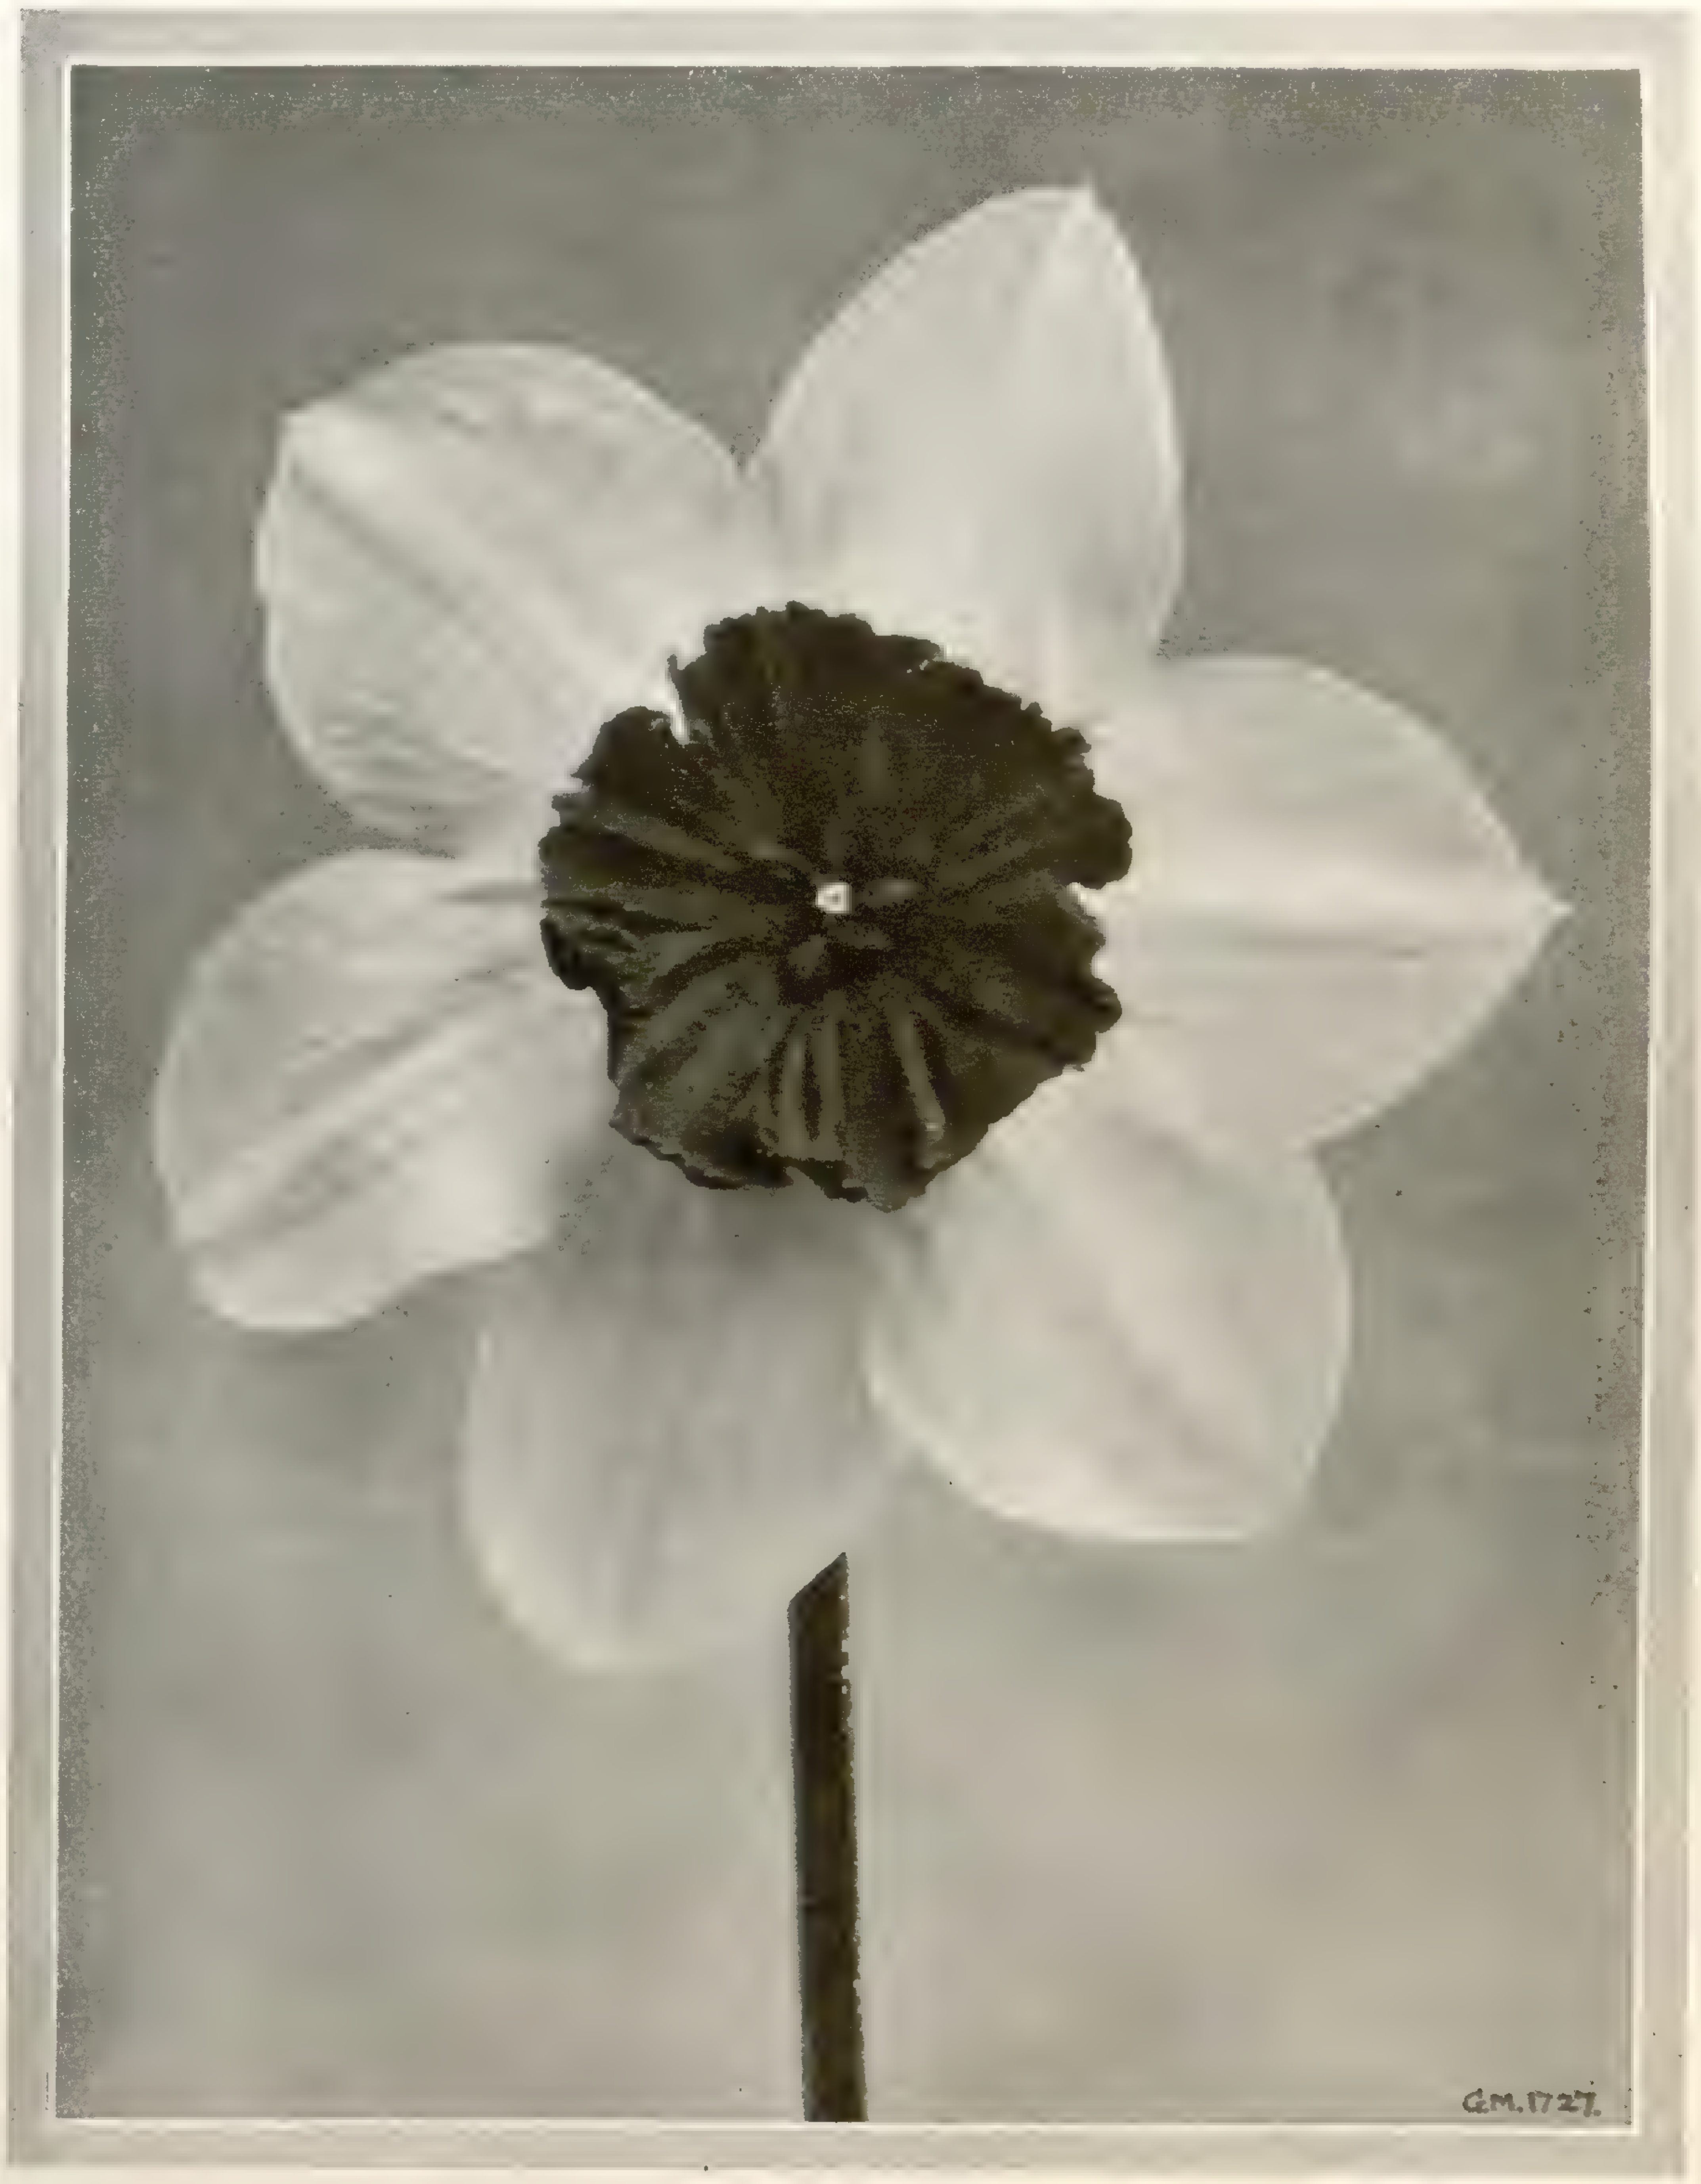
There are numerous varieties of hyacinths suitable for bedding purposes, and these create charming effects in the spring when planted in beds of bold design. They are especially useful for the furnishing of beds near the dwelling-house, where their full beauty can be readily seen. They are also very effective in masses in the front of shrubberies, the green background bringing out their various hues to the best advantage.

Bedding hyacinths may be had in all shades of colour, and some nurserymen make a speciality of the most approved varieties that are of uniform height, and flower at the same time. Uniformity of height and colour is most important, as the effect of the series of beds may be spoiled by one or more of those employed not being in bloom at the same time as the majority. Dark blue, porcelain blue, crimson, bright red, dark rose, light rose, yellow, and pure white are some of the most attractive colours in hyacinths. These can be planted in beds of one colour, or intermixed at the planter's discretion. Probably, masses of distinct colours are the most effective; but really charming combinations of colour can be formed, and these will probably be much appreciated provided they are used in the right place. For instance, a round bed with a star-shaped centre, composed of crimson, and the remainder filled in with light blue, is very distinct and pleasing. Other colours can be combined with good effect, and pretty designs created, or they may be arranged in circles; in fact, there is practically no limit to the combinations that can be effected.

The single hyacinths are the most satisfactory for bedding, as they bloom more regularly, and produce finer flower spikes than the doubles. Amongst the best-named varieties are L'Ornement Rose, a lovely pale rose variety; Rosy Gem, bright rose; Schotel, pale lilac-blue; King of the Belgians, crimson; Queen of the Blues, light blue; Marie, dark blue; Gertrude, dark rose; City of Haarlem, clear yellow; and L'Innocence, pure white.

The best time to plant hyacinths is in October, after the beds are cleared of their summer occupants. Any ordinary garden soil that has been well cultivated will give good results, but in cases where this is of a heavy nature, a liberal amount of coarse sand and leaf-soil can be incorporated with advantage. A little sand should be placed under each bulb as it is planted. Place the bulbs six or eight inches apart each way, and plant them four or five inches deep, pressing the soil firmly around them. The time of their flowering can be regulated by the planting, for if buried deeper they will be later coming into bloom. If the beds are covered with some fibre or similar material when the planting is completed, it will afford protection to the bulbs against severe frost, and can be gradually removed when growth commences in the spring. Should the weather be dry when they are coming into bloom, a thorough watering will assist them to develop their flower spikes, and help to prolong the period of bloom. There are several fibrous-rooted plants that may with advantage be associated with the hyacinths as they add materially to the general effect. Double white arabis, polyanthuses, violas, alyssum, iberis, saxifragas, and primroses are some of the most useful of these, and help to give a finish to the whole arrangement. When used as a carpeting to the beds of hyacinths great care will be necessary to select colours that will properly harmonise. It is also essential to allow the hyacinths an additional amount of space to adequately show off the groundwork. Red or crimson hyacinths look well set in a groundwork of white arabis, while the latter forms a charming margin to a bed containing dark blues. One of the purple-shaded violas is very pleasing in association with a white variety, such as L'Innocence. Myosotis and white hyacinths are also very attractive. The polyanthuses and primroses are the most appropriately used with blue hyacinths like Marie and Queen of the Blues.

J. Gardner.



NARCISSUS MARIE LOUISE.

A beautiful Barri variety, the blooms of large size, with white perianth and rich scarlet cup. Finely exhibited by Messrs. Barr and Sons, last season.

BULBS.—A practical treatise on the cultivation of hardy, hothouse and greenhouse bulbous and tuberous rooted plants is "Bulbs and their Cultivation," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

PYRUS NIEDZWETZKYANA.

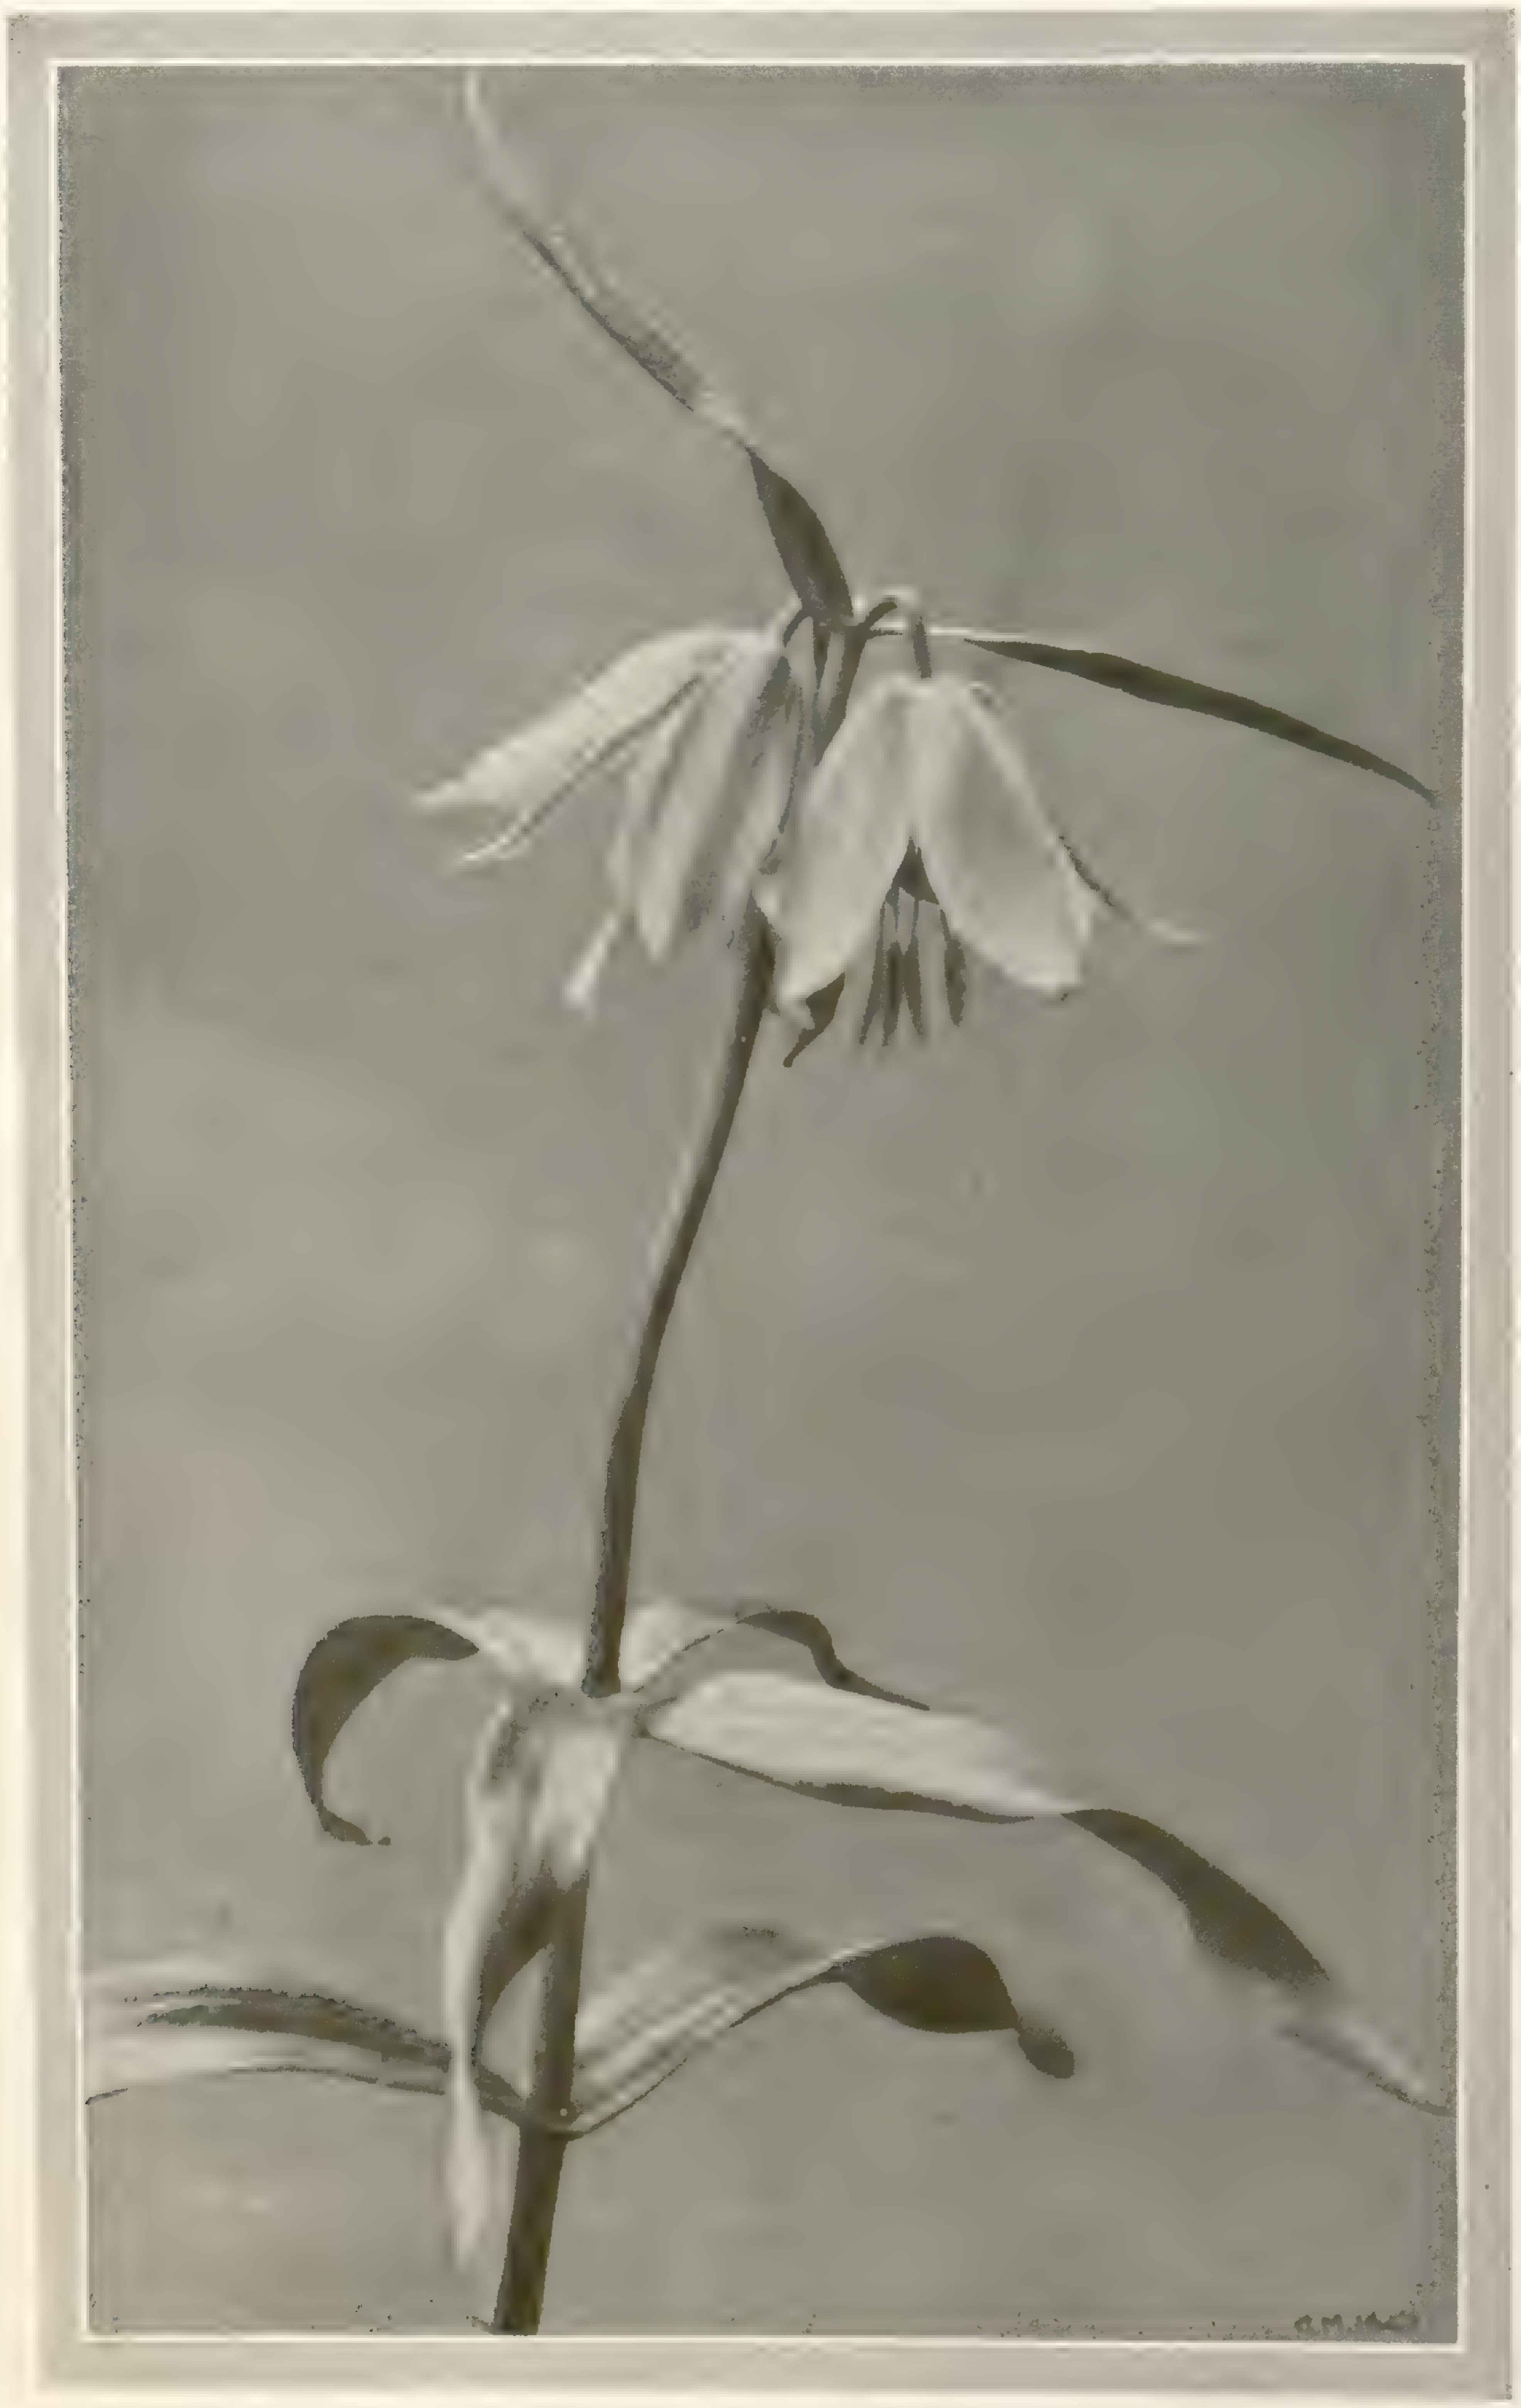
Within a short distance of the main gate at Kew a specimen of this showy pyrus may be seen bearing a considerable number of fruits. These fruits are quite as remarkable in colour as the flowers were at an earlier date, for they are of a deep red, or reddish-purple, hue, without any of the green colouring which is usually evident on fruits of apples and crabs. It is interesting to note that the red colour is found throughout the flesh of the fruit, though this is brighter in colour than the outer part, and more closely resembles that which is peculiar to the flower. The tree is also characterised by having its branches, roots, and leaves stained with red. Apart from the colour, it bears a striking resemblance to an ordinary crab apple, and seems as if it will grow into a tree of similar size.

P. Niedzwetzkyana was introduced from the Caucasus a few years ago, and has been called a variety of P. malus. There appears to be good reason for it being considered a variety, and not a good species, for from seeds ripened in this country a percentage only of the young trees have come true. It is a tree which deserves general cultivation, for it is distinct from any other crab.

W. Dallimore.

FRITILLARIA IMPERIALIS CHITRALENSIS.

This distinct and beautiful fritillary is one of the most noteworthy of the bulbous plants flowering early in the spring months that have been introduced to cultivation within the past few years, and has the promise of becoming popular when generally known. It was first introduced to public notice in this country on February 22, 1910, when Miss Watson, of North Court, Finchampstead, Hants, submitted specimens to the Royal Horticultural Society's Floral Committee. The members of that body were much impressed by its distinctive charms, and resolved that specimens shown be sent to Kew for identification, and, subject to it being named, it should receive an Award of Merit. At the meeting of the Floral Committee held on March 8 of the same year, a report was received from Kew to the effect that this fritillary was a geographical form of the well-known Crown Imperial (Fritillaria imperialis), and had received the varietal name of Chitralensis. The bulbs were sent to Miss Watson by her brother, Colonel H. D. Watson, C.I.E., when serving with his regiment, the 2nd King's Own Ghoorkhas, in Chitral, where this variety is said to be hardly less plentiful than is the daisy in this country. In general character it differs materially from Fritillaria imperialis, being much dwarfer and more slender in growth; the leaves are greyish-green, and the pendulous flowers are rich yellow. The specimen herewith illustrated was one of several exhibited by Messrs. R. Wallace and Co. at a meeting of the R.H.S. held in the spring of this year.



FRITILLARIA IMPERIALIS CHITRALENSIS.
A geographical form of the Crown Imperial, bearing rich yellow flowers; introduced to cultivation by Colonel H. D. Watson, C.I.E.

Kalanchoe flammea.—It is given to very few plants to attain the amount of popularity achieved by this kalanchoe in so short a time after their introduction, for it soon became a universal favourite. Such a result is not at all surprising, as it is a very beautiful subject for the embellishment of the greenhouse during the summer, and, is also very distinct from the plants commonly employed for the purpose.—W. T.

POPPY ANEMONES.

There is no gainsaying the fact that the Poppy Anemone, as Anemone coronaria is called, is not so popular as it was at one time. It is a little difficult to account for this, except on the assumption that we find in many gardens it is not long-lived without renewal, and that there are many who have formed an erroneous idea regarding the supposed difficulties attached to its cultivation.

Many of the plants will remain good and in sound flowering condition in soils which suit them without any trouble of lifting and replanting, and we find in warm sandy soils that there are poppy anemones which have lived and flowered for long years.

At the same time they are all the better for annual lifting, resting, and replanting in well-manured soil, so as to ensure the finest flowers and increased vigour on the part of the plant.

Soil and Position.

A sandy soil, well enriched with a liberal dressing of old manure, preferably that from the cowhouse, is the best, but the poppy anemones can be successfully grown in other soils, although they do not like those of a cold clayey nature. There are some gardens where no pains will induce the flower to thrive, and, as a case in point, we may mention that the late Mrs. Laurenson, the lady who raised the lovely St. Brigid anemones, while living at Howth, in Ireland, could not grow them when she removed to another garden near Bray.

These anemones will thrive well in an open position, but one learns that they do very satisfactorily if in a half-shaded one, such as under the partial shade of apple trees in a border, such as we see in many gardens. The writer knows of a fine display of St. Brigid anemones in such a position, where they lived and throve for years.

Cultivation.

The soil should be prepared in good time, and the tubers planted in autumn, say in October, although some delay doing so until spring, and thus secure flowers during summer. In the latter case the position should be more shaded. The soil ought to be deeply dug, and as the work proceeds a good quantity of thoroughly rotted manure should be added. The tubers may then be planted, choosing for the purpose a day when the soil is moderately dry, and planting the tubers about two inches deep, covering them with similar soil to that in the beds. In autumn no watering will be required, but with spring planting it may be needed if the work is left until March or April. In spring the anemones may receive good waterings, using pure water, with, at intervals, an application of weak clear liquid manure. The tubers may be increased by division when they are of good size and of a form adapted for dividing.

Raising from Seeds.

Poppy anemones are easily raised from seeds, and these, which are difficult to separate so as to sow thinly, should be well mixed with dry sand, separating the seeds as much as possible, and sowing them very thinly in sandy soil in small drills about a quarter of an inch deep, and covering with similar soil. Press down the soil, and water in dry weather. Seedlings should be pricked out when they have made three or four rough, or true, leaves, and watered carefully after the operation. The best time to sow seeds is in spring, and they come freely when sown in the open. In autumn the young plants may be allowed to remain, and many will flower the next spring.

After Treatment.

When the leaves have withered the anemones may be raised, and stored in a cool place in dry sand or earth until planting time in autumn. As already indicated there are gardens where they may be left undisturbed for years.

In order to maintain the quality of the strain the seeds should be collected only from the best flowers, of the finest and most varied colours, marking with a piece of twine or a bit of coloured wool the plants from which the seed is to be gathered. This seed saving should be performed every day while the seeds are ripening, as they blow readily away, and many will be lost if this is neglected.

Varieties.

In former times the cult of the anemone was largely in the hands of florists, who cultivated the double forms. These were magnificent flowers to which names were often given, but they were not so suitable for the ordinary lover of flowers, and they have largely fallen into unmerited neglect. Double varieties can still, however, be obtained under name, and are comparatively cheap.

The St. Brigid anemones, readily raised from seeds, are, as it were, the golden mean between the single and the double varieties, and are handsome flowers, a large proportion being semi-double, and of the most varied and brilliant colours, ranging from white, through flesh colour, pink, and rose, to the most brilliant scarlets and crimsons, with blues of the most varying tints, while some are prettily zoned or striped.

The single varieties are in many cases of charming form, and of the most varied colouring. Some are cup-like in their formation, and, like the finest doubles, received the fervent admiration of the older florists. A splendid strain is that known as the French de Caen, but there are now really few poor strains of poppy anemones, while the prices of tubers and seeds are wonderfully low.

For bedding or for lines of one colour some of these flowers are sold to colour under name. A lovely single white one is The Bride.

The writer has been a lover and a cultivator of the poppy anemone for many years. His affections are shared by many other flowers, but he has never lost his old love for the charming Anemone coronaria in all its varied forms and hues.

S. Arnott.

PRIMULA LINDSAYI.

A pretty primula is the hybrid called Lindsayi, after its raiser, Mr. R. Lindsay, of Kaimes Lodge, Edinburgh, who has raised many excellent hybrids, and whose work deserves mention now that the introduction of so many new Chinese primulas bids fair to increase the taste for these delightful flowers, which, it is only right to say, need a little more attention than is necessary for, say, a mossy saxifrage, or a free-growing alpine of the same character. In Primula Lindsayi we have a pretty plant with neat foliage and flowers of a kind of deep crimson and a purplish yellow eye. It likes a fairly good place in entire or partial shade in a sunny garden, but will do with less shade in a place where the sun's rays are not so powerful or are not so freely given. A good loam will grow it well, and it is all the better for occasional division and replanting—treatment which suits so many of its sister flowers. Now that primulas, especially hardy kinds, are so popular, P. Lindsayi should not be overlooked.

L. T.

DAFFODILS IN THE PLEASURE GROUNDS.

There would be no difficulty in writing a lengthy essay in praise of the beauty of daffodils and their value in contributing to the interest and attractions of the flower garden and pleasure grounds during the spring months. There is hardly a position where they would be out of place, or to which they would not give an added charm. Wondrously beautiful are large breadths on wide spreading lawns, and in open areas in woodlands and plantations; highly attractive are groups of moderate size arranged on the margins of pool or stream; exquisitely beautiful are small clumps of the smaller kinds nestling amid the rocks in the alpine garden; and very effective are bold masses in the flower garden, formal or otherwise. Much might be written in commendation of each of these ways of utilising the daffodil in beautifying the surroundings of the houses, but with so many matters associated with spring flowering bulbs requiring attention at the present time, it is necessary to be brief and practical. Bearing this in mind, we may with advantage turn our attention to the consideration of the best methods of procedure in the production of colour effects in the flower garden with daffodils either alone or in association with other spring flowers.

A SUCCESSFUL EXAMPLE OF CULTIVATING DAFFODILS IN THE GRASS.
At Hillingdon Court, the residence of Lord Hillingdon.

First of all, it may be at once stated as a general principle that the varieties selected for beds and borders should have a good constitution, bear flowers that are effective in masses, and be moderate in price. Other points for consideration are the preparation of the soil and the time and manner of planting. The simplicity of these points will render any lengthy reference to them quite unnecessary. With regard to the time of planting, the importance of this being done immediately the beds and borders can be prepared for their reception cannot be too strongly insisted upon. Daffodils having large firm bulbs, such as those of the Emperor and Empress, may be planted at Christmas with the full assurance of their producing a pleasing colour effect; but the flowers will not be so large in size or so stout in substance as those of similar bulbs planted two or three months earlier. The bulbs deteriorate more or less rapidly after, say, the middle of October, and those who would obtain the most ample return for their expenditure of time and money should make strenuous endeavour to have the planting completed by that period. If its completion can be effected earlier so much the better, especially in the case of the Barri and poeticus varieties, which suffer severely when kept out of the ground until the autumn season is considerably advanced. For this reason when delay is unavoidable plant the varieties belonging to these two sections first.

HYACINTH LA VICTOIRE.
A splendidly developed specimen of this fine red variety from Mr. E. Beckett's first-prize collection at the R.H.S. Bulb Show in March last.

In the preparation of the beds it will be simply necessary to dig them over to a depth of about twelve inches, and if the soil has been much impoverished, to previously give a moderate dressing of some good artificial fertiliser. Thinly-planted beds are seldom so effective as one could wish, and, excepting where fibrous-rooted plants are associated with them, from six to eight inches is a good distance at which to put the bulbs apart, the smaller space being given to the Barri and poeticus varieties and others of similar growth, and the greater to the strong-growing trumpet varieties. The following can be specially recommended for massing in beds and borders, for while beautiful and effective, the bulbs are obtainable at a price that admit of the stock being renewed annually at a comparatively small cost. Trumpet varieties: Emperor, Empress, Grandis, P. R. Barr, W. P. Milner, and Victoria. Incomparabilis varieties: Sir Watkin and Stella superba. Barri varieties: Barri conspicuus, Falstaff, John Bain. Leedsi varieties: Maria Magdalene de Graaff and Mrs. Langtry. Poeticus varieties: Ornatus and poetarum.

In the cultivation of daffodils in the grass two methods of procedure are open. One is to arrange them in broad irregular groups, each consisting of one variety, and the other to plant them somewhat irregularly over the whole area, and to use one, two, three or more varieties. The arrangement in groups is perhaps the best where the area is large and broken up by trees and shrubs in groups or otherwise; but in small areas the second of the two methods is in some respects preferable. In either case the bulbs should be rather thinly and irregularly planted. In planting daffodils on the lawn and in the wild garden an endeavour should be made to imitate Nature, which does not, as a rule, arrange daffodils or other flowers in such manner as to suggest a series of nursery beds. The daffodils growing on one of the lawns at Hillingdon Court, Uxbridge, the residence of Lord Hillingdon, and herewith illustrated, affords an excellent example of successful planting. In the illustration they appear rather thin, but in a critical inspection of the flowers there was no suggestion of thinness, but, on the contrary, it was seen that there were more than enough to produce a rich display.

Planting in the grass should be done as early in the autumn as convenient and the condition of the soil will permit. It is not advisable to attempt this work when, as at the present time, the soil is dry and hard, for it is then difficult, and the bulbs are not committed to Mother Earth under the most favourable conditions. It will therefore be wise to wait until the rains come and moisten the ground. The planting is more easily done with a dibber fitted with a tread, such as used for planting potatoes, than with an ordinary hand dibber, and if shod with iron so much the better. Still more useful is a bulb planter fitted with an iron scoop, which when thrust into the ground cuts a small circular piece of turf, and this it brings out with it when drawn back. When the second hole is made the first piece of turf is pushed out, and then lies ready for filling in the hole after the bulb has been dropped into it.

The varieties recommended for beds are admirably adapted for grass culture, but there are a number of others that are suitable for the purpose. In select positions groups of the choicer varieties, such as Beauty, Madame de Graaff, Madame Plemp, Glory of Leiden, and Santa Maria would form a feature of much interest. G.

RAISING DAFFODILS FROM SEED.

One of the remarkable features of gardening in recent years is the number of amateurs who have successfully taken up the hobby of raising new daffodils from seed, and few flowers have been more improved during the last few years. There is still, however, room for development, and the object of this communication is to induce everyone who cultivates this lovely queen of spring flowers to try his or her hand at hybridising

It is impossible in the limited space at my disposal to treat the subject fully, but the following simple directions may help those who have had no experience of the operation to make a beginning. The necessary outfit is simple and inexpensive. In the first place, the beginner must have a good stock of patience, for it takes from three, or more often four, to six years for a daffodil raised from seed to produce a flower. But, if an annual sowing is made, after the first three years there will always be something new coming on. And when the new flower appears it is fixed.

The only other requisites are a pair of forceps (supplied by most of the special daffodil firms for about two shillings) for removing the anthers and a small camel-hair paint brush. Nature has provided the daffodil with means to reproduce itself from seed by self-fertilisation. In the centre of every daffodil flower there is a long slender style, flattened out at the end into what is called a stigma, round which are clustered six stamens with enlargements at the end of each called anthers. When the flower is fully developed the stigma becomes viscid, or slightly sticky, and the anthers burst, shedding a quantity of fine yellow dustlike substance called pollen, which, on coming into contact with the stigma, adheres to it, causing self-fertilisation to take place.

In order to produce a new variety we must resort to cross-fertilisation. We first select two varieties for parents: one of them being the seed-bearer, which we must prevent from fertilising itself by removing the anthers before they have burst, (i.e., before the flower is quite open) by means of the forceps mentioned above. This process is called de-anthering. In about two days (more or less according to the atmospheric conditions) the flower will be fully developed, and the stigma in a condition to receive the pollen from the flower selected for the second or pollen-bearing parent. This pollen is then collected on a camel-hair brush, and applied to the stigma of the de-anthered flower. Nature will do the rest.

The flower operated upon should then be marked by a label placed in front of it and a note should be made of the cross. If all goes well, and the cross has "taken," the seed pod will begin to swell. The best time to carry out cross-fertilisation is on bright mornings; and it is advisable to repeat the operation on each flower to make sure that the stigma has been in the right condition for pollination. Pollen will keep fresh for about a fortnight or more, so by keeping the anthers in small pill-boxes it can be used on a flower which was not expanded at the time the pollen was collected.

The seed pod generally begins to turn yellow as soon as the seed is ripe, and by making a small incision with a knife we can see the seed, which when ripe is black and shiny.

It should then be gathered, and sown as soon as possible, in boxes of any convenient size—but not less than 4in. deep. These must be well drained, and filled to within an inch and a-half of the top with good turfy loam, with plenty of sand to keep it open. The seeds should be sown an inch or rather more, apart, and covered with about one inch of soil. The boxes should then be plunged to the upper edge in a cold frame and the soil kept just moist. All the air possible should be given, only using the lights to protect from heavy rains and frost.

During the winter the slender grasslike seedlings will appear at irregular intervals, and the boxes should then be lightly top-dressed with cocoanut fibre to prevent mossing of the soil.

In two years' time the seedlings can be transplanted direct from the boxes to a raised bed in the open, in rows about nine inches apart, and three inches apart in the rows. The soil must be kept well hoed and free from weeds. In these beds the seedlings will flower, and the promising ones can be marked for removing at the usual time for lifting (i.e., when the leaves are beginning to die down) to another bed.

Of course, we cannot expect all the seedlings to be first-rate. Sad to say, the proportion of really good flowers is very small. But we can provide against certain failure by making our crosses from flowers of good form and substance only. The beginner should not use flowers of poor constitution or those that have weak perianths as parents. No hard-and-fast rule can be laid down as to how the parent flowers will influence the result of the cross, but, generally speaking, the male gives colour and the female form.

Many of the modern daffodils are very shy seeders, and others seem to produce pollen which is not fertile, but experience will show what varieties are not suitable for cross-fertilisation.

It is encouraging to the beginner to know that it is not by any means necessary for him to buy the most expensive varieties to ensure success; some of the best of the newer varieties were raised from quite ordinary varieties.

Much might be written as to the best varieties to use, and in what direction the present-day hybridist should aim, but I must conclude by urging all daffodil lovers to follow the advice of the late Mr. Burbidge—"Raise seedlings—hybrids, if you can—but raise seedlings."

Christopher Bourne.

THE CULTURE OF HYACINTHS.

Though these are not so universally grown as they were some few years since, they still form one of our most beautiful and important plants for early spring decorations. For the embellishment of conservatories, reception rooms, and even the cottage window, they are of the highest value. Fortunately, the price is not prohibitive, or closely approaching thereto, as was the case in the distant past, and many of the most beautiful varieties may be purchased for a quite small sum, and they are now well within the range of even our humblest enthusiastic horticulturists. Their culture is simple, and by observing the principal rules anyone, and, indeed, even children, may cultivate them satisfactorily. There are many ways of growing these flowers, but unquestionably the most satisfactory way is to grow them either in pots or pans. And, in my opinion, the best results can be obtained by growing them singly in medium-sized pots, those known as forty-eights, or five-inch, being best.

HYACINTH CORREGIO.
A new and valuable addition to the Single White Hyacinths. This fine specimen formed part of Mr. E. Beckett's first-prize collection at R.H.S. Bulb Show in March last.

Potting.

The bulbs should be procured as early in September as possible, and potted up immediately they are received, it being of the utmost importance that they should have a long season of growth before being forced into flower, and that none of their vitality should be lost before potting. The pots should be clean, and well drained, placing some coarse material from the potting soil over the crocks to ensure a perfect waterway. A good mixture of soil should be used, the best being one consisting of rich fibrous loam three parts, and one part each of well-decayed cow manure and leaf-mould, with a small quantity of coarse sand, the whole being thoroughly well mixed, this being best done a week or so beforehand. Turn over once or twice, and see, when using, that it is moderately moist only. The soil should be pressed fairly firm, and the crown of the bulb be just above the level of the pot. When potted they should receive a thorough watering in, filling up the pots three or four times, and, after these have become drained and nicely dried, place them in a cool position on a bed of ashes or boards, and over each bulb put an inverted three-inch pot, a small piece of slate being placed over the hole of this. Then cover the pots to a depth of five or six inches with finely-sifted cinder ashes.

After Management.

After the bulbs become well rooted, and active growth commenced, which will, generally speaking, be, if they are potted early, from five to eight weeks, remove to a cold frame or shelves near to the glass in the greenhouse. Do not allow them to suffer from an insufficiency of water, and make sure that every particle of the soil is moistened when watered. Immediately the development of the spike commences liquid manure should be liberally given; that made from animal manure, such as that of cows and horses, being decidedly the best, with a little soot added. Most varieties respond to forcing quite easily, consequently by introducing them in batches at intervals the flowering season is much prolonged. The spikes will need a neat support, and a slight shading should be given the plants, especially the red varieties, immediately their flowers commence to show colour. A splendid method of showing these off, especially in large conservatories, and even suitable places in the house, is to group them in pans, ten plants in each, using one variety only. These may be taken out of the pots and arranged in the pans just before the spikes are fully developed, filling between the bulbs with fine soil, and then giving a thorough watering. The flowers of these will be found to last if they are carefully handled equally as well as if left undisturbed in the pots.

Hyacinths in Glasses.

This used to be quite a common method of growing hyacinths, but is very little practised in these days. Nevertheless, it is simplicity in itself, and anyone may succeed if suitable glasses are obtained and the following details observed. The glasses made for the purpose should be nearly filled to the top with water, enough, in fact, to just allow the bulb to stand clear of the water, and a few pieces of charcoal placed in each glass. The bulbs should then be placed in position, and the glasses may be stood in a dark room or cupboard. When they are rooting freely they should be gradually inured to more light, and finally be given plenty of air. The water will require replenishing occasionally, and I prefer to change it entirely two or three times during the growing period. As the spikes advance they will need supporting, this being best done with thin wire stakes, which may be pierced through the bulb without injury.

Varieties.

There are large numbers of beautiful varieties, but the cultivator will be well advised in selecting a few of the best and most distinct, and growing several of these rather than numerous sorts. Having during the past few years tested many of the most popular varieties, I will name those which, in my opinion, are among the very best for general decoration. They are nearly all single.

Jacques, fine pink; Lady Derby, beautiful pink; La Victoire, rather new, quite the finest red in cultivation; Moreno, a good pink of easy culture; Vuurbaak, a beautiful red, rather thin spike. The best whites are: La Grandesse, an old, but still one of the best of the white varieties; L'Innocence, excellent pure white, and Correggio, a magnificent new pure white variety, which came to the front last year. It is unquestionably one of the finest ever raised, and is bound to become popular. Blue shades: Enchantress and Electra, both charming light blues; Ivanhoe, a fine dark blue, very attractive, new; King Menelik, nearly approaching black, a magnificent variety, very large truss; King of the Blues, another very fine old variety, very dark blue, fine truss, should be grown in every collection; Lord Balfour, fine large bells, very distinct colour, which is nearly mauve; Schotel, beautiful light blue. There are many yellow varieties, but I consider only one really worth cultivating, and that is City of Haarlem, which has flowers of a lovely shade of primrose yellow, fine spikes, and for a yellow very easily produced. The only semi-double I recommend is Koh-i-noor, a beautiful rose colour, but the flowers take a very long time to develop.

EDWIN BECKETT.

SPRING-FLOWERING BULBS BY THE WATERSIDE.

The important question of planting bulbs by the waterside deserves some attention at this period, when bulbs and bulb planting are uppermost in the gardener's thoughts. The subject of bulbs for waterside planting is as yet in its infancy, and few have realised the value of bulbous flowers for this purpose as fully as they might. One has only to look at the banks of the woodland stream in spring to note the value of our own wildling bulbs for adorning the water margins. Be it daffodils, anemones, bluebells, or other subjects, the exquisite carpeting of the banks by masses of colouring is both pleasing and effective. In confining myself to spring-flowering bulbs I am reluctantly forced to exclude many later-flowering species, which we esteem of especial value for the purpose in hand.

In most cases bulb planting will be a supplementary help to existent arrangements of herbaceous, foliage, and other plants. In very few instances will the planter desire to depend upon the displays of bulbs alone, so that the subjects must be considered simply as an adjunct to existing arrangements. Two strong reasons are apparent for bulb planting. To secure adequate covering for bare spaces during early spring, and to obtain a wealth of blossom before flowers appear in quantity.

Waterside planting should be made as bold as possible, because tiny colonies of small subjects would appear "lost." Thus for preference select few subjects, and plant them boldly.

Daffodils, when used, should, for preference, run in great drifts, in and out amongst the waterside plants and ferns. Choose free-growing showy varieties. Trumpets, like Maximus, M. J. Berkeley, Emperor, Empress, Albicans, Madame Plemp, etc.; incomparablis, such as Sir Watkin, Figaro, Cynosure, and Frank Miles; Leedsi, including Minnie Hume, Katherine Spurrell, Duchess of Westminster, Amabilis, and M. M. de Graaff. The stronger, free-flowering forms of poeticus, and the best of the double narcissi, are not to be despised for the work in hand.

Fritillarias of the meleagris type should be freely used, as they love a fair amount of moisture. Once established they will take care of themselves for a long period, and delight the eye every spring with their quaint pendant blossoms and rare colourings.

Irises I would recommend to be freely used, English irises in particular, which I have found succeed very well just above the water margin. Spanish irises do not afford quite the same dainty colourings as the English irises, but are extremely valuable for their richer hues. There is no need for me to give an extended list of either, as gardeners are usually well acquainted with both groups. A few other irises I should like to recommend are I. filifolia, I. Lusitanica, I. tingitana, and I. t. Danfordiæ; these should be kept a little above the water margin.

Tulips are not specially adapted for waterside work, because of their failure to ripen their bulbs in much moisture, though on raised ground a little away from the water the May-flowering Cottage and Darwin tulips are superb. If tulips are to be used one should secure some of the tall grand varieties associated with these two divisions, while for a shady, semi-moist spot I can find no tulip to surpass the sweetly fragrant, golden-hued Tulipa sylvestris, which is delightful when well grown.

I would further urge a trial for some of the ornithogalums, which do well in partial shade and moisture. A selection, say, O. lacteum, O. pyramidale, O. umbellatum, and O. nutans, would suffice to make a planting amongst waterside ferns and similar subjects. A few of the best of the alliums may be used, also those very pretty anemones, A. nemerosa alba, A. n. rosea, A. n. Robinsoniana, and A. n. flore-pleua, together with the moisture-loving A. sylvestris and A. ranunculoides, these anemones being a delight when well massed upon half-shady banks.

Especially noteworthy are the camassias, which are splendid close in by the water margin. We group them among waterside primulas, Japanese irises, and astilbes, and they give charming effects with their starry blossoms before their associates are showing flower. We use chiefly C. esculenta, C. esculenta alba, and the pretty forms of C. Leichtlini. C. Cusicki and C. Fraseri should also be included, though the latter is dwarfer than the majority.

Puschkinia libanotica and P. scilloides are good in moist situations, and are useful for drifting through colonies of low plants. Muscari and scillas are good, if used in the foreground at a little distance from the pools, and the leucojums, or spring snowflakes, are charming en masse a few inches above the water.

I have also found triteleias do well in cool, moist spots, but they are so small, and the same remark applies to the exquisite wood lilies, trilliums, which could be readily naturalised by the sides of small streams. Dodecatheons invariably do well in moist boggy places near to the water, but stagnant conditions must not prevail. Erythroniums can be grouped near them in a slightly drier spot, some of the newer forms being particularly pleasing. Eremuri, though not strictly speaking waterside subjects, can be introduced so as to dominate water scenery if desired, the fine height of these subjects allow them to be arranged a fair distance from the pool or stream, and yet give their own telling effect to the scene. The bold and most robust forms should be used, say, E. robustus, E. himalaicus, and E. Elwesianus, would be grand if properly arranged.

The foregoing will suffice to show that bulbs and tubers can be freely used. There are others which go to swell the list at later periods. Some of the American lilies, selected gladioli, montbretias, callas, watsonias, etc. which give charming pictures by the waterside. The soil should in all cases be good, deeply worked, and planting should be carried out as early as possible in autumn.

P. S. HAYWARD.

Pelargonium tetragonum.—Among the numerous plants composing that most interesting series of pelargoniums sent up from Aldenham Gardens at the meeting of the Royal Horticultural Society on July 18, was this quaint and uncommon species. Out of flower it would not for one moment be taken for a pelargonium, consisting as it does of a cluster of succulent stems almost devoid of foliage. The flowers are as strange as the plant itself, for the lower petals are almost suppressed, and the two large, erect upper ones are pinkish, veined with a deeper hue. This species is often noticeable at Kew, but outside of a botanic garden it is rarely seen.—W. T.

GOOD BEDDING TULIPS.

The tulips create a brilliant effect in gardens at a season of the year when Nature is seen at her best; and in view of the fact that gardeners generally will be despatching their bulb orders very shortly, I propose to offer a few remarks as to varieties of proved worth and merit. In speaking of single varieties it is superfluous to give more than passing notice to such fine standard sorts as Keiserskroon, Duchesse de Parma, a beautiful and cheap variety, Thomas Moore, Joost van Vondel, Bacchus, Rembrandt, Vermilion Brilliant, Cottage Maid, Chrysolora, Mon Tresor, White Swan, etc., so we pass on to note others that are less known but well worthy of extended cultivation, being both distinct and beautiful.

AN EFFECTIVE YELLOW BEDDING TULIP, MON TRESOR.

I would strongly advise that, in addition to White Swan and the superlatively beautiful White Joost van Vondel, a comparatively new sort named White Hawk be given a trial. It is of strong growth, long lived as regards its season of beauty, and of great purity. To extol the merits of Proserpine is unnecessary, but attention should be drawn to La Rêve, which has flowers that are soft rose suffused with orange. The colour may be termed an art shade, and it is difficult to understand why it fell out of cultivation for a time. I have failed to note Fabiola, a fine variety in violet and white colouring, in many large parks and gardens, and surely it must rank amongst the very best. I have nothing but praise for Prince of Austria, fragrant, fine shape, and possessed of soft orange-red colouring. It is wonderfully effective when massed. Very effective is Couleur Cardinal, the beauty of the rich crimson colouring being enhanced by a plumlike bloom on the outer petals. Another splendid variety in rich maroon and scarlet is named Koh-i-Noor, but up to the present it is high priced. I noted a bed of La Remarquable at Kew last spring, and was much impressed with its strikingly beautiful appearance, and it was very clear that it found many admirers. The flowers are of large size, rich plum colour, with a silver margin, and I predict that it will be extensively planted in future.

There are a number of very fine scarlet varieties in commerce, but where great brilliance is desired, Maas should be employed; it quite dazzles one when the sun is shining upon it. A very refined flower is Claremont Silver, which has pink and white blooms, and, as a bedder, it leaves nothing to be desired, and the same applies to Grace Darling in nasturtium red. Pink Beauty and Maréchal Niel should be given a place in every garden, their colouring is deep rose flushed white, and orange-red shaded yellow respectively. Brightly coloured tulips are considered or voted vulgar by many people, but they will find nothing to grumble about in Superintendent, a delicate variety in violet and white.

AN ADMIRABLE BED OF TULIP KEIZERSKROON NEAR KEW PALACE.

A word as to double varieties, and what a glorious wealth of colour and beauty can be had at a comparatively trifling cost when such kinds as Titian and Gloria Solis are brought together in big masses. Let Vuurbaak in fiery scarlet be toned down through rubbing shoulders with Rose Blanche, of snowy whiteness, or again to tower above a carpet of double arabis. "Superb" is a mild term for El Toreador in chestnut and orange colouring, and it should be allotted a prominent position in the bedding arrangements. The same holds good of Marriage de ma Fille, white, striped rose, while Bleu Celeste is worthy of its name. Yellow Tournesol is a splendid bedder, and should be associated with Myosotis Royal Blue.

The Darwins must now be briefly considered in relation to bedding, and no one will disagree with me when I say that they place the ordinary tulip completely in the shade from an artistic point of view. At the same time they are imposing to a degree. Beds that are intended for tender subjects in summer such as celosias, may well be devoted to them, as also the more distinct and beautiful amongst the May-flowering section. Having grown a large number of Darwins for this purpose I can recommend the following as being quite first-rate: Early Dawn, rose-pink; Margaret, blush, and very fine; The Sultan, deep maroon; White Queen, white, tinted blush; Carmen, brilliant scarlet; Mr. Farncombe Saunders, intense crimson.

Beds of Cottage tulips in Picotee, creamy-white, edged pink; The Inglescombe varieties; Vitellina, sulphur and white; Gala Beauty, vermilion on gold ground; Elegans and Elegans alba, and La Merveille, terra cotta, shaded orange, will find many admirers, and when their beauty is past the bulbs may be transferred to borders with a view to becoming naturalised colonies.

Walter H. Aggett.

Calceolaria integrifolia.—The date of the introduction of this calceolaria does not seem to be generally known, at all events it is only within the last few years that its merits have been recognised to any extent. Like most of the calceolarias it is, no doubt, a native of South America, but is of a more decided shrubby character than many other members of the genus. It first came prominently forward as an outdoor shrub in the West of England, but it is also valuable in all districts for the embellishment of the greenhouse or conservatory. In this way it may be grown as a good-sized bush, and will then keep up a supply of its golden yellow blossoms throughout the summer and autumn months.—W. T.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

HEATING APPARATUS.—At this season repairs that are necessary should be attended to, and a general survey of the boilers and hot-water pipes be made. Those who have had long experience with low-pressure boilers will generally agree that it is desirable the whole of the water should be drained from the boilers and pipes at least once a year. This removes the rust and dirt, and prevents, to some extent, corrosion and rust which are so detrimental when permitted to remain. When the boiler and pipes are emptied an opportunity is afforded to attend to any alterations required, the stopping of any leaky joints, and split collars made good. It is better to have the fires out for one night at this season than to take any risks of a breakdown during the winter when the conditions are the least favourable. In dealing with hot-water pipes provided for heating houses that have been built some years, one finds that in many cases they have in passing from the main into sectional houses been embedded in the brick work. This is a most undesirable practice; it checks expansion and contraction, and it is usually in these places that spit collars are found. If this does not occur, the mortar and moisture combined rusts away the pipes, and generally causes leakages. In fixing pipes it is advisable they should be kept clear of everything; ashes especially should not be permitted to remain in contact with them. See that any leaky valves are repacked, oil others, and see that the air taps and outlets are in working order before the pipes are refilled. Flues and chimneys should be swept and made clean, and the fire-bars replenished. This last-named is frequently a serious item in garden expenditure, for where the fires have to be driven during the greater part of the year, the bars quickly burn through or become distorted, so that new ones are frequently required. This is generally found to be the case where the ordinary dry ash-pits are in use. Some six years ago the late Mr. Norman Cookson had two large size Robin Hood boilers fixed for some of our orchid houses, and he insisted on having the ash pits made in concrete sufficiently deep to hold nine inches of water. To show the advantage of this from the point of fire-bar saving, I might mention that one set of fire-bars were ordered extra, to come with the boilers, and it is worth recording that we have more than one-half of that set still by us. The steam rising from the hot ashes dropping into the water prevents the fire forming clinkers, and seldom is one of any size taken from the fires, although coke is used. I would advise all who are fixing new boilers to have water ash-pits beneath.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

BOUVARDIAS.—These are now showing abundance of flower buds, and their flowering shoots should be made secure to a neat green stake, which has been placed previously in the centre for the support of the plant; thin strands of green raffia tape may be used for this purpose. Thoroughly overhaul the plants with a view to destroying insect pests; and after the pots have been cleansed they may be taken to their winter quarters, in which a temperature of about 55 deg. should be maintained. At intervals of ten days or a fortnight top-dress with some approved artificial fertiliser. The foliage and the general appearance of the stock will be much improved by watering alternately with clear soot water and an occasional watering of a weak solution of farmyard liquid.

SELAGINELLAS.—These are most serviceable for decoration, both as an edging to plant stages to which some of its forms are well adapted, and for association with cut flowers arranged in vases. Selaginellas have a distinct advantage over most other similar foliage subjects, being of easy culture. They succeed admirably in almost any kind of compost, providing it is porous, and propagation is easily effected. Insert four to six pieces of the stem or the extreme growing tips in small pots or shallow pans filled with light soil; place them in a shady position until root action has commenced. With few exceptions, most of the species and their varieties will thrive in an intermediate stove temperature provided they are well shaded from strong sunshine. If S. cæsia is placed upon a shelf near the glass, kept somewhat on the dry side, and exposed to the sun, the foliage will attain a beautiful rose-pink colour, resembling autumn tints, the long trails of foliage, if cut and tastefully arranged with white flowers for dinner-table decoration, cannot fail to command appreciation.

SHADING MATERIALS.—These may now be removed without delay, selecting a dry day, when all the materials may be rolled up, labelled for each house, and stored in some suitable position. The light at this season is most beneficial to plant life, and whenever possible advantage should be taken of all that now remains before the dull days of winter come upon us.

CLERODENDRON BALFOURI. — Specimen plants that have completed their flowering season may now be gradually brought to a state of rest by a reduction of water and temperature. The flowering stems and all weak or undesirable wood should be cut away so as to induce the permanent shoots to become thoroughly well ripened. During the ripening off process the shoots must not be allowed to suffer seriously through excessive dryness at the roots. A temperature of 50 deg. to 55 deg. is ample during their resting period. After the foliage has ripened off very little water will be required until they are started into growth again early next spring. They may, however, be examined occasionally with a view to watering if the wood shows signs of shrivelling.—JOHN DONOGHUE, Bardon Hill Gardens.

THE FLOWER GARDEN.

SHRUBBERIES.—Where new beds and borders of shrubs are to be made the preparation of the ground should be commenced. Considerable advantage is gained by well working the soil sometime beforehand, for it will then become settled by the time for commencing planting. The ground should be trenched to the depth of two feet, and if the soil is poor it is advisable to enrich it by adding a liberal quantity of decayed manure, such as that from an old hotbed, or burnt garden refuse, and thoroughly incorporating it with the soil. In designing new borders avoid straight lines where possible, although in some cases formality will to a certain extent be necessary. An inspection of existing borders and beds must be made before the leaves fall to note any alteration that may be considered necessary. In some instances plants will have overgrown the space allotted to them, and must be rearranged. If this is carried out, the surplus will be useful in making the new beds. By examining the shrubberies and deciding what is to be done early in the autumn, the actual lifting and replanting is made much easier, and mistakes are not so likely to occur.

ROCK GARDEN.—The principal work at present in this department consists in cleaning up the plants and top-dressing where necessary. Many subjects growing in the crevices will have become loose through the soil being washed away by continuous waterings. These must be made firm again with soil and stones, wedging the latter in tightly to withstand the heavy rains. All decaying matter, dead flowers, and weeds should be removed. There must be no delay in propagating any plants that have been overlooked. The reserve plants will require attention, some will want repotting or top-dressing, especially those which are intended for spring planting. Many of the young plants that were raised from cuttings and seeds earlier in the year will require more root room, and should be repotted. At the end of the month some of the hardiest may be planted. These include aubrietias, alyssums, helianthemums, arabis, iberis, etc. In refilling spaces in which the plants have died out it will be advisable to replace the old soil with fresh.

LAWNS.—Frequent sweepings will be necessary now to keep the grass clear of leaves, also the roller will have to be brought more frequently into use. The bare patches caused by the continuous dry weather must be sown with grass seeds. Loosen the surface of the bare places with a rake, and sow the seeds, covering them with a small quantity of finely-sifted soil. If the birds are troublesome cover the seeds with netting.—E. C. POOLEY, Gnaton Gardens.

FRUITS UNDER GLASS.

LATE PEACHES.—As soon as the crop has been gathered, open the house to the fullest extent, or take off the lights if practicable, so as to give the trees a thorough rest and full benefit of sun and air. At the same time see that roots and leaves do not lack sufficient moisture. A suitable preparation for cleansing the trees of insect pests should be applied to them with force from a garden engine. A solution of paraffin and soft soap is a fine cleansing medium when used with discretion, and if applied a few times will be effectual in clearing away insect pests. Preparations for lifting and replanting any trees that require renovation should soon be taken in hand, and when a house is to be replanted with new trees, the old ones should be taken out at once and the formation of a new border be commenced, and I would strongly advise the whole border being taken out, and then have the walls touched up and pointed if necessary, and the wood and iron work painted. Then prepare the soil for the new border, which should only be made large enough for two years. Provide an adequate supply of clean drainage materials, and see that there is a drain to carry off superfluous water. Then put in about a twelve-inch layer of the materials, the lower six inches to be rough, and the other part finer. Over the drainage place some good turves grass side downwards. These will last a surprisingly long time, and will keep the finer soil from being washed down amongst the drainage. The best compost for a peach border is good maiden loam, to which should be added mortar or lime rubble—that from old buildings preferred—wood ashes and bone-meal, the latter at the rate of one in fifty, and a good sprinkling of soot. Well mix by turning the mixture over several times, and keep dry till used in making the border.

VINERIES. — Carefully examine the bunches once a week and remove all decayed berries, as one that is decayed will soon injure a number of others. As the sun declines in power begin to take away newly-formed laterals, and those that were left to afford shade in the tropical weather we have experienced. This should be done gradually.

EARLY HOUSE.—If the vines are cleared of fruit the shoots may be pruned back to three or four eyes, as the wood is quite ripe and the foliage turning colour. Continue to syringe in the case of insect attacks, especially mealy bug, as now is the very best chance of ridding the vines of it. Use a wash consisting of half a pint petroleum emulsion to about twenty gallons of water. Apply with the garden engine, and with considerable force, directing it into all crevices and holes, and do the work carefully and skilfully, when it will be found that the extermination will be nearly perfect, or at any rate, the numbers be brought so low that it should be an easy matter to permanently eradicate the insects at a later period.

ORCHARD HOUSE.—Keep the house cool and airy, and prevent the entry of wasps by means of netting. Cherries have remained in splendid condition this season under the protection of muslin; we have only recently sent our last supplies to table.—W. A. COOK, Leonardslee Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

The meeting held on September 12 was a moderately good one, so far as the display was concerned, but it was not especially large nor were there many novelties of outstanding merit. Dahlias provided by far the greater part of the exhibition, and they were remarkably good for so dry a season.

ORCHID COMMITTEE.

Messrs. Hassall and Co., Southgate, contributed a neat little group, wherein were Lælio-cattleya Dominiana, L.-c. Walter Gott, Cattleya Adula, and the pretty C. iridescens —the latter derived from C. bicolor and C. Eldorado.

From Mr. R. G. Thwaites, Christchurch Road, Streatham, came a very fine old-gold coloured form of Cattleya Adula, and good examples of C. Dusseldorfi Undine, Lælio-cattleya Bletchleyensis, L.-c. Ophir, L.-c. Euphrosia, and other good things.

Cattleya Carmen, carrying four beautiful mauve-purple flowers, with bright purple-and-yellow tip, was shown by Messrs. James Veitch and Sons, Chelsea.

Mr. Barker, gardener to W. P. Burkenshaw, Esq., Hessle, sent the white Cypripedium Venus Hessle var., and C. Fascination and C. Dallas were sent by Lady Audley Neild, Gortleton, Chippenham.

Conspicuous in the group staged by Messrs. Charlesworth and Co., Haywards Heath, were Brasso-cattleya Digbyano-Mossiæ, the handsome B.-c. Thompsoni, C. Gaskelliana alba, C. Rhoda, Lælio-cattleya Phryne, Miltonia Bleuiana nobilior, and a particularly handsome hybrid derived from crossing Lælio-cattleya Martinetti and Sophronitis grandiflora and named Sophro-lælio-cattleya Jeanette (F.C.C.) This had a spread of four inches, and the colour is a lovely soft shade of crimson-tinted scarlet, with golden shading in the lip—a splendid acquisition.

Sir Trevor Lawrence, Bart., Dorking, sent up a finely-flowered specimen of Dendrobium glomeratum, with a profusion of rosy flowers.

Mr. G. Day, gardener to H. S. Goodson, Esq., had Cypripedium Lord Derby and Lælio-cattleya Colmani, Goodson's var., on view.

The group from Mr. Hale, gardener to S. Lakin, Esq., Ridgeway, Haslemere, included numerous lælio-cattleyas, oncidiums, and cypripediums.

Cattleya Thurgoodiana was conspicuously good in the attractive little contribution from Mr. E. V. Low, Vale Bridge, Haywards Heath. One plant carried two spikes,each with four fine flowers. Cattleya Adula, C. Grossi, C. Gaskelliana alba, Cypripedium James H. Veitch, and the curious Bulbophyllum grandiflorum were other good and interesting subjects.

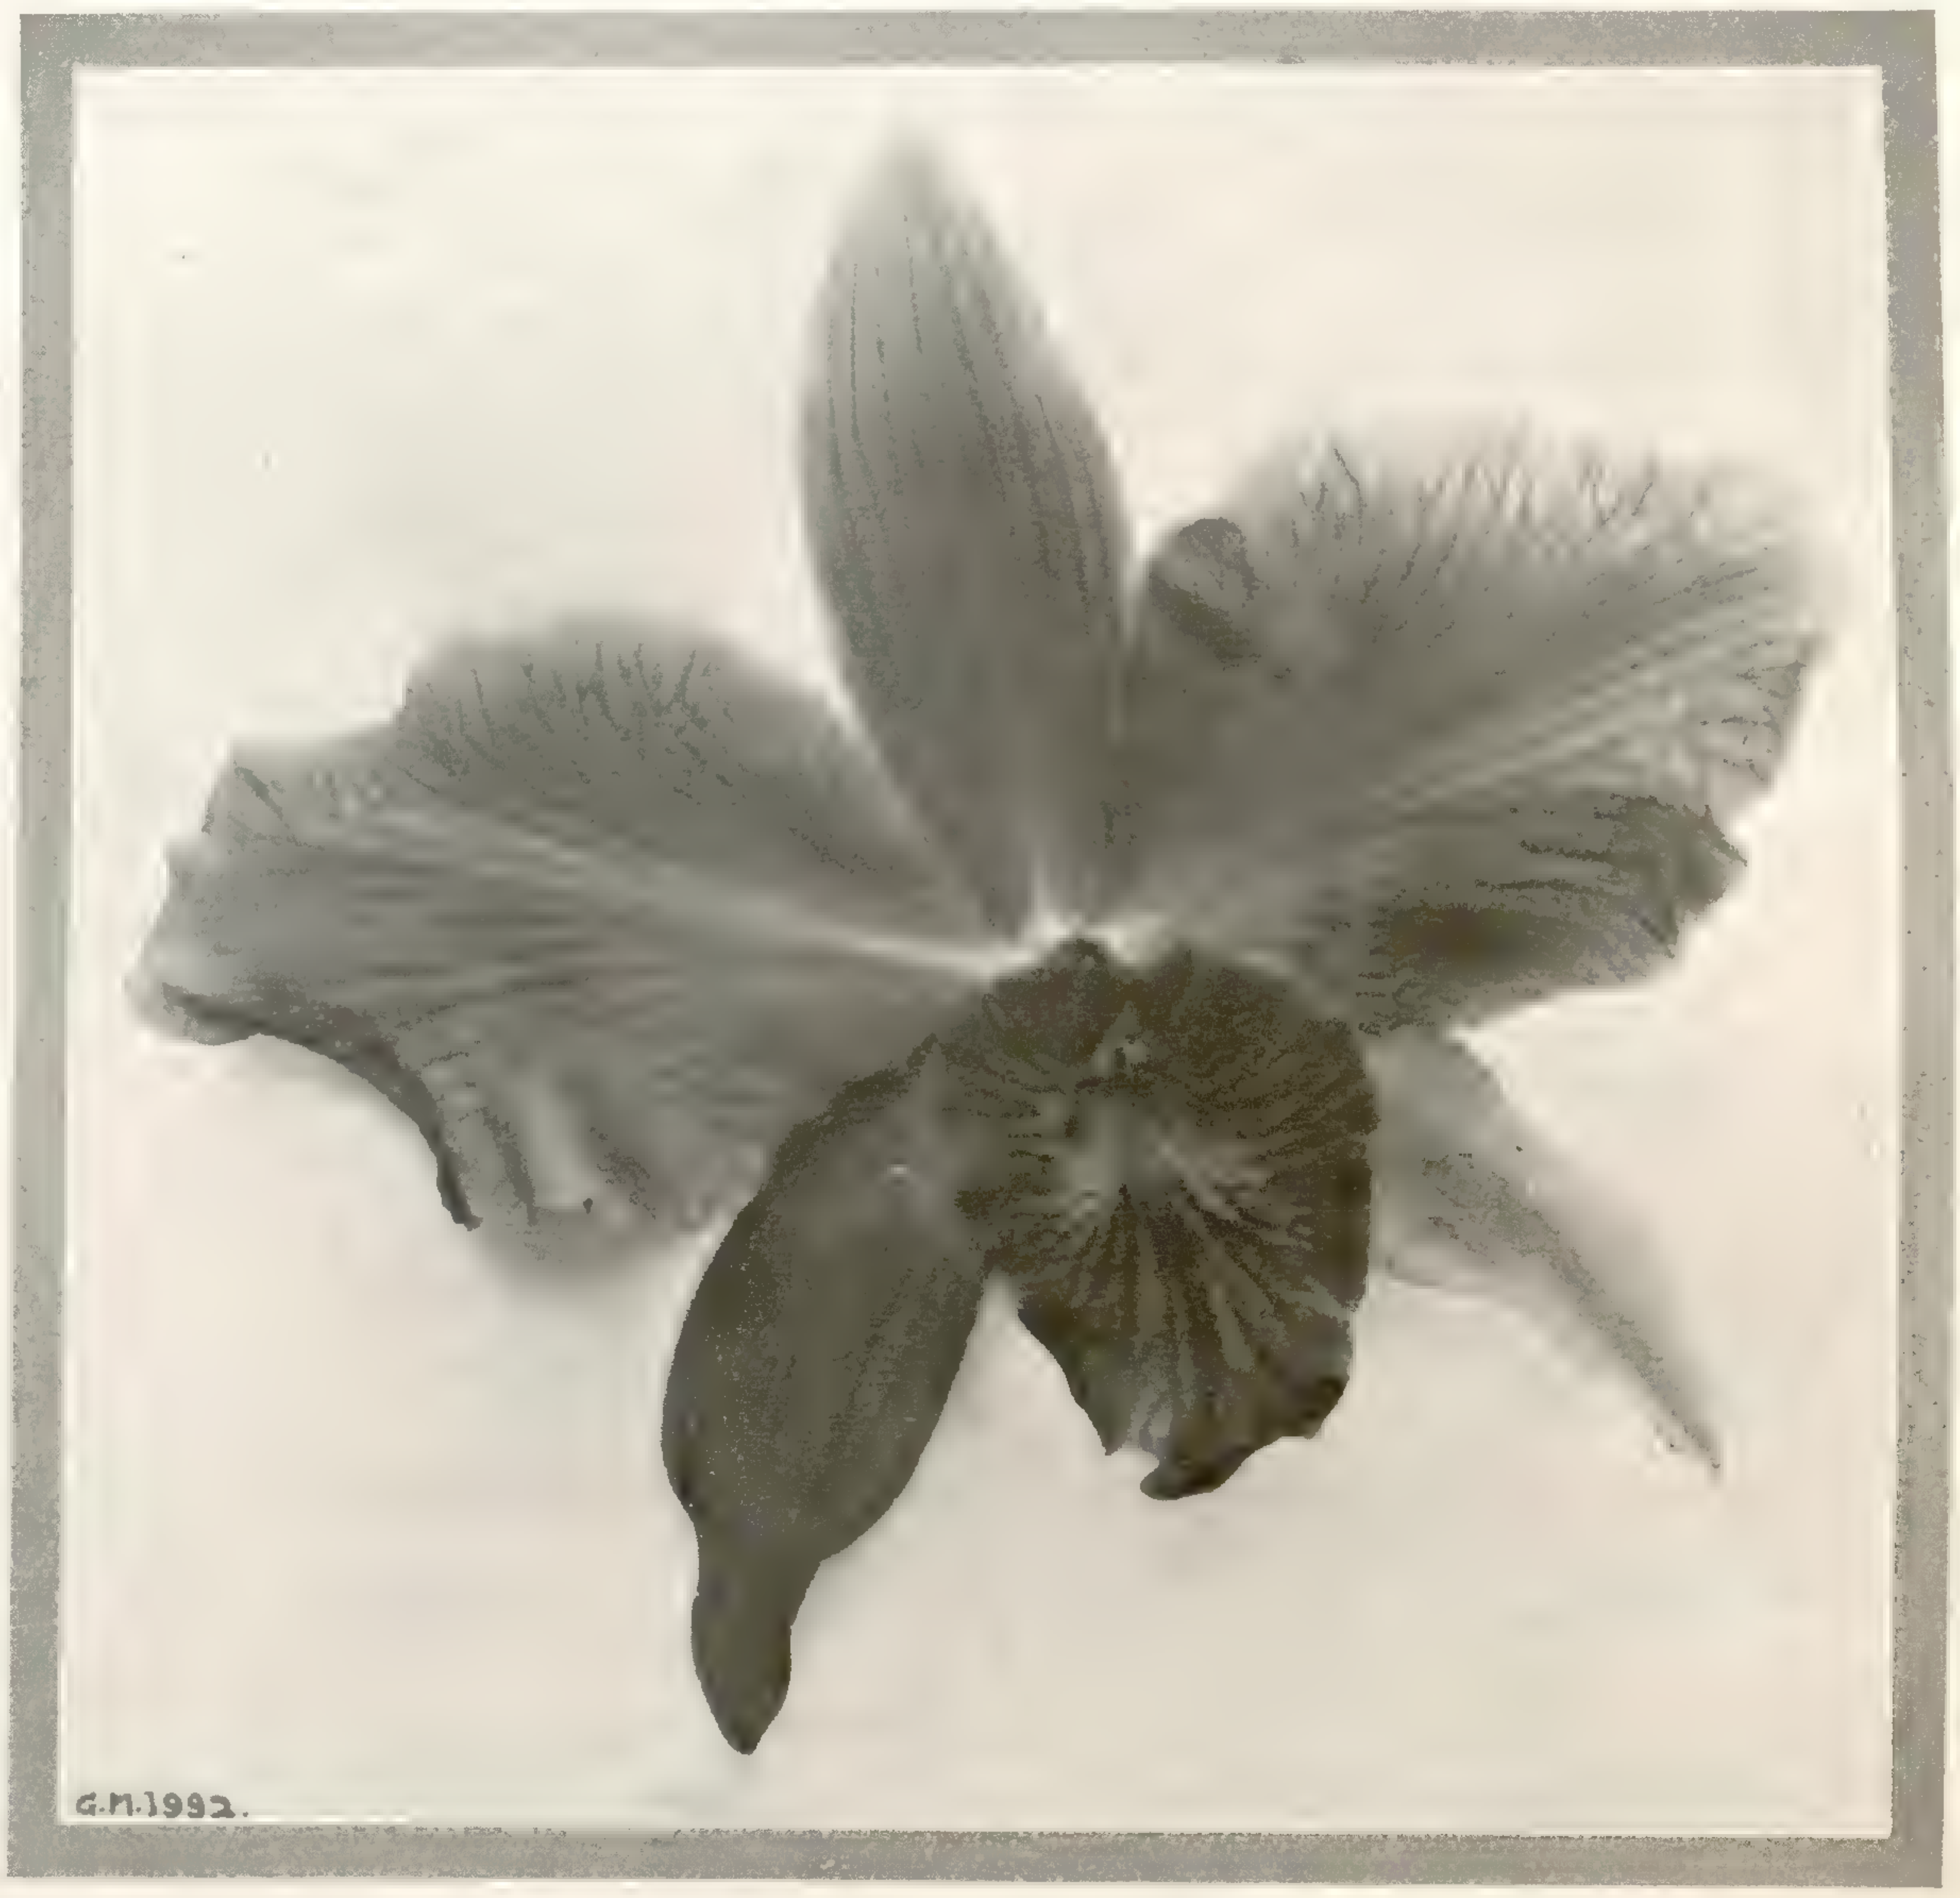
Messrs. Sander and Sons, St. Albans, were represented by a quite attractive exhibit, in which the plants were pleasingly disposed with maidenhair ferns. Cattleya Ella, C. Wavriniana, C. Hardyana, Lælio-cattleya Lord Rothschild, L.-c. Colmaniana. L.-c. Fabius, L.-c. Britannia, Sophro-lælio-cattleya Medea, with dark bronzy-purple flowers; the handsome Vanda Sanderiana ,the old Cypripedium Parishi, and Cycnoches maculatum were also included.

Oncidium varicosum, O. ornithorhynchum, Cattleya Pittiana, Houlletia Brocklehurstiana, the lovely Vanda cærulea, Odontoglossum grande. and other beautiful things were exhibited largely by Messrs. Stuart Low and Co., Bush Hill Park, Enfield

FLORAL COMMITTEE.

A remarkable exhibit of dahlias was finely staged right across the top end of the hall by Messrs. Carter Page and Co., London Wall. There were over two hundred varieties on view, representing cactus, pompon, collarette, single, and pæony-flowered sections. The latter were set up in large stands to form a background and centre, and on either side were baskets of the leading cactus forms, about a dozen and a half flowers of each. At the ends were the single and pompon varieties. Among the cactus dahlias Mrs. Shoesmith (white), Faunus (buff), J. H. Jackson (maroon). Caradoc (yellow), John Peel (scarlet), Ibis (scarlet), Snowdon (white), Echo (mauve), and Mrs. Mawley (soft yellow) attracted our attention.

Dahlias were shown extensively by Messrs. Hobbies, Lim., Dereham, who filled tall stands with the leading pæony-flowered and collarette kinds, and set up lower stands of cactus varieties between the rest. The collarette dahlias attracted a great deal of attention, notably such sorts as Souv. de R. Bernardin, Comte de Nodler, Maurice Rivoire (A.M.), Le Congo Belge, Henri Farman, Mdme. Gygax, Meteor, and Rhein Krone.



SOPHRO-LÆLIO-CATTLEYA JEANETTE.

A beautiful hybrid, with large crimson-scarlet, orange shaded flowers. F.C.C., R.H.S., September 12. Messrs. Charlesworth and Co., Haywards Heath.

Pæony-flowered dahlias from Mr. Chas. Turner, Slough, made a good display, set up with sprays of asparagus and purple plum foliage; Bella Donna, Sunstar, Salome, Bayard, Duke Henry, Berthe von Suttner, buff and pink; Solfaterre, Geisha, and Eleanor, are varieties worthy of special mention. With these were some charming pompon forms, and the single decorative variety Union Jack (A.M.), white and scarlet, with occasionally a purplish petal.

The varieties of Aster amellus, from Messrs. G. Bunyard and Co., Maidstone, served to show the range of form and colour now to be found in this autumn-flowering subject; macrantha major, maximus, Purple Queen, Stone, and bessarabicus, were a few of the best and most distinct forms.

Messrs. J. Cheal and Sons, Crawley, staged a group of dahlias, consisting of half a dozen pyramids of blooms; several sections were represented, but pompon and single varieties were most attractive. Among the latter we made note of Betty, Formosa, Leander, Miss Roberts, Brilliant, Owen Thomas, Stromboli, Columbine, Lady Bountiful, and Flora as particularly beautiful, while Albatross, Mahdi, Bridesmaid, Killarney, Minerva, and Theresa are new varieties to be kept in mind.

Messrs. Allwood Brothers, Wivelsfield Nurseries, Haywards Heath, brought forward two new carnations named White Wonder (A.M.), and Gloriosa; the former is a very fine white, sweetly scented, and the latter is a lovely shade of pink.

Mr. J. R. Box, Lindfield, appears to have made special arrangements with the clerk of the weather, as he was able to put up a really fine exhibit of hardy flowers; he showed masses of late spikes of a fine selection of delphiniums, good vases of gaillardias, a central mass of excellent phloxes, and a background of Solidago Golden Wings; Gladiolus princeps was fine, and so was the splendid golden Helianthus sparsifolius, a plant that everyone interested in hardy flowers for autumn blooming should certainly possess.

The varieties of Amaryllis Belladonna shown by Mr. J. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, were of great interest. Particularly fine was the Kew variety, carrying an umbel of thirty flowers and buds, the blooms rich pink, with a soft orange tint in the base of the tube (A.M.). Sir Charles Strickland's var., rosea superba and rosea perfecta were also submitted, but the Kew variety, as shown (and which Mr. Watson believes to be Amaryllis Parkeri), was ahead of the rest. Mr. H. J. Elwes sent a few flowers of Amaryllis Belladonna, but these had suffered in transit.

Messrs. Sander and Sons showed Brunsdonna Sanderæ and B. Sanderæ alba, and gained an A.M. for the latter. The parentage given was Brunsvigia Josephinæ and Amaryllis Belladonna; these appear to be excellent garden plants, and seem to be well-nigh identical with the form of A. Belladonna known as the Kew variety, which was at one time considered to be a hybrid between the plants above-mentioned.

A bank of the handsome and useful Gesnera Orange King proved the value of this showy plant, and had many admirers; this and a group of clematises were staged by Mr. L. R. Russell, Richmond.

Mr. Bradford, gardener to E. H. Brown, Esq., Highwood, Roehampton, presented a large, elegant and attractive group, consisting chiefly of brilliantly coloured and finely cultivated crotons in great variety; these were pleasingly grouped with palms, aralias, Dracæna Sanderiana, and Lilium speciosum arranged over a groundwork of maidenhair ferns and Caladium argyrites.

Another dahlia exhibit of considerable size and composed wholly of the big showy pæony-flowered varieties, was set up by Messrs. Bakers, Wolverhampton, and it included a wide range of colour.

The delphiniums set up by Mr. Amos Perry, Enfield, were very effective, while the fern-edged pool of water-lilies lent an air of coolness to the gallery end of the hall; Kosteletzkia virginica, with large white hibiscus-like flowers, was also shown by Mr. Perry, and it is an interesting and rarely seen plant.

Begonia Washington, carrying a profusion of neat double scarlet flowers, and a selection of varieties of Rex begonias, all with handsome silvery foliage, formed a group from Messrs. H. Cannell and Sons, Swanley.

A large dahlia exhibit from Messrs. T. S. Ware, Lim., was effective chiefly by reason of the big blooms of such pæony-flowered dahlias as Mrs. G. Gordon, Mrs. Alfred Platt, Admiration, Klondyke, and Mrs. Ainslie.

Some new cactus dahlias raised by Messrs. James Stredwick and Son, St. Leonards, included Yellow Wave, rich yellow; Richard Box, soft lemon-yellow (A.M.); Miss Stredwick, rich mauve-pink, with soft yellow shading in the centre (A.M.); Golden Plover, and the crimson Auckland.

Messrs. W. Cutbush and Son, Highgate, submitted a miscellaneous group of liliums, crotons, palms, heaths, etc., and Messrs. H. B. May and Sons, Edmonton, demonstrated the usefulness of the varieties of Veronica Andersoni, and the beauty of plumose ferns. Mr. G. Reuthe, Keston, showed alpines and the golden Sternbergia macrantha.

Mr. J. T. West, Tower Hill, Brentwood, presented dahlias in good style, and was especially successful with the neat pompon and pompon cactus varieties; among the former we made note of Sunny Daybreak, Adelaide, Nelly Fraser, Queen of the Whites, Ideal, Little Bugler, Bacchus, and Little Dorrit.

FRUIT AND VEGETABLE COMMITTEE.

Onions are of immense value, and a gardener always endeavours to provide a full supply of these edible bulbs. There is now a great number of varieties, and it is only when a goodly collection is staged that the differences can be properly estimated. On this occasion Mr. Stanard, Hertford, put up fifty baskets of clean, well-grown specimens; besides the small pickling and other varieties there were handsome sets of Ailsa Craig, Magnum Bonum, Giant Red Rocca, Sutton's Perfection, Sutton's A1, Improved Reading, and Sutton's Globe; the red rocca varieties and the silver skins lent colour to a capital display.

Ten dishes of tempting nectarines from Gunnersbury Park, Acton, were brought up by Mr. G. Reynolds, gardener to Leopold de Rothschild, Esq., and there were good fruits of Spenser, Byron, Albert Victor, Pineapple, Humboldt, Darwin, Stanwick Elruge, Goldoni, and Pitmaston Orange.

The plum trees in pots submitted by Messrs. Wm. Paul and Son, Waltham Cross, together with a few apple trees, filled one corner of the hall. The plums were splendidly cropped, and such an exhibit should still further increase the popularity of orchard house methods of culture; Jefferson, Pond's Seedling, Monarch, Late Green Gage, Victoria, Coe's Golden Drop, Cox's Emperor, Grand Duke, Prince Englebert, and white Magnum Bonum were the leading varieties of plums so well represented.

Mr. T. Heron, gardener to H. B. Brandt, Esq., Capenor, Nutfield brought up nine bunches of Alicante, six of Alnwick Seedling, nine of Appley Towers, three of Lady Downes, four of Golden Queen, and also four bunches of Muscat of Alexandria grapes; the black grapes showed good colouring, and were of fair size and carried excellent berries.

Apple and pear trees in pots, carrying goodly crops of fruit, made up an interesting exhibit from Messrs. Stuart Low and Co., Enfield; in front of the trees were dishes of picked fruits, chiefly of Jas. Grieve, Jolly Beggar, Cellini, Peasgood's Nonsuch, Bramley's Seedling, Chas. Ross, Rival, and Bismarck apples.

Mr. G. W. Miller, Clarkson Nurseries, Wisbech, brought up several dishes of his Red Victoria apple, an early and brilliant variety.

Mr. Stapleton, headmaster at the Purfleet School Garden, Essex, sent up a collection of hardy fruits grown by boys from 11 to 14 years of age; there were nice dishes of Colonel Vaughan, Lady Sudeley, Lord Derby, New Hawthornden, and Beauty of Kent apples; Thompson and Souv. de Congres pears; Jefferson, Admiral, and other plums. In each case the dishes were carefully labelled, and the season of the variety indicated.

CERTIFICATES AND AWARDS.

First-class Certificate. — To Sophro-lælio-cattleya Jeanette, from Messrs. Charlesworth and Co., Haywards Heath.

Award of Merit.—To Amaryllis Belladonna, Kew variety, from Mr. J. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton; to Amaryllis Kewensis alba from Mr. A. Worsley, Isleworth; to Brunsdonna Sanderæ alba, from Messrs. Sander and Sons, St. Albans; to perpetual carnation White Wonder, from Messrs. Allwood Brothers, Haywards Heath; to Collarette dahlia Maurice Rivoire, from Messrs. Hobbies, Lim., Dereham; to cactus dahlias, Miss Stredwick and Richard Box, from Messrs. J. Stredwick and Son, St. Leonards; and to single decorative dahlia Union Jack, from Mr. Chas. Turner, Slough.

MEDALS.

Silver-gilt Flora.—To Messrs. Carter Page and Co., London Wall, for dahlias; to Messrs. Hobbies, Lim. Dereham, for dahlias; to Messrs. Sander and Sons, St. Albans, for orchids.

Silver-gilt Knightian.—To Mr. Stanard, Hertford, for onions.

Silver-gilt Banksian.—To Mr. J. R. Box, Lindfield, for hardy flowers; to Mr. Bradford, gardener to E. H. Brown, Esq., Roehampton, for group of crotons, etc.; to Mr. J. T. West, Brentwood, for dahlias.

Silver Flora.—To Messrs. Charlesworth and Co., Haywards Heath, for orchids.

Silver Knightian.—To Mr. G. Reynolds, gardener to L. de Rothschild, Esq., Gunnersbury Park, Acton, for nectarines; to Messrs. William Paul and Son, Waltham Cross, for fruit trees in pots; and to Mr. Heron, gardener to H. P. Brandt, Esq., Nutfield, for grapes.

Silver Banksian.—To Messrs. J. Cheal and Sons, Crawley, for dahlias; to Messrs. Wm. Cutbush and Son, Highgate, for miscellaneous plants; to Messrs. H. B. May and Sons, Edmonton, for veronicas and ferns; to Mr. Ames Perry, Enfield, for water lilies and delphiniums; to Mr. L. R. Russell, Richmond, for clematises and gesneras; to Mr. Chas. Turner, Slough, for dahlias; to Messrs. Hassall and Co., Southgate, for orchids; to Mr. E. V. Low, Haywards Heath, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Mr. Hale, gardener to S. Larkin, Esq., Haslemere, for orchids; to Messrs. S. Low and Co., Enfield, for fruit trees in pots; and to Mr. Stapleton, Purfleet School Garden, for fruits.

Bronze Flora.—To Messrs. H. Cannell and Sons, Swanley, for begonias; and to Messrs. T. S. Ware, Lim., Feltham, for dahlias and asters.

National Dahlia Society.

It could hardly be expected that this show, held at the Crystal Palace on September 7 and 8, should be quite up to the average of recent years, for the excessively dry weather during the past two months has not been at all suitable for dahlias, but, although the entries in the open classes were not so numerous as usual the quality of the flowers was good.

TRADE CLASSES.

Mr. J. Walker, Thame, was awarded first prize for forty-eight show varieties, for a fine level display. The varieties employed were T. J. Saltmarsh, Colonist, Mrs. Gladstone, Claret Cup, The Reverend, Purple Prince, Charles Wood, Virginale, Comte de la Saux, J. Nicholson, Duchess of York, Golden Fleece, Harry Keith, Mrs. C. Noyes, Mabel Stanton, Duke of Fife, Dr. Keynes, Henry Clark, Watchman, James Cocker, William Rawlings, W. Powell, Harrison Weir, Standard, Ethel Britten, A. Rawlings, T. W. Girdlestone, Marjorie, Bloodhound, J. T. West, Gracchus, Miss Cannell, Mrs. J. Downie, Tom Jones, Prince of Denmark, T. Pendered, Florence Tranter, Southern Queen, David Johnston, Dandy, Victor, Perfection, Diadem, John Walker, Imperial, Mariner, and Mrs. Kendall. Mr. J. Walker was deservedly awarded first prize for eighteen fancy varieties, distinct. Although the flowers were not quite so large as usual, they were of good colour and well finished. The finest examples were Mrs. Saunders, Edmund Boston, W. Sheldon, Comedian, Mrs. J. Downie, H. Eckford, Hercules, Mabel, J. Forbes, Emin Pasha, and Goldsmith.

For twelve show and fancy varieties Messrs. C. Carrington and Son, nurserymen, Derby, won first prize with some good heavy flowers, in which were noted Rev. J. B. M. Camm, Perfection, Wm. Keith, Duchess of York, and Mrs. Saunders. Messrs. J. Cheal and Sons, second. In the premier class for eighteen bunches of cactus varieties of six blooms each, there were two entries, Messrs. James Stredwick and Son, St. Leonards-on-Sea, once more carrying off the first prize with a really fine display; all the more remarkable in such a season. The varieties were Mrs. D. Fleming, Marquis, Golden Plover, H. H. Thomas, Miss Hills, Lodestar, Miss Stredwick (very fine), Vanity, Mrs. Stephens, Uranus, Orion, Indomitable, Dr. R. Appleton, Wm. Marshall, Red Admiral, Satisfaction, Mynora, and Elite. Messrs. J. Cheal and Sons were second with a very nice display, though hardly as large as the winners. Their best bunches were Red Admiral, Satisfaction, The Imp, Rev. T. W. Jamieson, Debutante, and Snowdon.

In the class for twenty-four blooms, distinct, Messrs. C. Carrington and Son were first, having good deep flowers of Brigadier, Conquest, Mary Perrier, Glory of Wilts, Pride of Essex, Joan of Arc, and Nelson. Mr. M. V. Seale, Vine Nurseries, Sevenoaks, followed, having good typical blooms of The Lion, Mary Perrier, Johannesburg, and H. H. Thomas.

Messrs. J. Cheal and Sons were the only competitors in the class for twelve vases of garden cactus varieties, and were deservedly awarded first prize. The vases were all beautifully set up with appropriate foliage. The varieties employed were Mrs. Paton, Mrs. T. H. Cook, Mauve Queen, Mrs. Freeman Thomas, Mrs. Usmar, Lustre, Gold Crest, Mrs. Landale, J. H. Jackson, Snowdon, and the Hon. Mrs. Greville.

Messrs. J. Cheal and Sons were the only exhibitors of twenty-four bunches of pompon varieties, distinct. The exhibit was very fine, the blooms being neat and in perfect condition. Some of the best were Jessica, Elsa, Little Mary, Girlie, Nora, Ivy, Hecla, Mars, Marietta, Glow, Adelaide, Ideal, Zerlina, and Cyril.

For twenty-four bunches of single varieties, distinct, Messrs. Cheal and Sons were awarded first honours with a beautiful set, the most conspicuous being Eclipse, Rosebank Scarlet, Peggy, Eric, Rosemary Bridge, Betty, Kitty, Fugi San, Miss Roberts, Snowdrop, Miss Moreland, and Lady Bountiful.

The class for pæony-flowered varieties was patronised by Messrs. J. Cheal and Sons, who won first prize for good vases of The Geisha, King Leopold, Empress, Bertha Von Suttner, South Pole, and Hampton Court.

AMATEUR CLASSES.

These were well filled, and in many instances the competition was excellent.

For twelve blooms, show or fancy, Mr. G. Densley, Nags Head Hill, St. George's, Bristol, won first prize with deep, well-finished flowers. His best varieties were Colonist, Lord Salisbury, Tom Jones, Henry Clark and Victor. Mr. A. P. Ironsides, West End Cottage, The Hamlet, Chippenham, was second, having neat examples of John Walker, Majestic, and Florence Tranter. Mr. H. S. Cooper, The Hamlet, Chippenham, was third; there were five entrants.

Mr. S. H. Cooper led off with twelve fancy varieties; his best flowers were Rev. J. B. M. Camm, Professor Fawcett, Lottie Eckford, and Mrs. Saunders. Mr. G. Densley was second.

The silver challenge cup for six vases of garden cactus varieties was secured by the Rev. A. Bridge, Worth Rectory, Crawley, Sussex, with good examples of White Ensign, Golden Eagle, Mary Perrier, Arthur Pickard, Snowdon, and the Hon. Mrs. Greville.

The silver challenge cup for nine varieties of cactus dahlias, three blooms each, was keenly contested. Mr. F. Grinstead, Beaufort Park, Battle, captured it with good examples of C. E. Wilkins, Indomitable, H. H. Thomas, Mrs. D. Fleming, Rev. A. Bridge, Satisfaction, Beauport Beauty, Red Admiral, and H. Peerman. Mr. F. W. Fellowes, The Lane House, Kings Walden, Hitchin, was second with a capital set, Glory of Wilts, Red Admiral, H. H. Thomas and Monarch being especially good. Third, Rev. A. Bridge.

Mr. H. Peerman, Glencross, Nantwich, led off for twenty-four distinct cactus varieties with a really good collection. His best were Thomas Parkin, Joan of Arc, Mary Perrier, Mrs. C. Wyatt, Crystal, Prima Donna, and H. H. Thomas. Mr. J. Bryant, 5, St. Martin's Terrace, Salisbury, had a good display for second place, having nice flowers of H. H. Thomas, Rev. T. W. Jamieson, Debutante, Snowdon, and Indomitable.

For twelve distinct varieties there were seven competitors, Mr. H. Peerman again being placed first with a good even display. Mrs. C. G. Wyatt, H. H. Thomas, H. Peerman, and Thos. Parkin being especially good. Mr. F. Grinstead was second, and Mr. G. Davidson, 68, Benshaw Manor Road, Thornton Heath, third.

The pompon class only secured two entries, Mr. A. P. Ironsides being to the fore with small, though well-developed flowers. The best bunches were Darkest of All, Douglas, Ideal, Ivy, and Marietta. Mr. H. Brown, Havelock Road, Luton, was second.

The Rev. A. Bridge won first prize for twelve bunches of singles, staging in first-rate style, a few of the best being Leslie Seale, Columbine, Lady Bountiful, Princess of Wales, Betty, and Cardinal.

The following classes were for amateurs who cultivate their plants unaided. For twelve blooms, distinct, show or fancy, Mr. G. Densley won first prize with fair blooms of Goldsmith, Colonist, Warrior, and Dr. Keynes. Mr. E. T. Matthews, 48, Lewis Road, Derby, followed, and Mr. W. Marks, Rownhams, Southampton, third.

In the class for six cactus varieties, three blooms each, Mr. C. Luckin, Apsley, Pulborough, won well with Indomitable, Red Admiral, H. L. Brousson, and Dr. Roy Appleton. Mr. A. Langridge, 39, Brownlow Road, Dalston, was second, lacking a little in the staging, while the third prize was awarded to Dr. R. Appleton.

OPEN CLASSES.

Pompon cactus varieties were represented by two exhibitors. For twelve varieties, distinct, six blooms in a bunch, Messrs. J. Cheal and Sons were placed first with typical blooms of these charming flowers. They were Little Fred, Mignon, Modesty, Mrs. H B. Brandt, Molly, and Firefly. Mr. M. V. Seale followed with nice bunches of Cecilia, Firefly, and Abundance.

Mr. H. Peerman won handsomely for six cactus blooms, one variety, with H. H. Thomas, while Mr. M. V. Seale was second with Glory of Wilts.

For a similar number of show varieties Mr. J. Walker was awarded first for Wm. Powell in good form. Mr. G. Densley second with The Reverend, and Mr. M. V. Seale third with Tom Jones.

In the class for six bunches of single fancy varieties Messrs. J. Cheal and Sons led with good bunches of Owen Thomas, Lady Bountiful, Leslie Seale, and Marjorie. Mr. M. V. Seale was second. Messrs. J. Stredwick and Son were most successful for fancy cactus varieties, having fine bunches of Orion, Magpie, Uranus, Elf, and Jupiter. Mr. M. V. Seale was second.

NON-COMPETITIVE EXHIBITS.

Messrs. Hobbies, Lim., Dereham, arranged a large exhibit, chiefly composed of pæony-flowered and collarette varieties. The whole were tastefully displayed in tall stands and mounds. In the former section the most prominent varieties were London, Warrior, South Pole, Leveller, and Dr. Hogg, while the latter included the well-known varieties Mons. L. Ferard, Maurice Rivoire, Gallia, and Meteor. The cactus varieties were also well represented. The whole exhibit was beautifully arranged, and received the premier award. Mr. J. Walker, Thame, contributed a display that was conspicuous for its quality, the cactus varieties being especially good, while the double forms were quite a feature.

Messrs. H. Cannell and Sons, Swanley, again contributed a fine display of cactus, decorative, single, and collarette varieties. The chief cactus sorts were White Progenitor, Fredya, Mrs. Douglas Flemming, Iolanthe, and Beryl. The collarette section included disbudded examples of Maurice Rivoire, Albert Naumene, Mons. Martinet, and Le Negro. The same firm also had a really fine collection of apples, which were beautifully clean and bright. From Mr. M. V. Seale, Sevenoaks, came a beautifully arranged exhibit of cactus, single, pompon, and double varieties.

Mr. J. T. West, Tower Hill, Brentwood, had a splendid display; the cactus, pæony-flowered, and pompon sorts were the best features. Among the pæony varieties were noted fine specimens of Turner, Holman Hunt, Liberty, Rembrandt, Lord Milner, and Raphael.

Mr. C. Turner, Slough, presented a fine exhibition of pæony-flowered dahlias nicely displayed with grasses and other suitable foliage. Some of the best varieties were Eleanor Lamartine, Bertram, Lemberg, Sunstar, and Bertha von Suttner.

From Mr. J. B. Riding, Chingford, came a large exhibit of collarette and pæony-flowered dahlias. The former were exhibited in about thirty varieties, and included Crown Princess Charlotte, Leuchfleur, Diamant, Maurice Rivoire, Madame Porrier, Mons. L. Ferard, Orphee, and Souv. de Chabanne.

Messrs. Keynes, Williams, and Co., Salisbury also had a nice exhibit of cactus varieties with some good pompons. The former were good and tastefully displayed. Messrs. Carter and Co., Raynes Park, also had an effective display of cactus and pæony-flowered varieties, in a setting of maidenhair ferns, which gave a cool and pleasing effect in spite of the terrible heat.

AWARDS.

First-class Certificate.—To cactus dahlias Uranus and Miss Stredwick, from Messrs. J. Stredwick and Son; Collarette dahlia Maurice Rivoire, from Messrs. Hobbies, Lim.

Large Gold Medal.—To Messrs. Hobbies.

Gold Medal.—To Messrs. H. Cannell and Sons; Mr. J. T. West, Brentwood; Mr. J. Walker, Thame; Mr. M. V. Seale, Sevenoaks.

Silver-gilt Medal.—To Mr. C. Turner, Slough; Mr. J. B. Riding, Chingford.

Silver Medal.—To Messrs. Carter and Co., Raynes Park; Messrs. Keynes, Williams, and Co., Salisbury.

Scottish Horticultural Association.

The September meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 5th inst. Mr. Massie, the president, was in the chair, and there was an attendance of 80 members.

Mr. Alex. Porter, market gardener, Davidson's Mains, read a paper on "Montbretias." The most important use of the montbretia was, he thought, as a decorative subject for the flower garden, but it was also useful as a pot plant, and for cut flowers. As a flower garden subject it supplied shades of colour rarely met with in other flowers, and planted in isolated groups on the lawn it formed a pleasing feature. The origin of the numerous varieties now in existence was Montbretia crocosmæflora, a hybrid between M. (Tritonia) Pottsi and Crocosmia (Tritonia) aurea, which was raised by M. Lemoine, of Nancy, and sent out by him in 1882; but with the advent of Crocosmia aurea imperialis, a form obtained by Max Leichtlin, of Baden-Baden, by selection, and C. aurea maculata, a South African variety, the hybridists were put in possession of new factors, and by crossing the older varieties with these, Lemoine obtained some magnificent sorts, with almost perfectly symmetrical flowers, with petals of splendid substance and striking and distinct colours, and with well branched spikes. The next raiser of note was Mr. Davison, of Westwick House Gardens, Norfolk, among whose productions was Prometheus, perhaps the largest flowered montbretia ever raised. Another Continental raiser was Herr Pfitzer, of Stuttgart, among whose productions was the popular Germania.

Montbretias would thrive on various soils, but the ideal rooting medium was a sandy loam, and as to cultivation all that was necessary was to manure and dig in the usual way; but in light sandy soils plenty of well decayed manure or leaf-mould should be added as a safeguard against drought. The time of planting would vary with soil and locality. In light soils in mild localities planting might be done in November or December, but if the soil was heavy and the locality cold, it should be delayed till April. Even in mild localities, plants put in in autumn should be protected by litter or bracken, or some other light material. The distance apart of the plants would, of course, depend on the object. If a display of colour was wanted in the flower garden, three to four inches would not be too close, but for exhibition spikes the distance should not be less than four to five inches. As the plants increase rapidly, they should be lifted and replanted annually. Lifted in November, they should be stored in shallow boxes in some light sandy soil in a cool place where frost could not reach them, and in March they might be allowed a little heat to start them, hardened off in a cold frame, and planted out in April. For pot culture, they should be grown in fibrous loam, with some well decayed manure and sand, and a little bone-meal. They might be potted any time during the winter or early spring, and treated in the same way as those for outdoor use, but when the pots become well filled with roots, a little artificial manure might be given at intervals of eight or ten days. When the spikes show flower the plants should be removed to the conservatory. For pot cultivation, those with rings or markings on the perianth should receive first consideration, but these kinds were not so appropriate for bedding purposes. Varieties suitable for pot cultivation are Aureole, Lothario, Tête Couronne, Anneau d'Or, and Globe d'Or; and among the most select for bedding purposes were Vulcan, Brilliant, Germania, Feu d'Artifice, Eldorado, Crœsus, Messidor, King Edmund, Norvic, and Ernest Davison. An interesting discussion followed, and on the motion of Mr. Todd, a very hearty vote of thanks was accorded to Mr. Porter for his interesting paper.

The exhibits were: Montbretias and Aster Abendroete, from Mr. Porter; Liliums sulphureum and nepalense and dwarf Tritoma Marie Dirken, from Messrs. Dicksons and Co., Edinburgh; perpetual-flowering carnations grown in a small greenhouse in a back garden, from Mr. John Fraser, East Norton Place, Edinburgh; American seedling tomato, from Mr. W. Williamson, Logie Green Nursery, Edinburgh; large polyporous (versicolor ?), and Bladder Senna (Colutea) in fruit, from Messrs. James Grieve and Sons, Edinburgh.

The Chairman made sympathetic reference to the death of Mr. Robert Laird, who for ten years was secretary of the association, and the secretary was instructed to convey to Mrs. Laird and her family the sincere sympathy of the members in their sad bereavement.

The Secretary read to the meeting the following letter from Lord Pentland, the Secretary for Scotland, in reply to the address of welcome presented to the King on the occasion of the recent Royal visit to Edinburgh:

"Scottish Office, Whitehall,
"August 4, 1911.

"Sir,—I am commanded by the King to thank the office-bearers and members of the Scottish Horticultural Association for their address of loyalty and welcome upon the occasion of the first visit of their Majesties the King and the Queen to Scotland after their Coronation. I had the honour to lay the address before His Majesty, who was pleased to receive the same in the most gracious manner.—I am, Sir, your obedient servant,

"(Signed) Pentland.

"W. H. Massie, Esq.,
"President of the Scottish Horticultural Association,
"19, Waverley Market, Edinburgh."

On the motion of Mr. Fife, a very hearty vote of thanks was accorded to the Honourable Lady Miller and to Mr. Malcolm for their kindness on the occasion of the visit of the members to Manderston and Duns on August 19.

At the next monthly meeting, on October 3, the evening will be devoted to a conference and discussion on early-flowering chrysanthemums.

Eight new members were elected.

MESSRS. G. BUNYARD AND CO.'S FINE COLLECTION OF FRUIT AT THE EDINBURGH SHOW.

Royal Caledonian Horticultural Society.

(Continued from page 676.)

and Mr. J. Simpson third, but, having regard to the season, it appeared to us that the first and second awards might have been made. Roses in vases were largely shown, but space will not admit of their being referred to in detail. It must, however, be mentioned that Mrs. Russell, Rosegarth, Newton Mearns, was successful in securing the premier award for six vases with blooms remarkable for their high development.

Roses were plentiful and of good size and colour in the trade classes, and at the head of the competitors in the class for thirty-six were Messrs. Adam and Craigmile, Aberdeen, with large, fresh, and superbly coloured blooms. Conspicuous in the collection were the blooms of Rev. Allan Cheales, Gloire de Chedane Guinoisseau, George C. Waud, Madame Ravary, C. J. Grahame, Hector Mackenzie, Mrs. Isabella Milner, Killarney, Captain Hayward, Caroline Testout, and Dean Hole. Messrs. Cocker and Sons, Aberdeen, were second with large and otherwise well-developed blooms of Earl of Warwick, Gustave Piganeau, Frau Karl Druschki, C. J. Grahame, His Majesty, Hugh Dickson, Lady Ursula, and Madame Wagram. The Killermont Nursery Company, Bearsdel, Dumbartonshire, third. For eighteen blooms Messrs. D. and W. Croll, Dundee, were first with a fresh lot of flowers, The Lyon being very conspicuous. Mr. R. Ferguson, Dunfermline, second.

In the classes for twelve blooms of distinct varieties the Killermont Nursery Company was first for white varieties with Frau Karl Druschki. For red roses Messrs. J. Cocker and Sons were first with bright blooms of Hugh Dickson. For twelve pink roses Messrs. D. and W. Croll were awarded the first prize for The Lyon, which, whatever may be its colour, is assuredly not pink. The class for twelve vases of decorative roses was a good one, and the three or four dozen vases, arranged in a single line along the centre of the principal table devoted to roses, produced a pleasing effect. Mr. W. Ferguson was successful in securing the principal award with bold arrangements, and Messrs. J. Cocker and Sons were a capital second.

For a collection of roses arranged for effect Mr. W. Ferguson had a large and tasteful display, and well merited the first prize awarded him. The flowers were arranged in pyramids and in boxes, and attracted a full share of attention.

Sweet peas were largely shown, and, if not equal to those we have seen at Edinburgh in more favoured years, they were sufficient both in numbers and merit to form a very pleasing feature. For twelve vases Mr. T. M. Kirkwood, Crieff, was first with a remarkably fine collection, the flowers of good size and brightly coloured. Mr. J. Fletcher, Auchenheath, was a very close second, his collection consisting chiefly of high-coloured flowers, and it was interesting to note that the orange varieties, in the way of Earl Spencer, were perfect in colour. Mr. J. Loan, Coldstream, was third with a collection of much merit.

OTHER CUT FLOWERS.

Hardy flowers were plentiful and well staged. For a collection of twelve vases Mr. J. Richardson, School House, Manot, was first with a tastefully-set-up lot, in which montbretias, herbaceous lobelias, Veronica longifolia subsessilis were conspicuous. Mr. J. Bryden, Inverleithen, secured the second award with a capital set. Annual asters in vases were not particularly attractive, for the majority of the vases contained mixtures, and the colours most favoured by the exhibitors were red, white, and blue. Perennial asters, on the other hand, were very attractive. Mr. J. Loan, Kirkcaldy, had the best six, and Mr. J. Richardson and Mr. Duff were second and third respectively with good sets.

Cactus dahlias, set up in vases, produced a good display of colour, and afforded an excellent object-lesson in staging these flowers at competitive gatherings. They were shown in collections of six varieties, six blooms of each in separate vases, and the blooms were cut with sufficient length of growth to stand about fifteen inches above the vase. As a matter of course, they were cut with a portion of the branch and wired, but until such times as we have varieties with long stems we must be satisfied with this method of staging, which is far preferable to that of facing the blooms now so general. Messrs. M. Campbell and Son, High Blantyre, obtained premier honours in the class with an effective set; Mr. J. Bowness, Busby, was a good second.

Roses may be grown to perfection by following the instructions given in Roses and their Cultivation, by T. W. Sanders. A selection is given, with description of all the best varieties, and full details for culture outdoor and under glass. Price 2s. 6d. net, by post in box 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

Early-flowering chrysanthemums were so largely and well staged as to produce a fine effect. The practice at Edinburgh is to arrange the flowers in large vases with sufficient stem to form large sheaves, with the top flowers two feet or so above the mouth of the vase. The chief class was for eighteen vases, and in this the premier place was taken by Mr. John Smellie, who had a collection of great excellence. The varieties included Improved Polly, rich golden-yellow and bronze; Dolly Reeves, rose; Leslie, bright yellow; Hector, lilac; Nora Blick, rich red; Elstob Yellow, bright yellow; Improved Masse, red rose; White Masse, Caledonia, creamy white, a pretty variety with buff with red centre. Mr. G. Bowness second.

PLANTS.

Stove and greenhouse plants in bloom were represented by a considerable number of medium-sized and well-flowered specimens. Mr. J. McNiell was first for four with a good collection in which an ixora and a statice were the best. The same exhibitor was first for a single specimen with a large, finely-flowered statice. The competition in the classes for ornamental-leaved plants was more spirited than usual, and in that for six Mr. Millan, gardener to the Earl of Home, Douglas Castle, was a splendid first with huge specimens of Alocasia spectabilis, Anthurium crystallinum, Calathea zebrina, Dieffenbachia magnifica, and other of the finer kinds. Mr. J. Thorn, Carlowrie, was a good second with a six in which dracænas and crotons were prominent. Mr. A. Knight, Brayton, was third with neat specimens. There were classes also for crotons and dracænas, and the exhibits in them contributed their full share to the attractions of the exhibition. Mr. Thorn scored for two dracænas, and Mr. Millan for a pair of crotons, the plants in each case being finely grown and richly-coloured.

Classes are provided for begonias, fuchsias, British ferns, zonal pelargoniums, early-flowering chrysanthemums, liliums, and several other classes of plants that are of value for the conservatory, and as a whole did credit to the cultural skill of the several exhibitors.

VEGETABLES.

Vegetables were shown in large quantities, and in excellent condition, and were of much interest as evidence of the possibilities of high-class culture under untoward conditions. There was a keen competition in the larger of the two classes for displays of vegetables; the several kinds being staged in capital order throughout, and the taste shown in the arrangement of the displays reflected much credit upon the several exhibitors.

In the class for eighteen dishes, not less than twelve kinds, grown in Scotland, Mr. Robert Stuart, gardener to Lord Lauderdale, Chilestone Castle, obtained premier honours with a collection of quite exceptional excellence. The collection comprised magnificent bulbs of Cranston's Excelsior and Ailsa Craig onions, Sutton's Autumn Mammoth, and Magnum Bonum cauliflowers of great excellence, the heads being the finest that have come under our notice this season. Dobbie's Selected parsnip, a yard or so long, and perfect in shape; Gladstone pea, the pods of immense size, well filled, and of the deepest green; Britannia and White City potatoes, the tubers rather on the large size and perfect in shape; beet, good in shape and colour; red and white celery of high quality; Lyon leek, of large size; and cucumbers, tomatoes, and French beans that were in keeping with the other kinds. Mr. J. E. Davis, gardener to Colonel E. R. Stewart Richardson, Ballathie, was second with a highly meritorious display, in which the cauliflowers, potatoes, runner beans, and tomatoes were the most noteworthy. Mr. Stewart arranged his vegetables on black velvet; while Mr. Davis employed velvet of a light green colour, and the darker colour was by far the best for the display of the various kinds of vegetables.

In the class for twelve kinds the premier place was occupied by Mr. S. Gordon, gardener to Sir E. Maxwell, Bart., Whauphill, Wigtonshire, who had a display in which the whole of the kinds staged represented cultural skill of a high order. Of exceptionally high quality were the celery, leeks, cauliflowers, Tender and True parsnips, potatoes, and carrots. Mr. F. W. Urquhart, gardener to H. Mungall, Esq., Melrose, staged a remarkably fine collection for second place, and Mr. A. Morrison, who was third, staged a display of the most meritorious character. Mr. Thomas Lockart, Dalmeny Park, scored for twelve varieties of potatoes with a grand lot of tubers, and Mr. J. Cassar, Dunbar, and Mr. J. M. Stewart were second and third, both showing well.

NON-COMPETITIVE EXHIBITS.

Messrs. G. Bunyard and Co., Maidstone, contributed, not for competition, a remarkably fine collection of fruit, comprising about one hundred varieties of apples, pears, plums, and decorative crabs. Conspicuous in the collection were such noteworthy varieties as Peasgood's Nonsuch, Norfolk Beauty, Lady Sudeley, Gascoigne's Scarlet, James Grieve, Mère de Ménage, Rival, Cockle's Pippin, King of the Pippin apples, Marguerite de Marillat, William's Bon Chretien, and Beurre d'Amanlis pears.

Messrs. E. Webb and Sons, Stourbridge, exhibited a comprehensive collection, comprising melons, tomatoes, and vegetables in great variety, and including a large number of the fine types with which the name of the firm is associated. With the vegetables, etc., were excellent sweet peas, lilies, and other flowers, and arranged with their well-known taste the effect was marvellously beautiful.

Messrs. Cunningham, Fraser, and Co., Edinburgh, contributed a very large and highly meritorious display of hardy flowers, as also did Mr. McOmish, Crieff.

Messrs. Dobbie and Co., Edinburgh, made a glorious display of dahlias, in which all the best of the show, fancy, collarette, pæony, and cactus varieties were represented at their best. Messrs. Dobbie also had a big collection of sweet peas, a bank of miscellaneous flowers, and a collection of potatoes.

Messrs. J. Veitch and Sons, Chelsea, exhibited a collection of pot fruits, which by reason of its extent and the splendid condition of the heavily-fruited trees, formed one of the most important of the many features of interest.

Mr. John Forbes, Hawick, Lim., contributed a magnificent collection of hardy flowers, in which many of the choicer varieties of pentstemons, phloxes, and hollyhocks were splendidly represented, with displays of dahlias, violas, and verbenas.

Messrs. W. Cutbush and Son, Highgate, tastefully arranged on the floor of the hall a big collection of cut flowers, with a lily pool as a centrepiece.

Mr. Proctor, Portobello, contributed an effective group of early-flowering chrysanthemums.

Messrs. Storrie and Storrie, Glencarse, Perthshire, exhibited a large table of fruit trees in pots, all bearing crops of great excellence, and a considerable collection of apples, pears, plums, and other fruits, arranged on plates. The exhibit was one of much interest, and was rendered additionally attractive by the groups of brightly-coloured celosias in association with the pot trees.

Messrs. M. Campbell and Son, of Blantyre, had an attractive table of cactus dahlias and early-flowering chrysanthemums. Messrs. Lang and Mather, Kelso, exhibited hardy flowers in quantity. Messrs. W. and D. Croll, Dundee, staged a large collection of apples.

Mr. R. Bolton, Carnforth, presented a fine display of sweet peas, the high-coloured varieties being particularly attractive. Messrs. Gunn and Sons, Olton, staged herbaceous phloxes in quantity and of much merit.

Pansies and French marigolds were finely shown by Mr. M. Cuthbertson, Rothesay, who had cut flowers of other good things, notably early-flowering chrysanthemums. Pansies were also contributed by Messrs. Lister and Son, of Rothesay.

Messrs. Young and Co., of Cheltenham, exhibited a large collection of cut flowers of perpetual-flowered carnations, which was equally remarkable for the high quality of the blooms and the taste shown in their arrangement.

Messrs. T. S. Ware, Lim., Feltham, staged a magnificent bank of tuberous begonias, which were admirably grown and splendidly flowered.

Messrs. J. Cocker and Sons exhibited a very fine display of hardy flowers, in which many of the finest of the subjects now in bloom were represented.

Messrs. R. Laird and Sons, Lim., Pinkhill Nurseries, had a bold group of coniferous trees, with arrangements of roses and dahlias. Mr. John Downie, Edinburgh, contributed a charming display of fine foliage plants and ferns. Messrs. T. Methven and Sons, Edinburgh, had an attractive group of lilies and clematis.

Messrs. J. Fairley and Co., Cairneyhill, Fifeshire, arranged a group of roses that was distinct in style and attractive.

Messrs. G. Gibson and Co., Leeming Bar, contributed hardy flowers in abundance and in good style. Messrs. Fairbairn and Sons, Carlisle, had a bright display of dahlias, in which the cactus varieties predominated.

MEDAL AWARDS.

Gold Medal.—Messrs. J. Veitch and Sons, fruit trees in pots; Messrs. Dobbie and Co., cut flowers; Messrs. Storrie and Storrie, fruit trees, etc.

Silver-gilt Medal.—Messrs. E. Webb and Sons, melons, vegetables, and sweet peas; Mr. J. Forbes, Hawick, Lim., phloxes and pentstemons; Mr. John Downie, plants, etc.; Mr. D. M'Ormish, phloxes and pentstemons; Messrs. Young and Co., Cheltenham, carnations; Messrs. Cutbush and Son, cut flowers, etc.; Messrs. Clibrans, vegetables.

Silver Medal.—Rev. J. Hast, apples; Messrs. Cunningham, Fraser, and Co., herbaceous plants; Messrs. G. Gibson and Co., hardy flowers; Messrs. J. Fairley and Co., roses; Messrs. Thomas Methven and Sons, clematis and lilies; Mr. R. Stannard, onions; Messrs. Laing and Mather, cactus dahlias, etc.; Messrs. G. Fairbairn and Sons, dahlias; Messrs. G. Bunyard and Co., hardy fruit; Messrs. M. Campbell and Sons, dahlias and chrysanthemums; Messrs. Gunn and Sons, phloxes; Messrs. T. S. Ware, Lim., begonias; Mr. R. Bolton, sweet peas; Rev. H. Mayall, sweet peas; Messrs. Myer and Son, sweet peas; Messrs. J. Cocker and Son, hardy flowers.

NEW PLANTS, ETC.

PTERONIA INCANA.

A South African shrub having a wide range within the area occupied by the genus. The flowers are yellow, and the small linear leaves are grey. "Bot. Mag.," t. 8,380.

DRACOCEPHALUM ARGUNENSE.

A handsome perennial labiate, a native of Dahuria, Mandshuria, and the Amur region of China, which has been known in European gardens about ninety years, and was reintroduced by Messrs. J. Veitch and Sons about thirty years ago. The plant attains a height of about two feet, and the flowers are deep lavender and borne in small whorls. "Bot. Mag.," t. 8,384.

SPIRÆA VEITCHI.

A distinct and handsome species, resembling in some respects S. canescens, from which, however, it is distinguished by its glabrous leaves. The species was discovered by Mr. E. H. Wilson in Western Hupeh, and introduced to European gardens by Messrs. J. Veitch and Sons. This fine shrub attains a height ranging from eight to ten feet, bears a profusion of creamy-white flowers, and has proved hardy in this country. "Bot. Mag." t. 8,383.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

DISEASED CELERY.—G. M., Northampton: The celery is suffering from an attack of a fungus named Cercospora api, and commonly known as Celery Leaf Blight. This disease is most common in wet seasons, and then spreads rapidly, especially during the earlier stages of celery growth. As carefully as possible remove the infested leaves, and place them in a vessel as they are cut, and as soon as the work is complete burn the diseased foliage in the boiler furnace. It is probable that little can be done at this date to prevent the spread of the disease, but an ammoniacal carbonate of copper solution sprayed on will check the trouble when the plants are young. Spray the healthy rows with a solution of potassium sulphide. Keep a sharp look-out for evidence of attack, and do not hesitate to remove and burn any leaf that shows the slightest sign of infection.

BITTER ROT IN APPLES.—J. B., Harrow: The specimens of Warner's King apples sent afford ample evidence of the work of Glœsporium fructigenum, a fungus that produces the all-too-familiar brown patches that commence as mere dots when the fruits are about half grown. Where this disease is troublesome, the trees should be frequently examined, and all fruits showing signs of the disease should be promptly picked, and so far as possible used (an extra thick peeling will remove all the affected parts), the rejected portion being burnt at once. Diseased fruits should not be stored with healthy ones, neither should they be allowed to remain on the ground as they fall, or be allowed to remain on the trees if, as sometimes happens, they shrivel up. Thorough cleanliness, winter spraying, and spraying with potassium sulphide or copper carbonate solutions in July have resulted in a vast improvement in the crops.

LOGANBERRIES. — E. A. S., Woodbridge: We have frequently drawn attention to the merits of the loganberry, as it is a free cropping fruit, and one of great value for tarts and for preserving. It was raised in California from a cross between the raspberry and the blackberry. The fruits are similar in colour and character to those of the raspberry, but they are much larger and of greater length, full-sized berries having a length of 1¼ inches. In flavour the fruits most closely resemble the raspberry, but they are more acid, and for that reason they are preferred to raspberries by many when cooked, and they are more refreshing when used for dessert, but for the latter purpose they should not be gathered until quite ripe. For bottling loganberries are of immense value, and their cultivation for this purpose is rapidly extending. The soil for loganberries should be prepared as for raspberries, and the plants should be put out at the same time, and in much the same manner as advised for these fruits, one-year-old plants being the best. Owing to their more vigorous growth they require more space between the rows than do the raspberries, and also strong supports. Where there is more than one row on the same plot the rows should be eight feet apart. For supporting the growths a trellis six feet high should be provided, and this should be formed with stout posts and strong wires stretched between them at distances of twelve inches apart, commencing from the strand of wire stretched along the top of the posts. The plants should be eight feet apart in the rows, and seven or eight shoots be allowed to each, the others being removed at a quite early stage. The canes remaining from fruiting in the following year should be loosely tied to the wires or other support as growth progresses, and after the fruiting period the old canes should be cut away, as in the case of raspberries.

HOUSING PERPETUAL CARNATIONS. —T. D., Plymouth: You cannot be too careful in the preparation of the house in which the perpetual carnations are to remain all the winter. Assuming the stock to be in a cold frame, the plants will receive no harm therein for another two or three weeks if the weather continues open. Give the house a thorough cleaning inside and out. Scrub the inside with hot soapy water after removing the old ashes from the stages. When all the glass, woodwork, and walls have been cleaned down, proceed to limewash all the wall spaces, adding some paraffin to the wash. Put new clean ashes on the stages, shut the house up as tightly as possible, and fumigate it thoroughly with sulphur. After this has been done open all the ventilators and doors, and as soon as the atmosphere in the house is sweet, the carnations should be housed. See that all pots are well washed, the drainage clear, the plants clean, and the surface soil lightly stirred before housing commences.

FIG FAILING TO RIPEN FRUITS. —A. J. H., York: The fruits arrived in such a bad condition that they gave us no clue to the trouble. We gather from your remarks, however, that the trees do not receive a full share of sunshine. This would naturally have a bad influence, because the ripening of the growths as well as the ripening of the fruits would suffer, and if growth is not fully matured the crop cannot be large or properly perfected. A large and rich root run may also add to the difficulty of securing perfect fruits, and most likely if the roots were restricted a fair crop of fruits would result, even if the other conditions are not the most favourable.

NAMES OF PLANTS.

G. S., Ryde.—1, Buddleia variabilis; 2, probably Abelia rupestris.

W. O., Brinksway.—Both specimens are garden varieties of Hibiscus syriacus.

H. L., Stone.—1, Pteris serrulata; 2, Adiantum formosum; 3, A. aneitense; 4, Doodia aspera; 5, Pteris serrulata cristata; the flower is Hibiscus syriacus.

T., Kells.—We have carefully compared the specimen with growing plants and herbarium specimens, and find it to be Poterium tenuifolium; it is too slender, and the leaves too narrow and too deeply incised to be P. canadense.

C. E. M., Lincs.—The specimens sent were not sufficient for proper identification; 1, Polystichum angulare proliferum; 2 and 6 are probably euonymuses the latter a form of E. latifolia; 3, a linaria, species not recognised; 4, send in flower; 5, Lonicera japonica aureo-reticulata.

NAMES OF FRUITS.

G. F. Guildford —1, Warner's King; 2 and 3, Worcester Pearmain.

G. C. G., Bury St. Edmunds.—Probably a Pershore plum with curious malformation; there is no disease present, and the peculiarity may be confined to the tree in question.

Azalea balsaminæflora.—Botanically this is a form of the Indian azalea, its real name being Rhododendron indicum balsaminæflorum, but it is generally known by that at the head of this note. In habit it is quite different from most varieties of the Indian azalea, forming as it does a dwarf, somewhat spreading shrub, clothed with small narrow leaves. A striking feature is furnished by the blossoms, which are quite double, about two inches across, and of a beautiful salmon tint. It is hardy in many districts, but the flowers develop best with glass protection. This azalea is also known as Azalea rosæflora, an appropriate name, as the partially expanded blossoms resemble little rose buds.—W. T.

Autumn preparation of the soil.

The destruction of soil insect pests—the Gardener's greatest scourge.

Don't wait until your crops are spoiled before you apply CLIFT'S MANURIAL INSECTICIDE, and then grumble because it will not transform them to what they *should* have been.

When digging this autumn enhance the value of every other measure you adopt for the benefit of future crops, and assure successful fruit flower and vegetable fields by dressing the soil with CLIFT'S MANURIAL INSECTICIDE.

Two to three ounces to the square yard dug in to a depth of three or four inches will effect a clean sweep of soil insects—wireworms, millipedes, centipedes, leatherjackets, wood lice, etc., *before* you sow or plant. The soil can be cropped within 24 hours of application.

Do it now! the cost is small and the trouble nil.

CLIFT'S MANURIAL INSECTICIDE.

PRICES: 1 ton, £9 0 0; ½ ton, £4 15 0; 1 cwt., 10/6: ½ cwt., 6/6; 28 lbs., 4/6; 14 lbs., 3/6

KELWAY'S MANUAL OF HORTICULTURE is the best of all Garden Books. 2s. post free, from KELWAY and SON, LANGPORT, SOMERSET.

Capt. ———, Londonderry.
10th February, 1911.

"I have received your Horticultural Manual, and on looking through it, I felt compelled to write and thank you for it. To an enthusiastic amateur gardener like myself, who, through reading the weekly papers on the subject, is familiar with many of the names but not with the corresponding flowers, this book must be absolutely invaluable, and the artistic way in which it is got up, and the beautiful photographs with which it is embellished, make it a treasure well worth having. I have had the Catalogues of most of the leading firms sent to me, but nothing compares in the remotest way with yours."

VOL. LIV.—No. 3,021. SATURDAY, SEPTEMBER 23, 1911.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Roses.

In June and July, when the glorious Queen of Flowers is resplendent in her innumerable forms, decking, in the shape of bush or standard, or rambling climber, a myriad gardens with brilliant colour and a thousand and one varying arrangements of delicate petal and grouping, our minds are naturally preoccupied with that particular branch of the great rose family which affords us so much visual enjoyment. Floral charm, delicacy of odour, and brilliancy of petal constitute, however, quite secondary items in the value to humanity of the rose family as a whole, as we shall presently see. The order of Rosaceæ is a very extensive one, consisting of eight suborders, about 82 known genera, and at least 1,000 species, each characterised by some peculiarity of structure; but the arrangement of five petals to form the corolla and a cup is the predominant feature. The mode in which the seed is borne upon the plant varies enormously, as may be gathered from the fact that a very large number of our fruits belong to the rose family, viz., raspberries, strawberries, blackberries, plums, apples, pears, medlars, quinces, cherries, almonds, peaches, nectarines, and apricots, all of which produce flowers that are easily recognised as roselike, though when we come to the seed, as we have said, the diversity is great. In the Queen of Flowers, we see a tough, somewhat pear-shaped leathery receptacle, inside which are tightly packed a number of rough, hard seeds, unassociated, as a rule, with anything of an edible or attractive character; but in Rosa rugosa we see at once a strong link with the apple, since the seeds are enveloped in an edible and somewhat sweetish pulp of a bright red colour. When, however, we study the strawberry or other berries akin thereto, we find a far greater number of quite small seeds arranged on the surface or just embedded in the fruits on entirely different lines. In the apples, pears, medlars, and quinces, we find the seeds or pips in the very heart of a thick mass of pulp, which constitutes what we consider to be the fruit proper, and in each of these fruits there is a number of seeds. Turn we now to the other fruits mentioned, plums, cherries, almonds, and the modified almonds, the peaches, nectarines, and apricots, and in each fruit the centre is occupied by one seed only, protected by a very hard shell, so hard that this section of the rose tribe is termed "stone fruit," and, as compared with the numerous tiny surface seeds of the strawberry, presents probably a greater contrast in the form of the seed as could be found in any other order of vegetation. In this connection of stone fruit, the almond, with its normally repellent, leathery skin, adapted like the husks of the walnut, chestnut, and other nuts solely for the protection of its precious contents, the reproductive kernel, has been transformed by selection into the peach, nectarine, and apricot, each producing a highly attractive pulp, which invites attack both by bird and animal, to say nothing of mankind; but as a counterpoise to this we have only to examine these thickened and hardened stones and compare them with the comparatively frail one of the almond to see that Nature, after all, has taken her precautions. She has, indeed, taken other precautions, since the precious seed contains an appreciable quantity of one of the deadliest poisons known, viz., prussic acid, the presence of which gives rise to the peculiar odour of the almond tribe and its flowers. One section of the rose family therefore gives us a deadly but perfumed poison, and another the attar of roses, an innocuous and delicious odour produced by the Queen of Flowers in propria persona. Among the flowers which deck our gardens and our landscapes it is the rose which has given us our hawthorns—whitethorn or blackthorn—which render the earlier months of the year resplendent with masses of tiny blossoms, each a true rose in miniature, and in the late autumn and winter yielding the bird world its feast of brightly coloured haws, with which we have only to compare the larger ones of our finest roses to recognise the relationship from another point of view. The geums and potentillas are roses; the spiræas, different as they appear, are roses, as are all the rubus family. The common bay laurel and the Portugal laurel are both roses. If, therefore, in travelling through the country during the summer season, feasting our eyes on the wealth of rose blossoms with which it is lavishly besprinkled, we also remember that all the orchards we pass are presumably perfecting the fruit which is succeeding the earlier spring outburst of snowy white or literally rosy-pink inflorescence, and that we owe all this to the one great rose family we have treated of, we shall certainly the more appreciate the goodness of that Creator, who, from unappreciable beginnings, has fashioned forth so inestimable a gift to humanity as that family, as a whole, represents.

MR. ROBERT LAMB.

Mr. Robert Lamb, who has for the comparatively long period of a quarter of a century been actively engaged in the management of the parks and gardens belonging to the City of Manchester, has achieved so high a degree of success in the performance of his various duties as to have obtained the esteem of the citizens, and a foremost position among the large body of men who at the various provincial centres are busily engaged, in bringing, as far as is practicable, the amenities of the country into town life. After some years' experience in such gardens as those of Cullen House, Hopetoun House, Possingworth, and Buckingham Palace, and in several of the leading nurseries at Edinburgh and London, Mr. Lamb entered the service of the Manchester Corporation in 1886 as superintendent of Phillip's Park. Here he would appear to have afforded ample evidence of his remarkable ability, for in 1892 he was appointed general superintendent of the Manchester Parks. At that time Manchester only possessed three parks and two or three recreation grounds, and now they number sixty-five. This immense increase is a matter of much interest as evidence of the great change which public opinion has undergone with regard to the importance of open spaces in populous centres. The additions that have been made since Mr. Lamb assumed his present position are also of interest from the fact that they have all been planned and laid out by him, with the exception of a few minor spaces that were taken over at the time of the amalgamation of several out-townships. Both in the preparation of the plans and their execution Mr. Lamb evinced rare taste and judgment, and it is not surprising that the citizens of Manchester are proud of the beautiful parks which have been provided for their enjoyment. In several of the principal parks the permanent attractions are enhanced by the displays of summer bedders, notably Phillip's, Queen's, Alexandra, Crumpsall, Cheetham, Crowcroft, Birchfields, Gorton, and Heaton parks. With the exception of Alexandra and Heaton Parks, bulbous plants are freely used for beautifying the several parks during the spring months. In addition to forming the many new parks Mr. Lamb has introduced the system of preparing the necessary trees and shrubs at the Corporation's own nurseries, which extend over about sixty acres. During the past twelve months an eighteen-hole golf course, with an area of about 120 acres, has been laid out in Heaton Park under the supervision of Mr. Lamb; this was opened on the 7th inst., and described in one of the papers devoted to golf as "probably one of the finest links in the country." Ample provisions have been made for those interested in the games of bowls and quoits as evidenced by the fact that last year the total number of players was 146,431, while there were 33,643 players in the numerous tennis courts. There are also some 50 cricket and football pitches, and at Platt's Fields and Boggart Hole, Clough, two lakes have been recently opened for boating. We mention this as showing what has been done in Manchester in the provision of facilities for open-air recreations, and the necessity of great business abilities as well as horticultural knowledge of a high order by the occupant of a position such as that filled with so much ability by Mr. Lamb, who also has to annually supervise upwards of 500 band and other musical performances.

Calceolaria Golden Glory.—From Messrs. R. Veitch and Son, of Exeter, we have received a gathering of flowers of their hardy calceolaria, Golden Glory, which present a highly attractive appearance on our table, and confirm in a marked manner the high opinion we have had of this fine hybrid from the first. The flowers we have received have been gathered from plants that have ripened a crop of seed, and are now blooming with the same degree of freedom as early in the summer, while the individual trusses are equal to the finest of those that have as yet come under our notice. This free and continuous habit of flowering greatly enhances the value of the hybrid, which is rapidly increasing in popularity.

Evaporation from Leaves.—In the course of a lecture at Portsmouth on the "Balance-sheet of a Plant," Dr. Francis Darwin said the balance-sheet of organisms in a state of Nature was a highly complex thing, and all they could do was to hope that every accurate study of structure or function and environment might serve as a contribution to the knowledge thereof. The leaf was well known to be built up of cells which did not fit together with absolute accuracy. In the intracellular spaces evaporation went on, and it was through the stomata, or minute holes in the surface of the leaf, that water vapour escaped from the spaces by diffusion. The stomata were capable of opening and shutting like little windows, and it was in this way that the evaporation from a leaf was said to be regulated. He said that with some degree of nervousness. A few years ago no one would have hesitated to say baldly and plainly that the stomata were undoubtedly the regulators of transpiration or evaporation. But this was not now so certain. The conception on which they had all been brought up—namely, that apart from the physical surroundings (the dryness or dampness of the air) transpiration was regulated by the aperture of the stomata—was now being attacked. Investigations had been carried out by Mr. Francis Lloyd at the Desert Laboratory, in Arizona, with the view of testing the regulatory capacity of stomata. Mr. Lloyd's work was excellent, but he was not convinced that his conclusion was just —that conclusion being broadly that transpiration was not regulated by the stomata, but by some unknown physiological property of the plant. He believed they were on the right road in adhering to the old-fashioned view of the importance of the stomata in regulating transpiration. But there was still much travelling to be done on that road, and in attempting to take his audience with him along it he recognised that he had failed to bring them to any definite conclusion as to the balance-sheet of plants in the matter of water.

First College Garden in Scotland.—On the 16th inst. Lord Pentland formally opened the first college garden that has been formed in Scotland. The scheme was formulated by the St. Andrew's Committee for the Training of Teachers, and nearly four acres of land was obtained on lease for the purposes of the garden near Dundee. This land has been laid out as a garden and equipped with various glass structures and the necessary potting shed and a lecture hall. In the course of the opening ceremony, Lord Pentland said the idea embodied in the scheme was that those teachers who were likely to be occupied in rural places should so qualify themselves that they might turn their surroundings to the best account for the benefit of their ordinary pupils. Carried on in the right spirit a course of school gardening could not fail to foster a healthy respect for honest manual work; and its usefulness as an educational instrument would be enhanced in direct proportion to the degree in which it was interwoven with the other work of the pupils.

The Small Holdings Problem.—In the course of an address given at the general meeting of the Royal Horticultural Society on the 12th inst., Mr. Thomas Smith directed attention to the insufficiency of the Small Holdings Act as a means of inducing people to go back to the land. He said that, in his opinion, no permanent improvement in the situation is possible until every worker on the land is assured of an existence under better material conditions and given more frequent opportunities of associating with his fellow men. At present small holders are not, as a rule, much better off than the farm labourers. These aspects of the question were, according to Mr. Smith, ignored in the Small Holdings Act, which, to be a success, must be supplemented by a fund to place the necessary holdings within the reach of eligible men. In addition to the provision of land and money the small holders should be educated in the knowledge of how to use both to the best advantage, and this pointed to the necessity for regular and systematic courses on the numerous branches into which agricultural and horticultural pursuits and rural industries are divided. To secure intercourse between the small holders themselves and other sections of the community, Mr. Smith suggested that holdings should be grouped into small communities of from 100 to 200 families, all engaged in some main industry, with land held in reserve to provide for expansion that would take place both for subsidiary and complementary enterprises and for social purposes.

Horticultural Education in Scotland.—In the recently-issued calendar of the Edinburgh and East of Scotland College of Agriculture, particulars are given of the courses which may be taken at the central institution in the departments of agriculture, horticulture, and forestry. In horticulture, during the coming session a commencement will be made with the newly-instituted two years' course leading up to a special certificate. It is hoped that this course, which has been established at the instance of the Scottish Horticultural Association, will be taken advantage of by intending nurserymen, market and estate gardeners, and others. Under the new arrangements with the University of Edinburgh, the teaching in forestry subjects is to be shared between the University and the College, and details are given of the courses offered in the combined forestry school.

N.C.S. Chrysanthemum Conference.—The National Chrysanthemum Society has arranged to hold a conference at Carr's Restaurant, Strand, W.C., on December 4, at 7 p.m. Two papers will be contributed, and their titles and authors are "The Culture of Disbudded and Spray Flowers," by Mr. F. W. Ladds, of Swanley Junction; and "Soil Preparation for Chrysanthemums and the Use of Some Chemical Plant Foods," by Mr. Percy Cragg, of Heston.

Honey Harvest in the North.—The honey harvest in the North-east of Scotland is now practically finished, and, after a succession of profitless years beekeepers are able to report a substantial balance on the right side. The dry, warm weather in May this year enabled the bees to make an early start in accumulating stores. Swarming was common about the end of May, and beekeepers looked forward with confidence to a successful and remunerative season, for stocks were daily growing stronger, and there was an indication of plenty of clover blossom. There was a rich flow of clover honey in July, and some beekeepers reported stores of 70 to over 100 lbs. per hive as having been obtained from clover alone. The chief difficulty was, of course, the prevention of excessive swarming and the loss of bees. Reports from various places are, on the whole, highly satisfactory, and, taken all over, the average yield is calculated at from 70 to 80 per cent. in excess of the average of the two past seasons. The harvest in heather honey is not quite finished. Some strong stocks have already accumulated stores of 70 lbs. to 90 lbs., and in certain instances nearly 1 cwt. per hive. Clover honey is not finding a ready sale at high prices; it can be obtained at 6d. to 8d. per lb. Heather honey is more in demand, and is bringing from 1s. to 1s. 3d. per lb., although in some places it may be got at 10d. per lb.

Wart Disease of Potatoes in Cheshire.—The Agricultural Sub-Committee of the Cheshire Education Committee having come to a decision adverse to the appointment of an inspector under the destructive Insect and Pests Acts, the Board of Agriculture have written to that body strongly urging a reconsideration of the matter. The Board, in the course of their letter, pointed out that the interests of the county were very largely agricultural and horticultural, and among the crops grown, potatoes held a very important place, the area planted being over 20,000 acres—a figure which was exceeded in England only by Cambridgeshire, Lancashire, Lincolnshire, and the West Riding of Yorkshire. Wart disease, which the Board were anxious to stamp out, is, so far as their inspector's investigations had gone, present in Cheshire to an alarming extent. No fewer than 202 parishes were believed to be more or less seriously affected, and in certain places the disease had reached a higher density than anywhere else, except the part of Lancashire which immediately adjoined the eastern part of Cheshire. Moreover, the disease, which in other counties was confined mainly to allotments and cottage gardens, had appeared in many of the fields cultivated by the farmers in Cheshire, so that the loss incurred by this disease was probably greater in Cheshire than anywhere else in Great Britain. The Board had for some time arranged for experiments to be made for remedies for this disease, and these experiments showed that if certain measures were adopted to secure the destruction of infective material, and if certain varieties of potatoes were grown on infective soils, healthy crops of potatoes could be grown, and there was good reason for hoping that the disease might eventually be kept under, and perhaps exterminated by these means.

St. Ignatius' Bean.—The current issue of the "Kew Bulletin" contains much that is of botanical interest, the most important of the contributions being the account of Strychnos Ignati and other East Indian and Philippine species of Strychnos. An account of Strychnos Ignati was published in Hooker's "Icones," April, 1892, based on material collected in Mindanao, Philippine Islands, by Boxall in 1891. Owing to a statement of Boxall that there is another species of Strychnos known as St. Ignatius' bean, which is much more plentiful than the plant figured, and that it is the seeds of this species which are exported as St. Ignatius' beans, some uncertainty exists as to the identity of the true Strychnos Ignati. This uncertainty has been increased by the description and figure given by Vidal, as his plant is very different from Boxall's, both in floral and in foliage characters. In the course of his review of the several species Mr. A. W. Hill considers that the question of the exact identity of S. Ignati remains to some extent an open one: but he considers it is now quite clear that the plant figured in "Icones" does yield the St. Ignatius' beans of commerce.

THE WEATHER IN THE NORTH.

A Record Summer.

The past summer, writes our Aberdeen correspondent, has been one of the most remarkable experienced in the North of Scotland for many years. The figures given below were supplied by the meteorological station attached to King's College, Aberdeen University, and are very interesting.

In these northern regions the possible amount of sunshine for the month of July is 16.9 hours per day, and the actual amount registered during the past July was 7.7 hours per day, or 47 per cent. of the possible. This is no less than 15 per cent. above the normal, the general average being taken for a series of twenty-four years from 1881 to 1905. The first fortnight of July was really the most brilliant of the year, especially the second week, from the 9th to the 15th, when the amount of sunshine was no less than 38 per cent. above the average. In the first week ending the 8th, the amount of sunshine registered was 14 per cent. above the average. The second fortnight of the month was less brilliant than the first, and the third week showed actually 1 per cent. less sunshine than the average, while in the last week the sunshine was only 2 per cent. above the average. August was also a month of brilliant weather, although there was somewhat less sunshine than in July, the average being 5.8 hours per day out of a maximum of 14.9 hours per day, or 39 per cent. of the possible, giving a figure of 6 per cent. above the general average amount of sunshine according to the standard established during the years referred to.

The Temperature.

As may be supposed, the temperature was also higher than usual. The warmest day was on Wednesday, July 5, when the temperature registered was 80.6 degrees Fah. The minimum temperature for the month was 43 degrees Fah. on Monday, the 10th. The mean air temperature for the month was 65.3 degrees, and the minimum 50 degrees, giving a mean of 58.2 degrees. In August the maximum temperature was 77.3 degrees Fah. on Wednesday, the 9th. That day, it may be noted, preceded a remarkably brilliant display of lightning and severe thunderstorm.

The Rainfall.

While the distinguishing feature of July and August was the exceptional amount of sunshine, the paucity of the rainfall in those months is another noteworthy fact. The total rainfall in July in the North-eastern district was only 1.50 inches, as compared with the average of 2.90 inches for the period from 1871 to 1905. In August the rainfall was only 1.12 inches, and the average for that month in the period referred to is 3.08 inches. The rainfall during the great thunderstorm on August 9 was .32 inch, and was the biggest fall of any night during the month, the rest of the small total being made up of comparatively light showers. The readings of the hygrometer for July showed that the greatest rainfall on any day in the month was .30 inch on the 16th—the day after St. Swithin's Day. On seven days of the month there was a clear sky, on six days the sky was overcast, and on only one was there any mist.

The Wind.

Another feature of the weather during this remarkable summer was the comparative absence of strong winds. Calm weather prevailed on no fewer than fifteen days of July, and only on three days did the force of the wind extend to from four to seven miles an hour. The force of wind recognised by meteorological authorities as constituting a gale is twelve miles per hour. Here there were in July six days when the wind blew from the north, and on a similar number it came from the north-east, and on eight from the east. On twelve days the wind blew from the south-east, and on twenty from the south. On twenty days the wind was from the south, and on eleven days the direction was from the south-west. Pleasant breezes blew from the west on seven days, and from the north-west on eight days. Be it noted that on several days the wind varied, and this accounts for the greater number of days mentioned than there are days in the month. In August the number of days on which the wind blew at a rate of over twelve miles an hour was seven, but on only one of those day could the velocity be reckoned as constituting a gale. On the other hand, there were eleven calm days in August. Giving the most prevalent wind on any one day, the winds of August may be stated thus: From the south, 16 days; from the north, 7 days; from the east, 5 days; from the west, 3 days.

HYPERICUM PATULUM VAR. HENRYI.

Hypericum patulum has long been known in gardens as a handsome flowering shrub, but it could never be very widely grown as it was liable to injury from a moderate amount of frost, and killed by a frost of more than average severity. It, however, served a good purpose, for when mated with the common H. calycinum it was instrumental in producing the hybrid H. Moserianum, which is a very beautiful and floriferous shrub. H. patulum is a native of India and China. The variety under notice, H. patulum Henryi, also from China, is found in a somewhat cooler region, therefore it has proved hardier in this country, and is easily one of the most useful of the many kinds of St. John's wort which may now be obtained. Growing to a height of two or two and a half feet, it is of vigorous constitution, with dark green ovate leaves rather more than an inch long. The golden flowers are borne in clusters from the points of the branches, and the blossoming period extends from July until September.

Cuttings root with ease if inserted in sandy soil in a close case in July, and plants so raised are large enough in twelve months' time to be transferred to permanent places. As is the case with other hypericums, it succeeds in light loamy soil. If the older branches are thinned out, and the others shortened in February, the health of the plants is improved thereby.

-W. D.

Variegated Ivy-leaved Pelargonium L'Elegante.—While innumerable varieties of ivy-leaved pelargoniums have been sent out within the last 40 years, at which time L'Elegante was well known, we have still none to approach it as a variegated leaved kind. It is extremely useful as a basket plant, the habit of growth being free and spreading without any of the stiffness to be found in some of the double-flowered varieties of this section. In this variety the leaves are freely variegated with white, which, when fully exposed, becomes heavily suffused with rose, and it is then lovely. The flowers are whitish, and not particularly attractive. Of course, they are single, as double-flowered forms were not known when this was sent out.—W. T.

NATIONAL DAHLIA SOCIETY.

The second exhibition of this society for the season was held at the Royal Botanic Gardens, Regent's Park, on September 20 and 21. The trade exhibits were splendid, and the amateur classes were fairly well filled with good flowers, but in the open competitive classes the traders seemed to fight shy of each other, for rarely were there more than three competitors. On the whole the show was a good one, and visitors found the Victoria regia and the fruiting bananas additional attractions.

OPEN CLASSES.

In the open class for three bunches of cactus dahlias, varieties introduced for the first time in 1909-10, Mr. M. V. Seale, Sevenoaks, gained a first with handsome bunches of Johannesburg, Prima Donna, and Mary Purrier, the flowers pleasingly associated with foliage and grasses. He was the only exhibitor. The neat pompon cactus dahlias are delightful, and the best set of twelve bunches came from Mr. M. V. Seale, whose Firefly, Martha, Dandy, Alwyn, and Nain were very pretty; Messrs. J. Cheal and Sons, second.

Messrs. J. Stredwick and Son, St. Leonards, presented the best set of a dozen bunches of cactus dahlias, winning with handsome flowers of H. H. Thomas, Mrs. D. Fleming, Jupiter, Satisfaction, Elite, Golden Wave, Orion, the lovely Miss Stredwick, Olympic, Uranus, Indomitable, and Snowdon; Messrs. J. Cheal and Sons, second. Mr. Seale scored for two dozen cactus blooms on boards, and it was a pity he had no competitors in such a class. For a dozen cactus dahlias, on boards, Mr. Charles Turner was to the front, and had Glory of Wilts and Red Admiral in excellent form; Messrs. J. Cheal and Sons, second.

There were two exhibitors of three vases of mixed cactus dahlias, arranged with foliage and grasses, and premier honours fell to Mr. M. V. Seale for an effective exhibit; Mr. Charles Turner, second. Mr. Seale was the only contributor of six cactus dahlias, one variety, and he was awarded first prize for Snowstorm.

Mr. Mortimer led for two dozen show dahlias, and some of his best examples were J. Hickling, Red Cap, James Cocker, and Shotteshan Hero; Mr. M. V. Seale, Sevenoaks, second. The Messrs. Cheal had the best dozen show dahlias, and Mr. Mortimer scored for six show blooms with his new crimson Edward Lee.

Pompon dahlias were not quite so good as usual; Mr. Seale led for a dozen bunches, and his leading varieties were Cyril, Midget, Daisy, Edith Bryant, and Blush Gem; Messrs. J. Cheal and Sons, second.

Twelve bunches of single dahlias usually makes up a fine class, but on this occasion there were only two competitors. Messrs. J. Cheal and Sons came first with beautifully clean and bright examples of Lady Bountiful, Elaine, Mrs. Joynson Hicks, Winona, Kitty, Cardinal, Owen Thomas, Stromboli, Miss Roberts, Columbine, Miss Morland, and Rosemary Bridge; Mr. Seale second.

Mr. Charles Turner was a capital first for six vases of pæony-flowered dahlias, with splendid flowers of Salome, Seedling, Eleanor, Geisha, Bayard, and Bertha Von Suttner; Messrs. J. Cheal and Sons second. Mr. Turner also gained a first for six bunches of giant decorative varieties, and here Loveliness and Yellow Colosse were the leading sorts.

AMATEURS.

Mr. S. H. Cooper, The Hamlet, Chippenham, gained first prize for a dozen show and fancy dahlias with capital flowers; Mr. A. Robbins, Prospect Place, Keynsham, second, and Mr. A. P. Ironsides, West End Cottage, Chippenham, came third. There were four entrants in the class for three vases of cactus dahlias, ornamental foliage allowed, and here the awards were made in favour of the Rev. A. Bridge, Worth Rectory, Three Bridges—whose varieties were Hon. Mrs. Greville, White Ensign, and Arthur Pickard—Mr. G. Stevenson, Chadworth Cottage, Esher, and Mr. C. J. Blake, Clovelly, West Hill, Putney.

Four sets of nine bunches of cactus dahlias, three blooms per bunch, were staged, and the best set came from Mr. F. W. Fellowes, Lane House, King's Walden, who staged Monarch, Rev. J. Jamieson, Snowdon, Satisfaction, Harold Peerman, Indomitable, Mrs. D. Fleming, H. H. Thomas, and Jupiter in fine form; the Rev. Arthur Bridge second, and Mr. F. Grinstead, Beauport Park, Battle, third. For a dozen blooms, on boards, Mr. H. Peerman, Glenross, Nantwich, scored with big blooms of Joan of Arc, Wm. Marshall, Advance, H. Peerman, Gwendoline Tucker, etc.; Mr. W. Lockyer, gardener to the Rev. J. Twentyman, Greenhill Park, New Barnet, second; and the Rev. A. Bridge third.

The best twelve cactus dahlias, in four varieties, came from Mr. Charles Luckin, Apsley, Thakenham, and were Snowdon, Red Admiral, Rev. T. Jamieson, and H. H. Thomas; the Rev. A. Bridge second, and Mr. F. W. Fellowes, third.

The Dean Gold Medal and first prize for a dozen cactus dahlias, distinct, fell to Mr. F. W. Fellowes, King's Walden, and his selection was Satisfaction, H. H. Thomas, Ivernia, Indomitable, Dr. R. Appleton, Prima Donna, Rev. T. Jamieson, Monarch, Glory of Wilts, Jupiter, Red Admiral, and Mrs. Fleming; Mr. Charles Luckin second, and Mr. H. Peerman third; five entries. Mr. C. Luckin led for six bunches of cactus dahlias, three blooms of each, with fine specimens of C. E. Wilkins, Red Admiral, Mrs. D. Fleming, Dr. R. Appleton, H. H. Thomas, and Satisfaction; Mr. S. H. Cooper was second, and Mr. A. Langridge, Brownlow Road, Dalston, N.E., third.

Mr. Luckin, Mr. S. H. Cooper, and Mr. A. P. Ironsides were placed in the order of mention for a dozen show and fancy dahlias. The Rev. A. Bridges was the only exhibitor of a dozen bunches of single dahlias, and he deservedly received the first prize for a good set of Brilliant, Owen Thomas, Rosebank Scarlet, etc.

Out of nine competitors Mr. S. H. Cooker, Chippenham, led for six cactus dahlias with beautiful flowers of C. E. Wilkins, Clincher, R. Grinsted, Glory of Wilts, H. Peerman, and Nelson; Mr. A. H. Farmer, Kitchener Road, Walthamstow, second; and Mr. G. Davidson, Bensham Manor Road, Thornton Heath, third. Mr. A. Brown, Seagrave, Beds, had the best six bunches of pompon dahlias, Mr. S. H. Cooper coming second, and Mr. A. Robbins, Keynsham, third. Mr. A. Brown was the only exhibitor of six bunches of single dahlias, and received the first prize.

Mr. A. P. Ironsides scored for a dozen bunches of pompons, and was followed by Mr. H. Brown, Havelock Road, Luton, and Mr. S. H. Cooper, Chippenham.

In the maiden classes Mr. H. C. Keen, Middleton Road, Dalston; and Mr. H. P. Howard, Chesham, were the leading prize winners.

NEW VARIETIES.

First Class Certificates.—To Collarette dahlias Diadem and Leitstern, from Messrs. Dobbie and Co., Edinburgh; the former has rosy and the latter crimson flowers. To Golden Wave and Frederick Wenham, respectively yellow and fawn pink cactus varieties, from Messrs. J. Stredwick and Son, St. Leonards; to garden cactus dahlia Sunlight, from Messrs. J. Stredwick and Son; and to Florrie Wells, a ruby-coloured cactus dahlia from Mr. H. Shoesmith, Woking.

NON-COMPETITIVE.

Messrs. T. S. Ware, Lim., Feltham, presented an attractive exhibit of dahlias, making a bold effect with tall stands of Geisha, Mrs. A. Platt, Mrs. Gordon, and other bold pæony-flowered varieties; between these stands they put up vases of the beautiful and graceful Solidago Golden Wings; along the front the popular cactus varieties were grouped in small vases. Messrs. James Carter and Co., Raynes Park, had a very pleasing exhibit, in which pæony-flowered dahlias were lightly associated with Solidago Golden Wings, graceful single sprays of this fine perennial making up the background. The foreground of the group was composed of cactus dahlias set in a groundwork of maidenhair fern.

From Chingford, Mr. J. B. Riding brought up a large collection of pæony-flowered decorative and collarette dahlias; of the latter he has a fine collection, and on this occasion he displayed about three dozen varieties, these including such striking sorts as Maurice Rivoire, Gallea, Madame Gygax, etc. A particularly bold and striking exhibit came from Mr. J. T. West, Tower Hill, Brentwood, who had cactus, pompon cactus, decorative, pompon, show and pæony-flowered varieties. Mr. West had a charming lot of pompon cactus sorts, and displayed very pretty sets of Wm. Marshall, Flash, Snowbird, Cheerful, Vivid, and Norah. The fine Brentwood Yellow, a fine dwarf decorative dahlia, was represented by plants as well as flowers, and was greatly admired.

Messrs. Dobbie and Co., Edinburgh presented a very striking lot of collarette dahlias, staging the blooms in masses of a variety; a few of the finest were Maurice Rivoire, Diadem, and Leitstern, the latter a very elegant and striking form, crimson and white.

Among the pæony-flowered dahlias shown by Mr. Charles Turner, Slough, the beautiful Loveliness stood out conspicuously; Sunstar, Leander, Coriande, and Hermosa were others possessing many attractions.

In the great conservatory a huge exhibit from Messrs. Hobbies, Lim., Dereham, provided the finest feature of the show. In nearly every case each variety was set up in quantity in a tall stand, with asparagus and other light foliage among the blooms. Each stand would be from 4ft. to 6ft. high and 2ft. wide when filled, and when we state there were thirty-eight of these stands some idea of their importance may be formed. All the front stands were filled with collarette sorts, and the back ones with pæony-flowered varieties; among the latter Sunset, Catherine, Loveliness, Mrs. Cragg, Careless, Leveller (fine crimson scarlet), Dr. Van Gorkem, Fanny, Geisha, and Magnet were uncommonly fine. In another group the Dereham firm had a display of roses.

Some delightful flowers of good cactus dahlias figured in the centre of a group from Messrs. J. Burrell and Co., Cambridge, and Indomitable, Florid, Fulgent, Glory of Wilts, Red Admiral, Prima Donna, Esther, and Lurid were especially worthy of note; very neat were the pompon and pompon cactus varieties in this exhibit. Messrs. Spooner and Son, Hounslow, contributed a fine table of hardy fruits.

MEDALS.

Large Gold.—Messrs. Hobbies, Lim., Dereham.

Gold.—Mr. J. T. West, Brentwood; Messrs. Burrell and Co., Cambridge; Messrs. T. S. Ware, Lim., Feltham; Messrs. W. Spooner and Son, Hounslow, for fruits.

Silver Gilt.—Messrs. Dobbie and Co., Edinburgh; Messrs. J. Carter and Co., Raynes Park.

Silver.—Mr. Charles Turner, Slough; Mr. J. B. Riding, Chingford.

Crossandra undulæfolia.—This belongs to the order acanthaceæ, and is therefore a near ally of the justicias, eranthemums, aphelandras, and other popular garden plants. It is very closely related to the aphelandras, and like most members of that genus the flowers are borne in terminal spikes, protected when in the bud state by large bracts. In the case of this crossandra the flowers, which are very freely borne, are of an uncommon shade of orange-salmon. It is a native of the East Indies, and succeeds best in an intermediate temperature. Given this it will with ordinary treatment flower more or less throughout the summer. Cuttings of the young growing shoots strike roots very readily during the spring and early summer months.—W. T.

NEW PLANTS, ETC.

SOPHRO-LÆLIO-CATTLEYA JEANETTE.

This is unquestionably one of the very finest of the hybrids derived from Sophronitis grandiflora. The second parent is Lælio-cattleya Martinetti. The flower shown (see p. 689) was fully four inches wide, shapely, and brilliant. The colouring is difficult to describe, but light and bright crimson-scarlet, with a suggestion of orange give a good idea of the shade. The neat lip is bright ruby-crimson with orange-yellow base and throat. F.C.C., R.H.S., September 12. Messrs. Charlesworth and Co., Haywards Heath.

CARNATION WHITE WONDER.

A finely-formed and fragrant white perpetual carnation that promises to be of great value. The flowers are of good size and borne on long stiff stems. White Wonder is regarded as one of the very best of the new American seedlings. A.M., R.H.S., September 12. Messrs. Allwood Brothers, Wivelsfield Nurseries, Haywards Heath.

DAHLIAS.

Maurice Rivoire.—A showy collarette dahlia with large flowers and broad ruby-crimson, purple-tinted ray florets, a yellow disk, and several white "collar" florets. This is a very decorative variety, and one that lasts in good condition much longer than the single varieties. F.C.C., N.D.S., September 7; A.M., R.H.S., September 12. Messrs. Hobbies, Lim., Dereham.

Union Jack.—A decorative single variety, but one that is not quite up to exhibition form. The segments are white, broadly edged with scarlet, and occasionally a flower carries a purplish segment, and it is to this peculiarity that the variety owes its name. A.M., R.H.S., September 12. Mr. Charles Turner, Slough.

Miss Stredwick.—A large and handsome cactus dahlia, with long florets that incurve at the tips. The colour is mauve-pink, with a yellowish glow at the base of the central florets. F.C.C., N.D.S., September 7; A.M., R.H.S., September 12. Messrs. James Stredwick and Son, St. Leonards.

Richard Box.—A beautiful cactus variety with deep elegant blooms and incurving florets. The colour is a charming shade of soft yellow. A.M., R.H.S., September 12. Messrs. James Stredwick and Son, St. Leonards.

Uranus.—A large fancy cactus dahlia of excellent form. The ground colour is creamy white, and on this are laid innumerable light splashes of rose-pink. F.C.C., N.D.S., September 7. Messrs. James Stredwick and Son, St. Leonards.

BRUNSDONNA SANDERÆ ALBA.

The parentage of this plant was given as Brunsvigia Josephinæ and Amaryllis Belladonna, but it differs from Amaryllis Parkeri, which is supposed to be of similar origin. Both in B. Sanderæ and B. S. alba the flowers are produced as in the case of A. Belladonna, and not in the circular umbel of A. Parkeri. The flowers are white, with very pale orange shading at the base. The combination title given is a bad one, and its only merit is its euphony; Brunsyllis or Amaryvigia would have been according to precedent and in some degree indicative of the genera combined. A.M., R.H.S., September 12. Messrs. Sander and Sons, St. Albans.

AMARYLLIS PARKERI.

Shown under the name of Amaryllis Belladonna Kew variety, and subsequently considered to be A. Parkeri. Mr. Hudson presented the finest inflorescence of a Belladonna lily we have seen. The flower stem was a yard high and very stout, and at its apex it carried a circular umbel of thirty flowers and buds, thus differing considerably from the usual forms of A. Belladonna, which carry their flowers in a half circle. A. Parkeri is considered to be a hybrid between Brunsvigia Josephinæ and Amaryllis Belladonna, but the plant shown was received by Mr. Hudson from New Zealand under the name of A. Belladonna Kew variety. The flowers are bright rose coloured, with pale orange shading in the base of the tube and also on the exterior. Whatever its origin (and it is to be hoped that this will be discovered), the plant is a first-rate one, and will probably secure the higher award some day.. A.M., R.H.S., September 12. Mr. James Hudson, V.M.H., gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton.

AMARYLLIS PARKERI ALBA.

This was exhibited as A. Belladonna Kewensis alba, and it is evidently a white form of A. Parkeri, as it is like the Gunnersbury plant in all but colour, its flowers being white, with pale orange shading in the base and exterior of the tube. A.M., R.H.S., September 12. Mr. A. Worsley, Mandeville House, Isleworth.

APPLE CHARLES EYRE.

A fine and extremely promising culinary apple of conical shape and regular outline. It has a pale green skin, and solid flesh of excellent flavour. Without any special treatment the tree has produced fruits of 12oz. weight and upwards. The variety was raised by Mr. Chas. Ross. A.M., R.H.S., September 12. Mr. W. Pope, The Gardens, Welford Park, Newbury.

CUCUMIS METULIFERUS.

This species, which is commonly known as the Horned Cucumber, was originally discovered by Diège in Pondoland in the vicinity of St. John's River. The plant has not been met with in South-East Africa by any subsequent collector; but in tropical Africa it is very widely distributed. When grown under the conditions favourable to the ordinary cucumber, the species grows vigorously, and bears freely. At first the short fruits are olive-green, and when they attain maturity they become rich scarlet. "Bot. Mag.," t. 8,385.

CARNATION WHITE WONDER.
A fine new white perpetual variety, sweetly scented. A.M., R.H.S., September 12, 1911. Messrs. Allwood Brothers.

The Jerusalem Sage (Phlomis fruticosa).—This, the principal shrubby member of the genus, cannot be regarded as showy, yet it has a decidedly uncommon appearance, and when in bloom is by no means unattractive. It is a member of the Labiate family, and forms a bush a yard or more in height, whose woolly stems are clothed with oblong wrinkled leaves.—W. T.

NOTES FROM HERE AND THERE.

We are drawing near to the end of this dry but glorious summer, and it looks as if it intends to keep up its reputation to the very finish, as September has made its entry dry, sunny, and warm. It is September, nevertheless, and in some respects the conditions are more autumnal than they are at this time of the year in a normal season. You look out on cornfields and see no standing sheaves, for the harvest is in, and in many cases the stubble has been broken up in preparation for the next crop. Prematurely ripe foliage falls from the trees to the ground with a rustling pitter-pat, and the foliage on the oaks looks as brown as if it had been seared by a scorching fire. In the early morning or late evening there is a misty chilliness in the air, which at times is suggestive of frost, and the ingathering of the shadows a bit sooner to-day than yesterday remind one that the long evenings are coming. These are the signs of the season, and it is not without some tinges of regret that we hail the close of this glorious summer.

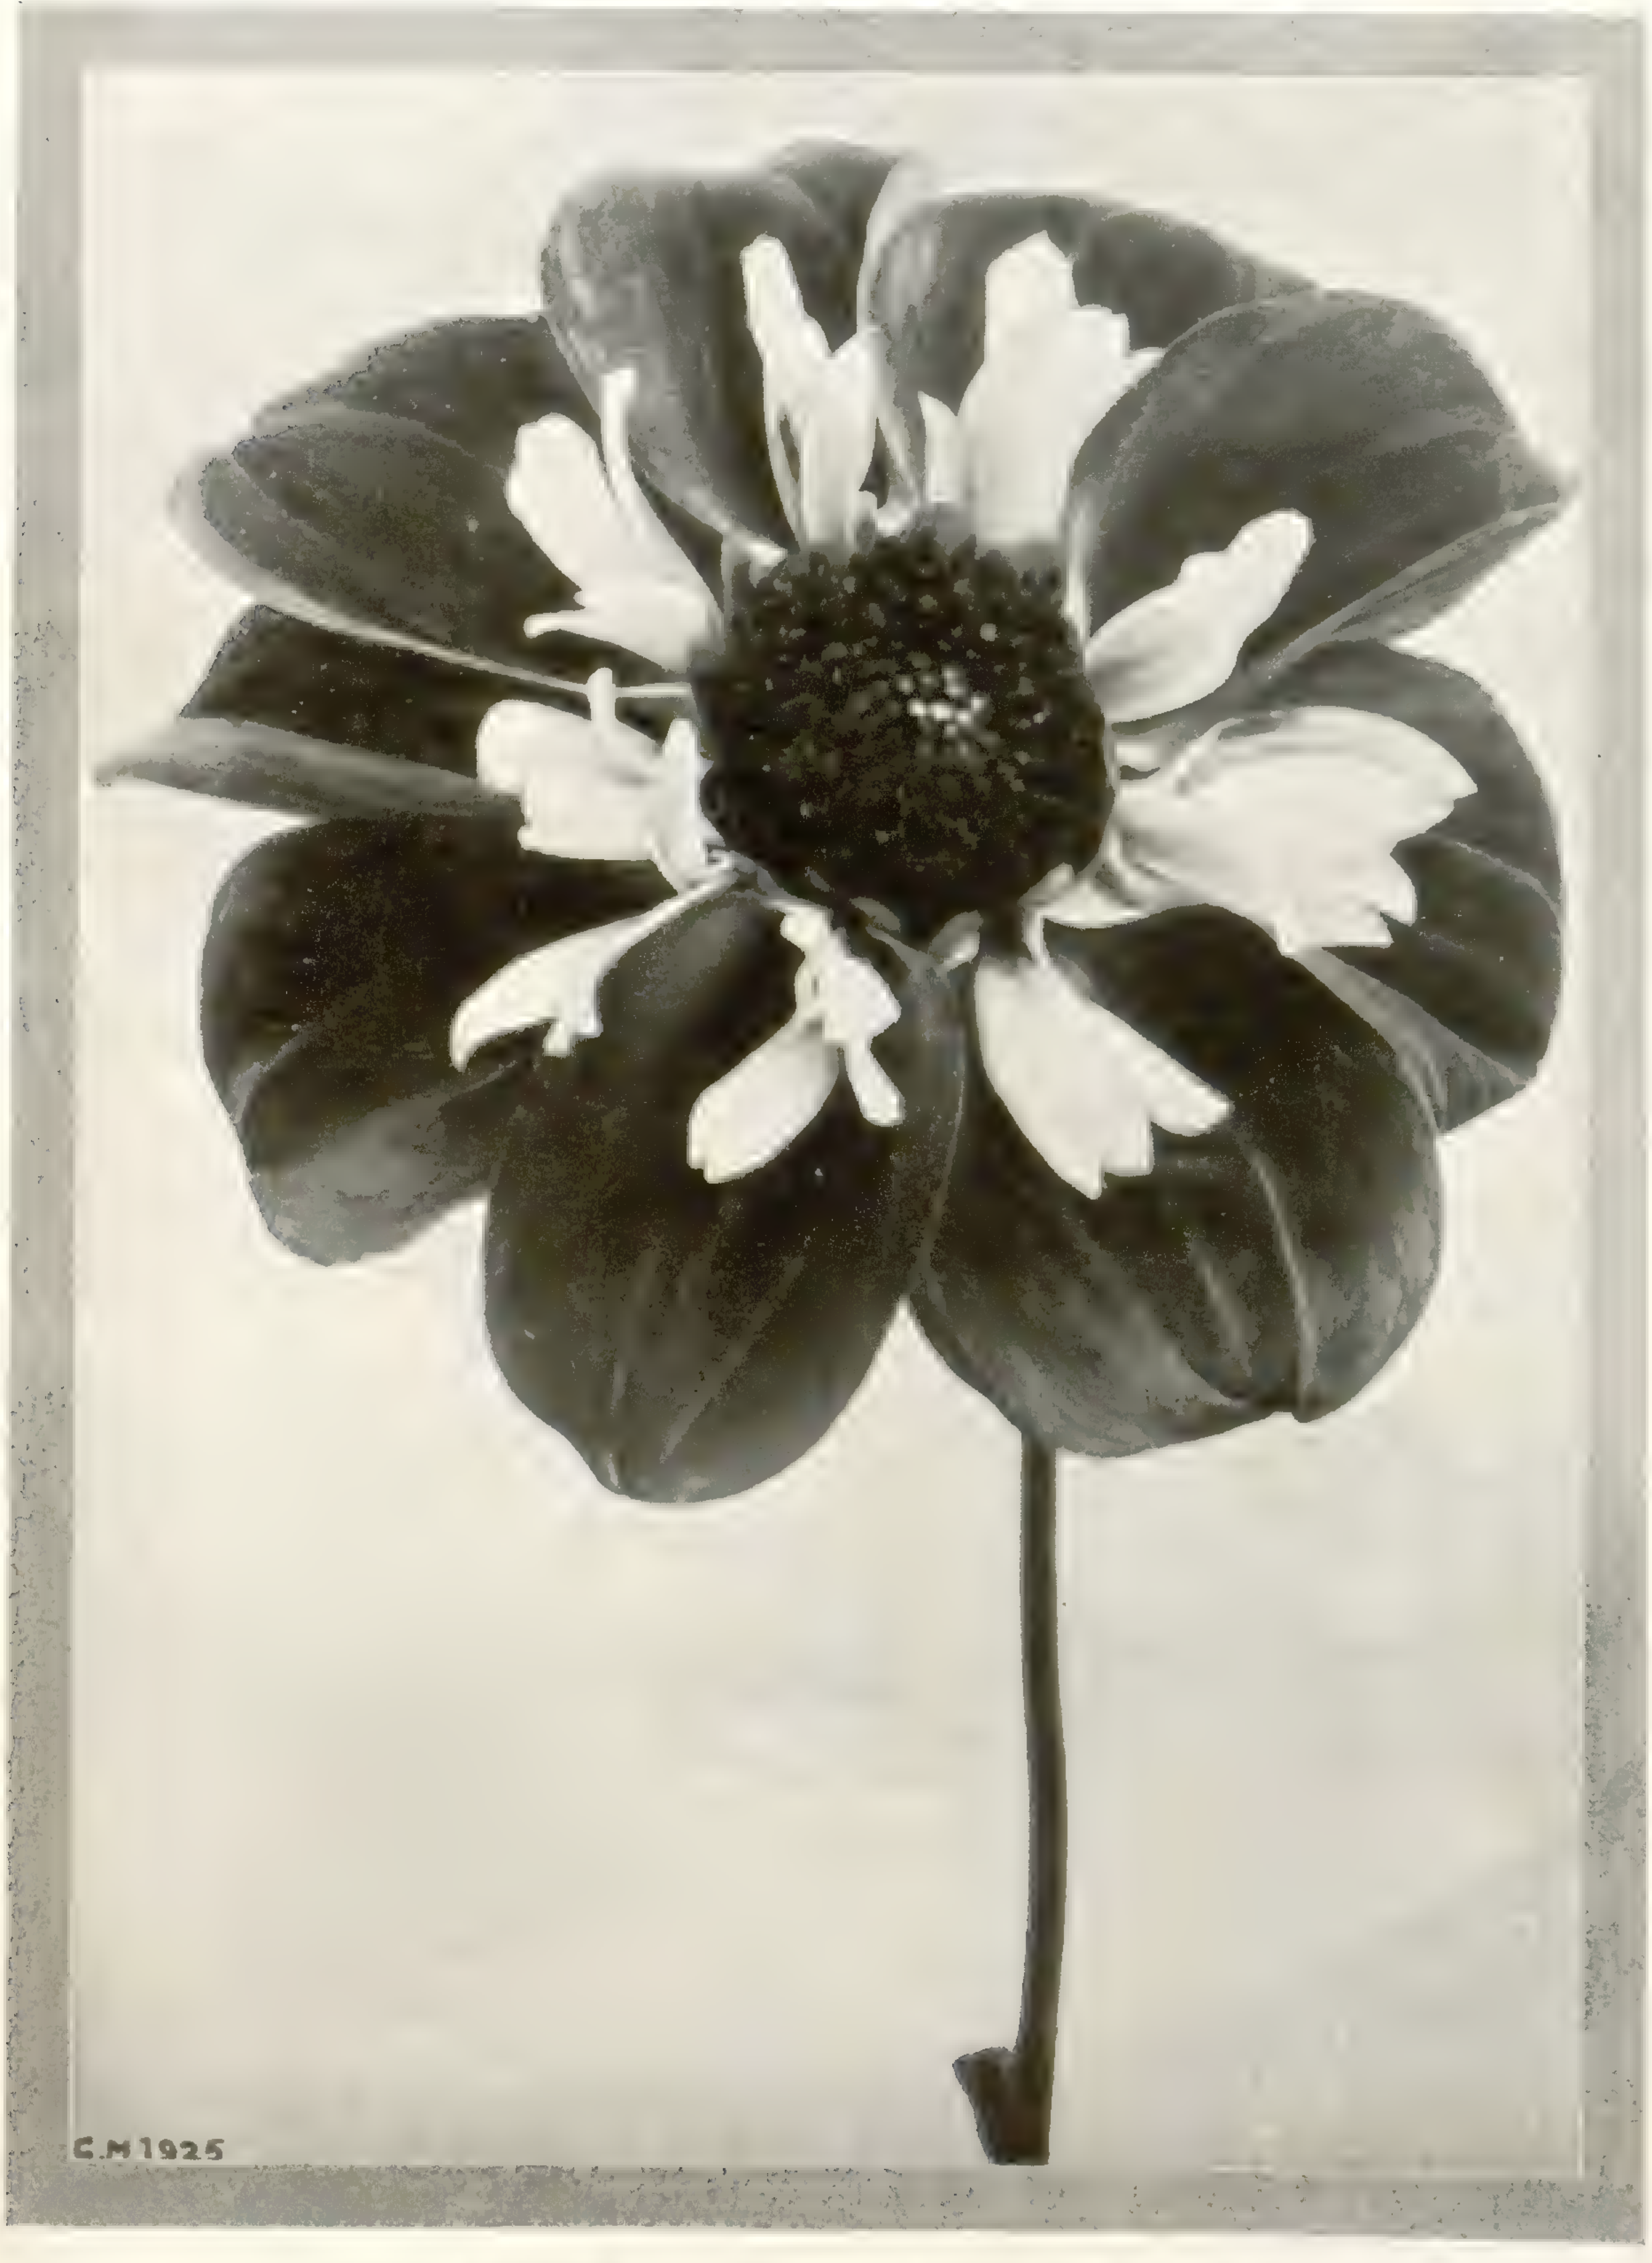
We have learnt this season to be thankful for small mercies in the way of rain, and it is surprising what an effect even a light shower or two has on vegetation, particularly if the downfall is followed by a cloudy day. Look at the pastures and the lawns. A few weeks ago they looked so brown and dry that it hardly seemed possible that the grass could grow again, but it has, and in glancing over a landscape the monotonous brown is intermingled with the fresh green of growing grass, and farmers are hopeful now of getting pasturage for their stock before the winter comes on. What is apparent in the field may also be observed in the garden, and though it will take days of rain to penetrate the dry soil, one can hardly overestimate the good that the few spasmodic showers have done. Gardeners have had such a heavy amount of watering to do this season, which at its best is weary work, that no wonder they have become tired of it, and even in some cases given it up as a bad job. And, after it all, we cannot help but notice that one of Nature's showers does more for vegetation than hours of watering.

Scarcity of vegetables is the general complaint just now, and perhaps the individual who feels the pinch most is the man who has to depend on the greengrocer for these commodities. The latter complains that he cannot obtain vegetables to supply his customers, while the market gardener compares the yield of this season with last and blames the drought; but, of course, there is another side to the story, because by the law of supply and demand when commodities are scarce you have to pay more for them. As a case in point, I was chatting the other day with a small holder who grows scarlet runner beans, but he was not worrying himself because his output is not one-quarter what it would have been in a normal season, for his little lot was fetching more money than a full crop would have done in an ordinary season. What a run there is just now on vegetable marrows, and how many a grower wishes that he had some of those marrows which went on the manure heap last year as unsaleable; but there, if he had the quantity, he would not get the price, and that is just the difference.

The outlook for winter greens is anything but rosy this year, and it will be surprising if a few months later on the story of scarcity is not general. Never, perhaps, was there a more trying summer for winter vegetables, and to-day there are thousands of plants still standing in the nursery bed because the conditions have not been favourable for planting them out. What is the prospect for autumn cauliflower? Poor, I am afraid, and the supply of established Brussels sprouts, savoys, etc., is far below the average. Some have mastered the difficulty by puddling in plants and watering afterwards, but in many cases the water supply ran out, and what was to be done then? Fortunate were those people who took advantage of the rains which fell copiously about Coronation time, and planted their winter greens, for these are the only ones which look really well. The experience is not without its lesson, which is to look ahead, and miss no opportunity of planting when plants and ground are ready, for one never knows what this uncertain climate has in store for us.

Most of us know from painful experience how insect pests flourish under the condition of a sunny summer like this, and there is a tendency to treat everything that crawls or flies as an enemy. For instance, I met with a man the other day who was in trouble about a piece of turnips which somehow or other had managed to pull through the drought. It is true that at first the flea had riddled the leaves with little holes, and later the foliage became infested with aphis, but the man knew these pests, and was not so much perturbed; but one day he came across a horde of crawling insects with which he was unfamiliar, and at once concluded that another foe had come to put an end to his turnip crop. He hardly stopped to examine or consider, his one anxiety being to kill the intruders, and he was not easily persuaded that they were not enemies but friends, for, as a matter of fact, the insects were the larvæ of the ladybird, and a careful inspection showed, much to the satisfaction of the grower, that they were feeding voraciously on the turnip aphis.

H.



COLLARETTE DAHLIA MAURICE RIVOIRE.

An attractive variety of this increasingly popular section; it has ruby-red flowers and white "collar" florets. F.C.C., N.D.S., September 7: A.M., R.H.S., September 12. Messrs. Hobbies, Lim.

"CHRYSANTHEMUMS AND HOW TO GROW THEM FOR EXHIBITION," by J. B. Wroe.—Full details on timing and stopping for Northern, Southern, and Midland growers, selections of the best varieties, illustrated instructions on taking the buds, cuttings, staging, etc. Prices 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

A COMBINATION OF LILIUMS AND ANEMONES.

In the arrangement of hardy plants in flower beds it is of the utmost importance that the subjects used shall carry on the display for as long a period as possible, and also that all shall be complementary to each other. For several reasons which need not now be detailed, liliums are not a complete success when planted alone in beds on the lawn, and therefore we find them frequently planted among low-growing shrubs that flower in spring or early summer. A quite new combination, however, is Lilium Hansoni and Anemone japonica alba. This we have seen and admired at Kew. The ample leafage of the Japanese anemone forms a splendid groundwork for the lilies, which rise well above their later flowering companions. We have on numerous occasions drawn attention to pleasing and useful combinations of hardy plants, and as the one now illustrated could be adopted in most gardens we feel sure many of our readers will welcome this brief reference to it.

SNOWDROPS.

The snowdrop is generally regarded as a type of modest beauty; as such it appeals to every class of flower lover. It is extremely easy to grow, and increases fast, having every claim to be considered a subject offering success to those having only an elementary knowledge of gardening. For those gardening under the difficulties of a town no other spring flower rewards their efforts in a more generous way than the snowdrop. All it asks for is some slight protection in the open from atmospheric deposits, so that its flowers may be kept unsullied from dirt; even where limitations of space prevent its enjoyment in the open it is still possible to grow snowdrops in pots or window boxes, as all the forms of galanthus are amenable to this treatment.

When grown under restricted conditions a rich loamy soil will give the best results, the bulbs being planted or potted up early in autumn, the latter being placed in a cool window until growth appears; water will only be required at intervals, as the soil much not remain saturated. Once the shoots appear above the soil the plants may be transferred to a living room, there to unfold their flowers. Snowdrops are best planted in the open during early autumn, the depth to plant the bulbs being from four to six inches; as a rule deep planted bulbs yield the finest flowers.

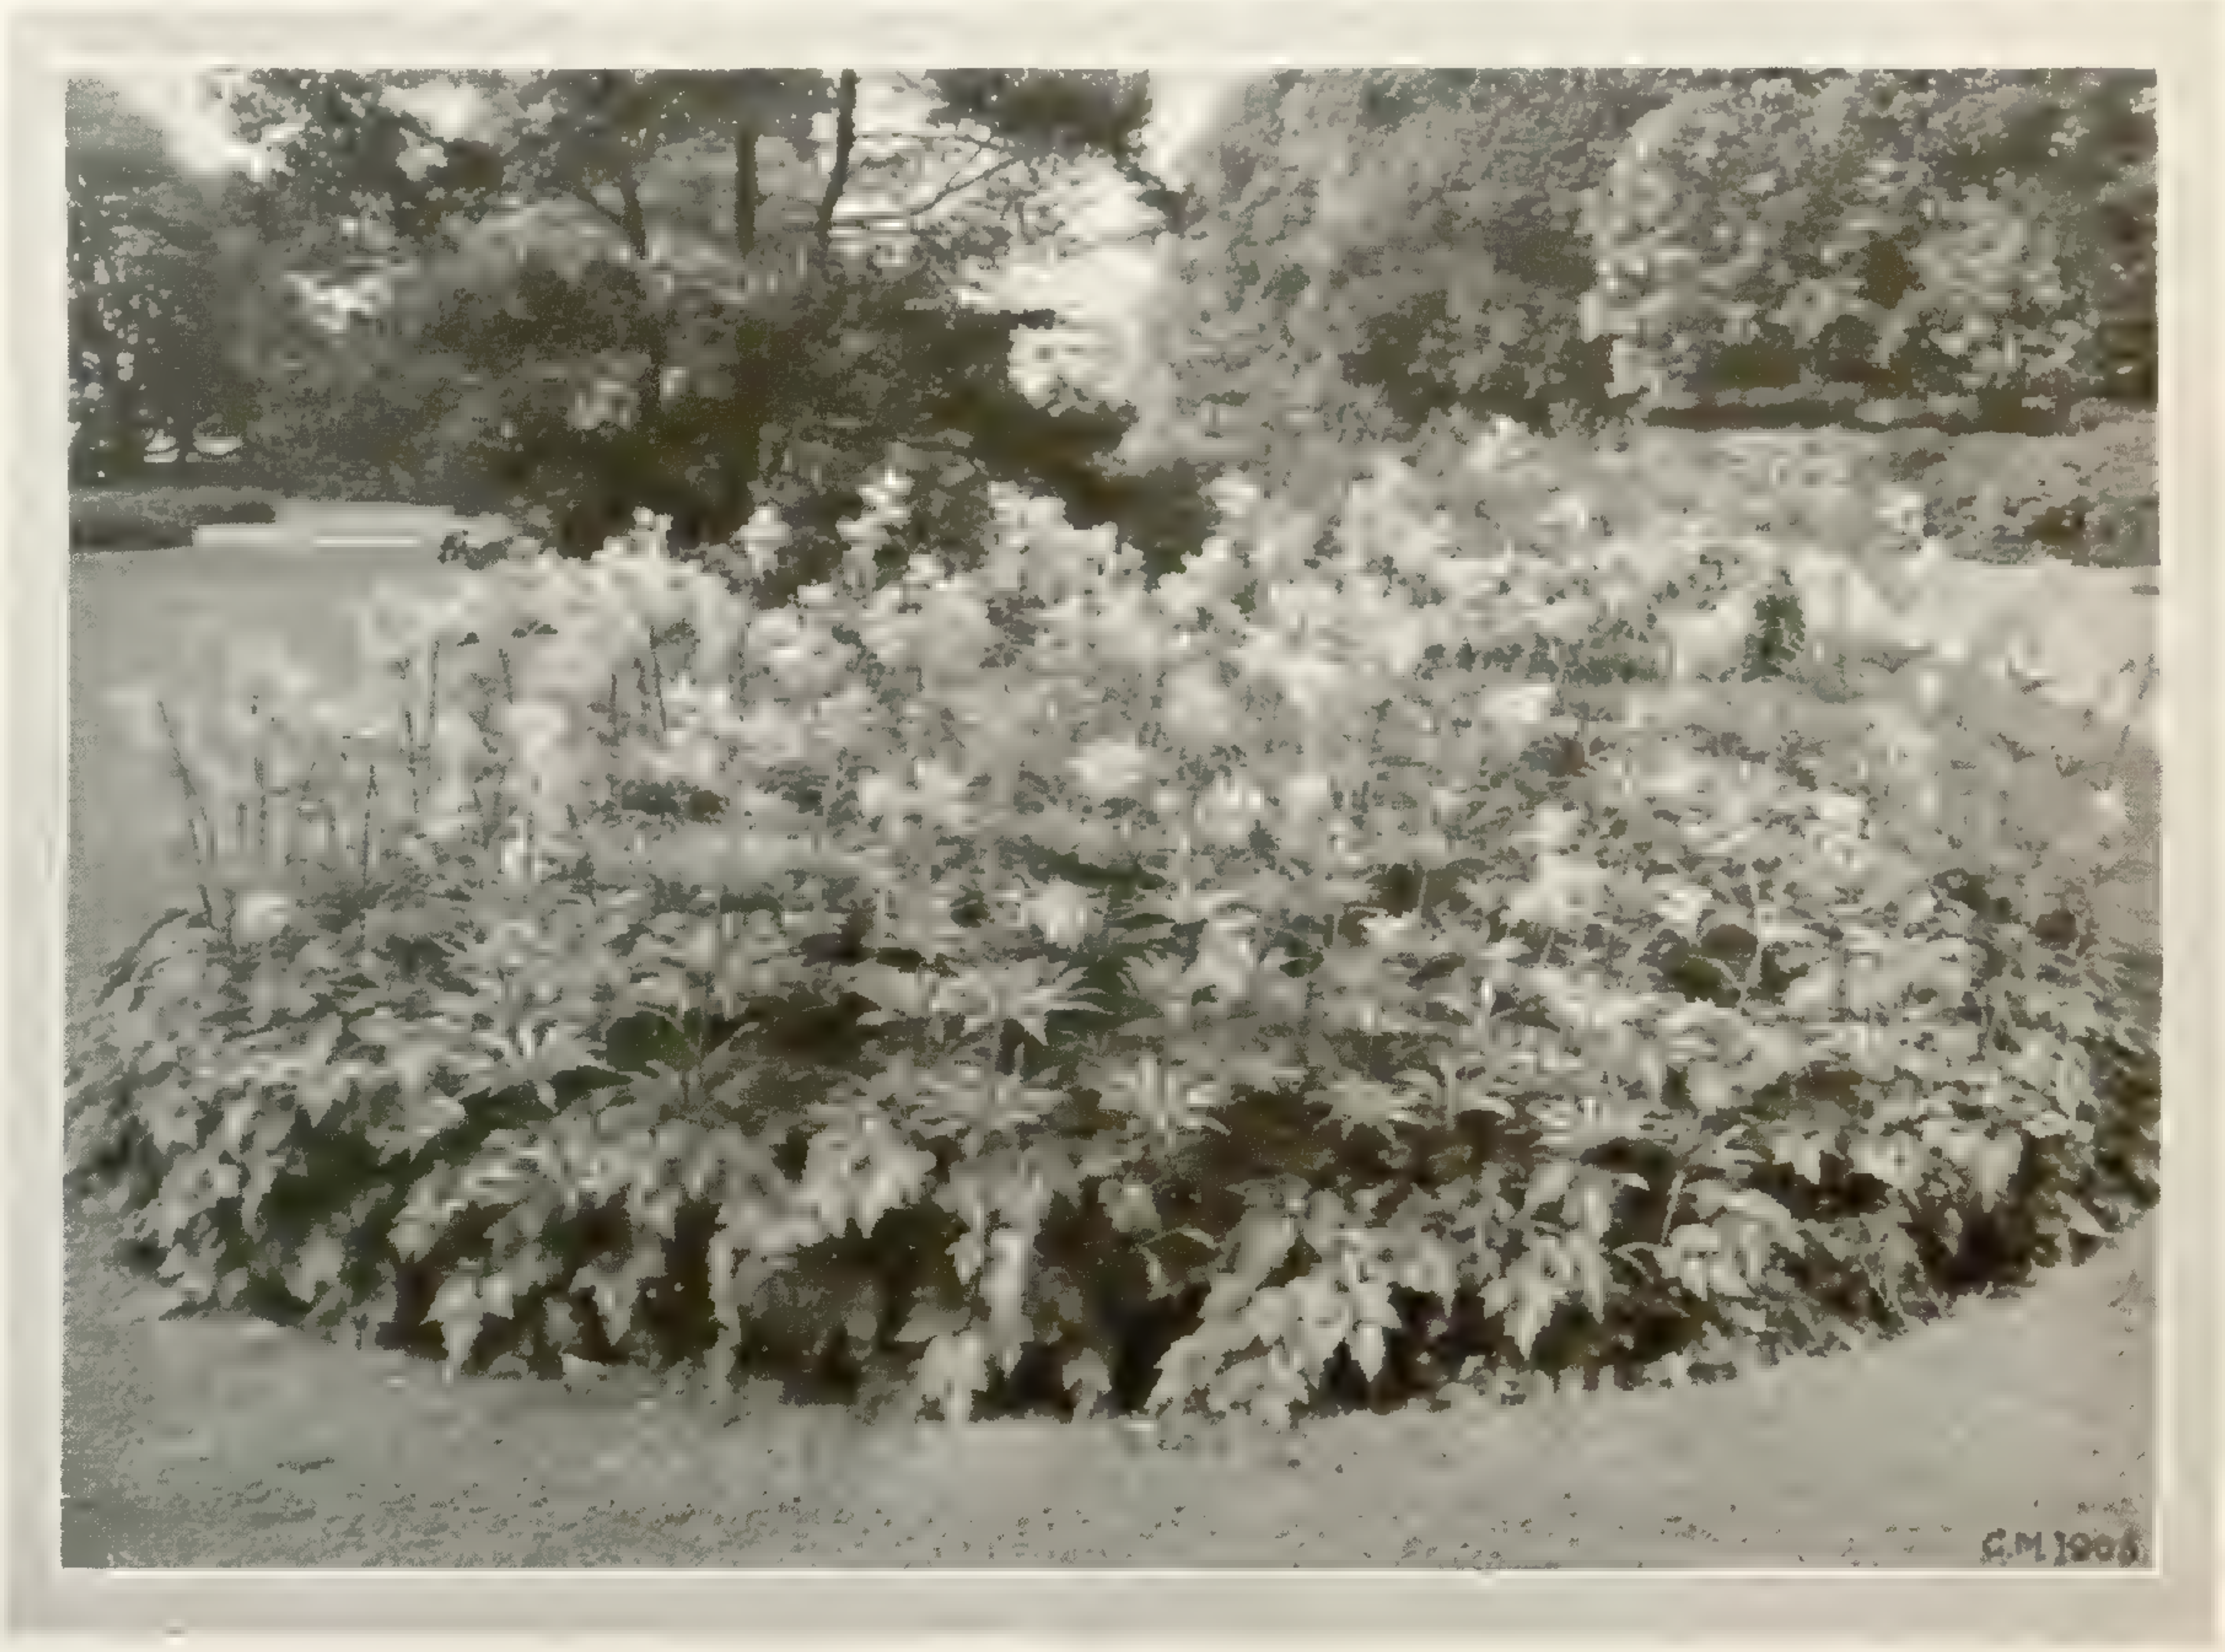
The common Snowdrop (Galanthus nivalis) is represented by double and single forms, and is the freest and cheapest kind to plant in quantity, figuring largely in country districts around cottage gardens; the milk-white flowers produce perfect snowdrifts in February, so that they transform their surroundings into picturesque scenes of more than ordinary beauty.

Galanthus Elwesi is a selected form, with large flowers on stout stems, and very broad leaves. It will not succeed under the same trying conditions as the type, but more generally prefers a good garden soil, and in such it flowers and increases freely. G. Cassaba and G. Erithræ are even finer forms than the last, differing in small details, the flowers being very large and globular. G. Cassaba has erect, broad glaucous leaves, in strength resembling those of a daffodil, and its flowers appeal to me as being more refined than those of G. Erithræ.

G. Fosteri is a fine free species, with glossy green leaves and shapely flowers, carried on tall stems, and very freely produced; a most admirable subject for pots and boxes. G. Ikariæ is the freest of all to flower; the foliage is pale green, broad and recurving; the flowers large and pointed, hang like pendant pearl drops from slender stems, and when in bloom the plant presents one of the most charming and distinct examples of these modest hardy flowers.

The choicer forms of snowdrops are all very effective in a cool greenhouse in winter, where the purity of the flowers is also appreciably increased. Grown in the open they are most effective when grouped as colonies in warm nooks on the rock garden, and with a carpet of mossy phlox or saxifrage through which to grow one gets the utmost from them in effect.

Thomas Smith.



LILIUM HANSONI GROWING WITH ANEMONE JAPONICA ALBA AT KEW.

RUST AND PERPETUAL CARNATIONS.

This disease (Uromyces caryophillinus) has used up as much printer's ink as any disease I know, and yet to-day our knowledge of it is but very limited. Certainly the dread of rust has greatly subsided since the year 1890. In fact, the present danger is that all too many treat its presence far too lightly, and particularly is this true of the market growers. Undoubtedly rust is not nearly the awful disease it was once supposed to be, yet it is sufficiently serious to warrant all good growers using every means within their power to keep their stock perfectly free from it.

Certain varieties are more prone to this disease than others. This is particularly noticeable by those who raise seedlings, as some plants become affected and others remain perfectly healthy under precisely the same conditions. Of course, any seedling prone to disease should be destroyed, for no matter how good its flowers may be, it is constitutionally weak, and the Floral Committee of the Perpetual Flowering Carnation Society intend in the future to ignore all varieties which fail to come up to their standard in this respect, now that we have the choice of so many good novelties annually.

Rust is developed in nearly all cases by either excessive moisture on the foliage or in the atmosphere, and it can hardly exist in a dry, buoyant air.

The dews of late summer and autumn develop rust on several varieties, therefore these should not be exposed to dews, but should be cultivated entirely under glass. Personally, I strongly favour early housing for all varieties. We commence gentle fire heat at night after the middle of September, and for three winters we have not been troubled with any fungoid disease, and yet the Sussex air is what might be termed humid. Good stock, of course, plays its part, but my argument is that under correct conditions, which can be promoted almost anywhere, rust ought not to exist.

The best remedy for rust is, in every case, first to remove all affected leaves, and then to dust the plants with a mixture of equal parts of sulphur and air-slaked lime. This will work marvels. To paint some lengths of the hot-water pipes with a mixture of sulphur and lime is also an excellent remedy for winter. I do not favour any liquid remedy, as the principle of the whole thing seems contrary to plants with glaucous foliage. Some growers of repute, however, recommend Bordeaux mixture; and liver of sulphur, used at the rate of about one ounce to ten gallons of soft water, with a little soft soap in it, is becoming increasingly popular in the United States. This mixture should be sprayed on when the sun is shining.

To sum the whole matter up, it is safe to say that plenty of ventilation, causing a dry, buoyant atmosphere, and houses thoroughly cleaned each year, will do much to prevent disease. We lime-wash all our walls and stages during each summer, as cleanliness is the great secret of good carnation cultivation. Montagu C. Allwood.

Asparagus.—The past summer has apparently suited this crop, and rarely has it made better growth. As soon as growth has died have the tops removed and the beds cleared of all weeds. The soil is unusually dry for the time of the year, and a good watering will assist in swelling the crowns for next season's supply. Afterwards mark out the alleys and cover the crowns with the soil, putting the beds in order for the winter.—C. Flack, Cholmondeley Castle Gardens.

BULBOUS PLANTS IN THE ROCK GARDEN.

Now that the bulb planting season is with us, a few remarks may not be out of place concerning those bulbs which are suitable for cultivation in the rockery. They should take a prominent position, and, with careful arrangement, will greatly add to the interest of this popular phase of gardening. There is a wonderful selection to choose from, some kinds adapting themselves to the nooks and crannies amongst the rocks, others to the grass slopes and banks.

The genial climate of the south and south-western counties offers a splendid opportunity to those who wish to grow the choice and tender varieties which cannot be managed in gardens in cold localities. But even for these latter there are many hardy species proof against any weather. For instance, a colony of Narcissus cyclamineus growing in the grass at the base of a stone is very effective. There are also N. triandrus (Angel's Tears), N. minimus, and N. bulbocodium, all most suitable for the purpose. The hardy cyclamen provide an interesting group, and will thrive in the pathway, when planted in a nook at the base of a rock out of harm's way.

Among the anemones we have A. appennina blanda, which is one of the best; it makes a beautiful bit of colour, which is highly appreciated. Others are A. pulsatilla, A. fulgens and fulgens græca, A. nemerosa fl. pl., and A. Robinsoniana. The species of tulips include some rare and beautiful flowers, and a grand effect is obtained by planting T. Griegi in a carpet of Aubrietia Dr. Mules. T. Kaufmanniana is a handsome species, and should be planted at the base of the rockery to enable one to see the full beauty of the blossoms when they are quite expanded. T. Clusiana, the Lady Tulip, is small and pretty, and we also have T. Ostrowskiana, T. Didieri alba, T. Tubergeniana, T. Haageri, T. præstans, and T. saxatilis.

The Calochortus family comprises many choice and beautiful plants. They require a light, sandy, and well-drained soil, with a sunny aspect, one of the chief points being to keep the bulbs as dry as possible in the winter. They are quite hardy when afforded suitable situations, but failures are bound to occur if planted in wet, cold soils. The erythroniums are very suitable for the rock garden, and make themselves quite at home. A cool spot in the lower part of the rockery should be afforded them, and their requirements regarding soil are loam and peat. The most natural effect is obtained when they are associated with dwarf rhododendrons, azaleas, etc.

Chionodoxas and scillas are highly appreciated when seen growing in large groups or drifts in the grass. They can also be planted in a carpet of dwarf sedum or saxifrage, through which they will push their slender growths and flower stems. The muscari are another class of bulbous plants which require to be massed to obtain the necessary effect. The beauty of these is absolutely lost when planted in small clumps. It is much better to make one drift of a hundred bulbs than to split up the same number into several small lots. Tecophilæa cyanocrocus is a choice and rather tender spring-flowering bulb. In the mild climate of the southern counties it will thrive outdoors, and should be planted in well-drained sandy loam in a sunny position.

There are many kinds of iris which adapt themselves exceedingly well to rock garden adornment. Generally speaking a light sandy soil suits the bulbous kinds when given a warm position. Some are rather tender, and require a little protection in the winter. I. reticulata and its varieties Krelagei and histrioides, are very beautiful, and they flower in the early part of the year. I. alata flowers even earlier than the above, and often one sees the fine blue blossoms in January. It is a tender species, and should be afforded some protection. The lovely Algerian Iris tingitana is rather tall for the rockery, yet if a warm sunny nook can be found for it it should certainly be grown. Iris bucharica is another choice species which requires a warm position. We have also I. sindjarensis, I. Vartani, I. Bakeriana, and I. Warleyensis. I. Susiana, the Mourning Iris, is a magnificent flower, and is a plant which well repays a little extra trouble in its cultivation. A warm corner should be afforded it, with a light and thoroughly drained soil. In damp, cold localities it is advisable to afford it the protection of a handlight during the late autumn and winter. The chief point in the successful cultivation of the bulbous species is to keep the bulbs dry in autumn and winter and allow them to thoroughly ripen and rest. To accomplish this artificial means often have to be resorted to, such as covering the soil with a small handlight or a sheet of glass. These irises strongly dislike any disturbance, and when a clump is found to be growing well it should be left severely alone.

IRIS BUCHARICA.

An interesting and beautiful species with white and yellow flowers. The group illustrated was exhibited in the spring of this year by Messrs. W. Cutbush and Son, Highgate.

The trilliums are beautiful plants for moist and shady situations, where they will grow freely. A mixture of peat and loam suits them.

E. C. Pooley.

THE ORANGE-BERRIED PYRACANTHA.

On several occasions within the last few years attention has been drawn to this plant, both in the horticultural press and by specimens exhibited at the Horticultural Hall. It has appeared as Cotoneaster angustifolia, the name by which Mr. M. L. de Vilmorin distributed the plant from his arboretum at Les Bavies. On the occasion of a plate being published in the "Botanical Magazine," t. 8,345, in 1910, its botanical affinities were worked out, and it was found to agree closely with the plant known in gardens as Cratægus pyracantha; therefore, as that plant possessed characteristics which were not shared by other species of cratægus, the generic name of Pyracantha given by Roemer was revived for the three species which had been known as Cratægus pyracantha, C. crenulata, and Cotoneaster angustifolia respectively.

Seeds of P. angustifolia were sent to Les Bavies from Eastern Tibet in 1895, and a few years later a well-fruited branch exhibited at the Horticultural Hall, in London, created much favourable comment, for it was as well fruited as we usually find the common pyracantha to be, and the colour was a rich orange. The species may be easily distinguished from the older one on account of the greyish appearance of its narrow evergreen leaves. For planting against a wall it makes an excellent companion for the ordinary pyracantha, or "Buisson ardent," but it is less useful for the open border, for although it grows with the greatest freedom, a moderate amount of frost injures it rather severely. It will therefore be understood that it must have wall protection, except in the warmer parts of the country.

W. DALLIMORE.

WAXPOD, OR BUTTER BEANS.

There are two distinct types of waxpod beans in cultivation, one a dwarf grower and the other belonging to the climber, or runner, type. It is to the merits of the latter that I more particularly wish to direct the attention of those in search of fresh delicacies for the table. I am sure that, were their superb qualities better known, their cultivation would be widely extended, even to the curtailment of the space now devoted to so many of the older forms, both dwarfs and climbers. That these would be entirely superseded is very improbable; in fact, such procedure would be unwise until at least a thorough trial of the butter beans had been carried out.

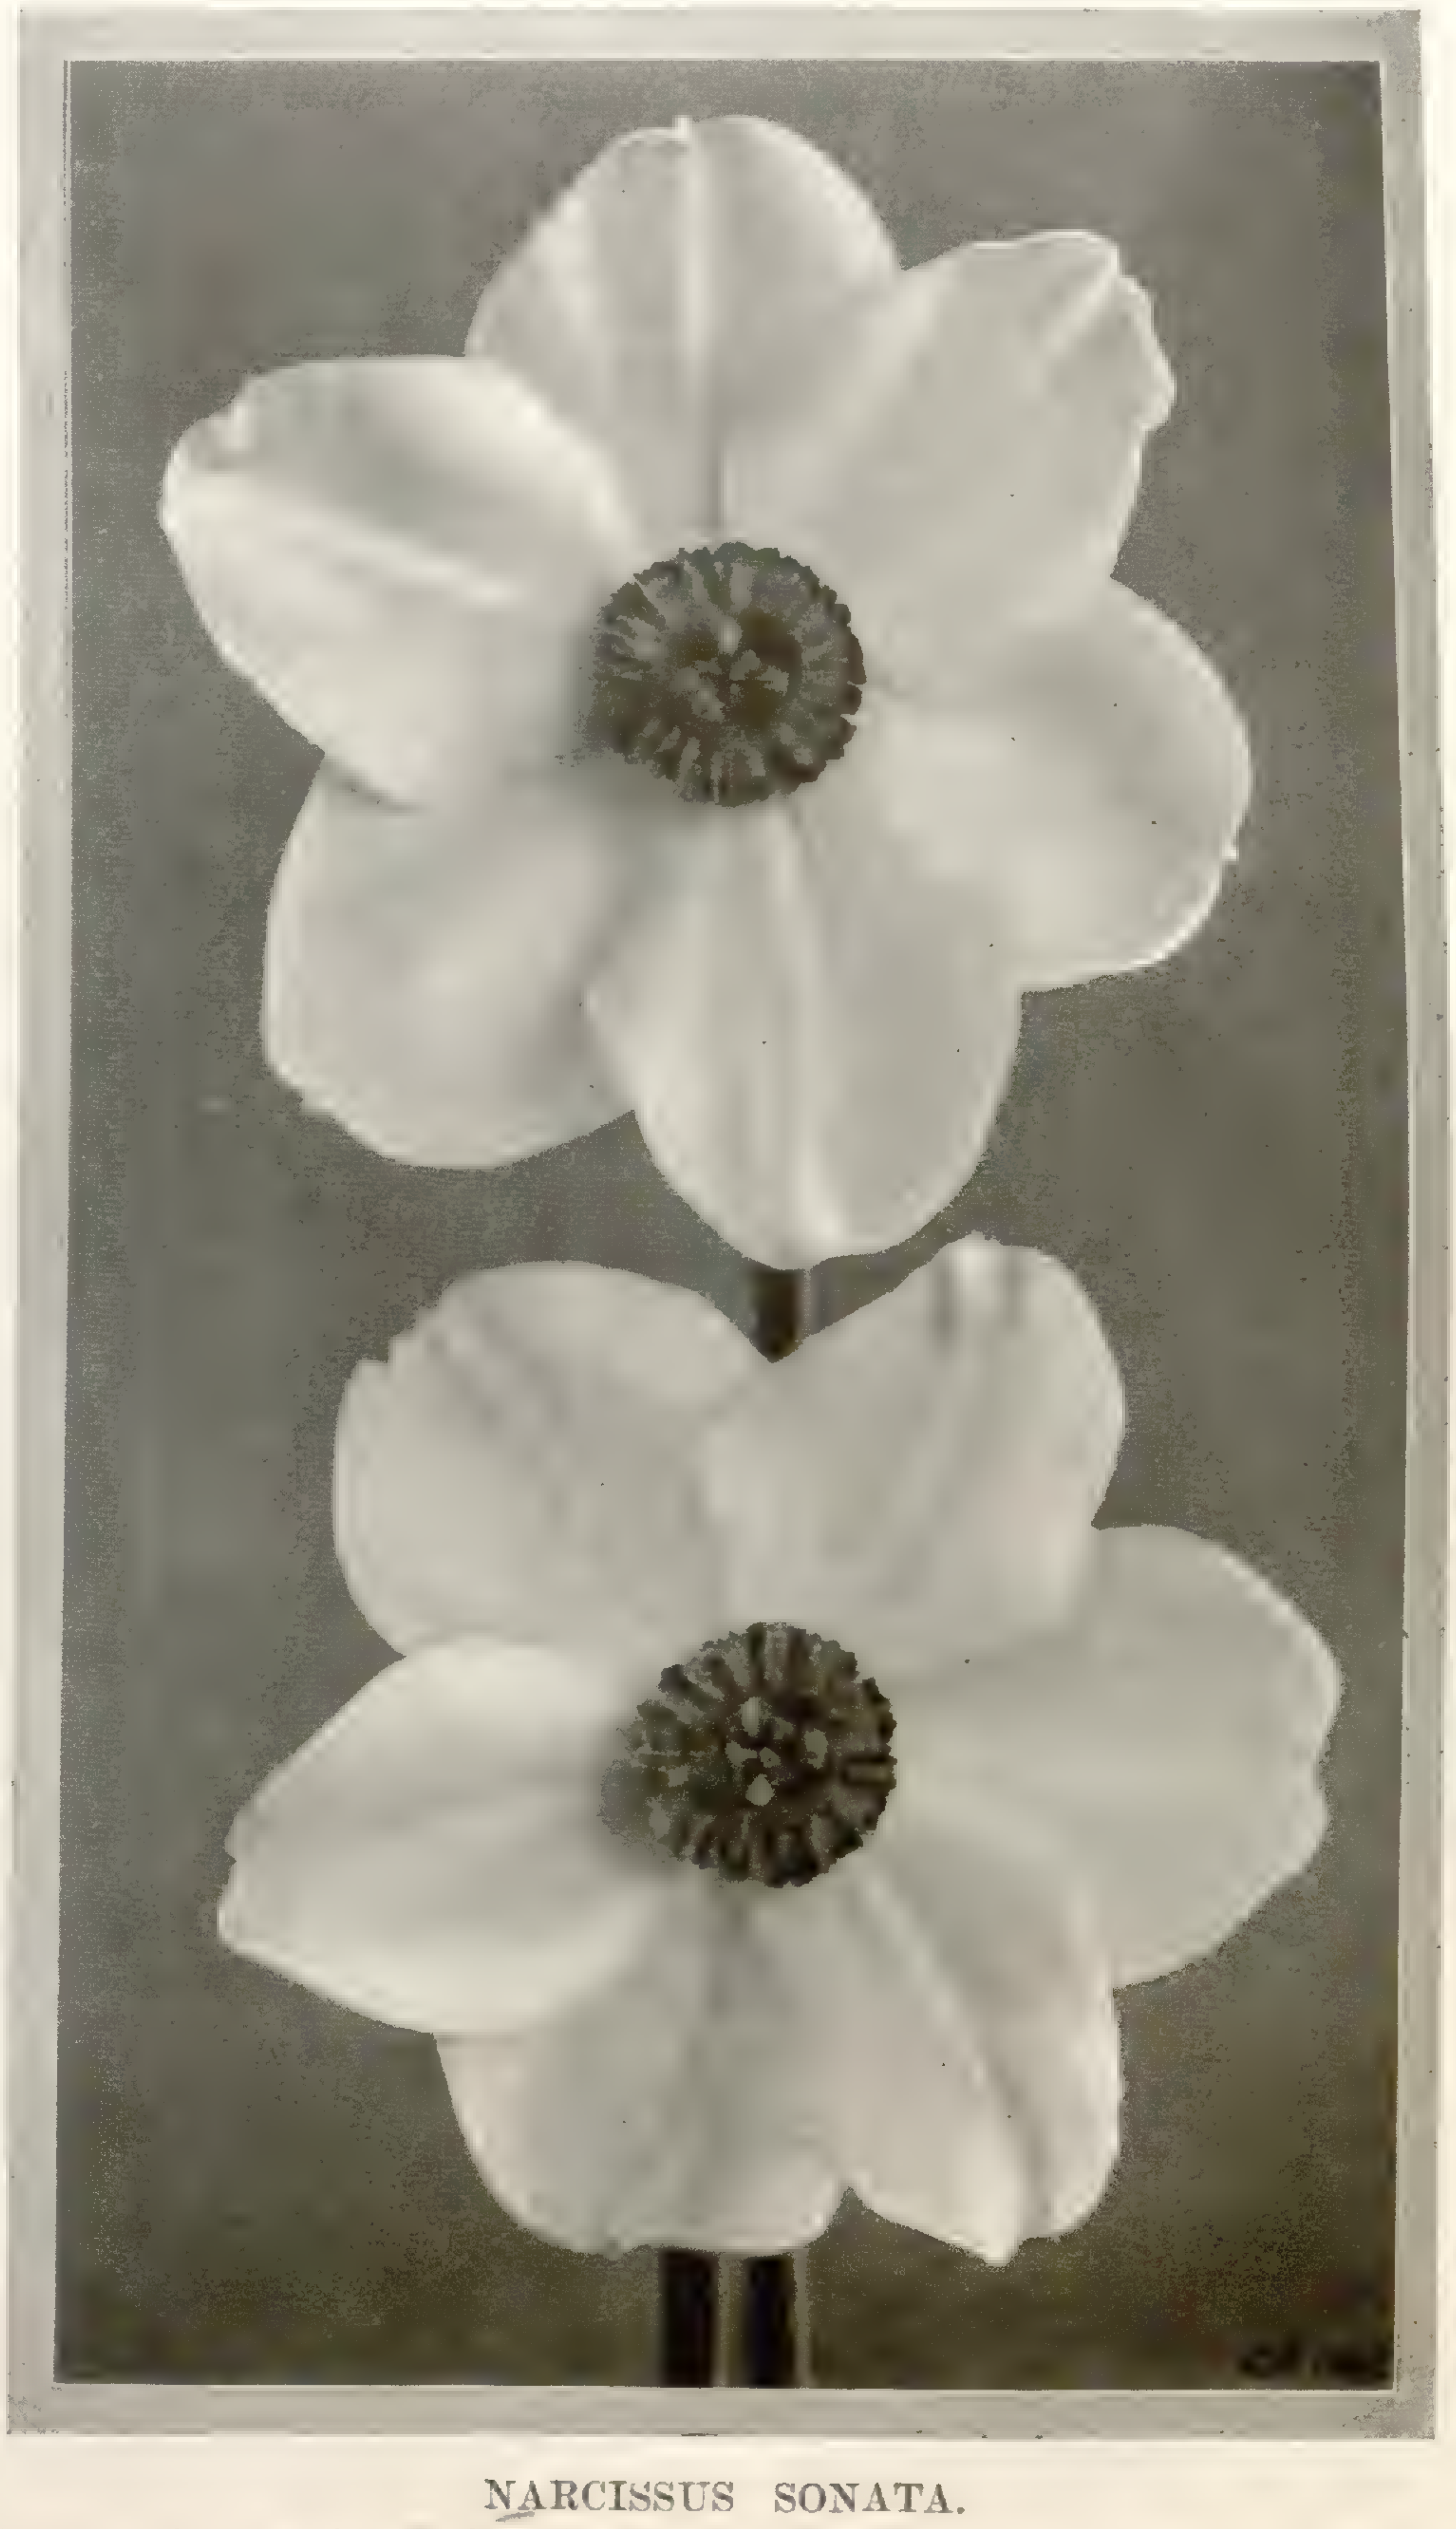
The present season, with its excess of heat and bright sunlight, appears to have been highly favourable to butter beans, of which the golden-podded variety Mont d'Or is, perhaps, the best of a somewhat limited class, owing to its free growth and bearing capacity, and to the pale yellow colour of the pods as they become fully grown.

In their preparation for table the pods may either be cut in the usual way or boiled whole, the latter course being most in favour, as thereby the colour is partly retained and the rich flavour more pronounced. In northern gardens a rich, well-exposed site, where sunlight and air obtain free access to the rows, is most essential, and in seasons of drought occasional sprinklings overhead greatly aid the proper setting of the flowers; and copious root waterings, whenever possible, will prolong growth, and consequently the supply and quality of the pods.

JAMES DAY.

A NEW POET'S NARCISSUS.

The chaste beauty and sweet fragrance of the Poet's Narcissus have always found favour among lovers of spring flowers, and it is small wonder that a narcissus possessing so many good qualities as it does should have attracted the attention of raisers. It was early used as a parent for the production of a new race of daffodils, but in more recent years the several varieties have been intercrossed for the purpose of obtaining new and improved forms of pure poeticus type, and great success has attended the work. The one unfortunate part about the increase of Poet's Narcissi is that so many of them vary so little from each other that only the ultra-expert can distinguish one from the other. It must not be forgotten, however, that the raising of true Poet's daffodils has already produced a desirable effect in the cut flower markets, as considerable stocks of large-flowered, finely-formed, long-stemmed, and substantial varieties are now in cultivation, and these splendid flowers are eagerly purchased by the leading florists.



NARCISSUS SONATA.

A beautiful poeticus variety raised by Mr. F. H. Chapman; the stock was purchased by Messrs. R. H. Bath, Lim. A.M., R.H.S., May 9, 1911.

To the daffodil fancier these varieties of Narcissus poeticus appeal strongly, and every new one that appears is closely scanned, and its qualities estimated to the last degree. Among those that have passed muster this year is the one figured in the present issue. At the meeting of the Royal Horticultural Society's Daffodil Committee, held on May 9, Mr. F. H. Chapman submitted the variety named Sonata, which had an Award of Merit made in its favour. This, as will be seen, is of beautiful form, while the crimson and orange cup is unusually beautiful in shape and colour. This fine variety passed into the hands of Messrs. R. H. Bath, Lim., of Wisbech.

CHRYSANTHEMUMS.—For full instructions on the Culture of Early-flowering Chrysanthemums in beds or borders for garden or greenhouse decoration, read the Second Edition of CHRYSANTHEMUMS FOR GARDEN AND GREENHOUSE, by D. B. Crane, price 2s. 6d. net; or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

SWEET PEAS FOR FLOWERING UNDER GLASS.

The cultivation of sweet peas for early blooming indoors is annually increasing, and I have no doubt will continue to do so as long as these flowers continue in popular favour. The beautiful displays of indoor-grown sweet peas at the Temple Show this year was ample evidence that they can be as well grown indoors as outside. Although most of the exhibits were from nurserymen or market growers, such displays must tend to increase their cultivation in private gardens generally under glass, and those who have good lofty houses available might with advantage utilise one or more of them in the cultivation of sweet peas.

BASKET OF ROSE KAISERIN AUGUSTA VICTORIA.

One of the set of five baskets of roses that secured first prize at the National Rose Society's Autumn Show for Messrs. W. Spooner and Sons.

The flowers in one or two of the best exhibits at the Temple Show were, from my personal knowledge, cut from plants that were planted out in the houses and trained in just the same manner as those grown for exhibition in the open. No wonder, therefore, that we saw some really excellent examples of sweet peas; but for the supply of cut flowers for general decorative purposes such a system is not necessary, for by utilising ten or twelve inch pots much more bloom may be obtained in a given height than from those planted out. In the latter case the house or houses must practically be given up to the peas from January to early in June, which is a quite long time, and really extra good results are required to warrant such a course being adopted. When grown in pots they only take up a small amount of room during the winter and early spring months; in fact it is not till about the first week in April that they need much spacing out, although, of course, everyone with a practical knowledge of sweet pea culture is aware that the more light and air given them the better will be the results.

For this phase of sweet pea cultivation it is quite essential that early sowings should be made. The third week in September is probably the best time to sow to ensure really first-class results, although sowings made from that date till the middle of October will prove satisfactory.

I prefer to sow in 48-size pots, placing from four to six seeds in each pot, and using a moderately light compost, not too rich. The pots when filled may be placed out of doors, but as at this time of the year we often have wet spells of weather, it is advisable to place them in a frame where lights can be put over them when necessary. When this is done there is no danger of the soil becoming excessively wet, which is very detrimental to germination. After a season such as the present one the seeds will no doubt be exceptionally hard and ripe; therefore to assist germination a very small portion of the outer skin should be shaved off. This, however, is only necessary in the case of the larger, hard-seeded varieties, and should not be practised with those having white or lavender flowers. It is hardly necessary to say that as soon as the young plants appear through the soil full exposure to light and air should be given them to ensure a strong, short-jointed growth quite from the outset.

With the advent of very cold weather the pots should be partly plunged in ashes, allowing a little space between each one; this prevents the soil becoming dry, also in the event of it being frozen it keeps the pots from breaking. It is not advisable to have the soil or plants frozen if it can be avoided, and arrangements should be made to cover them with mats or some other protective material in the event of very cold weather. With a little protection the plants may with advantage be left in the cold frames till the middle or even the end of January. By this time they should be strong and bushy plants, and from five to six inches in height, with plenty of roots. They should then be removed to a light, airy house, and here they will soon begin to grow quite freely. At this stage no artificial heat should be used except, of course, when the frosts are very severe.

Early in February they may be shifted into their flowering pots, ten or twelve inch being the best sizes. The compost should not be too rich, but just a nice friable loam to which have been added some bone meal, lime rubble, and enough spent hotbed manure to keep the loam moderately open. Pot rather firmly, after which the pots may be placed quite close together for a time, and if they are fairly wet at the time of potting they may not require water for a few days, but after this they must have a good soaking, and this will be found to last them some time, as the growth will be slow. As necessary small twigs should be placed around them to keep them in position, using those about eighteen inches long. They will require spacing out as growth proceeds, and quite early in April they must be given all the room that is to be allotted them, and the permanent stakes put to them.

It is an advantage to stand them at this stage on a cool surface, and if an inch or two of short manure can be placed under the pots it will be found a good rooting medium when they are coming into bloom, as it is just then that they require a good root run and plenty of moisture. If they have to be stood in a house with stages, a turf turned upside down under each pot will help to conserve the moisture, and thus save time with the watering-pot.

As I already mentioned, up to the time the plants are in bloom watering must be carefully done, not only to keep a stocky growth, but also to try and prevent bud-dropping. Once they are well in bloom there is no fear of this, and, being well rooted, they will take almost an unlimited amount of water and liquid manure, and if either is neglected they will very quickly suffer. The matter of ventilation is an important one, and as the plants are coming into bloom great care is necessary to see that the temperature does not rise unnecessarily high, this being also one of the chief causes of bud-dropping indoors.

The choice of varieties must, of course, be left to the individual, but it is not wise to grow too many nor those of very delicate shades of colouring, as the colours are not apt to improve under glass, although in some instances they do so. Those I have noted doing really well under glass are Sunproof Crimson, Thomas Stevenson, Earl Spencer, Doris Usher, Mrs. Henry Bell, Frank Dolby, Constance Oliver, Gladys Burt, Clara Curtis, Moneymaker, and Nettie Jenkins.

If well managed, sweet peas under glass will continue in bloom for a considerable time, and may be done quite well in any cool house where there is plenty of head room, the critical time with them being just as they commence flowering, but once this is passed they are no trouble whatever. Greenfly is the only insect likely to trouble them, but a good syringing or two or a slight fumigation will soon get rid of this pest, and even after they are turned out of doors the plants will continue blooming, and if the flowers are not wanted will often set a really good crop of seed, and this on varieties from which one has a great difficulty in obtaining seed when growing in the open ground.

THOMAS STEVENSON.

WYCHALL NURSERY, KING'S NORTON.

The last day of July will linger long in my memory as one of the most enjoyable days I spent during the present summer. It was on that day I visited Wychall Nurseries, King's Norton, where Messrs. A. R. Brown, Lim., cultivate an extensive and very fine collection of border carnations and picotees. Mr. A. R. Brown has breathed the perfume of carnations from his earliest days, and may well claim to have inherited his love for these flowers. His father was prominent among the leading florists of the last century, whilst his grandfather was growing and showing carnations away back in 1795. That our friend made good use of his opportunities for acquiring knowledge of this particular branch of floriculture ample evidence is afforded by the robust health of the plants forming the collection at King's Norton, and by the fact that since the year 1886, when he started in business for himself, the firm has won over 2,000 prizes and five champion medals. Mr. Brown was exhibiting long before the year 1886, and, in fact, has still in his possession a pair of ivory tweezers that were made for him when five years old. As might be expected, Mr. Brown has many an interesting tale to tell of his experiences, and recollections of shows attended in his boyhood, when he came into close contact with such men as Dodwell, Simonite, Moreton, and others who were prominent as cultivators in those days. Mr. Brown himself retains many of the characteristics of the florists of the old school. His intense interest in his flowers, and hearty goodwill toward all who have a kindred spirit makes a visit to the Wychall Nursery most pleasant. Mr. F. J. Johnston, who recently joined Mr. Brown in partnership, is also ever ready to welcome visitors, and, being a keen business man, is equally alert to attend to the needs of clients whose orders come by post.

The houses at Wychall Nurseries are light, airy structures, built expressly for carnation growing, and at the time of my visit the strong, healthy plants were, in spite of the blazing sun and tropical heat, carrying a grand crop of lovely flowers. Would that I could adequately describe the delightful display of flowers in the several houses. Were that possible, anyone who had not before thought of growing carnations would be eager to make a start forthwith. The best that can be done is to mention a few of the more distinct and beautiful varieties in the collection.

Following the bent of my own particular inclination, attention was first given to the yellow-ground fancies, and one of the first to catch my eye was Clement, a variety raised by the Rev. C. A. Gottwaltz, and introduced to commerce last year by Messrs. Brown. It is a flower of handsome build and petal, heavily marked with mahogany on a clear yellow ground. James Butler is one that will be sent out this autumn, and it should have the attention of growers. The markings are purple, and the flower may be described as an improved Henry Gough. Becky Sharp is another that calls for mention. It is a sport from Lord Steyne, maintaining the large size and fine form of its parent, but having the chaste crimson edge and markings of Sam Weller. Linkman, Hercules, Liberté, and Gaiety are a few other yellow-ground fancies of merit.

The yellow-ground picotees were naturally the next section to claim my attention, and we lingered long among them discussing the points and varying charms of the heavy-edged, medium, and wire-edged varieties. There were some wonderful flowers here, despite the fact that the heat was very trying to carnations, and many flowers were prematurely opening, and withering with equal rapidity. Among them all, Archie Brown was conspicuous for the perfection of its fine purple edge, whilst Ida Pope was pointed out as the best heavy-edged Mr. Brown has yet raised. It is bright scarlet on a rich yellow ground. A very pretty flower is Molly Dalrymple, raised by Rev. Gottwaltz. Its large smooth petals have the finest bright red wire edge, on a rich apricot ground. This should become popular. Togo, Lady Gascoigne, and Mrs. Kearley were distinct and beautiful in their way, but I must leave them to deal with white-ground picotees.

Among heavy-edged scarlets Duchess of York would be difficult to surpass, the edge is so well defined, and the broad petals are of a glistening whiteness. For outdoor culture W. H. Johnstone cannot be surpassed, and Mrs. Crooks is a capital show flower. Lady Ethel is edged with clear rose, and Silas Osbaldiston is of rich purple. Maud Brown is one of the best wire-edged, its rosy tint being clearly defined against the pure white ground. Mention must be made of Muriel Stevens, it being a perfectly built bloom with a wire edge of purple; a glance at a fully-developed bloom is sufficient to captivate anyone who knows the points of a show carnation. A lovely heavy-edge purple is Lady Sybil, the variety that won premier for Messrs. Brown at the Midland Carnation Show on August 2. The flakes and bizarres, once so highly prized by every grower, appear to have lost to some extent the affection erstwhile bestowed upon them. Where our forefathers saw in a well-balanced bizarre, or sharply-defined flake the very acme of perfection, it is not heard of to-day, for even prominent growers express the view that these are too hard and artificial-looking. For my part, however, the old-time show flowers are very attractive, and I was pleased to find at King's Norton such good old varieties as Gordon Lewis, a purple flake introduced by Dodwell many years ago. Robert Houlgrave, a fine scarlet bizarre; Ophelia, sent out by Martin Smith; George Rudd, and Brier Lea, both pink and purple, the latter of Messrs. Brown's raising; with Guardsman, the best of the scarlet flakes; and Mrs. T. Lord, a rose flake, will make a nice little set for anyone to start with, but the catalogue contains the names of a good many more of various colours and distinctive form.

There are still to be mentioned the selfs, which at the present day are the most popular of all. There are selfs to suit everybody at King's Norton, whether for colour, size, or form, but it must be added that unless a variety is particularly good in all particulars its career in Messrs. Brown's nursery is short, for every season the collection is subjected to severe scrutiny, and there is an annual weeding out of superseded varieties. Several selfs raised by Mr. Brown occupy foremost positions among the varieties in their particular colours, and of these Alba, a capital white; Rosemary, a rose self; Aleppo, deep crimson; Iberia, one of the best yellows in cultivation; and Alderman, a flower with fine broad petals of a vivid scarlet, can be thoroughly recommended. Alma is another good rose-coloured variety of exceptional brightness, and this completes a splendid half dozen.

My notebook contains the names of many more, but it must suffice to mention Cambria as a most perfectly-modelled yellow; Crystal, as one of the finest whites; and Conrad, the most pleasing of the heliotrope shades.

Of the novelties one of the first to attract attention was a large, beautifully-formed flower of a brilliant cerise shade that caught the eye as soon as the house was entered. Signal Light is the name aptly given. It should be an extremely popular variety. Royal Velvet is so named because its colour is Royal purple, and the petals carry a beautiful sheen. Another very fine variety, Mrs. F. J. Johnstone, is a crimson self of rare richness. Wyatt is a very broad-petalled rose-coloured flower that is possessed of all the qualities of a good carnation. A yellow-ground picotee with a purple wire-edge, and bearing the name of Alec, attracted my attention, and at the Midland Show Alec was a variety around which the experts lingered to discuss the points. VISITOR.

BASKET OF ROSE COUNTESS OF SHAFTESBURY.

One of the set of nine baskets of roses that won first prize at the National Rose Society's Autumn Show for Mr. Hugh Dickson.

Fokienia Hodginsi. — In the younger days of many of us, the introduction of a new conifer, more particularly a new genus of coniferæ, would have aroused a great deal of interest. It is different now, and it is questionable if the specimens shown at a recent meeting of the Royal Horticultural Society, when it was given an Award of Merit, were not simply passed over by the majority of visitors. As shown, the little specimens, at least from a horticultural standpoint, bore a great resemblance to the comparatively new Libocedrus macrolepis, which also is a native of China.—W. T.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

MASDEVALLIAS. — The robust growing masdevallias, such as M. Veitchiana, M. coccinea, M. Davisi, M. ignea, and the other species and hybrids of this section may now be examined preparatory to repotting. Before repotting it is advisable that all the leaves of the plants should be carefully sponged to remove dust and insect pests. In most hot, dry seasons, such as we have experienced this year, it will be found that, should the atmosphere become at all dry, the under sides of the leaves will become attacked by red-spider, and so a sharp look-out for these must be kept, and where found, a weak solution of soft soap will aid in their destruction. Where the plants are cleansed before potting it prevents any possibility of disturbance, which is so easily done where the plants have been recently repotted. In dealing with large specimens it is not advisable to repot more frequently than is absolutely necessary. Where the potting compost is in a good state of preservation carefully remove any dead leaf bracts, old flower scapes, and decaying matter about the base of the leaves. Where the moss has become overgrown, carefully remove this, and replace with fresh chopped moss and potting compost as the case may require, but be particularly careful that the centre of the plants is made firm.

POTTING.—Where the plants have outgrown their receptacles, or in cases where the potting compost has become decomposed, it is best to turn the plants carefully out of their pots. Where the new roots are well advanced, and there is likelihood of damage being caused in removing the old compost in the ordinary way, it is a good plan to procure a pail of rain water, and, by immersing the roots in the water, the compost may generally be washed clean away. As this section of masdevallias require an abundance of root moisture during the greater portion of the year, one of the principal essentials to successful cultivation is clean and ample drainage. Fill the pots to at least two-thirds of their depth with drainage. Peat and sphagnum moss, two parts of the former to one of the latter, with sufficient sand and finely-broken crocks added to render the whole porous, make a good compost. See that the peat used is of a durable quality, especially where dealing with large specimens. Press the compost firmly about the base of the plants, mounding it slightly to the centre. After potting water with rain water, wetting the compost through, shade for some days from glaring light, and maintain a humid atmosphere about the plants by damping and syringing among the pots, stages, etc., and should the outside conditions be at all dry, a spraying overhead once or twice a day will be beneficial. The stronger growing kinds, such as M. macrura, M. elephanticeps, M. gargantua, M. cucullata, and others may also be attended to at the present season, but the small-growing kinds, and the M. Chimæra section should have potting delayed until the early spring. —H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CHRYSANTHEMUMS.—The early-flowering bush varieties should now be placed indoors, and, if possible, in a house by themselves, so that they may be followed by the later varieties. The Japanese and incurved sections are now rapidly developing their buds, and preparations should be made for housing them when this becomes necessary. Vineries and peach houses are generally used for this purpose, so that it is advisable to remove all unnecessary foliage to secure as much light as possible for the plants. Give the house a good syringing, and if the borders are at all dry let them have a thorough watering, so that by the time the plants are brought in the atmosphere will be as dry as possible. Mildew often makes an appearance soon after housing, and as a preventive a syringing with sulphide of potassium, using half an ounce to a gallon of soft water, will be found effective. Overcrowding must be avoided, and a free circulation of air secured on all possible occasions. Continue to feed the plants until the buds show colour, when it must be discontinued. Artificial heat is not necessary until the blooms begin to expand, and then only sufficient to keep the atmosphere dry or exclude frost. More care must be exercised in watering after the plants are housed.

POT ROSES.—The whole batch of these should now be overhauled and the weak ones discarded. Where repotting is necessary this should be done at once. The remainder will need to be turned out of their pots to see that the drainage is clear and clean. Remove a portion of the top soil, and top-dress with fibrous loam, adding a little bonemeal and charcoal. When this work is finished the pots should be plunged in leaves in an open position. This will prevent the new soil drying quickly, and also assist in the formation of new roots. Care must be taken to keep the plants free from insect pests and mildew.

CINERARIAS. — The most forward of these plants should now be potted into their flowering pots, using a fairly rich compost for the purpose, and potting rather firmly. Before replacing the plants, the bed of the cold frame should be sprinkled with soot or lime to prevent slugs doing damage to the foliage. Keep down close to the glass by standing them on inverted pots. Ventilation and shading must be carefully attended to until the plants recover from the check occasioned by potting, after which a plentiful supply of air may be admitted. Rearrange the plants frequently, and give more room as the foliage develops.

VIOLETS IN POTS. — Where these are desired they should be lifted with a good ball of soil and potted. Stand them in a shady corner, where they will soon recover from the check.—A. Grubb, Porter's Park Gardens.

HARDY FRUITS.

THE FRUIT ROOM.—Continue to gather apples and pears as they become fit, arranging them in the fruit rooms to the best advantage; loose strips of wood an inch or two square will be found useful to separate the varieties, and where many are grown they should be carefully labelled, both for instruction and appearance sake. The floor should be damped down morning and evening, or as often as it becomes dry, giving plenty of ventilation till the first sweating of the fruit is over, which will continue for three or four weeks, but after that preservative conditions are best assured by opening the ventilators for a few hours during the middle of the day whenever the weather is favourable.

PLUMS.—Plums are generally bearing a very satisfactory crop. Victoria, Transparent Gage, Monarch, and Coe's Golden Drop may be considered the most reliable kinds for general purposes. Too many varieties will but prove an encumbrance, taking up valuable space that could oftentimes be used to better advantage. These varieties will invariably be found carrying heavy crops if the season is at all favourable. The last-named variety is one of the very best late dessert plums grown. Lose no time in making preparations for planting any wall trees that are required; old worn-out trees should be grubbed out, and when planting time arrives select a few reliable varieties that will maintain a long and continuous supply.

PEACHES AND NECTARINES. — Trees that are making a too luxuriant growth should receive attention by being root-pruned as soon as the borders are sufficiently moist. The general plan of doing this is to dig out a trench from three to six feet from the stems of the trees to be operated on according to their size, severing all the large woody roots at this distance, and preserving the small fibrous ones as much as possible. These should be laid back in new material, or in any case a goodly addition of maiden loam and plenty of lime rubble must be intermixed with the old soil. This should be thoroughly rammed, and too much emphasis cannot be laid on the necessity of having the soil well consolidated to ensure success in cropping. It would be no exaggeration to say that if young trees of stone fruits were annually root-pruned for three or four years this would be most beneficial to their health and cropping capabilities.

AUTUMN PLANTING. — Preparations should be made wherever possible for any new plantations of fruit, as autumn planting is the most satisfactory unless the soil is practically unworkable, when it may be an advantage to postpone the work until early spring. Where new orchards are being formed the drainage in the first place must not be forgotten, as it must carry away any excess of water and keep the land sweet. The cultivation of the land must of necessity be carried out according to the soil and conditions. Provide good square holes, trenched at least two spits deep, and if of very close texture add lime rubble or burnt earth to the staple soil; avoid the use of rank manure, even if the soil is of the poorest description at planting time, the soil being more regularly enriched, and kept sweet by periodical surface dressing.—J. Whittle, Cheveney Gardens.

THE KITCHEN GARDEN.

FRENCH BEANS. — Owing to the continued drought a scarcity of vegetables is within view in many gardens, and much forethought will be needed to secure a supply through the winter. Sow a good batch of French beans in eight-inch pots at the present time, and grow the plants on sturdily in a light house with a temperature of about 55 degrees, allowing plenty of air during fine days, and affording moisture to the foliage accordingly. The plants that have been grown on the south border as advised, and protected by frames, will need to be covered by mats at night.

ENDIVE. — The plants that have sufficiently completed their growth should be lifted carefully with balls of earth to their roots, and planted in frames rather thickly, but not so as to cause them to damp. They can here be protected as necessary against frost. Quantities may be taken to the mushroom house or suitable cellar to blanch as they are required, allowing about a fortnight for each batch to become ready for use. The later stock, if growing in the open, will also require some form of protection, such as planting them in frames with room for development, or placing them closely under the shelter of a south wall, where further coverings can be given during extreme weather.

BEET.—Before sharp frosts set in have this crop pulled and stored. It is very necessary to use care when carrying out this work to keep the roots intact, or they will deteriorate, and not keep a satisfactory colour when cooked. As far as I am aware, there is no better way of storing them than in moderately dry sand in a frost-proof root house.

LEEKS.—These will now be advanced in growth, and a final watering of liquid manure should encourage them to further development. Afterwards draw soil up to the stems with a hoe on a dry day, taking care not to fill the centre of the plants with soil.

CABBAGE.—If the old cabbage plot has been retained for cutting, it will most probably prove very valuable during the autumn and early winter months, there being a great scarcity of greens in most places.

GENERAL REMARKS. — The annual kinds of herbs should be harvested by this. Any that are not dry may be finished in a cool vinery or peach house to make up the stock. A sowing of mustard and cress may now be made under glass for the next supply, as it will only grow very slowly outside after this date. Place handlights over any young radishes that may be partly grown. — C. Flack, Cholmondeley Castle Gardens.

THE NATIONAL CHRYSANTHEMUM SOCIETY,
EARLY AUTUMN SHOW
will be held at the CRYSTAL PALACE
on
OCTOBER 4th and 5th, 1911.
Schedule and full particulars post free from the Secretary,
RICHARD A. WITTY,
72, Savernake Road,
Gospel Oak, London, N.W.

BIRMINGHAM CHRYSANTHEMUM SHOW.
BINGLEY HALL, NOVEMBER 7, 8, and 9, 1911.

Schedules now ready, and all particulars may be obtained on application to
ALFRED NOAKES.
Secretary,
148, Bristol Street,
Birmingham.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

National Chrysanthemum Society.

The Floral Committee met at Essex Hall on Monday, September 18, signed the attendance book, had a brief chat on various points in the work of the society, and then went its way; there was not a bloom on the tables, and nearly everyone was complaining that the early chrysanthemums were late and poor this year, owing to the drought.

In the evening there was a good attendance at the meeting of the General Committee. Owing to the efforts of Mr. Ballantine and Mr. C. H. Curtis, the society now has a complete set of its schedules; these have been bound up, and now form an interesting record of proceedings. Mr. Witty, the secretary, reported a balance in hand of £93 9s. 7d., and a profit of £2 9s. on the society's outing; he also stated that the net cost of the publication of the Conference Proceedings was £21 12s. 10d.

Arrangements were completed for a Chrysanthemum Conference at Carr's Restaurant on December 4 at seven o'clock, when papers will be read by Mr. F. W. Ladds and Mr. Percy Cragg. The society's annual dinner will be held at the Holborn Restaurant on November 23. Judges were elected for the October and November shows, and it was decided that all prize monies be paid to the successful competitors immediately after each exhibition.

National Rose Society.

The autumn show held at the Royal Horticultural Hall on Thursday, September 14, was a great and pleasant surprise to everyone who saw it, and probably the exhibitors themselves were most surprised. The competition was good, with a few exceptions, and both trade and amateur growers turned up splendidly; not only did they come, but they brought flowers, and in a very large number of instances the flowers were quite good; while, if we make allowances for the extraordinary and rainless summer, it must be conceded that in extent and quality the show was a fine one. The day was fairly cool, the roses kept well, and there were plenty of visitors.

NURSERYMEN.

In the premier trade class for three dozen blooms, distinct, Mr. Hugh Dickson, Royal Nurseries, Belfast, was a capital first with fairly large and handsome flowers, among which Mrs. Wagram, C. J. Grahame, Ards Pillar, Gladys Harkness, May Miller, Mrs. David M'Kee, Frau Karl Druschki, and J. B. Clark were exceptionally fine: Messrs. J. Cocker and Sons, Aberdeen, obtained second prize and the silver medal for the best H. T. rose with Earl of Warwick, and silver medal for the best H. P. rose with the beautiful crimson Gloire de Chedane Guinoisseau. Messrs. Alex. Dickson and Sons, Newtownards, co. Down, third; and Messrs. Adam and Craigmile, Rubislaw, Aberdeen, fourth.

The class for eighteen tea or noisette roses brought out five competitors, and premier honours fell to Mr. G. Prince, Longworth, for a set that included excellent examples of White Maman Cochet, Madame Constance Soupert, W. R. Smith, and Souv. de Pierre Notting; Messrs. J. Jefferies and Son, Cirencester, came second, and Mr. Henry Drew, Longworth, third. Messrs. Adam and Craigmile, who were not placed, obtained the silver medal for the best tea rose with a fine Molly Sharman Crawford. Unusually attractive was the first-prize set of twelve vases of exhibition roses, seven blooms of each, staged by Mr. Hugh Dickson; some of the blooms had a few damaged petals, but the flowers were of splendid size for the time of year, particularly those of Lyon Rose, Caroline Testout, Mrs. J. Laing, J. B. Clark, Mrs. Wagram, Ulrich Brunner, Mrs. Stewart Clark, and Frau Karl Druschki; Messrs. J. Cocker and Sons took second place. The best vase of a dozen blooms of any rose was from Mr. Hugh Dickson, and the variety, appropriately, was Hugh Dickson, presented in beautiful form; Messrs. H. Lane and Son, Berkhamsted, second with Marechal Niel, and Messrs. W. Crisp and Sons, Colchester, third.

There were two entries of twenty-four bunches of decorative roses, and first prize fell to Mr. John Mattock, New Headington, Oxford, for a pretty set, in which Duchess of Wellington, Lady Waterlow, Teresa Bevan, La Tesca, and Irish Elegance were good; Mr. John Pigg, Royston, Herts, came second. For a dozen bunches the awards fell in order of mention to Messrs. W. Spooner and Son, Arthur Bridge, Woking; Mr. Frank Woollard, Lewes Road, Brighton; and Mr. Chas. Turner, Slough.

There were three sets of twelve bamboo stands filled with decorative roses, and Mr. John Mattock's premier collection would have looked better had a little more room been allowed it; Felicite Perpetne, Dorothy Perkins, Madame Antoine Marie, Madame Jean Dupuy, Baby Dorothy, Marie Van Houtte, Gustave Regis, and Irish Elegance were his leading varieties; Mr. W. Bentley, Belgrave, Leicester, a capital second, and Mr. H. Drew, Longworth, third. The class for a dozen varieties of polyantha roses brought out four competitors, and Messrs. W. Spooner and Son, Woking, secured the first prize, and showed Leonie Lamesch, Mrs. Wm. Cutbush, White Pet, Jessie, etc.; Mr. G. Prince, Longworth, second, and Messrs. S. Bide and Sons, Farnham, third.

A really superb collection of three dozen bunches of roses, arranged on a space 12ft. by 3ft., won for Mr. John Mattock, New Headington, the premier award in what was a striking and effective class. Mr. Mattock presented particularly good bunches of E. V. Hermanos, Pharisaer, Medea, La Tosca, Lyon Rose, Maman Cochet, Paula, Lady Ashtown, Irish Elegance, Souv. de Pierre Notting, Florence Pemberton, and Reine Carola de Saze; Mr. G. Prince, Longworth was not far behind, and showed grand bunches of Marquis de Sinety, Souv. de Pierre Notting, Marie Van Houtte, Madame Jules Gravereaux, Lyon Rose, Gottfried Keller, and the crimson Chateau de C. Vougeot; Mr. R. Adams, White Wells Nurseries, Bath, third.

Rose hips are always attractive, and have a distinct decorative value, especially when shown in bunches. Messrs. Paul and Son, Cheshunt, had the best nine bunches, distinct, and especially effective were R. microphylla, R. rugosa alba, and R. rubrifolia. Mr. George Prince was second, and he had a splendid bunch of sprays of R. rubrifolia.

BASKETS AND VASES OF ROSES.

Unquestionably the method of showing roses in sprays, as cut, staged in broad baskets, one variety in a basket, is a most effective one, as from it one obtains a fair idea of the manner in which the roses bloom, as well as of their effect en masse.

Mr. Hugh Dickson, Belfast, was a capital first for nine baskets of roses, any sections, one variety in a basket, and he had a grand lot of blooms of Frau Karl Druschki, Countess of Shaftesbury, Hugh Dickson, Irish Elegance, Simplicity, General Jacqueminot, Mrs. Frank Workman, Lady Pirrie, and La Tosca; Mr. John Mattock annexed the second award, and Messrs. Paul and Son came third. The best five baskets of roses were those from Messrs. W. Spooner and Sons, Woking, who led from three competitors with Mons. J. Hill, Caroline Testout, Lyon Rose, Kaiserin Augusta Victoria (very fine), and Prince de Bulgarie; Mr. H. Drew second, and Mr. J. Pigg third.

Three baskets of cut roses (amateurs) found the Rev. J. H. Pemberton to the front with such free-flowering sorts as Ecarlate, Earl of Warwick, and Florence Pemberton; Mrs. H. Balfour, Headington Hill, Oxford, second.

Nine roses of distinct varieties made a good class, and Mr. Hugh Dickson led with Mrs. Aaron Ward, Mrs. David McKee, Betty, W. K. Smith, etc.; Mr. J. Mattock, second, and Mr. W. Bentley, Leicester, third.

GROUPS OF ROSES.

The gold medal for a corner group of roses, tastefully arranged, and representing practically all sections of the flower, was well won by Messrs. Paul and Son, Cheshunt, who set up bowls and stands of Frau Karl Druschki, Mdme. J. Guinnoisseau, Mdme. Melanie Soupert, Lyon Rose, Mdme. Abel Chatenay, etc., over a groundwork of polyantha roses and ferns. The silver-gilt medal offered as second prize was won by Messrs. Hobbies, Lim., Dereham, with an elegant display, in which standard weeping roses, and berried sprays of briar roses played a conspicuous and pretty part.

As usual, there were several competitors in the class for a representative group of cut roses set out on a table space 18ft. by 6ft. These, four in number, made a rare display opposite the main entrance. The gold medal and first prize fell to Messrs. W. and J. Brown, Peterborough, for a very artistic display carried to a considerable height; the stands and tubes were thinly disposed over a groundwork of low vases, and the leading varieties were Lyon Rose, Florence Pemberton, K. A. Victoria, Mdme. Abel Chatenay, Mdme. Jean Dupuy, and Mdme. Constant Soupert. The second prize fell to Messrs. Gunn and Sons, Olton, who were very close competitors, and put up a very handsome and effective display; Messrs. J. Jefferies and Co., Cirencester, came third. Messrs. Alex. Dickson and Sons, Newtownards, were awarded an extra prize.

The finest group of cut roses, arranged on a table space of 60 square feet, was set up by Messrs. George Jackman and Son, Woking; the large bamboo stands of Caroline Testout, K. A. Victoria, Lady Ashtown, Lyon Rose, and White Maman Cochet formed the feature of this exhibit. Second prize went to Mr. F. M. Bradley, Peterborough, whose tall stands were scarcely so well filled as on former occasions.

AMATEURS.

Mr. Eversfield, Denne Park, Horsham, obtained premier honours in the open amateurs' class for eighteen blooms, distinct, and in his set the best specimens were of White Maman Cochet, Perle von Godesberg, Frau Karl Druschki, Mdme. Jules Gravereaux, Lady Ashtown, and W. R. Smith; Mr. Conway Jones, Gloucester, came second; and the Rev. J. H. Pemberton, Havering, had to be content with third place, and Mr. Lindsell failed to secure an award. Mr. G. Speight, Market Harborough, had a fine dozen blooms, and his Horace Vernet secured the silver medal as the best H.P. in the amateurs' section; Mr. W. O. Times, Hitchin, second.

In the class for eighteen roses, distinct, Mr. Mahlon Whittle, Leicester, put up a very beautiful set, his examples of Mdme. Constant Soupert (silver medal, amateurs' tea rose), Lyon Rose, Bessie Brown, Mdme. Jules Gravereaux, Mdme. Hast, Mdme. Pierre Notting, and Florence Pemberton;

Mr. W. Upton, Leicester, second; and Mr. E. B. Lehmann, Ifield Lodge, Crawley, third; eight entries. Mr. B. J. Walker, of Market Deeping, secured the first prize for six blooms, distinct, in a class open to growers of fewer than 500 plants; he had eight competitors. In a class for the same number of blooms, open to growers of fewer than 200 plants. Mr. Whitcombe, Kateshill, Bewdley, was the chief prizewinner.

The best set of a dozen teas and noisettes came from Mr. Conway Jones, Gloucester, and he had lovely examples of W. R. Smith, Maman Cochet, Nita Weldon, White Maman Cochet, and Auguste Comte; Mr. E. M. Eversfield, Horsham, second. Mr. M. Whittle, Belgrave Avenue, Leicester, led for nine teas and noisettes with lovely blooms of Mdme. Jules Gravereaux, Maman Cochet, White Maman Cochet, and Souv. de Pierre Notting; Mr. G. Speight, Market Harborough, second; and Mr. H. R. Darlington, Potter's Bar, third. Mr. W. Upton, Leicester, and Mr. J. Hart, were first and second respectively for six blooms among growers of fewer than 200 tea roses; twelve entries.

Mr. E. M. Eversfield led for four vases of teas and noisettes with Mdme. Jean Dupuy, Mdme. Jules Gravereaux, Maman Cochet, and Souv. de S. A. Prince; Mr. Conway Jones second; and Mr. A. Seale, Bassett, Hants, third. Mr. Eversfield also scored for six vases of roses, and had in his set the premier amateurs' H. T. rose, a fine flower of Earl of Warwick; Mr. G. A. Hammond, Burgess Hill, a good second; and Mr. Conway Jones, third.

For a dozen vases of decorative roses the Rev. J. H. Pemberton had matters all his own way, and in the class for six vases, distinct, the prizewinners in order of merit were Mrs. J. W. Smythe, Sparrows Herne Hall, Watford; Mr. J. Hart, Little Heath, Potter's Bar; and Mr. H. R. Darlington, Potter's Bar.

A splendid set of a dozen bunches of roses, arranged on a space 6ft. by 3ft., won first prize for Mr. T. Stevenson gardener to E. G. Mocatta, Esq., Woburn Place, Addlestone; the varieties, finely shown, were Souv. de Pres. Carnot, Rhea Reid, Maman Cochet, K. A. Victoria, Earl of Warwick, Caroline Testout, Lady Ashtown, Pharisaer, Molly Sharman Crawford, Mary Countess of Ilchester, Madame Ravary, and Mrs. T. Roosevelt; Rev. J. H. Pemberton second, and Mr. Conway Jones, Hucclecote, Gloucester, third. Mr. Thomas Stevenson, Woburn Place Gardens, Addlestone, led in the class for six bamboo stands of decorative roses, with well-filled arrangements of White Pet, Prince de Bulgarie, Orleans Rose, Madame Abel Chatenay, Gruss au Teplitz, and Papillon; Mrs. J. Walter Smythe, Sparrows Herne Hall, Watford, second; and Mr. Conway Jones third.

The Rev. J. H. Pemberton led in the class for seven bunches of roses, in vases, and here he had Earl of Warwick, Frau Karl Druschki, and Florence Pemberton in good form; Mr. H. R. Darlington secured second award, and Mr. Conway Jones was third. For five vases of roses Mr. H. Robins, Ingatestone, was first with E. G. Mocatta, Esq., Addlestone, second; and Miss Beatrice Langton, Raymead, Hendon, third. For three vases Mr. S. W. Burgess, Old Bank House, Tonbridge; Rev. L. Chalmers Hunt, William Rectory, Hitchin; and Mr. W. P. Packridge, Petersfield, secured the prizes as mentioned.

NEW ROSES.

Not many new varieties were submitted on this occasion. Sunburst, raised by M. Pernet-Ducher, we have seen before, and its charming colouring is very attractive. The only variety gaining official recognition was Mrs. Muir Mackean, a splendid broad-petalled H. T. rose, with deep rose-red colouring that is suffused with crimson-scarlet in the newly opening blooms. If this will keep its colour during unkind weather it should become popular. The variety was shown by Messrs. S. McGredy and Sons, Portadown, Ireland, and gained a silver gilt medal.

DECORATIVE EXHIBITS.

First prize for a table decoration of roses fell to Mrs. G. A. Hammond, Cambrian House, Burgess Hill, for a design of Irish Elegance, but one which was, to our way of thinking, somewhat weak; Mrs. Tisdall, Woodford Green, was placed second with Lyon Rose and Mrs. Frank Tisdall; the colours blended well, and this table attracted more attention than any other from the visitors; Miss Beatrice Langton, Hendon, third.

The bowls of roses (amateurs') were not, on the whole, particularly striking; Mrs. Courtney Page, Earldoms, Enfield, led with blooms of Kaiserin Augusta Victoria in fine condition; Mrs. Tisdall came second with Edward Mawley; and Mrs. G. A. Hammond was placed third. For a bowl of exhibition roses Mrs. Tisdall was again first, and she used the variety Mrs. A. Tate; Mrs. J. W. Smith second with Irish Elegance; and Mrs. J. Davis, Burgess Hill, third with a bowl of Lady Pirrie.

In the open class for a bowl of roses Mr. Hugh Dickson led the way, followed by Mr. E. J. Hicks, with the pretty Comtesse de Cayla; Messrs. S. Bide and Son coming third.

East Anglian Horticultural Club.

There was a goodly number of members to support the president (Mr. L. Smith) at the September meeting of this club. The weather report for the past month, supplied by Mr. John H. Willis, revealed some phenomenal figures in temperature and sunshine. The exhibition tables were well filled in all sections. Of the more prominent of these a word of special praise was due to Mr. F. Williams, gardener to Louis Tillett, Esq., Catton, for his fine pot of Cypripedium insigne. Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, also staged a very good cypripedium. Mr. D. Howlett, Thorpe, was great with dahlias, securing the principle prizes, and also an award of merit for a new pink seedling pæony-flowered variety. Mr. S. Hunt brought up a grub, which is attacking narcissus bulbs, and those plants allied to it, causing serious loss. He also brought up two fine fruits of Cox's Orange Pippin, infected by a new form, locally, of a fungus that spots the fruits a deep crimson under the epidermis.

Mr. C. H. Fox, gardener to Lady Mansel, Old Catton, read a paper upon the subject of "Stove and Greenhouse-Flowering Plants." The paper was not given for its botanical value, the writer said, but to give practical experience upon some of the choicer subjects which should be grown for table and other decoration. Throughout it was practical, and gave cultural hints on every side of the plants' treatment.

A large number of members took part in the very educational discussion which followed.

Reading Gardeners' Association.

By the kind invitation of the President, the members of this association were recently afforded the opportunity (a treat enjoyed more than once before) of inspecting his fruit plantation at Caversham, and considerably more than 100 availed themselves of Mr. Parfitt's hospitality. Assembling at five p.m., the party were received by their host, and under his personal conduct proceeded at once to inspect the heavily-laden trees, which bore silent witness to Mr. Parfitt's careful and thorough cultivation. An hour was quickly passed rambling through the orchard, and during this time many were busy with pencil and note-book making copious observations to be used either in the planting or growing season to follow. Shortly after six p.m. tea, thoughtfully provided by Mr. Parfitt, was taken in a shady corner of the plantation, and afterwards the President announced that he had received letters from the Vice-president (Mr. Leonard Sutton) and Mr. W. Pole Routh expressing regret at their unavoidable absence.

Mr. Parfitt then expressed the pleasure it gave him to see a large number of members present, and pointed out that although his orchard was principally devoted to the cultivation of that splendid apple Cox's Orange Pippin, many other well-known favourites also found a place. Mr. Parfitt explained that although, early in the year, he had grave doubts about securing a crop, by careful handling, copious watering, and heavy mulching, he had succeeded in supplying what nature, in this marvellous year, had so largely withheld, and this, in combination with the glorious sunshine and great heat, had produced a record crop for quality and "complexion." Mr. Parfitt informed his guests that during June, July, and August he had used 380,000 gallons of water, equal to 1,700 tons, and equivalent to a rainfall of eight inches. Many tons of stable manure were used as a mulch to prevent loss of moisture from evaporation.

Mr. Powell, in proposing a vote of thanks to the President for his kindness, said that all would go away wiser for the splendid object-lesson they had enjoyed, which proved that expenditure in the right direction had been repaid ten-fold.

The vote was carried with acclamation, and cheers having been given for the President, the party dispersed.

United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Royal Horticultural Hall, Vincent Square, Westminster, on Monday evening, September 11, Mr. Charles H. Curtis in the chair. The death certificate of the late Mr. George Attrill was produced, and the sum of £42 4s. 8d. standing to his credit was granted his nominee, Mrs. Attrill. The death certificate of the late Mr. George Thompson was also produced. Two amounts of interest on deposit accounts were granted to members, as per Rule 18. The amount of sick pay for the past month was £30 10s. Another discussion took place on the National Insurance Bill as affecting this society, pending a further communication from the Treasury.

North-East of Scotland Horticultural and Arboricultural Association.

A meeting of those interested in the resuscitation of this association was held in the Aberdeen Corn Exchange on Saturday evening, 2nd inst. There was a somewhat poor attendance, and Mr. David Edwards presided. The Chairman explained the object for which the meeting had been called together, and said that the association had now been in abeyance for seventeen years. For some time past there had been a desire on the part of several of the old members that the association should once more be brought into existence, and, in his opinion, there was a wide field in Aberdeen for the work of such an association in disseminating among young gardeners information that would be of value to them in their profession. That the desire to resuscitate the association was an earnest one was proved, he thought, when he informed them that they had with them that night Mr. Reid and Mr. Wyllie, who had discharged the duties of secretary and treasurer of the association seventeen years ago. They had also with them one of their oldest members in the person of Mr. France. Mr. Wyllie referred to the small attendance at the meeting, and said that much more enthusiasm would have to be manifested before the association could be resuscitated. Mr. France spoke of the needs of such an association, and said they had the funds for the working of the association, and all they required was energy and enthusiasm on the part of the members to bring the success it deserved. Mr. J. B. Rennet, the secretary of the Aberdeen Horticultural Society, also referred to the help which the association would be to horticulturists in the way of initiating them into the scientific work of their profession.

After further discussion it was agreed

that a circular should be issued to all those in Aberdeen interested in the work requesting their attendance at a further meeting to be held a fortnight hence, when the question of resuscitating the association would again be considered. Mr. Wyllie afterwards intimated that the funds standing to the credit of the association amounted to £14 2s. 5d. The meeting closed with a vote of thanks to Mr. Edwards for presiding.

Messrs. Dickson and Robinson's Vegetable Show.

Three years ago Messrs. Dickson and Robinson, of Manchester, inaugurated an onion show, for the purpose of inducing a little friendly rivalry among the wide circle of gardeners who grow their well-known Premier onion. The success that attended that venture was duly recorded in the pages of the Gardeners' Magazine. Encouraged by repeated success last year, the firm decided that their third show should follow the lines of a general vegetable show, with classes for all seasonable vegetables, and on Wednesday, September 13, the show was opened in a spacious building secured for the purpose, situated in close proximity to the Manchester Cathedral.

In common with all horticultural shows held during the latter half of this phenomenal season, entries suffered somewhat in consequence of drought, but in spite of this, the display that came before the judge and the goodly crowd of visitors was of great excellence, reflecting credit upon the exhibitors for skilful cultivation under difficulties, and upon the firm for the high quality and stamina of their strains of vegetables.

Three classes were provided for "Premier" onions, one for four bulbs, open to the United Kingdom, a second class for four bulbs, open only to growers in or north of Birmingham; and a third for the heaviest single bulb. There were forty entries in the first class, and really handsome onions were staged throughout. Almost every entry brought uniform and symmetrical bulbs of good size, the most conspicuous fault being a trifle of scorching and blistering that was here and there apparent. The first prize was secured by Mr. F. West, The Gardens, Hackwood Park, Basingstoke, who showed four beautiful globular bulbs of even size, clear skinned, and well finished; Mr. W. H. Davis, Castle Hill Gardens, Buckland Newton, Dorchester, was second with another good dish; Mr. Arthur Cobb, The Gardens, Duffryn, near Cardiff, had four solid bulbs with good shoulders, for which he secured third prize; and Mr. Thos. Jones, Bryn Penylan, Ruabon, came fourth, losing points through one or two soft spots in his otherwise good bulbs. Fifth prize went to Mr. Henry Folkes, Gaddesden Place, Hemel Hempstead; sixth to Mr. H. Tysoe, The Gardens, The Lodge, Bedford; and seventh to Mr. Thos. Sparkes, Wimblehurst, Horsham, Sussex.

Nineteen entries in the class for growers north of Birmingham, made a good display, Mr. T. Jones, Ruabon, scoring with four beautiful specimens; second prize was awarded Mr. R. H. Smith, Newton Hall Gardens, Newton, his bulbs, though smaller, being models of what an onion should be. Mr. J. Kean, The Gardens, Ford House, Ulverston, was third, good weight being spoilt by coarseness; fourth went to Mr. E. Winchester, Brookside, Rubery, Birmingham; Mr. E. Jones, Rhiewport Gardens, Bevnew, Montgomery, fifth; Mr. Mills, The Gardens, Shavington Hall, Market Drayton, sixth; and Mr. Ibbs, Shavington, seventh. Mr. Arthur Cobb, The Gardens, Duffryn, Cardiff, scored for the heaviest onion, the weight being 3lb. 2oz.; the bulb was, however, a coarse one, and roughly finished.

One bunch of tomato, "Moneymaker" brought thirteen entries, and some wonderful bunches were shown; the winning lot had twenty-one symmetrical fruits, eighteen of which were ripe. Mr. Thos. Abbott, The Holms Gardens, Regent's Park, London, was the exhibitor; Mr. Thos. Heaman, The Gardens, Poynton Towers, near Stockport, came second. Mr. G. L. Blackburn, Bericote House Gardens, Leamington, was third, his fruit being green; fourth; Mr. E. H. Caterer, Dunoran, Tunbridge Wells, and Mr. Barker, Clumber Gardens, Worksop, fifth.

Twenty-two dishes of runner beans faced the judge, and a capital lot they were. Mr. John Tomlinson, Foxes Green Farm, Whitegate, near Northwich, was the premier winner, his beans being quite a foot long and very crisp; second prize was taken by Mr. H. Folkes, Hemel Hempstead, the other prizes going to Mr. F. West, Hackwood Park; Mr. W. Cox, Oakfield Gardens, Bridgwater; and Mr. G. W. Young, Rampton Manor, Lincoln. Six roots of Market Favourite beet made another strong class, Mr. J. Oakes, 60, Carrington Road, Flixton, Manchester, scoring first, and followed by Mr. G. W. Young; Mr. Mills, Shavington; Mr. Wm. Hester, Inwood Gardens, Templecombe, Somerset; and Mr. H. Bishop, The Gardens, Birch Hall, Colchester, in the order mentioned.

The first prize for three Sugarloaf cabbages was secured by Mr. George Ashby, Prospect Grange, Irlam; Mr. Levi, Brazendale, second with three of the hardest-hearted specimens one could wish for; third prize went to Mr. W. Bricknell, Sherston Manor, Northenden; Mr. Thos. Guy, The Gardens, Halsall House, Ormskirk, fourth; and Mr. R. Walker, Altrincham, fifth. Mr. T. Jeeves, Holbeach, led for six Perfection carrots; second going to Mr. E. Jones, Berriew, Montgomery; third to Mr. W. Hooper, Radlett Lane, Shenley, Barnet; fourth to Mr. H. Tysoe, Bedford; and fifth to Mr. Corbett, Mulgrave Castle Gardens. For Matchless Shorthorn carrots the prizes were awarded to Mr. Jackson, Greg-y-Nog, Newtown, Montgomery; Mr. Jees, Holbeach; Mr. H. Tysoe; and Mr. E. Winchester. Snowdon cauliflowers came up very well, the entries numbering eleven, and the whole of the exhibits being of better quality than we have seen at many an open show this season. Mr. Jackson, Greg-y-Nog, Newtown, was the winner, his trio being close, white, and of good size; Mr. Geo. Ashley, Irlam, was a good second; and the others went to Mr. Hooper, Mr. A. Leary, The Gardens, Swanscoe Park, Macclesfield; and Mr. T. Jones, Ruabon.

The Prize Pink celery exhibited were fine, well-blanched sticks, the seven entries all running close for the coveted awards. Mr. Winchester led, with Mr. H. Tysoe a close second; third going to Mr. Bishop, with Mr. Hooper fourth, and Mr. Barker fifth. Another interesting class was that for Exhibition leeks, and here Mr. H. Tysoe scored a well-merited victory with half a dozen splendid specimens; Mr. Miller was a good second, just losing points on evenness; Mr. E. Jones, Berriew, Montgomery, third; Mr. Wm. Hester, Templecombe, fourth; and Mr. J. Oakes, Flixton, fifth. Parsnips filled a long table, and included some fine roots, especially those for which Mr. H. Bishop, Colchester, was awarded first prize. Other classes were for savoys, turnips, and peas, the names of Messrs. T. Guy, A. Cobb, E. Jones, and R. Walker figuring among the winners.

The only resemblance between a Pine Spray Syringe and others is in the shape of the barrel. The metal is more substantial. For the rest, the combination spraying head renders Spray, Rose, and Bend instantly obtainable without the addition or removal of a single fitment, while the adjustable leather bucket plunger gives perfect suction, never allows water to escape past it and up your sleeve, and wears interminably.

A written request from your ironmonger or seedsman, and a Syringe will be sent in 24 hours for your approval. Price **10/6.** Sole proprietors and manufacturers. **Robinson Bros., Ltd., West Bromwich.**

PINE SPRAY SYRINGE (patent).

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.
